SECTION I - INTRODUCTION

1.1 PURPOSE

This report presents the hydrologic analysis for the proposed development located at the southeast corner of Goya Avenue & Indian Street, in the City of Moreno Valley, County of Riverside, State of California. The main objective of this report was to analyze the post construction “peak” run-off quantities for the proposed development.

1.2 PROJECT DESCRIPTION

The project is located across APNs 316020020, 316020021, 316020022, 316020023, and 316020014 at the southeast corner of Goya Avenue and Indian St as shown in Appendix A. The existing 13.74-acre site consists of residential tracts. It generally slopes from northeast to southwest at a gradient of approximately 0.8%. No existing underground storm drain facilities exist near the site that is tributary to the project. The site is bordered by Goya Avenue to the north, Indian Street to the west, and Residential development to the south and east. Indian Street are existing improved streets to be widen to add curb and gutter. Along the project site frontage, Goya Avenue is an existing dirt road and is part of street improvements at 0.39-acre and street improvements for southern portion of Iris Avenue at 0.37-acre for the residential tracts site.

The developed site will be residential homes with open space. The site will be graded to generally follow the existing condition drainage patterns to minimize adverse effects to the current topography and minimize the use of import soil.

The basin and storm drain curb inlet will ensure the project detains up to the 100-year stormwater volume exceeding the pre-developed condition while restricting outflow up to the 100-year pre-developed flow rate for the proposed onsite development only. The basin will both detain and infiltrate the project’s onsite runoff as no underground storm drain facilities exist near the site.

The basin will operate as an extended detention: it will detain the onsite flows for the storm events specified herein while also acting as detention basin to treat the project's runoff. While the basin will be 5' deep with 1' of freeboard, it will act as a biotreatment detention basin as determined by the BMP calculation sheets herein. The basin will only store runoff in excess of this in order to attenuate runoff to the pre-development condition.

Please see the Hydrology Map in Appendix D for delineation.

SECTION II - FLOW VOLUMES

2.1 METHODOLOGY

This hydrology study was based on the Riverside County Flood Control and Water Conservation District (RCFC&WCD) Hydrology Manual dated April 1978. This manual allows the use of two methods: the Rational Method and the Synthetic Unit Hydrograph Method.

The Rational Method was used to determine peak flow rates for each tributary area for pipe sizing to ensure that capacity for the 10-year and 100-year storm events were met. The Synthetic Unit Hydrograph Method was used to calculate pre-developed and post-developed runoff volumes and peak flow rates for the 2, 5, 10, and 100-year storm events at durations of 1, 3, 6, and 24 hours.

Basin modeling was performed using the Hydraflow Hydrographs Extension for Autodesk Civil 3D 2022. Synthetic Unit Hydrograph Method storm events were input into the extension to simulate basin depths,

Weighted % Impervious: 43%

Stormwater quality volumes were determined in the project water quality management plan (WQMP). See project WQMP for more information.

Please see Appendix C for Riverside County Approved CivilD Bonadiman Software Calculations as well as basin sizing calculations. See Appendix D: Hydrology Map for an illustration of drainage patterns, tributary sub areas, and storm drain pipes to convey runoff to the onsite basin.

2.2 DESIGN CRITERIA

Rational Method

Design Storm: 10 & 100-year

Soil Type: "B" (assumed for all areas).

Runoff Coefficients: A conservative on-site runoff coefficient of 0.90 was used for calculation of the post-developed runoff.

Synthetic Unit Hydrograph Method

Design Storms: 2, 5, 10, 100 year at 1, 3, 6, 24 hours

Antecedent Moisture Condition (AMC):

I (2 & 5-year)

II (10 & 100-year)

SECTION III - SUMMARY

Both the Rational Method and the Synthetic Unit Hydrograph Method were used to evaluate the hydraulic and hydrologic performance of the proposed development using the parameters described in Section 2.2. Peak runoff and storage for the development were calculated and are summarized in the following tables. The results of both calculations show that the proposed basin and storm drains are adequately sized to both convey and detain the runoff in excess of the pre-developed condition for the storm events indicated. Please see Appendices C & D for detailed calculations and locations of facilities.

Please note that Hydromodification and Hydrologic Conditions of Concern (HCOC) criteria do not apply to this project due to the downstream Canyon Lake sump. See the project WQMP for more information.

Rational Method Stormwater Calculations Summary

1. All runoff index (RI) numbers are for Antecedent Moisture Condition (AMC) II.
2. Quality of cover definitions:
 Poor-Heavily grazed or regularly burned areas. Less than 50 percent of the ground surface is protected by plant cover or brush and tree canopy.
 Fair-Moderate cover with 50 percent to 75 percent of the ground surface protected.
 Good-Heavy or dense cover with more than 75 percent of the ground surface protected.
3. See Plate C-2 for a detailed description of cover types.
4. Use runoff index numbers based on ground cover type. See discussion under "Cover Type Descriptions" on Plate C-2.

Bioretention Facility - Design Procedure		BMP ID	Legend:	Required Entries
				Calculated Cells
Company Name:	South of Goya		Date: 3/16/2023	
Designed by:	SK	County/City Case No.:		
Design Volume				
Enter the area tributary to this feature			$A_T =$	13.7 acres
Enter V_{BMP} determined from Section 2.1 of this Handbook			$V_{BMP} =$	14,845 ft ³
Type of Bioretention Facility Design				
<input checked="" type="radio"/> Side slopes required (parallel to parking spaces or adjacent to walkways) <input type="radio"/> No side slopes required (perpendicular to parking space or Planter Boxes)				
Bioretention Facility Surface Area				
Depth of Soil Filter Media Layer			$d_S =$	3.0 ft
Top Width of Bioretention Facility, excluding curb			$w_T =$	130.0 ft
Total Effective Depth, d_E $d_E = (0.3) \times d_S + (0.4) \times 1 - (0.7/w_T) + 0.5$			$d_E =$	1.79 ft
Minimum Surface Area, A_m $A_M (ft^2) = \frac{V_{BMP} (ft^3)}{d_E (ft)}$			$A_M =$	8,272 ft ²
Proposed Surface Area			$A =$	13,500 ft ²
Bioretention Facility Properties				
Side Slopes in Bioretention Facility			$z =$	4 :1
Diameter of Underdrain				6 inches
Longitudinal Slope of Site (3% maximum)				0.8 %
6" Check Dam Spacing				0 feet
