Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
4.4 BIOLOGICAL RESOURCES		
<p>Impact 4.4.6.2: Riparian Habitat or Other Sensitive Natural Communities: The three on-site drainages, including the Quincy Channel, contain riparian/riverine area. While the proposed project would incorporate the design standards identified in the City's Municipal Code, the development of the proposed project may result in the elimination of habitat for special-status plant species (mule fat scrub) or reduce population size of sensitive plant species below self-sustaining levels. Therefore, a potentially significant impact would occur and mitigation is required.</p>	<p>4.4.6.2A As outlined in the project's Determination of a Biologically Equivalent or Superior Preservation (DBESP) report, the project applicant shall compensate for the <u>temporary and permanent impact on and loss of jurisdictional waters and streambeds by providing a minimum 2:1 off-site replacement of equivalent riverine/riparian habitat prior to project construction.</u> (0.36 acre impact = 0.72 acre replacement). This off-site replacement shall be accomplished through the contribution of in-lieu fees to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of riparian habitat adjacent to the tributaries of the San Jacinto River or within the Santa Ana River watershed. Documentation of acceptance of the SAWA contribution shall be provided to the City prior to issuance of a grading permit. <u>Offsite restoration, enhancement, and/or land purchase mitigation for the drainage impacts will occur at an offsite location through one or more of the following: an USACE approved mitigation bank, through an in lieu fee mitigation program, and/or land purchase and conservation. DFG and USFWS will need to provide concurrence that this mitigation is equivalent or superior to that proposed for impact through their review and acceptance of the DBESP.</u></p> <p>4.4.6.2B The project applicant shall retain qualified personnel to prepare and implement a Habitat Mitigation and Monitoring Plan (HMMP) to oversee restoration of temporarily affected areas (0.35 acre of riverine/riparian habitat) to their pre-construction contours and vegetation. The HMMP will be approved by USACE and CDFG prior to the City issuing any</p>	<p>Less than Significant with Mitigation</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	occupancy permits. <u>Riparian/riverine resources that are temporarily impacted by project construction shall be returned to their preconstruction contours and hydroseeded, as outlined in the DBESP.</u>	
<p>Impact 4.4.6.3: Jurisdictional Waters/Wetlands: Implementation of the proposed project would result in permanent impacts to 0.051 acre (354 linear feet) of non-wetland waters of the United States and waters of the State and 0.362 acre (440 linear feet) of State streambed associated with the eastern, southern, and western drainages. In addition to permanent impacts, the proposed project would result in temporary impacts to 0.054 acre (332 linear feet) of non-wetland waters of the United States and waters of the State and 0.33 acre (547 linear feet) of State streambed associated with construction activities. This is a significant impact requiring mitigation.</p>	<p>4.4.6.3A The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE and a Section 1602 Streambed Alteration Agreement from the CDFG. Direct temporary impacts to more than 0.1 acre of jurisdictional area that are regulated by the USACE, CDFG, and RWQCB shall be mitigated at a 2:1 ratio, including enhancement and/or creation of wetlands or the contribution of in-lieu fee to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of off-site riparian habitat, as outlined in Mitigation Measure 3.3.6.2A. <u>The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE, a Section 401/Porter-Cologne Water Quality Certification from the RWQCB, and a Section 1602 Streambed Alteration Agreement from the CDFG. Offsite restoration, enhancement, and/or land purchase mitigation of jurisdictional drainage impacts will occur at an off-site location through one or more of the following: an USACE approved mitigation bank, through an in-lieu fee mitigation program, and/or land purchase and conservation.</u></p>	Less than Significant with Mitigation
4.5 CULTURAL RESOURCES		
<p>Impact 4.5.6.1: Prehistoric Cultural Resources: The cultural resources survey indicates there are no recorded cultural sites or surface evidence that cultural resources are present on the project site. Correspondence from Native American groups represents appropriate consultation under SB 18. The site's location within the Moreno Hills Complex indicates a potential exists that excavation and construction activities may uncover</p>	<p>4.5.6.1A <u>Prior to the issuance of a grading permit, the Project Applicant shall provide evidence to the City of Moreno Valley that a Cultural Resources Monitoring Agreement has been secured for qualified Tribal representatives, and that a</u></p>	Less than Significant with Mitigation

City of Moreno Valley

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<p><u>4.5.6.1C</u> If a significant archaeological resource(s) is discovered on the property, ground disturbing activities shall be suspended 100 feet around the resource(s). The archaeological monitor and representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division shall confer regarding mitigation of the discovered resource(s). A treatment plan and/or preservation plan shall be prepared and by the archaeological monitor and reviewed by representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division and implemented by the archaeologist to protect the identified archaeological resource(s) from damage and destruction. The landowner shall relinquish ownership of all archaeological artifacts that are of Native American origin found on the Project site to the culturally affiliated Native American tribe(s) for proper treatment and disposition. A final report containing the significance and treatment findings shall be prepared by the archaeologist and submitted to the City Planning Division, the appropriate Native American tribe(s), and the Eastern Information Center at the University of California, Riverside. All cultural material, excluding sacred, ceremonial, grave goods and human remains, collected during the grading monitoring program and from any previous archaeological studies or excavations on the project site shall be curated, as determined by the treatment plan, according to the current professional repository standards and may include the Pechanga Bands curatorial facility.</p> <p><u>4.5.6.1D</u> Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:</p>	

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<p><u>"If any suspected archaeological resources are discovered during ground-disturbing activities and the archaeological monitor or Tribal representatives are not present, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call the project archaeologist and the Tribal representatives to the site to assess the significance of the find."</u></p> <p><u>4.5.6.1E If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made by the Coroner. If the Riverside County Coroner determines the remains to be Native American, the California Native American Heritage Commission must be contacted within 24 hours. The Native American Heritage Commission must then immediately notify the "most likely descendant(s)" of receiving notification of the discovery. The most likely descendant(s) shall then make recommendations within 48 hours, and engage in consultations concerning the treatment of the remains as provided in Public Resources Code §5097.98.</u></p>	
<p>Impact 4.5.6.2: Paleontological Resources: The project site is located in an area identified as having a "high sensitivity" for paleontological resources. Construction of the proposed project has the potential to result in significant impacts to nonrenewable paleontological resources, requiring mitigation.</p>	<p><u>4.5.6.2D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:</u></p> <p><u>"If any suspected paleontological resources are discovered during ground-disturbing activities, the</u></p>	<p>Less than Significant with Mitigation</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<p><u>construction supervisor is obligated to halt work in a 100-foot radius around the find and call a qualified paleontologist to the site to assess the significance of the find. A qualified paleontologist shall evaluate the suspected resource. If the paleontologist determines that the find is not unique, construction shall be permitted to proceed. However, if the paleontologist determines that further information is needed to evaluate significance, the City of Moreno Valley shall be notified and a treatment plan shall be prepared and implemented in consultation with the City to protect the identified paleontological resource(s) from damage and destruction."</u></p>	
4.6 HAZARDS AND HAZARDOUS MATERIALS		
<p>4.6.6 Although the EIR did not identify any significant impacts related to hazardous materials, the mitigation measure was added to assure there will be no impacts related to soil contamination.</p>	<p>4.6.6.1A <u>Prior to issuance of a grading permit for the project, a qualified contractor shall test onsite soils for contamination by agricultural chemicals. If present in concentrations above established actionable levels or thresholds, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. This measure shall be implemented to the satisfaction of the Building Division including written documentation of the disposal of any agricultural chemical residue in conformance with all applicable regulations.</u></p>	Less than Significant
4.9 NOISE		
<p>Impact 4.9.6.1: Short-Term Construction Noise Impacts: Construction activities would include grading, excavation, and installation activities generating noise levels up 91 dBA L_{max} at 50 feet from an active construction area. These noise levels would diminish rapidly with distance from the construction site at a rate of approximately 6 dBA per doubling of distance. The worst-case scenario during construction would be a noise level of 91 dBA L_{max} at a distance of 50 feet from the noise source to the nearest existing sensitive receptor. However, compliance with the construction hours specified in the City's</p>	<p>4.9.6.1D. During all project site construction activities at Building 6 (i.e., closest to existing residences), the construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and</p>	Less than Significant with Mitigation

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code, mitigation measures have been identified to reduce the noise levels that would expose nearby sensitive receptors to noise levels in excess of the City's noise standards.	holidays, unless written approval is obtained from the City Building Official or City Engineer <u>for specific construction activities that must be conducted outside of the permitted time periods.</u>	
4.11 TRANSPORTATION		
<p>Impact 4.11.6.1A: Existing (2011) with project Conditions (Intersection) Traffic and Level of Service Impacts: The addition of project traffic to this scenario would result in conditions exceeding the established LOS standard at the following intersections:</p> <p>Redlands Boulevard/SR-60 Westbound Ramps (a.m. and p.m. peak hours); and</p> <p>Redlands Boulevard/Eucalyptus Avenue-Fir Avenue (p.m. peak hour).</p> <p>The project would contribute toward the worsening of the already unsatisfactory LOS at the intersection of Redlands Boulevard/SR-60 Westbound Ramps and would create a significant impact at the intersection of Redlands Boulevard/Eucalyptus Avenue-Fir Avenue. Therefore, mitigation is required at both intersections.</p>	<p>4.11.6.4A Prior to issuance of a building permit <u>Certificate of Occupancy</u>, the project applicant shall construct <u>pay the fair share contribution toward</u> the following traffic improvements through fees paid to the City of Moreno Valley based on the City's DIF system and the County's TUMF program:</p> <ul style="list-style-type: none"> • Redlands Boulevard/SR-60 Westbound Ramps. Install a traffic signal. This improvement is currently approved, and permitted by Caltrans. If not otherwise completed prior to project opening, the required traffic signal shall be constructed by the Applicant prior to issuance of the first Certificate of Occupancy. • Redlands Boulevard/Fir Avenue/Eucalyptus Avenue. If not otherwise completed prior to project opening, prior to issuance of the first Certificate of Occupancy, the Applicant shall construct the following improvements: Install a traffic signal and This improvement is listed in the City's DIF program. A add a northbound left-turn lane and a southbound left-turn lane. These improvements are listed in the TUMF. <p>If the improvements are constructed by others prior to the Certificate of Occupancy, the applicant shall pay its fair share towards the improvements through the City's DIF program.</p>	<p>With the implementation of the recommended improvements, the minimum level of service standards would be maintained for the Existing (2011) with project condition and impacts would be reduced to a less than significant level for all identified intersections. However, improvements to freeway facilities are under the authority of Caltrans. Since the City has no control over when and how the improvements will be in place, impacts associated with SR-60 ramp intersections would remain significant and unavoidable until such improvement is constructed.</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
4.12 GLOBAL CLIMATE CHANGE		
<p><u>Greenhouse Gas Emissions and Climate Change:</u> Construction of the project would emit approximately 37.5 tons per day of CO₂ equivalent emissions, while occupancy of the project will emit 61,000 tons of CO₂ equivalent emissions per year. The carbon dioxide, methane, and nitrous oxide emissions that would be associated with the proposed project is approximately 0.0024 percent of California's 2004 total emissions for carbon dioxide, methane, and nitrous oxide (492 Tg CO₂ Eq).</p> <p>The proposed project would be consistent with all feasible and applicable strategies to reduce greenhouse gas emissions in California. Therefore, the impact of the proposed project, based on these specifications, would be less than significant. The SCAQMD currently recommends that potential GHG emissions be addressed through energy efficiency.</p>	<p>4.13.6.1B. Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been incorporated into the design and construction of the project:</p> <ul style="list-style-type: none"> • Use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project. • Use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project. • Limit unnecessary idling of construction equipment. A reduction in equipment idling would reduce fuel consumption, and therefore, GHG emissions. • Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants. • Design the project building to exceed the California Building Code's (CBC) Title 24 energy standard, including, but not limited to, any combination of the following: <ul style="list-style-type: none"> ○ Increase insulation such that heat transfer and thermal bridging is minimized. ○ Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. 	<p>Less than Significant with Mitigation</p> <p>Since the project is consistent with the strategies to reduce California's emissions to the levels proposed by Executive Order S-3-05, the project's incremental contribution to climate change at the project level is less than significant.</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<ul style="list-style-type: none"> ○ Incorporate ENERGY STAR or better rated windows, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment. • Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping. • Install efficient lighting and lighting control systems. Use daylight as an integral part of the lighting systems in buildings. • Install light-colored “cool” roof and cool pavements. • Install energy-efficient heating and cooling systems, appliances and equipment, and control systems. • Install solar or light-emitting diodes (LEDs) for outdoor lighting <u>for auto parking areas.</u> 	

Draft EIR Section 4.1, AESTHETICS

4.1.1.1 Topographic/Vegetation Features (page 4.1-1)

Until recently, commercial citrus groves occupied the northwestern and northeastern portions of the project site, forming a dark-green canopy over approximately a third of the site area. The 2006 City General Plan EIR notes that the remaining citrus groves are “visually pleasing features” (MVGPF EIR, p. 5.11-2). However, in December 2013, the trees were removed due to ongoing maintenance and irrigation costs, and fire protection concerns (J. Jachetta, personal communication, December 2, 2013).

4.1.6 Significant Impacts

4.1.6.1 Scenic Vistas (page 4.1-9)

Views from SR-60 and Residences North of SR-60. ...As identified in Figure 4.1.3, existing views from this vantage point include SR-60 in the foreground, a concrete lane divider ~~and the tops of citrus groves~~ in the midground, and the Mount Russell Range in the background. As part of conditions of approval for the proposed project, two rows of ~~the existing~~ orange trees would be provided and

maintained on the northern portion of the project site adjacent to SR-60 and along the perimeter of the proposed project site adjacent to the public ROW or residential zoning. With development of the proposed project, buildings, associated parking lots, and ornamental landscaping would be built and placed on the project site. This would change existing views from the single-family residences north of SR-60 along Pettit Street. Foreground views would consist of SR-60, midground views would consist of a concrete divider and the tops of the ~~remaining~~ mature orange trees, and background views would consist of the upper half of the proposed warehouse buildings.

~~It is anticipated that the existing orange trees have an approximate height ranging from 12 feet to 16 feet.~~ Two rows of the former orange trees will be retained on the northern boundary adjacent to SR-60. Additionally, new orange trees would be planted along the northern length of Buildings No. 1 and 2. With the inclusion of the orange trees along this project boundary, the existing residences would see the upper 27 to 31 feet of the proposed buildings.

4.1.6.2 Scenic Resources and Scenic Highways (page 4.1-17)

... As illustrated in Figure 4.1.4, existing eastbound views on SR-60 would be altered with the development of the proposed project. Motorists would still view noise attenuation walls, urban development, landscaping, and ~~orange~~ scattered trees as they look to the south, although these views would be of short duration for motorists traveling at normal freeway speeds.

Level of Significance after Mitigation. Since there is no feasible mitigation is available to reduce impacts related to the substantial change in visual character from development of the proposed project, impacts associated with this issue would remain significant and unavoidable.

NOTE: *This conclusion would be the same regardless with or without the existing citrus trees onsite, so the conclusions and mitigation outlined in the DEIR do not change (i.e., significant).*

Draft EIR Section 4.2, AGRICULTURAL RESOURCES

4.2.1 Existing Setting (page 4.2-1)

NOTE: *The following paragraph was reworded to account for removal of the citrus trees.*

~~In addition to on-site farming of citrus, a~~Active agricultural operations take place on properties located to the north of SR-60, east and south of the proposed project site.

... The project site can be divided into ~~two three~~ categories of land cover: ~~citrus production,~~ hay/alfalfa production and fallow. ~~Currently,~~ Until recently, the majority of the northern portion of the site (approximately 57 acres) ~~was is~~ used for citrus production. ~~The remaining portions of the site are~~ Approximately 36 acres of the site, located in the southern portion of the site, supports hay/alfalfa and approximately 75 acres of fallow land is located in the northern portion of the site. Until December 2013, approximately 50 acres of the site contained citrus trees, but these were removed to eliminate ongoing maintenance and irrigation costs and potential fire safety issues. In any case, they are planned to be removed as part of project development. Currently, there are several abandoned wells and a non-functioning wind machine that were used in the past for on-site agricultural uses.

4.2.6.1 Conversion of State Designated Farmland (page 4.2-8)

Mitigation Measures. The potential mitigation measures identified by the City's General Plan have been deemed infeasible by the property owner under current economic conditions. In addition, supplementary analysis of the project site and local economic conditions indicates that continued citrus production and/or the raising of row crops would not be economically feasible on the project site (see Appendix E).

4.2.6.2 Conversion of an Existing Agricultural Operation to a Non-Agricultural Use (page 4.2-9)

Threshold	Would the proposed project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use?
-----------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The proposed project would result in the development of industrial uses on land that ~~was~~ has historically ~~been~~ utilized for citrus production. Implementation of the proposed project would result in the ~~retention~~ or provision of rows of citrus trees along the northern portion of the project site adjacent to SR-60, along the western perimeter of Building No. 6, and along the southern perimeter of Buildings No. 5 and 6. Although these citrus trees would be ~~retained~~ or provided along the perimeter of the project site, the ~~retention~~ or provision of citrus trees on site is for ornamental and landscaping purposes and not for agricultural cultivation. The conversion of the project site's agriculture land to non-agricultural uses is a result of various economic and demographic factors. Increased cost for water and a continuing demand for housing and other development in the City and region are the primary reasons for this agricultural land conversion.

NOTE: *The removal of the citrus trees onsite in December 2013 does not change the conclusions of the DEIR regarding agricultural impacts or mitigation. Loss of agricultural soils and former citrus activity would still be significant.*

Draft EIR Section 4.3, AIR QUALITY

Section 4.3.6.2 Equipment Exhaust from Construction-Related Activities (pages 4.3-23 and 4.3-24)

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.2C in response to concerns expressed by the South Coast Air Quality Management District (Letter B-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2C Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.

Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 3 off-road emission standards. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3

diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

Post January 1, 2015: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

A copy of each unit's certified tier specifications, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.2D in response to concerns expressed by the South Coast Air Quality Management District (Letter B-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2D All clearing, grading, earthmoving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.1H in response to concerns expressed by Johnson and Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2H The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and during smog season (May through October) by not allowing construction equipment to be left idling for more than five minutes (per California law).

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.2J in response to concerns expressed by Johnson and Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2J Grading plans, construction specifications and bid documents shall also include the following requirements notations:

- Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty;
- Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads;
- Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect;
- The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;

- The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours;
- High-pressure injectors shall be provided on diesel construction equipment ~~where feasible~~ if available;
- Engine size of construction equipment shall be limited to the minimum practical size;
- Substitute gasoline-powered for diesel powered construction equipment where ~~feasible~~ gasoline powered equipment is available;
- Use electric construction equipment where ~~feasible~~ it is practical to use such equipment;
- Install catalytic converters on gasoline-powered equipment where ~~feasible~~ this type of equipment is available;
- Ride-sharing program for the construction crew ~~shall be encouraged and~~ shall be supported by contractor(s) via incentives or other inducement;
- Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;
- Lunch vendor services shall be ~~provided~~ allowed on site during construction to minimize the need for off-site vehicle trips; and
- All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered.

***NOTE:** The following requirement was added to Mitigation Measure 4.3.6.2K in response to concerns expressed by Johnson and Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2K Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on site. In coordination and cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM₁₀ (fugitive dust) generation or other construction-related air quality issues within 24 hours.

Section 4.3.6.3 Localized Construction Equipment Exhaust Emissions Impacts (page 4.3-30)

4.3.6.3A Prior to the issuance of grading permits, the project applicant shall require by contract specifications that all trucks hauling dirt, sand, soil, or other loose materials are to be covered or ~~should~~ shall maintain at least 2 feet of freeboard in accordance with the requirements of California Vehicle Code (CVC) Section 23114 (freeboard means vertical space between the top of the load and top of the trailer).

Section 4.3.6.5 Long-Term Project-Related Emissions Impacts (page 4.3-33)

***NOTE:** A clerical error was made in the Draft EIR in Mitigation Measure 4.3.6.5B. These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

Mitigation Measures

- 4.3.6.5B** Prior to issuance of building permits, the project applicant shall provide evidence to the City that energy-efficient and low-emission methods and features of building construction shall be incorporated into the project design. These methods and features may include (but are not limited to) the following:
- Construction of buildings that exceed statewide energy requirements beyond 20_10 percent of that identified in Title 24, Part 6 Energy Efficiency Standards:
 - Use of low-emissions water heaters;
 - Use of central water-heating systems;
 - Use of energy-efficient appliances;
 - Use of increase insulation;
 - Use of automated controls for air conditioners;
 - Use of energy-efficient parking lot lighting; and
 - Use of lighting controls and energy-efficient lighting.
 - Utilize low-VOC interior and exterior coatings during project repainting.
 - Provide on-site improvements such as sidewalks or pedestrian walkways to promote pedestrian activity and reduce the amount of vehicle trips.
 - Installation of skylights and energy-efficient lighting that exceeds California Title 24 standards where feasible, including electronic dimming ballasts and computer-controlled daylight sensors in the buildings.
 - Shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and building shall be planted at the proposed project site. These strategies will minimize the heat island effect and thereby reduce the amount of air conditioning required.
 - Strategies to be considered include fans to assist natural ventilation, centralized water and space conditioning systems, high efficiency individual heating and cooling units, and automatic setback thermostats.
 - Reduction of energy demand associated with potable water conveyance through the following methods:
 - Incorporating drought-tolerant plants into the landscaping palette; and
 - Use of water-efficient irrigation techniques.
 - Energy-efficient low-pressure sodium parking lot lights or lighting equivalent as determined by the City, shall be used;
 - Buildings shall be oriented north-south where feasible;
 - Implement an on-site circulation plan in parking lots to reduce vehicle queuing;
 - Develop a trip reduction plan to achieve 1.5 average vehicle ridership (AVR) for businesses with fewer than ~~400~~ 250 employees or multitenant worksites;
 - Include bicycle parking facilities such as bicycle lockers and racks;
 - Include showers for bicycling employees use; and

- Construct on-site pedestrian facility improvements such as building access that is physically separated from street and parking lot traffic and walk paths.

Section 4.3.6.6 Project-Related Localized Operational Emission Impacts (pages 4.3-35 through 4.3-37)

Mitigation Measure 4.3.6.6A has been modified to address concerns expressed by the South Coast Air Quality Management District (Letter B-3), Sierra Club (Letter D-2), and Johnson & Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.3.6.6A Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of ~~20~~ 10 percent until January 1, 2014. For building permits issued after that date, new state energy standards require a 20 percent reduction from 2008 Title 24, Part 6 Energy Efficiency Standards. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. ~~Any combination of~~ The following design features ~~including but not limited to the following list~~ shall be used to fulfill this requirement:

- Buildings shall exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.
- Increase in insulation such that heat transfer and thermal bridging is minimized.
- Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.
- Incorporate dual-paned or other energy efficient windows.
- Incorporate energy efficient space heating and cooling equipment.
- Interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards shall be installed, as deemed acceptable by the City. Automatic devices to turn off lights when they are not needed shall be implemented.
- To the extent that they are compatible with landscaping guidelines established by the City, shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.
- Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.
- All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.
- To reduce energy demand associated with potable water conveyance, the project shall implement the following:
 - Landscaping palette emphasizing drought-tolerant plants;
 - Use of water-efficient irrigation techniques; and,
 - U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.
- The project shall provide secure, weather-protected, on-site bicycle storage/parking.

- The project shall provide on-site showers (one for males and one for females). Lockers for employees shall be provided.
- The project will establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce greenhouse gas (GHG) emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.
- The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.
- The project shall provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, stub outs for charging stations shall be indicated on the project building plans.
- Lease/purchase documents shall identify that tenants are encouraged to promote the following:
 - Implementation of compressed workweek schedules.
 - SmartWay partnership;
 - Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long-haul trips carried by SmartWay 1.0 or greater carriers.
 - Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long-haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers.
 - Use of fleet vehicles conforming to 2010 air quality standards or better.
 - Installation of catalytic converters on gasoline-powered equipment.
 - Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.
 - Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles.
 - Provision of preferential parking for EV and CNG vehicles.
 - Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.
 - Use of electric (instead of diesel or gasoline-powered) yard trucks.
 - Use of SmartWay 1.25 rated trucks.
 - Each facility operator shall provide regular sweeping of onsite parking and drive areas using street sweepers that comply with applicable SCAQMD Rules.

- Each facility operator shall maintain a log of all trucks entering the facility to ensure that, on average, the daily truck fleet meets applicable air quality emission standards. This log shall be available for inspection by City staff at any time.
- Each facility operator shall prohibit all vehicles from idling in excess of five minutes in all onsite areas.
- Each facility operator shall ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained and certified in diesel health effects and technologies, such as by requiring attendance at CARB-approved courses.
- Each facility operator which upon occupancy does not already operate 2007 and newer trucks shall in good faith be required to apply for funding to replace or retrofit their trucks such as Carl Moyer, VIP, Prop 1B or similar funds. Should funds be awarded, the tenant shall be required to accept and use them.

Draft EIR, Section 4.4, BIOLOGICAL RESOURCES

4.4.1 Existing Setting

4.4.1.2 Vegetation (page 4.4-4)

... Until December 2013, agriculture-citrus (citrus tree orchards) occurred on the northwestern, northeastern, and east-central portions of the project site and occupied approximately 57.2 acres. The trees were removed recently to avoid additional maintenance and irrigation costs, and to help reduce fire safety issues. Approximately 47.4 acres of ruderal vegetation occurs on the project site and is dominated by weedy vegetation that is typically associated with a past disturbance (agriculture).

Section 4.4.6.2, Riparian Habitat or Other Sensitive Natural Communities (page 4.4-29)

Impact 4.4.6.2: *The proposed project has the potential to permanently affect 0.36 acre of riparian/riverine habitat and to temporarily affect 0.35 acre of riparian/riverine habitat.*

Threshold	Would the proposed project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?
-----------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The project site consists of highly disturbed land from which most natural vegetation has been removed by regular disking for weed abatement and historical citrus cultivation.

NOTE: *The removal of the citrus trees in December 2013 does not affect the conclusions of the DEIR regarding biological impacts or mitigation.*

MITIGATION NOTE: *Based on a pre-application MSHCP project meeting with CDFG, USFWS, RCA, and RWQCB that occurred on October 10, 2012, the following minor changes and clarifications have been made to the indicated mitigation measures, mainly to incorporate temporary impacts into the compensation for permanent impacts but also to make the EIR mitigation measures consistent with the DBESP implementation measures:*

- 4.4.6.2A** ~~As outlined in the project's Determination of a Biologically Equivalent or Superior Preservation (DBESP) report, the project applicant shall compensate for the temporary and permanent impact on and loss of jurisdictional waters and streambeds by providing a minimum 2:1 off-site replacement of equivalent riverine/riparian habitat prior to project construction. (0.36 acre impact = 0.72 acre replacement). This off-site replacement shall be accomplished through the contribution of in-lieu fees to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of riparian habitat adjacent to the tributaries of the San Jacinto River or within the Santa Ana River watershed. Documentation of acceptance of the SAWA contribution shall be provided to the City prior to issuance of a grading permit. Offsite restoration, enhancement, and/or land purchase mitigation for the drainage impacts will occur at an offsite location through one or more of the following: an USACE approved mitigation bank, through an in lieu fee mitigation program, and/or land purchase and conservation. DFG and USFWS will need to provide concurrence that this mitigation is equivalent or superior to that proposed for impact through their review and acceptance of the DBESP.~~
- 4.4.6.2B** ~~The project applicant shall retain qualified personnel to prepare and implement a Habitat Mitigation and Monitoring Plan (HMMP) to oversee restoration of temporarily affected areas (0.35 acre of riverine/riparian habitat) to their pre-construction contours and vegetation. The HMMP will be approved by USACE and CDFG prior to the City issuing any occupancy permits. Riparian/riverine resources that are temporarily impacted by project construction shall be returned to their preconstruction contours and hydroseeded, as outlined in the DBESP.~~

NOTE: *The DBESP replaces the need for a separate Habitat Mitigation and Monitoring Plan.*

Section 4.4.6.3, Jurisdictional Waters/Wetlands (page 4.4-31)

- 4.4.6.3A** ~~The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE and a Section 1602 Streambed Alteration Agreement from the CDFG. Direct temporary impacts to more than 0.1 acre of jurisdictional area that are regulated by the USACE, CDFG, and RWQCB shall be mitigated at a 2:1 ratio, including enhancement and/or creation of wetlands or the contribution of in-lieu fees to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of off-site riparian habitat, as outlined in Mitigation Measure 3.3.6.2A. The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE, a Section 401/Porter-Cologne Water Quality Certification from the RWQCB, and a Section 1602 Streambed Alteration Agreement from the CDFG. Offsite restoration, enhancement, and/or land purchase mitigation of jurisdictional drainage impacts will occur at an off-site location through one or more of the following: an USACE approved mitigation bank, through an in-lieu fee mitigation program, and/or land purchase and conservation.~~

Draft EIR, Section 4.5, CULTURAL AND PALEONTOLOGICAL RESOURCES

Section 4.5.6.1 Prehistoric Cultural Resources (page 4.5-6)

All of the mitigation measures were modified to better address concerns expressed by the Pechanga Band and Morongo Tribe (Letters A-4 and A-5, respectively). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR, and are shown below:

- 4.5.6.1A** Prior to the issuance of a grading permit, the Project Applicant shall provide evidence to the City of Moreno Valley that a Cultural Resources Monitoring Agreement has been secured for qualified Tribal representatives, and that a professional archaeological monitor meeting Secretary of Interior standards has been retained by the Applicant to conduct monitoring of all mass grading and trenching activities and has the authority to temporarily halt and redirect earthmoving activities in the event that suspected archaeological resources are unearthed during Project construction. The Project Archaeologist and Tribal representatives shall attend the pre-grading meeting with the City and contractors to explain and coordinate the requirements of the monitoring program.
- 4.5.6.1B** Prior to the issuance of a grading permit, the Applicant shall provide evidence to the City of Moreno Valley that appropriate Native American representative(s), Project Archaeologist, and the Tribal representative(s) shall be allowed to monitor and have received a minimum of 30 days advance notice of all mass grading and trenching activities. During grading and trenching operations, the Tribal representatives and the project archaeological monitor shall observe all mass grading and trenching activities per the Cultural Resources Monitoring Agreement. If the Tribal representatives suspect that an archaeological resource may have been unearthed, the archaeologist, in consultation with the tribal representative, shall immediately halt and redirect grading operations in a 100-foot radius around the find to allow identification and evaluation of the suspected resource. In consultation with the appropriate Native American Tribe(s), the archaeological monitor shall evaluate the suspected resource and make a determination of significance pursuant to California Public Resources Code Section 21083.2.
- 4.5.6.1C** If a significant archaeological resource(s) is discovered on the property, ground disturbing activities shall be suspended 100 feet around the resource(s). The archaeological monitor and representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division shall confer regarding mitigation of the discovered resource(s). A treatment plan and/or preservation plan shall be prepared and by the archaeological monitor and reviewed by representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division and implemented by the archaeologist to protect the identified archaeological resource(s) from damage and destruction. The landowner shall relinquish ownership of all archaeological artifacts that are of Native American origin found on the Project site to the culturally affiliated Native American tribe(s) for proper treatment and disposition. A final report containing the significance and treatment findings shall be prepared by the archaeologist and submitted to the City Planning Division, the appropriate Native American tribe(s), and the Eastern Information Center at the University of California, Riverside. All cultural material, excluding sacred, ceremonial, grave goods and human remains, collected during the grading monitoring program and from any previous archaeological studies or excavations on the project site shall be curated, as determined by the treatment plan, according to the current professional repository standards and may include the Pechanga Bands curatorial facility.

4.5.6.1D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:

"If any suspected archaeological resources are discovered during ground-disturbing activities and the archaeological monitor or Tribal representatives are not present, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call the project archaeologist and the Tribal representatives to the site to assess the significance of the find."

Although DEIR Section 4.5.5.2, Human Remains, concludes potential impacts of the project will be less than significant with compliance with state law, Mitigation Measure 4.5.6.1E has been added at the request of the tribe to help assure there will be no significant impacts related to the potential discovery of human remains during grading:

4.5.6.1E If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made by the Coroner. If the Riverside County Coroner determines the remains to be Native American, the California Native American Heritage Commission must be contacted within 24 hours. The Native American Heritage Commission must then immediately notify the "most likely descendant(s)" of receiving notification of the discovery. The most likely descendant(s) shall then make recommendations within 48 hours, and engage in consultations concerning the treatment of the remains as provided in Public Resources Code §5097.98.

Section 4.5.6.2, Paleontological Resources

The following mitigation measure was added to address general concerns expressed by the Pechanga Band and Morongo Tribe (Letters A-4 and A-5, respectively).

4.5.6.2D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:

"If any suspected paleontological resources are discovered during ground-disturbing activities, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call a qualified paleontologist to the site to assess the significance of the find. A qualified paleontologist shall evaluate the suspected resource. If the paleontologist determines that the find is not unique, construction shall be permitted to proceed. However, if the paleontologist determines that further information is needed to evaluate significance, the City of Moreno Valley shall be notified and a treatment plan shall be prepared and implemented in consultation with the City to protect the identified paleontological resource(s) from damage and destruction."

Draft EIR Section 4.6, HAZARDS AND HAZARDOUS MATERIALS

Section 4.6. Significant Impacts

This section did not identify any significant impacts related to hazardous materials, including past use of pesticides on the project site in the past. However, the following measure is proposed in response to comments in Letter D-4 in this regard:

4.6.6.1A Prior to issuance of a grading permit for the project, a qualified contractor shall test onsite soils for contamination by agricultural chemicals. If present in concentrations above established actionable levels or thresholds, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. This measure shall be implemented to the satisfaction of the Building Division including written documentation of the disposal of any agricultural chemical residue in conformance with all applicable regulations.

Draft EIR Section 4.9, NOISE

Section 4.9.6.1 Short-Term Construction Noise Impacts (pages 4.9-26 and 4.9-27)

Mitigation Measure 4.9.6.1D was amended to be consistent with the City's Municipal Code for noise and to specify hourly limits for work nearest the existing residences. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.9.6.1D. During all project site construction activities at Building 6 (i.e., closest to existing residences), the construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and holidays, unless written approval is obtained from the City Building Official or City Engineer for specific construction activities that must be conducted outside of the permitted time periods.

Draft EIR Section 4.11 TRANSPORTATION

Section 4.11. (page 4.11-14)

Section 4.11.6.6 Mitigation Measures (page 4.11-31)

The following text has been amended to clarify the intension of the measure. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.11.6.4A Prior to issuance of a building permit Certificate of Occupancy, the project applicant shall construct pay the fair share contribution toward the following traffic improvements through fees paid to the City of Moreno Valley based on the City's DIF system and the County's TUMF program:

- **Redlands Boulevard/SR-60 Westbound Ramps.** Install a traffic signal. This improvement is currently approved, and permitted by Caltrans. If not otherwise completed prior to project opening, the required traffic signal shall be constructed by the Applicant prior to issuance of the first Certificate of Occupancy.
- **Redlands Boulevard/Fir Avenue/Eucalyptus Avenue.** If not otherwise completed prior to project opening, prior to issuance of the first Certificate of Occupancy, the Applicant shall construct the following improvements: Install a traffic signal and ~~This improvement is listed in the City's DIF program.~~ Add a northbound left-turn lane and a southbound left-turn lane. ~~These improvements are listed in the TUMF.~~

If the improvements are constructed by others prior to the Certificate of Occupancy, the applicant shall pay its fair share towards the improvements through the City's DIF program.

Draft EIR Section 4.12, UTILITIES AND SERVICE SYSTEMS

Section 4.12.1.7 Cumulative Impacts to Solid Waste Services (page 4.12-5)

The following text has been amended to clarify the Badlands Sanitary Landfill is scheduled to close in 2024 not 2016. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

AB 939 mandates the reduction of solid waste disposal in landfills. While the Badlands Sanitary Landfill has an estimated closure date of ~~2016~~ 2024, as previously identified, the City's waste hauler will also use other County landfills in the area (e.g., Lamb Canyon Landfill and El Sobrante Landfill). The estimated closure date of the Lamb Canyon Landfill is 2023 and the estimated closure date of the El Sobrante Landfill is 2030. With planned expansion activities of landfills in the project vicinity and projected growth rates contained within the City's General Plan EIR, sufficient landfill capacity would exist to accommodate future disposal needs through City build out in 2030. Therefore, build out of the City General Plan would not create demands for solid waste services that would exceed the capabilities of the County's waste management system. Consequently, cumulative impacts associated with solid waste within the City would be considered less than significant.

Draft EIR 4.13, GLOBAL CLIMATE CHANGE

Section 4.13.6.1 Greenhouse Gas Emissions (page 4.13-20)

The following text has been amended to clarify the intension of the measure. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.13.6.1B. Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been incorporated into the design and construction of the project:

- Use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project.
- Use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project.
- Limit unnecessary idling of construction equipment. A reduction in equipment idling would reduce fuel consumption, and therefore, GHG emissions.
- Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants.
- Design the project building to exceed the California Building Code's (CBC) Title 24 energy standard, including, but not limited to, any combination of the following:
 - Increase insulation such that heat transfer and thermal bridging is minimized.
 - Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.

- Incorporate ENERGY STAR or better rated windows, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment.
- Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping.
- Install efficient lighting and lighting control systems. Use daylight as an integral part of the lighting systems in buildings.
- Install light-colored “cool” roof and cool pavements.
- Install energy-efficient heating and cooling systems, appliances and equipment, and control systems.
- Install solar or light-emitting diodes (LEDs) for outdoor lighting for auto parking areas.

Draft EIR 6.0, ALTERNATIVES

Section 6.5 Environmentally Superior Alternative (page 6-39)

There was a typographical error in Table 6.M under Alternative 5 for Air Quality that has been rectified below. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

Table 6.M: Summary of Significant Environmental Impacts of the Project Alternatives

Topic	Proposed Project Impact	Impacts of Alternatives ¹					
		PP	1	2	3	4	5
Aesthetics	Scenic Vistas	S			S		
Aesthetics	Scenic Resources and Scenic Highways	S			S		
Aesthetics	Substantial degradation of the existing visual character or quality of the site and its surroundings	S			S		
Aesthetics	Cumulative Aesthetic Impacts	S			S		
Agriculture	Loss of State Designated Farmland	S		S		S	S
Agriculture	Conversion to a Non-agricultural Use	S		S		S	S
Agriculture	Cumulative Agricultural Resources	S		S		S	S
Land Use	Consistency with Regional or Local Land Use Plans, Policies, or Goals	S			S	S

Table 6.M: Summary of Significant Environmental Impacts of the Project Alternatives

Topic	Proposed Project Impact	Impacts of Alternatives ¹				
		PP	1	2	3	4

¹ Proposed Project (PP)
Alternative 1: No Project – No Build
Alternative 2: No Project (Tentative Tract Map 32255)
Alternative 3: Reduced Intensity
Alternative 4: Mixed Commercial/Office/Residential
Alternative 5: Off-Site Location
S = Significant

4. REDUCED INTENSITY ALTERNATIVE LESS INTENSIVE MODIFIED PLAN EVALUATION

Based on input received at the City's public hearings and after completion of the Final EIR on April 2, 2014, the applicant is proposing the City adopt the Reduced Alternative evaluated in the DEIR ([pages 6-18 through 6-24 and 6-37 through 6-40](#)). [The Reduced Intensity Alternative evaluated developing 25% less warehousing on the site \(1.7 million square feet\) compared to the Proposed Project \(2.2 million square feet\).](#) The applicant has [now proposed to develop 4 of the 6 warehouse buildings \(1.5 million square feet\), which is consistent with](#) the Reduced Intensity Alternative evaluated in DEIR Section 6.0 (1.7 million square feet). [The DEIR did not contain a specific site plan depicting the Reduced Intensity Alternative, so the applicant has prepared a conceptual site plan referred to in this analysis as the "less intensive modified plan".](#)

[The proposed less intensive modified plan is consistent with the](#) Reduced Intensity Alternative [and proposes that 84.8 acres of the site would be developed for warehousing while the remaining 38 acres](#) would remain undeveloped [at this time. The vacant land would retain](#) its existing General Plan and zoning designations (R2 and R5). This [less intensive modified plan](#) represents a net decrease in square footage of approximately 32 percent compared to the original proposed project, and a 7 percent reduction in square feet compared to the Reduced Intensity Alternative evaluated in the DEIR (see Table 4.A). The [less intensive modified plan](#) removes the two industrial buildings (Buildings 5 and 6 in the original site plan) closest to the residential homes southeast of the project site.

Warehouse buildings under the [less intensive modified plan](#) are 1,515 feet from the nearest existing residential neighborhood (southwest), and 1,636 feet from the existing neighborhood at the southeast corner. The [less intensive modified plan](#) also provides a 250-foot buffer between the nearest warehouse truck court and future residential uses. In addition, the large detention basin that was proposed at the south end of Building 6 in the original plan would be moved to near the southeast corner of Building 4 in the [less intensive modified plan](#). Approval of this modified plan would also establish a minimum 250-foot buffer from truck activity areas and future residential uses on the former location of warehouse buildings 5 and 6 under the original plan. Otherwise, the development characteristics of Buildings 1 through 4 would remain the same as those outlined and analyzed in the Draft EIR. For the purposes of this environmental analysis, the [less intensive modified plan](#) is considered equivalent to the Reduced Intensity Alternative except where noted [that impacts are less than those of the Reduced Intensity Alternative](#). The conceptual land plan for the [less intensive modified plan](#) is shown in Figure 4.2 in this section. Table 4.A presents the land uses and ITE rates of the four scenarios evaluated in the following sections.

It is important to emphasize that the [less intensive modified plan](#) would allow development of future residential uses in the southeast portion of the project site, consistent with the existing R-5 and RA-2 zoning (Parcel 5), adjacent to the existing residential neighborhood to the southeast. The modified plan also has a 250-foot setback from the project warehouses to the future residential uses, [consistent with the City's municipal code requirements](#) (i.e., use of a 250-foot buffer and a non-building easement over a portion of Parcel 5).

Table 4.A: Land Use Characteristics Evaluation Scenarios

Land Use (ITE rate) Characteristics	Land Use Scenario			
	Proposed Project	Existing Zoning	Reduced Intensity Alternative (EIR)	Less Intensive Modified Plan ¹
Warehousing (152)				
Square Footage	2,244,600	0	1,683,000	1,529,500
Gross Acres	122.8	0	90.8	84.8
Vacant Acres	0	0	32.0	(38.0)
Business Park/Business Park Mixed Use (770)				
Square Footage	0	622,000	0	0
Gross Acres	0	48.3	0	0
Multi-Family (230) Residential (R-15)				
Units	0	548	0	0
Gross Acres	0	36.5	0	0
Single Family (210) Residential (R-5 & R-2)				(Future)
Units	0	133	0	126
Gross Acres	0	38.0	0	38.0
TOTAL				
Square Feet	2,244,600	622,000	1,683,000 (-25%)	1,529,000 (-32%)
Units	0	681	0	126
Gross Acres	122.8	122.8	122.8	122.8

Source: ProLogis data and trip generation table from LSA Traffic Group, September 2014 (See FEIR Appendix F)

¹ **NOTE:** Residential units under this plan would be built at some later by a different developer with separate CEQA review. This plan is a sub-set of the Reduced Intensity Alternative from the DEIR, it is **NOT** a new alternative.

Figure 4.1 Original Site Plan

This Page Intentionally Left Blank

Figure 4.2 Less Intensive Modified Plan

This Page Intentionally Left Blank

It should be noted that the 38 acres of residential uses shown in Table 4.A for the less intensive modified plan are only approximate, and the actual acreage will be based on appropriate development constraints, development impact fees, and conditions of approval imposed on the property during the City's development review process of the revised parcel map and revised tentative tract map.

The following analysis is based on Section 6.3.3 of the DEIR but goes into more detail based on development details of the less intensive modified plan. Table 4.D at the end of this section summarizes the impacts of the less intensive modified plan compared to both the Proposed Project and the Reduced Intensity Alternative evaluated in the DEIR. In addition, this analysis shows what the impacts of developing the site under its existing zoning designations (i.e., with Business Park/Business Park-Mixed Use, Residential 15, Residential 5, and Residential 2 uses).

4.1 Aesthetics

- (a) **Proposed Project** – Project would introduce 6 large warehouse buildings into the area, with existing residential uses adjacent to the southeast. Impacts from loss of views and new night lighting are significant even with mitigation.
- (b) **Existing Zoning** – Development of the site under existing zoning designations would result in the alteration of the existing visual character of the site but with new residential uses adjacent to the existing residences to the southeast, and development intensity increasing from R2 next to the existing residences to more dense R5 and R15 uses to the north along Eucalyptus Avenue. This pattern would be consistent with that outlined in the existing General Plan and zoning. New development would adhere to City design and development standards for each particular land use, but would still be a substantial change from existing vacant conditions.
- (c) **Reduced Intensity Alternative** – Impacts to views and lighting are substantially reduced by eliminating 25% of development in the southeast portion of the site compared to the Proposed Project. However, impacts are still significant, similar to the Proposed Project.
Under the less intensive modified plan, impacts to views and lighting are substantially reduced by eliminating 32% of development proposed in the southeast portion of the site (Buildings 5 and 6) compared to the Proposed Project. However, impacts are still significant compared to the Proposed Project.
- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, but impacts of all three are significant due to the fundamental change in character for the area from existing conditions.

4.2 Agricultural Resources

- (a) **Proposed Project** – Project would introduce 6 large warehouse buildings onto an area designated as Prime Farmland and Farmland of Local Importance. Impacts from the loss of prime agricultural lands are significant and no mitigation is available.
- (b) **Existing Zoning** – Development of the project site with urban uses would result in the conversion of Prime Farmland. Impacts associated with development of this alternative would be significant and unavoidable.
- (c) **Reduced Intensity Alternative** – Impacts to farmland would be substantially reduced by eliminating 25% of development (i.e., in the southeast portion of the site) compared to the Proposed Project. Impacts are less than significant.
Under the less intensive modified plan, impacts to farmland would be substantially reduced by eliminating 32% of proposed development (i.e., Buildings 5 and 6 in the southeast portion

of the site) compared to that planned under the Proposed Project. Agricultural impacts associated with the development of the less intensive modified plan are less than significant as no development would occur (i.e., the land would remain at least temporarily vacant) in the southeast portion of the site. However, it is likely that the southeast corner of the project site would eventually be developed with residential uses. Subsequent CEQA analysis would need to be conducted at that time regarding all impacts of that proposed residential development on approximately 38 acres (see previous Table 4.A). The loss of this agricultural land would be temporarily delayed under this development scenario.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced to less than significant levels compared to the Proposed Project.

4.3 Air Quality

- (a) **Proposed Project** – Project would produce operational air pollutant emissions except for SO_x above CEQA threshold limits (see Table 4.B below). Impacts from increased air quality emissions would be significant even with mitigation.
- (b) **Existing Zoning** – A similar mix of equipment would operate during earthmoving and construction activities as the Proposed Project. Peak daily construction emissions would be below SCAQMD thresholds of significance for CO, ROC, and SO_x (See Table 4.B below). Although SCAQMD regulations and project-specific mitigation measures would reduce the amount of construction emissions, impacts associated with construction emissions for NO_x remain significant and unavoidable. Although the total number of trips is increased, the volume of each operational pollutant emitted during operation the Existing General Plan would be less since there would be no diesel trucks involved. Operational emissions would continue to exceed SCAQMD significance thresholds for NO_x, CO, and ROG, but would not exceed operational thresholds for PM₁₀ and PM_{2.5}. The impacts for the Existing General Plan development to air quality would be decreased, but the long-term air quality impacts resulting from this alternative would continue to be significant and unavoidable.
- (c) **Reduced Intensity Alternative** - Impacts due to operational air pollutant emissions would be reduced by eliminating 25% of development in the southeast portion of the site compared to the Proposed Project (see Table 4.B below). However, even with a 25% reduction in air quality emissions impacts are still significant even with mitigation.

Under the less intensive modified plan, impacts due to operational air pollutant emissions would be reduced by eliminating 32% of development proposed in the southeast portion of the site (Buildings 5 and 6) compared to the Proposed Project (see Table 4.B below). However, air quality emissions are still significant even with mitigation.

- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however impacts of all three are still significant.

Table 4.B: Comparison of Operational Emissions

Source	Pollutant Emissions (lbs/day)					
	CO	ROC	NO _x	SO _x	PM ₁₀	PM _{2.5}
Proposed Project	1,801	289	2,001	3.1	370	85
Existing Zoning	850	114	230	1.2	130	11
Reduced Intensity Alternative	1,351	217	1,501	2.3	278	64
less intensive modified plan	1,225	197	1,361	2.1	252	58
SCAQMD thresholds	550	55	55	150	150	55

Source: data from DEIR Section 6.0 and extrapolated from LSA Associates, Inc., September 2014

Note: During Public Comment and Hearings many people commented on the health impacts of truck related air pollution. While there are health effects associated with exposure to diesel particulate matter (DPM), the following graphs (Figures 4.3 and 4.4) indicated that compliance with state and federal regulations will substantially reduce diesel-related emissions in the coming years. In addition, the previous Table 4.B compares operational emissions of the proposed project to development under the existing zoning, the Reduced Intensity Alternative in the EIR, and the less intensive modified plan.

Figure 4.3 Heavy Duty Truck Emissions Particulate Matter

This Page Intentionally Left Blank

Figure 4.4 Heavy Duty Truck Emissions Nitrous Oxide

This Page Intentionally Left Blank

4.4 Biological Resources

- (a) **Proposed Project** – Project has the potential to impact migratory bird species, 15 listed special status species (including burrowing owl), riparian/riverine habitat, and jurisdictional waters/wetlands. However, these impacts can be reduced to levels of less than significant by implementation of the recommended mitigation measures.
- (b) **Existing Zoning** – This alternative would result in grading of the entire project site. No plant species listed by the State and/or Federal government as endangered or threatened were identified on site during the field reconnaissance. Similar to the proposed project, potential impacts of site development would be reduced to less than significant levels by implementing mitigation similar to that recommended for the proposed project.
- (c) **Reduced Intensity Alternative** – Impacts to migratory birds and riparian/riverine habitat would be reduced to less than significant in this alternative compared to the proposed project due to the elimination of 25% of development in the southeast portion of the site. This alternative would still have significant impacts related to jurisdictional water/wetlands and listed species (including burrowing owl), which would be reduced to less than significant levels by mitigation measures similar to the proposed project.

Under the less intensive modified plan, impacts to biological resources would be reduced compared to the Proposed Project due to the elimination of development in the southeast corner. Like the Reduced Intensity Alternative, the less intensive modified plan would have less than significant impacts to migratory birds and riparian/riverine habitat with mitigation. In addition, recommended project mitigation would reduce impacts to jurisdictional water/wetlands and listed species (including burrowing owl) to less than significant levels.

- (d) **Summary** – The Reduced Intensity Alternative, including the less intensive modified plan, have impacts to migratory birds, riparian/riverine habitat, jurisdictional water/wetlands, and listed species (including burrowing owl) that can be mitigated to less than significant levels with implementation of recommended mitigation.

4.5 Cultural Resources

- (a) **Proposed Project** – No cultural resources have previously been detected within the project limits. However, as undetected cultural or paleontological resources could be encountered so mitigation was recommended to reduce potential impacts to less than significant levels.
- (b) **Existing Zoning** – Development would result in ground-disturbing activities affecting the entire project site, and similar archaeological and paleontological impacts would be anticipated when compared to the Proposed Project. Adherence to the archaeological and paleontological mitigation measures identified for the proposed project would reduce impacts to less than significant, and no greater impacts would occur with this alternative.
- (c) **Reduced Intensity Alternative** – Similarly to the proposed project, this alternative would include ground-disturbing activities all but 34 acres in the southeast portion of the project site. Similar archaeological and paleontological impacts would be anticipated when compared to the Proposed Project. Therefore, adherence to the archaeological and paleontological mitigation measures identified for the proposed project would reduce impacts to less than significant levels. Compared with the proposed project, no greater impact would occur with this alternative.

The development area of the less intensive modified plan is smaller than the Proposed Project, so implementation of the recommended mitigation would reduce potential impacts to less than significant levels.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are similar compared to the Proposed Project, and all three would have the same mitigation which would reduce potential impacts to less than significant levels.

4.6 Forest Resources

- (a) **Proposed Project** – The City of Moreno Valley's General Plan does not identify any forest resources on the project site or surrounding area, and the project site is currently vacant, although it did support citrus trees in the past. Therefore, no significant impact would occur in relation to forest resources.
- (b) **Existing Zoning** – The City of Moreno Valley's General Plan does not identify any forest resources on the project site or surrounding area. Therefore, there are no significant impacts under the any development scenario for the project site.
- (c) **Reduced Intensity Alternative** – Although the Reduced Intensity Alternative project site is smaller than the Proposed Project site, the site is still in the same location. Therefore, like the Proposed Project, no significant impacts related to forest resources would occur.

Under the less intensive modified plan, development would be located on the same site as the Proposed Project. Therefore, no significant impacts to forest resources would occur.
- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are the same as the Proposed Project. No reduction in impact would occur.

4.7 Geology and Soils

- (a) **Proposed Project** – The Proposed Project, like all of southern California, would be subject to moderate to severe ground shaking. However, with adherence to UBC, the California Building Code, and City design and engineering standards. Impacts associated with this issue would be considered less than significant.
- (b) **Existing Zoning** – Development of the Existing General Plan would have geologic and soil-related impacts since the project site is located in a seismically active area and is subject to ground shaking resulting from activity on local and regional faults. Development of the proposed project site would be required to adhere to UBC, the California Building Code, and City design and engineering standards. Impacts associated with this issue would be considered less than significant.
- (c) **Reduced Intensity Alternative** – Although the Reduced Intensity Alternative project site is smaller than the proposed project site, the site is still in the same location. Therefore, like the Proposed Project adherence to UBC, the California Building Code, and City design and engineering standards will reduce significant impacts to less than significant levels.

The less intensive modified plan is the same site as the Proposed Project. Therefore, no significant impacts related to ground shaking would occur with adherence to UBC, the California Building Code, and City design and engineering standards.
- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are essentially the same as the Proposed Project. No reduction in impact would occur.

4.8 Global Climate Change

- (a) **Proposed Project** – Project would produce greenhouse gas emissions above CEQA threshold limits. Impacts from increased greenhouse gas emissions would be significant and require mitigation. The recommended measures would reduce potential climate change impacts to less than significant levels.
- (b) **Existing Zoning** – GHG emissions would increase as development under existing zoning designations would measurably increase the number of daily trips made to the site. Implementation of the mitigation recommended for the proposed project, or similar measures applicable to residential projects, could help keep these emissions at less than significant

levels, but this impact would need to be evaluated in a subsequent CEQA document when specific development was proposed.

- (c) **Reduced Intensity Alternative** – Impacts due to greenhouse gas emissions would be reduced by eliminating 25% of development in the southeast portion of the site compared to the Proposed Project. However, even with a 25% reduction in air quality emissions impacts are still significant and require mitigation measures similar to those recommended for the proposed project which would reduce impacts to less than significant levels.

Under the less intensive modified plan, impacts due to greenhouse gas emissions would be reduced by eliminating 32% of development planned in the southeast portion of the site (Buildings 5 and 6) compared to the Proposed Project. GHG emissions would require the recommended project mitigation to reduce levels to less than significant levels.

- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, but implementation of the required project mitigation would reduce GHG emission and climate change impacts to less than significant levels for all the other development scenarios.

4.9 Hazards and Hazardous Materials

- (a) **Proposed Project** – The Proposed Project would result in the on-site handling of hazardous substances, both during project construction and operation. However, adherence to existing regulations related to the handling and transport of potentially hazardous materials during construction and operation would reduce impacts to less than significant levels.
- (b) **Existing Zoning** – Development of the site according to existing zoning designations would result in the on-site handling of hazardous substances, both during project construction and operation. All development in the City is required to adhere to existing local, State, and Federal regulations pertaining to hazardous materials, therefore, impacts associated with hazards and hazardous materials under this alternative would be reduced in magnitude and would remain at less than significant levels.
- (c) **Reduced Intensity Alternative** – Because the Reduced Intensity Alternative would construct fewer warehouse uses, impacts associated with the transport or use of hazardous materials or potential upsets or accidents may be reduced in magnitude due to the reduced quantities of hazardous materials that would be present on the site. Similar to the Proposed Project, the Reduced Intensity Alternative would be required to adhere to applicable local, State, and Federal standards associated with hazards and hazardous materials. Impacts of the Reduced Intensity Alternative would remain at less than significant levels, similar to the Proposed Project.

Under the less intensive modified plan, impacts related to hazardous materials would be further reduced compared to the Reduced Intensity Alternative. In addition, like all projects in the City, the less intensive modified plan would be required to adhere to applicable local, State, and Federal standards associated with hazards and hazardous materials. The Reduced Intensity Alternative would remain less than significant, similar to the Proposed Project.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however impacts of all three are still less than significant with implementation of the recommended mitigation.

4.10 Hydrology and Water Quality

- (a) **Proposed Project** – The Project would modify existing on-site pattern of drainage and would require the installation of drainage improvements that may include detention/retention basins, connected to existing in-street drainage features, on-site storm drains, and other features. The project proposes three basins south of building 2 north of Eucalyptus Avenue and a basin south of buildings 5 and 6. With adherence to required local, State, and Federal policies pertaining to surface and groundwater resources, NPDES requirements, SWPPP, BMPs, and preparation of a WQMP impacts related to hydrology and water quality would be less than significant.
- (b) **Existing Zoning** – Development of the site under existing zoning designations would require the modification of the existing on-site pattern of drainage and would require the installation of drainage improvements that may include detention/retention basins, connection to existing in-street drainage features, on-site storm drains, and other features. The extent of the impermeable surfaces (parking area) would be similar to the project so it would have similar environmental impacts to the Proposed Project. All local, State, and Federal policies and regulations pertaining to surface water and groundwater resources would remain in effect under the existing zoning. Any development of the site has the potential to affect water quality due to sedimentation and erosion, runoff from paved surfaces, and contamination caused by a mixture of sediment, debris, and other contaminants. However, construction of any onsite land uses would be required to follow applicable NPDES requirements, including the preparation of and adherence to an SWPPP and BMPs. A standard condition with any such development would be the preparation and implementation of a WQMP, which would effectively mitigate post-construction water quality impacts from the developed area. Similar to the Proposed Project, potential impacts related to hydrology and water quality would be less than significant.
- (c) **Reduced Intensity Alternative** – Due to the smaller development area of the Reduced Intensity Alternative, this scenario would have a reduced impact on the project site compared to the Proposed Project. However, development of this alternative would still require the modification of the existing onsite pattern of drainage. Adherence with required local, State, and Federal policies pertaining to surface and groundwater resources, NPDES requirements, SWPPP, BMPs, and preparation of a WQMP would reduce impacts to less than significant levels.

Similar to the Reduced Intensity Alternative, the **less intensive modified plan** would reduce impacts to the project site **by not constructing** buildings 5 and 6 **proposed** in the southeast corner. However, this project would still require the installation of drainage improvements that may include detention/retention basins, connection to existing in-street drainage features, on-site storm drains, and other features. The **less intensive modified plan** proposes three basins south of Building 2 above Eucalyptus Avenue, similar to the proposed project, a small additional basin south of Building 1, and a basin east of Building 4. Similar to the Proposed Project the **less intensive modified plan** would be required to adhere to local, State, and Federal policies pertaining to surface and groundwater resources, NPDES requirements, SWPPP, BMPs, and preparation of a WQMP. Impacts would be less than significant.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the **less intensive modified plan**, are reduced compared to the Proposed Project, however impacts of all three are still less than significant.

4.11 Land Use and Planning

- (a) **Proposed Project** – The project would require a General Plan Amendment that would change the General Plan designations of the project site from Residential to Business Park and an amendment to the Circulation Element of the General Plan. A Zone Change from Business Park (BP), Multi-Family Residential (R-15), Suburban Residential (R-5), and

Residential Agriculture (RA-2) to Light Industrial for the project site would also be required. In addition, the Proposed Project would be inconsistent with regional projections and the City's Housing Element. Due to the lack of feasible mitigation this is a significant and unavoidable impact.

- (b) **Existing Zoning** – Development of this alternative would not require a General Plan Amendment for the residential uses or business park uses as these uses are allowed under the existing land use designations. However, the business park component of this alternative would require a change of zone to allow the construction of buildings greater than 50,000 square feet. This alternative would comply with applicable provisions of local and regional plans (e.g., Water Quality Control Plan and Air Quality Management Plan). Compliance with applicable City policies related to development within the project site would ensure that on-site alternative uses would be compatible with existing development in the project area. However, since the development envisioned under this Existing General Plan has already been tentatively approved by the City, this alternative would not require a General Plan Amendment. Therefore, land use impacts associated with this scenario would be reduced to less than significant levels. This alternative would also be fully consistent with the City's Housing Element regarding future sites for affordable housing (i.e., R-15 parcels).
- (c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative would require the same General Plan Amendment and Zone Changes excluding the 32 acres in the southeastern corner that would be used as a buffer for the existing residences to the southeast (see previous Table 4.A). This would reduce potential land use impacts associated with the GPA and Zone Change. However, the Reduced Intensity Alternative would still be inconsistent with regional projections and the City's Housing Element. Similar to the Proposed Project, due to the lack of feasible mitigation this is a significant and unavoidable impact.

The **less intensive modified plan** would be similar to the proposed project and Reduced Intensity Alternative in that it would require the same GPA and Zone Changes. Similar to the Reduced Intensity Alternative the southeast corner of the site would have a 250 foot buffer from any future residential uses, reducing potential land use impacts associated with the GPA and Zone Change. This alternative would leave 38 acres in the southeastern corner of the property temporarily vacant which would act as a buffer for the existing residences to the southeast (see previous Table 4.A). It is expected that this vacant land would eventually be developed with residential uses consistent with the existing General Plan and zoning. Similar to the Proposed Project and the Reduced Intensity Alternative, the **less intensive modified plan** is inconsistent with regional projections and the City's Housing Element. Therefore, impacts are significant and unavoidable.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the **less intensive modified plan**, are substantially reduced compared to the Proposed Project, however impacts of all three are still significant and unavoidable.

4.12 Mineral Resources

- (a) **Proposed Project** – The project site is not identified as a locally important mineral resource recovery site. Therefore, no impact related to mineral resources would occur.
- (b) **Existing Zoning** – Development of the project site with any build scenario would not result in the loss of or reduce the availability of mineral resources or the resource base from which they would be derived. No impact to mineral resources would occur.
- (c) **Reduced Intensity Alternative** – Although the Reduced Intensity Alternative project site is smaller than the Proposed Project site, the site is still in the same location. Therefore, like the proposed project no significant impacts related to mineral resources would occur.

The **less intensive modified plan** is also located on the same site as the Proposed Project. Therefore, no impact related to mineral resources would occur.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however all three are located on the same site and therefore have less than significant impacts on mineral resources.

4.13 Noise

- (a) **Proposed Project** – Project would produce construction noise levels that would require mitigation measures to reduce short-term noise impacts to levels of less than significant. However, project-related traffic noise would not be perceptible and therefore is considered a less than significant impact.
- (b) **Existing Zoning** – Development of the site under existing zoning designations would require the implementation of mitigation measures to reduce construction noise impacts to less than significant levels. The short-term noise impacts resulting from project construction and stationary noise impacts associated with the operation of the shopping center would be similar and remain less than significant with mitigation incorporated.

The increase in project-related traffic for this scenario would result in an incremental increase in traffic noise which increases the overall mobile source noise impact. Parking lot noise, mechanical ventilation noise, and noise from the loading docks would still occur under this alternative. In addition, the uses envisioned under the Existing General Plan would increase the number (i.e., more commercial buildings) and extent of noise sources but would still have noise approaching levels below significant levels. Therefore, project-related traffic noise would not be perceptible and therefore is considered a less than significant impact.

- (c) **Reduced Intensity Alternative** – Similar to the Proposed Project, the Reduced Intensity Alternative would have short-term construction noise impacts that would be mitigated to less than significant levels. Because the alternative is smaller than the Proposed Project it would generate less traffic and thereby less traffic-related noise. However, like the Proposed Project, noise impacts of this alternative would be less than significant.

Due to its reduced development footprint, noise impacts on sensitive receptors would be greatly reduced under the less intensive modified plan. If Buildings 5 and 6 are not constructed, the nearest sensitive receptors are 1,515 feet from the nearest warehouse. However, mitigation will still be required to further reduce construction noise impacts. Similar to the Proposed Project, operational noise impacts would be less than significant under this alternative and would still generate traffic onto surrounding streets, with a resulting increase in noise levels.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however construction noise impacts of all three are still less than significant with mitigation.

4.14 Population and Housing

- (a) **Proposed Project** – The proposed project would generate up to 1,532 job opportunities. The new employment opportunities resulting from development of the proposed warehouse uses would improve the City's current jobs-to-housing ratio by providing jobs to local residents. As the jobs would likely be filled by local residents the Proposed Project will not significantly increase the City's population. In addition, the Proposed Project will not displace housing or people.
- (b) **Existing Zoning** – Development under existing zoning designations would result in the development of business park uses making it difficult to conclude if or how many persons from outside of the area may be required to relocate to Moreno Valley to fill positions in the business park. Therefore, it is not possible to determine if this scenario would result in a

population increase in the City. However, the development of single-family and multi-family residential units would result in a direct increase to the existing population, consistent with the City's Housing Element. Potential impacts of this development scenario related to population and housing would be less than significant.

- (c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative would generate 25% fewer jobs compared to the Proposed Project. The Reduced Intensity Alternative would be located on the same site as the Proposed Project. Therefore, the alternative would not displace housing or people.

The less intensive modified plan would generate 32% fewer jobs compared to the Proposed Project (based on the square footage reduction). The less intensive modified plan would not displace housing or people. In addition, the southeast quarter of the site would maintain its General Plan Land Use Designations and Zoning (R2 and R5), which would allow the development of future residential housing. Based on this, it is expected this alternative would have less than significant impacts on population and housing.

- (d) **Summary** – Potential impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project; however, impacts of all three are still less than significant.

4.15 Public Services

- (a) **Proposed Project** – The Project would be required to pay development impact fees for schools, police services, and fire services. The payment of development impact fees would offset any impacts to these public services that may result from the development of the Proposed Project.
- (b) **Existing Zoning** – Demands on schools, parks, other public facilities, law enforcement, and fire protection services would be greater in magnitude than what was identified for the Proposed Project, however, payment of City and School DIFs would help offset the increased demands for service, so impacts would be reduced to less than significant levels.
- (c) **Reduced Intensity Alternative** – Compared to the Proposed Project, the Reduced Intensity Alternative would result in a reduction of approximately 25 percent of proposed warehouse uses. However, the magnitude of impacts on public services would be similar to the Proposed Project (i.e., no residential development). The Reduced Intensity Alternative would be required to pay development impacts to reduce potential impacts to less than significant levels.

Compared to the Proposed Project, the less intensive modified plan would generate approximately 32% less need for public services due to having fewer proposed warehouse uses. However, like the Proposed Project and Reduced Intensity Alternative, the less intensive modified plan would have a similar magnitude or overall of impact on public services (i.e., no residential uses). The project would be required to pay development impact fees and impacts would be less than significant.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however all three would have similar impacts to public services and would be required to pay development impact fees to reduce potential impacts to less than significant levels.

4.16 Recreation

- (a) **Proposed Project** – The Proposed Project does not contain any residential components. Therefore, there would be no significant increase in existing population and no increase in demand for park and recreation facilities. No impact would occur.
- (b) **Existing Zoning** – The increase in population from new housing would increase the demand for park and recreation facilities, therefore future development would be required to dedicate or provide in-lieu fees for approximately 7.24 acres of land for park uses (based on anticipated project population). The dedication of land and/or the payment of parkland fees would reduce potential recreation impacts to less than significant levels.
- (c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative would not result in any increase in the City’s population (i.e., no additional housing). Therefore, this alternative would have no impacts related to parks and recreation facilities, similar to the Proposed Project.

The **less intensive modified plan** would have little or no impact to parks or recreation similar to the Reduced Intensity Alternative and the Proposed Project because none of them propose any residential units which would generate additional population. Therefore, no significant impact to parks and recreation facilities would occur.
- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the **less intensive modified plan**, are reduced compared to the Proposed Project, however, none of these scenarios propose residential uses, therefore, all three would have no impact on parks and recreation facilities.

4.17 Traffic

- (a) **Proposed Project** – The Proposed Project would cause potentially significant traffic impacts on roadway segments and intersections through deficient LOS levels (4,408 daily trips and 7,527 PCE trips). The estimated trip generation for the Proposed Project, Existing General Plan Alternative, and the **less intensive modified plan** are compared in Table 4.C below. Even with mitigation some traffic impacts would be significant and unavoidable due to certain roadway improvements not being under the jurisdiction of the City and could not be guaranteed to be in place when development would be operational.
- (b) **Existing Zoning** – Development under existing zoning designations would result in an almost three-fold increase in average daily traffic (ADT) and a 55% increase in passenger car equivalents (PCE) trips compared to the Proposed Project (see Table 4.C). This additional traffic would substantially increase traffic impacts on nearby roads and intersections, resulting in much worse levels of service (LOS) even with mitigation. Note that the use of PCE accounts for increased traffic impacts due to the larger size of trucks on roadways.

The addition of traffic volumes associated with this scenario could result in deficient LOS levels at one or more of the intersections in the project vicinity during the lifetime of the development. While significant traffic impacts may occur under this alternative, these impacts could be mitigated by payment of DIF and (County) TUMF fees as appropriate. Despite the implementation of appropriate mitigation measures, certain roadway improvements would not be under the jurisdiction of the City and cannot be guaranteed to be in place when development under existing zoning designations would occur. Therefore, traffic-related impacts would remain significant and unavoidable.
- (c) **Reduced Intensity Alternative** – This alternative would reduce traffic trip generation and traffic impacts on local roadways by approximately 25% by eliminating a quarter of the total warehouse development in the southeast portion of the site compared to the Proposed Project. However, even with this reduction in traffic trip generation, impacts are still significant even with mitigation since some roadways that need improvements are not under the control of the City.

The **less intensive modified plan** would have slightly less traffic trip generation than the Reduced Intensity Alternative because it would have slightly less square footage. The estimated trip generation for the Proposed Project, Existing General Plan Alternative, and the **less intensive modified plan** are compared in the table below (see Table 4.C), which shows the **less intensive modified plan** would generate 30% less total traffic (PCE) compared to the Proposed Project. It is important to note that, while this modified plan does not propose residential development at this time, it would leave approximately 38 acres in the southeastern portion of the project property vacant for now. At some point in the future, it is anticipated this 38 acres would be developed into 126 housing units under the R-5 and R-2 zones as outlined in the previous Table 4.A, based on 5 units per acre for the R-5 property and 2 units per acre for the R-2 land. Even with a substantial reduction in trip generation, traffic impacts of this modified plan are considered to be significant even with mitigation. In addition, like the Proposed Project, including the Reduced Intensity Alternative, certain roadway improvements are not under the jurisdiction of the City and could not be guaranteed to be in place when development would be operational.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the **less intensive modified plan**, are substantially reduced compared to the Proposed Project (i.e., almost 30% less), however impacts of all three are still significant and unavoidable.

It should be noted that when residential uses are **eventually** added to the vacant land of the **less intensive modified plan** (southeast corner of the property), overall traffic impacts of these land uses would be 13.8% less than those anticipated under the Proposed Project, as shown in Table 4.C.

Table 4.C: Comparison of Average Daily Vehicle Trips

Scenario	AM Peak	PM Peak	Daily Trips (ADT) ¹	Trip Total (PCE) ²	% PCE to Project
Proposed Project					
Truck Trips	133	157	1,989	5,107

Car Trips	758	793	8,848	8,848	+
Total	1,894	1,860	12,188	11,693	55.3%
Reduced Intensity Alternative (from EIR)					
Truck Trips	100	118	1,491	3,830	-25.0%
Car Trips	132	149	1,815	1,815	
Total	232	267	3,306	5,645	
Less Intensive Modified Plan-Industrial Only⁴					
Truck Trips	91	107	1,337	3,428	-29.7%
Car Trips	139	156	1,864	1,864	
Total	230	263	3,201	5,292	
Less Intensive Modified Plan-Industrial + (Future) Residential⁴					
Truck Trips	91	107	1,337	3,428	-13.8%
Car Trips	234	282	3,064	3,064	
Total	325	389	4,401	6,492	

Source: LSA Associates, September 2014 based on land uses and ITE rates shown in Table 4.A (see FEIR Appendix F).

¹ Average Daily Trips (ADT)

² Passenger Car Equivalents (PCE)

³ Assumes 30 percent floor area ratio or site coverage for business park uses (i.e., total building square footage divided by the total gross site area).

⁴ **IMPORTANT NOTE:** ProLogis is proposing development of only industrial uses at this time – the industrial plus residential scenario is provided for information purposes only to show traffic generation under ultimate buildout conditions at some point in the future if the residential uses are developed on the vacant portion of the project property

4.18 Utilities and Service Systems

- (a) **Proposed Project** – The project would connect to existing utility infrastructure, require installation of water supply infrastructure, and would generate solid waste. However, the project would be required to adhere to existing requirements identified by the City and EMWD, obtain verification from the water purveyor that water is available to serve the development, and adhere to provisions of the solid waste provider of the site. These requirements would result in the project having less than significant impacts related to Utilities and Services.
- (b) **Existing Zoning** – Development under the existing zoning designations would connect to existing utility infrastructure subject to the terms and conditions of the City and EMWD. This scenario would generate approximately 226,718 gallons of wastewater per day, which is a fivefold increase over what the proposed project would generate, and would increase the wastewater treatment demand. However, adherence to existing requirements identified by the City and EMWD would result in impacts remaining at a less than significant level.

The development of the business park and various residential uses would require the installation of water supply infrastructure to serve the project site and would consume approximately 277,660 gallons of water per day, which is over three times more than what would be consumed by the Proposed Project. However, development under this scenario would be required to obtain verification from the water purveyor (EMWD) that water is available to serve the development. In the event that the amount of water required for this alternative is available, impacts associated with this issue would be less than significant. However, in the event that water is not available for the Existing General Plan, a significant impact associated with this issue would occur.

This development scenario would generate 5,158 tons of solid waste per year, which is over twice what the Proposed Project would be expected to generate. Therefore, demands on solid waste services and landfill capacity would be increased in magnitude. However, development under this scenario would also be required to adhere to the provisions of the solid waste provider that would service the project site. Even with the increase, solid waste impacts under this alternative would be expected to remain at less than significant levels.

- (c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative reduces total development compared to the Proposed Project by 25%, therefore it is reasonable to conclude that demands on utilities services would also be reduced by 25%. The Reduced Intensity Alternative, like the Proposed Project, would be required to adhere to existing requirements identified by the City and EMWD, obtain verification from the water purveyor that water is available to serve the development, and adhere to provisions of the solid waste provider of the site. Like the Proposed Project, the Reduced Intensity Alternative would have less than significant impacts related to utilities.

The less intensive modified plan reduces proposed development by 32%, compared to the Proposed Project (i.e., Buildings 5 and 6 would not be constructed). Therefore it is reasonable to conclude that demands on utilities services would also be reduced by approximately 32%. The less intensive modified plan, like the Proposed Project and Reduced Intensity Alternative, would be required to adhere to existing requirements identified by the City and EMWD, obtain verification from the water purveyor that water is available to serve the development, and adhere to provisions of the solid waste provider of the site. Like the Proposed Project and the Reduced Intensity Alternative, the less intensive modified plan is expected to have less than significant impacts related to utilities.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however impacts of all three are less than significant.

4.19 Cumulative Impacts

- (a) **Proposed Project** – The Proposed Project would have significant cumulative impacts related to permanent conversion of farmland, long-term operational air pollutant emissions of CO, ROC, NOx, PM10, and PM2.5, and increased traffic operations on local roadways and at local intersections. There are no feasible mitigation measures to reduce impacts related to the conversion of Prime Farmland, reduce long-term air pollutant operational emissions and mitigate increased traffic; therefore cumulative impacts would remain significant and unavoidable for these topics.
- (b) **Existing Zoning** – Development under the existing zoning designations would contribute toward the permanent conversion of farmland, long-term operational air pollutant emissions, and increased traffic operations on local roadways and at local intersections. In addition, there are no mitigation measures that would reduce long-term air quality operational impacts to below the SCAQMD threshold standard and no mitigation measures that would reduce impacts associated with increased traffic in the area. Therefore, cumulative impacts associated with long-term air quality and long-term traffic would remain significant and unavoidable. This scenario would also require the development of the project site. Since there is no feasible mitigation that would reduce the cumulative impacts associated with the conversion of Prime Farmland, cumulative impacts associated with farmland conversion would remain significant and unavoidable.
- (c) **Reduced Intensity Alternative** – Similar to the Proposed Project, the Reduced Intensity Alternative would have significant cumulative impacts related to permanent conversion of farmland, long-term operational air pollutant emissions, and increased traffic operations on local roadways and at local intersections. Although cumulative impacts would have a 25% reduction, there are no feasible mitigation measures to reduce impacts related to the conversion of Prime Farmland, reduce long-term air pollutant operational emissions and mitigate increased traffic; therefore cumulative impacts would remain significant and unavoidable.

Similar to the Proposed Project and the Reduced Intensity Alternative, the **less intensive modified plan** would have significant cumulative impacts related to permanent conversion of farmland, long-term operational air pollutant emissions, and increased traffic operations on local roadways and at local intersections. Although cumulative impacts would have a 32% reduction **in planned development** compared to the Proposed Project, there are no feasible mitigation measures to reduce impacts related to the conversion of Prime Farmland, reduce long-term air pollutant operational emissions and mitigate increased traffic; therefore cumulative impacts would remain significant and unavoidable.

- (d) **Summary** – Cumulative impacts of the Reduced Intensity Alternative, including the **less intensive modified plan**, are substantially reduced compared to the Proposed Project, however, all three development scenarios contribute to some cumulative impacts.

SUMMARY

The Proposed Project has significant and unavoidable impacts related to aesthetics, agricultural resources, air quality, land use, and transportation.

The Existing Zoning would also have significant and unavoidable impacts related to agricultural resources, air quality, and transportation, but would reduce aesthetic and land use impacts to less than significant levels compared to the Proposed Project, as long as future development was consistent with the City's development standards. It is also possible the Existing Zoning would substantially increase impacts on climate change, public services, recreation, and utilities, but it is expected these impacts could be reduced to less than significant levels with mitigation.

The Reduced Intensity Alternative under the EIR, including the currently proposed **l**ess **+**ntensive **m**odified **p**lan, would still have significant impacts related to aesthetics, air quality, land use, and transportation. Due to the reduced size of the **l**ess **i**ntensive **m**odified **p**lan (32% reduction), these impacts would be substantially reduced in magnitude compared to the Proposed Project. In addition, the **l**ess **i**ntensive **m**odified **p**lan would reduce impacts to agricultural resources to less than significant levels compared to the Proposed Project, at least until the southeastern portion of the site was developed with residential uses which are expected to be consistent with existing General Plan and zoning designations.

The following Table 4.D compares environmental impacts associated with the Proposed Project, Existing General Plan Alternative, and the Less Intense Modified Plan.

Table 4.D: Comparison of Impacts of the Proposed Project, Existing Zoning, and Reduced Intensity Alternative (including the Less Intensive Modified Plan)

Project Alternatives

- Compared with the proposed project, the level of the impact is increased.
- ← Compared with the proposed project, the level of the impact is reduced.
- + Compared with the proposed project, a new impact has been identified.
- Compared with the proposed project, an impact has been eliminated.
- ←SIG Compared with the proposed project, the level of the impact is reduced, yet still significant.

5. MITIGATION MONITORING AND REPORTING PROGRAM

5.1 INTRODUCTION

This Mitigation Monitoring and Reporting Program has been prepared for use in implementing mitigation for the:

ProLogis Eucalyptus Industrial Park

The program has been prepared in compliance with State law and the Environmental Impact Report (EIR) (State Clearinghouse No. 2008021002) prepared for the project by the City of Moreno Valley.

The California Environmental Quality Act (CEQA) requires adoption of a reporting or monitoring program for those measures placed on a project to mitigate or avoid adverse effects on the environment (Public Resource Code Section 21081.6). The law states that the reporting or monitoring program shall be designed to ensure compliance during project implementation.

The monitoring program contains the following elements:

- 1) The mitigation measures are recorded with the action and procedure necessary to ensure compliance. In some instances, one action may be used to verify implementation of several mitigation measures.
- 2) A procedure for compliance and verification has been outlined for each action necessary. This procedure designates who will take action, what action will be taken and when, and to whom and when compliance will be reported.
- 3) The program has been designed to be flexible. As monitoring progresses, changes to compliance procedures may be necessary based upon recommendations by those responsible for the program. As changes are made, new monitoring compliance procedures and records will be developed and incorporated into the program.

This Mitigation Monitoring and Reporting Program includes mitigation identified in the Final EIR.

5.2 MITIGATION MONITORING AND RESPONSIBILITIES

As the Lead Agency, the City of Moreno Valley is responsible for ensuring full compliance with the mitigation measures adopted for the proposed project. The City will monitor and report on all mitigation activities. Mitigation measures will be implemented at different stages of development throughout the project area. In this regard, the responsibilities for implementation have been assigned to the Applicant, Contractor, or a combination thereof. If during the course of project implementation, any of the mitigation measures identified herein cannot be successfully implemented, the City shall be immediately informed, and the City will then inform any affected responsible agencies. The City, in conjunction with any affected responsible agencies, will then determine if modification to the project is required and/or whether alternative mitigation is appropriate.

5.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: Eucalyptus Industrial Park

Item No. E.3

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non- Compliance
<p>proposed project construction documents, which shall be reviewed by the City.</p> <p>Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 3 off-road emission standards. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.</p> <p>Post January 1, 2015: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.</p> <p>A copy of each unit's certified tier specifications, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.</p>						

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non- Compliance
4.3.6.2D All clearing, grading, earthmoving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions. On-site truck idling shall be prohibited in excess of five minutes.	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During grading	Review of construction documents and on- site inspection		Issuance of a Stop Work Order
4.3.6.2E The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2F The contractor shall ensure that traffic speeds on unpaved roads and project site areas are reduced to 15 miles per hour or less to reduce PM ₁₀ and PM _{2.5} fugitive dust haul road emissions. Speed limit signs (15 mph maximum) shall be posted at entry points to the project site, and along any unpaved roads providing access to or within the project site and/or any unpaved designated on-site travel routes.	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2G Groundcover shall be replaced, and/or non-toxic soil stabilizers shall be applied (according to manufacturers' specifications) to any inactive construction areas (previously graded areas inactive for ten days or more).	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order

-1981-

Item No. E.3

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
4.3.6.2H The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and by not allowing construction equipment to be left idling for more than five minutes (per California law).	City of Moreno Valley Engineering and Building and Safety	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2I The contractor shall ensure use of low-sulfur diesel fuel in construction equipment as required by the California Air Resources Board (CARB) (diesel fuel with sulfur content of 15 ppm by weight or less).	City of Moreno Valley Engineering and Building and Safety	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2J. Grading plans, construction specifications and bid documents shall also include the following requirements: <ul style="list-style-type: none"> Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty; Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads; Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect; The contractor or builder shall 	City of Moreno Valley Engineering and Building and Safety Planning Division	Review plans, specifications, and bid documents prior to grading; conduct site inspections during construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non- Compliance
<p>designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;</p> <ul style="list-style-type: none"> • The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours; • High-pressure injectors shall be provided on diesel construction equipment if available; • Engine size of construction equipment shall be limited to the minimum practical size; • Substitute gasoline-powered for diesel powered construction equipment where gasoline powered equipment is available; • Use electric construction equipment where it is practical to use such equipment; • Install catalytic converters on gasoline-powered equipment where this type of equipment is available; • Ride-sharing program for the construction crew shall be supported by contractor(s) via incentives or other inducement; • Documentation shall be provided to the City of Moreno Valley indicating

Item No. E.3

Table 1.G: Air Quality Measure 4.3.6.2M Best Available Control Measures for Fugitive Dust (Apply to All Construction Activities)

Source Category	Control Measures	Guidance
Disturbed soil	<ul style="list-style-type: none"> Stabilize disturbed soil throughout the construction site; and Stabilize disturbed soil between structures. 	<ul style="list-style-type: none"> Limit vehicular traffic and disturbances on soils where possible; and If interior block walls are planned, install as early as possible; and Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.
Earthmoving activities	<ul style="list-style-type: none"> Pre-apply water to depth of proposed cuts; and Re-apply water as necessary to maintain soils in a damp condition and to ensure that visible emissions do not exceed 100 ft in any direction; and Stabilize soils once earth-moving activities are complete. 	<ul style="list-style-type: none"> Grade each Project phase separately, timed to coincide with construction phase; and Upwind fencing can prevent material movement on site; and Apply water or a stabilizing agent in sufficient quantities to prevent the generation of visible dust plumes.
Importing/exporting of bulk materials	<ul style="list-style-type: none"> Stabilize material while loading to reduce fugitive dust emissions; and Maintain at least 6 inches of freeboard on haul vehicles; and Stabilize material while transporting to reduce fugitive dust emissions; and Stabilize material while unloading to reduce fugitive dust emissions; and Comply with CVC Section 23114. 	<ul style="list-style-type: none"> Use tarps or other suitable enclosures on haul trucks; and Check belly-dump truck seals regularly and remove any trapped rocks to prevent spillage; and Comply with track-out prevention/mitigation requirements; and Provide water while loading and unloading to reduce visible dust plumes.
Landscaping	<ul style="list-style-type: none"> Stabilize soils, materials, slopes 	<ul style="list-style-type: none"> Apply water to materials to stabilize; and Maintain materials in a crusted condition; and Maintain effective cover over materials; and Stabilize sloping surfaces using soil binders until vegetation or ground cover can effectively stabilize the slopes; and Hydroseed prior to rain season.
Road shoulder maintenance	<ul style="list-style-type: none"> Apply water to unpaved shoulders prior to clearing; and Apply chemical dust suppressants and/or washed gravel to maintain a stabilized surface after completing road shoulder maintenance. 	<ul style="list-style-type: none"> Installation of curbing and/or paving of road shoulders can reduce recurring maintenance costs; and Use of chemical dust suppressants can inhibit vegetation growth and reduce future road shoulder maintenance costs.

Table 1.G: Air Quality Measure 4.3.6.2M Best Available Control Measures for Fugitive Dust (Apply to All Construction Activities)

Source Category	Control Measures	Guidance
Screening	<ul style="list-style-type: none"> • Pre-water material prior to screening; and • Limit fugitive dust emissions to opacity and plume length standards; and • Stabilize material immediately after screening. 	<ul style="list-style-type: none"> • Dedicate water truck or high capacity hose to screening operation; and • Drop material through the screen slowly and minimize drop height; and • Install wind barrier with a porosity of no more than 50 percent upwind of screen to the height of the drop point.
Staging areas	<ul style="list-style-type: none"> • Stabilize staging areas during use; and • Stabilize staging area soils at project completion. 	<ul style="list-style-type: none"> • Limit size of staging area; and • Limit vehicle speeds to 15 miles per hour; and • Limit number and size of staging area entrances/exits.
Stockpiles/bulk material handling	<ul style="list-style-type: none"> • Stabilize stockpiled materials, and stockpiles within 100 yards of off-site occupied buildings must not be greater than 8 ft in height; or must have a road bladed to the top to allow water truck access or must have an operational water irrigation system that is capable of complete stockpile coverage. 	<ul style="list-style-type: none"> • Add or remove material from the downwind portion of the storage pile; and • Maintain storage piles to avoid steep sides or faces.
Traffic areas for construction activities	<ul style="list-style-type: none"> • Stabilize all off-road traffic and parking areas; and • Stabilize all haul routes; and • Direct construction traffic over established haul routes. 	<ul style="list-style-type: none"> • Apply gravel/paving to all haul routes as soon as possible to all future roadway areas; and • Barriers can be used to ensure vehicles are only used on established parking areas/haul routes.
Trenching	<ul style="list-style-type: none"> • Stabilize surface soils where trencher or excavator and support equipment will operate; and • Stabilize soils at the completion of trenching activities. 	<ul style="list-style-type: none"> • Pre-watering of soils prior to trenching is an effective preventive measure. For deep trenching activities, pre-trench to 18 inches, soak soils via the pre-trench and resuming trenching; and • Washing mud and soils from equipment at the conclusion of trenching activities can prevent crusting and drying of soil on equipment.
Truck loading	<ul style="list-style-type: none"> • Pre-water material prior to loading; and • Ensure that freeboard exceeds 6 inches (CVC 23114). 	<ul style="list-style-type: none"> • Empty loader bucket such that no visible dust plumes are created; and • Ensure that the loader bucket is close to the truck to minimize drop height while loading.
Turf overseeding	<ul style="list-style-type: none"> • Apply sufficient water immediately prior to conducting turf vacuuming activities to meet opacity and plume length standards; and • Cover haul vehicles prior to exiting the site. 	<ul style="list-style-type: none"> • Haul waste material immediately off site.
Unpaved roads/parking lots	<ul style="list-style-type: none"> • Stabilize soils to meet the applicable performance standards; and • Limit vehicular travel to established unpaved roads (haul routes) and unpaved parking lots. 	<ul style="list-style-type: none"> • Restricting vehicular access to established unpaved travel paths and parking lots can reduce stabilization requirements.

APPENDIX B
SB 18 CONSULTATION DOCUMENTATION

SENATE BILL 18 (SB18) NATIVE AMERICAN CONTACT RECORD

Proposed Eucalyptus Industrial Park Project, City of Moreno Valley, Riverside County, California

Date LSA Requested a Sacred Lands File Search from the Native American Heritage Commission (NAHC): July 13, 2011.
 Date the NAHC Replied: July 20, 2011.
 Results of Sacred Lands File Search: Native American cultural resources were *not* identified in the USGS coordinates specified for the project area; however, the NAHC recommended that 10 tribes/individuals be contacted for information regarding cultural resources that could be impacted.

Groups Contacted	Date LSA Sent Letter to Tribes	Date a Response to the Letter was Received by LSA (if Applicable)	Follow-up Telephone Calls and/or emails
Los Coyotes Band of Mission Indians Spokesperson <i>Cahuilla</i>	07-25-11	No response received.	08-09-11: A follow up email was sent. 08-16-11: A message was left with an administrator. The Tribe will return the call if there are concerns.
Santa Rosa Band of Mission Indians Mayme Estrada, Chairwoman <i>Cahuilla</i>	07-25-11	No response received.	08-09-11: A follow up email was sent to Ms. Estrada, and also to Steven Estrada in Cultural Resources. 08-10-11: An email was received from Gabriella Rubalcava, Tribal Council. The email stated that the Band does not have specific concerns and deferred further consultation to Joe Ontiveros, Soboba Band of Luiseño Indians.
Pala Band of Mission Indians Tribal Historic Preservation Office/Shasta Gaughen <i>Luiseño, Cupeño</i>	07-25-11	No response received.	08-09-11: A follow up email was sent to Ms. Gaughen. She responded to say that the project is outside of their area and they have no concerns. A letter is forthcoming. 08-10-11: A letter stating the above dated August 5, 2011 was received.
Morongongo Band of Mission Indians Robert Martin, Chairperson <i>Cahuilla, Serrano</i>	07-25-11	No response received.	08-09-11: A follow up email was sent to Michael Contreras. He is the spokesperson for cultural resources. 08-17-11: Mr. Contreras responded by telephone to state that they have no concerns at this time. He requested a copy of the final report and a City contact should the Tribe wish to engage in formal consultation.
Ramona Band of Cahuilla Mission Indians Joseph Hamilton, Chairman <i>Cahuilla</i>	07-25-11	No response received.	08-09-11: A follow up email was sent to Mr. Hamilton, and also to John Gomez in Cultural Resources. 08-16-11: A second follow up email was sent to Mr. Hamilton and Mr. Gomez.
Pechanga Band of Mission Indians Mark Macarro, Chairperson <i>Luiseño</i>	07-25-11	No response received.	08-09-11: A follow up email was sent to Terrie Brown, Executive Secretary, and also to Paul Macarro and Anna Hoover in Cultural Resources. Ms. Hoover

Groups Contacted	Date LSA Sent Letter to Tribes	Date a Response to the Letter was Received by LSA (if Applicable)	Date and Results of LSA Follow-up Telephone Calls and/or emails
San Manuel Band of Mission Indians James Ramos, Chairperson <i>Serrano</i>	07-25-11	No response received.	responded to say that they do have comments and will send an official comment letter directly to the City. 08-09-11: A follow up email was sent to Mr. Ramos, and also to Ann Brierty in Cultural Resources. 08-16-11: A voicemail was left for Ms. Brierty.
Serrano Nation of Indians Goldie Walker <i>Serrano</i>	07-25-11	No response received.	08-16-11: Mark Lee Cochran, Ms. Walker's son who is also on the Tribal Council, spoke for the Tribe. They would like to be notified of any discoveries and also request a copy of the final report.
Soboba Band of Mission Indians Scott Cozaet, Chairperson; Attn. Carrie Garcia <i>Luiseno</i>	07-25-11	No response received.	08-09-11: A follow up email was sent to Darren Hill (the email contact provided by the NAHC) and also to Joe Ontiveros in Cultural Resources. The email to Mr. Hill was returned. 08-16-11: A voicemail was left for Carrie Garcia, the Executive Secretary for Chairman Cozaet as shown on the NAHC list. 08-17-11: A letter was received via email from Joe Ontiveros, Cultural Resources Department. The letter stated that the project is within the Tribe's Traditional Use Area and is very sensitive to the people of Soboba. The Tribe requests government to government consultation in accordance with SB18; that Soboba continue to be the lead consulting Tribe for the project; that project construction be monitored by a Soboba monitor; and that the proper procedures be taken and the requests of the Tribe are honored.
Cahuilla Band of Indians Luther Salgado, Sr., Chairperson <i>Cahuilla</i>	07-25-11	No response received.	08-09-11: A follow up email was sent to Mr. Salgado, and also to Environmental Officer Yvonne Markel. Ms. Markel responded to say that the Tribe presently has no knowledge of cultural resources within the project area. However, due to the possibility of encountering cultural resources during construction, they request monitoring by a Native American and can provide trained monitors. They also would like to request copies of any cultural resource documentation.

1. INTRODUCTION

The Final Environmental Impact Report (EIR) for the proposed ProLogis Eucalyptus Industrial Park (formerly known as the “ProLogis Moreno Valley Eucalyptus Project”) project is composed of the Draft EIR State Clearinghouse No. 2008021002 and Appendices; the Response to Comments; and the Findings, Statement of Overriding Considerations, Staff Reports, and Resolutions. Specifically, this document portion of the EIR includes the Comments and Responses volume of the Final EIR, EIR modifications or errata, and the Mitigation Monitoring and Reporting Program (MMRP). The purpose of this document is to respond to all comments received by the City of Moreno Valley (City) regarding the environmental information and analyses contained in the Draft EIR. Additionally, any corrections to the text and figures of the Draft EIR, generated either from responses to comments or independently by the City, are stated in this volume of the Final EIR. The Draft EIR text has not been modified to reflect these clarifications. The reason for the delay of more than a year in processing the Final EIR is that the City enacted an entitlement moratorium on new development along the SR-60 corridor in the eastern portion of the City, including the ProLogis site, while the City completed a land use alternatives study of this corridor. That report was officially received by the City on January 14, 2014, and the City rescinded the entitlement moratorium as of January 23, 2014.

IMPORTANT NOTE: Section 4.0 of this document has been added to evaluate the Reduced Intensity Alternative in more detail. To that end, the applicant has proposed a less intensive modified plan to address concerns expressed about the Proposed Project (i.e., its environmental impacts). The applicant is requesting the City consider adopting a Reduced Intensity Alternative as evaluated in the Draft EIR in the form of this less intensive modified plan that would reduce the size of the project by 32% by removing buildings 5 and 6 which are the two buildings proposed in the southeast corner of the project site (i.e., the buildings that are closest to the existing residences). This modified plan would allow development of future residential uses in the southeast portion of the project site, consistent with the existing R-5 and RA-2 zoning, adjacent to the existing residential neighborhood to the southeast. The modified plan also has a 250-foot setback from the project warehouses to the future residential uses, consistent with the City’s municipal code requirements.

1.1 CONTENT AND FORMAT

Subsequent to this introductory section, Section 2.0 contains copies of each comment letter received on the Draft EIR, along with annotated responses to each comment contained within the letters. Section 3 of this document contains corrections and errata to the Draft EIR. Section 4.0 evaluates a Reduced Intensity Alternative (less intensive modified plan) as described above, while Section 5.0 contains the MMRP.

1.2 PUBLIC REVIEW OF THE DRAFT EIR

As required by the California Environmental Quality Act (CEQA) Guidelines Section 15087, a Notice of Completion (NOC) of the Draft EIR State Clearinghouse No. 2008021002 for the Eucalyptus Industrial Park project was filed with the State Clearinghouse on July 17, 2012, and the Notice of Availability (NOA) of the Draft EIR was filed with the Riverside County Clerk on July 18, 2012.

The Draft EIR was circulated for public review for a period of 48 days, from July 18, 2012 to September 4, 2012. Copies of the Draft EIR were distributed to all Responsible Agencies and to the State Clearinghouse in addition to various public agencies, citizen groups, and interested individuals. Copies of the Draft EIR were also made available for public review at the City Planning Department, at one area library, and on the internet.

A total of fourteen (14) comment letters were received. Ten of the comment letters received were from Federal, State, regional, or local agencies. Four comment letters were received from private organizations or conservation groups – no letters were received from individuals. All 14 letters have been responded to within this document. In particular, comments that address environmental issues are responded to in Section 2.0.

It should be noted that one of the comment letters submitted by a private organization, Lozeau Drury LLP dated August 31, 2012, was inadvertently left out of the original Final EIR document issued on February 12, 2014. This letter has been added to the Final EIR and the document has been revised as of March 31, 2014 including responses to the Lozeau Drury letter.

1.3 POINT OF CONTACT

The Lead Agency for this Project is the City of Moreno Valley. Any questions or comments regarding the preparation of this document, its assumptions, or its conclusions, should be referred to:

Jeff Bradshaw, Associate Planner
City of Moreno Valley, Planning Division
14177 Frederick Street
Moreno Valley, California 92553
Phone: (951) 413-3224
e-mail: jeffreyb@moval.org

1.4 PROJECT SUMMARY

The following information is summarized from the Project Description in the Draft EIR. For additional detail in regard to Project characteristics and Project-related improvements, along with analyses of the Project's potential environmental impacts, please refer to Draft EIR Sections 3.0 and 4.0, respectively.

1.4.1 Project Location/Existing Conditions

The project site is located in the City of Moreno Valley, Riverside County. The approximately 122.8-acre site is generally located south of the Sr-60 Freeway between Redlands Boulevard and Moreno Beach Drive in the eastern portion of the City. The Quincy Channel forms the eastern boundary of the site. During preparation of the Draft EIR, one of the existing onsite conditions was the presence of hundreds of citrus trees in the central and northern portions of the site, which were left over from historical agricultural use of the property. During the entitlement moratorium described before Section 1.1, ProLogis decided to remove the citrus trees due to the high ongoing cost of maintaining and harvesting them, and the potential fire danger if the trees became too dry from not enough watering. This minor change in existing conditions is being documented in this FEIR and does not change any of the conclusions of the DEIR regarding significant impacts or mitigation measures. The trees were removed in the winter of 2013 so it was not during the spring breeding season for bird species in the area. This will be described in more detail in Section 4.4 of this document,

1.4.2 Proposed Project

The proposed development would result in the construction and operation of approximately 2,244,638 square feet of distribution warehouse uses in 6 buildings on an approximately 122.8-acre site. The buildings range in size from 106,106 to 862,035 square feet. The buildings will be constructed with a total of 326 vertical-lift dock-high roll up doors on the long sides of each building to allow access for

the loading and unloading of products from diesel truck/trailers. Each building also includes business office space for the management of each warehouse. A total of 372 truck trailer parking stalls and 1,110 vehicle parking stalls will be provided, with truck and vehicle parking provided at each warehouse sufficient for the anticipated trucks and vehicles for that particular building, in accordance with City standards for light industrial uses. The project provides 15 to 24 percent landscaping for each warehouse building area, with a total average of 18 percent compared to 10 percent minimum required by the City's Municipal Code.

1.4.3 Project Objectives

The purpose of the proposed project is to provide a new facility specializing in warehouse distribution services. Upon development, the proposed project will achieve the following:

- Provide industrial warehouse facilities that meet the substantial and unmet demands of businesses located in the City and County;
- Provide new industrial development that is attractive and minimizes conflicts with the surrounding existing uses;
- Provide a variety of new employment opportunities for the citizens of Moreno Valley and surrounding communities;
- Encourage warehouse distribution services that take advantage of the area's close proximity to various freeways and transportation corridors;
- Encourage new development consistent with the capacity and municipal service capabilities;
- Provide infrastructure improvements to meet phased project needs in an efficient and cost-effective manner;
- Cluster industrial warehouse uses near access points to the state highway system to reduce traffic congestion on surface streets and to reduce air pollutant emissions from vehicle sources;
- Develop land uses that provide the City with a positive revenue/cost ratio and provide needed infrastructure in a timely fashion;
- Address community circulation, both vehicular and pedestrian, utilizing available capacity within the existing circulation system, and provide fair share improvements to various future-year deficient intersection or road segments; and
- Reduce peak hour vehicle trips, energy and water consumption compared to existing General Plan land uses.

1.4.4 Required Permits and Discretionary Actions

The following discretionary actions are anticipated to be taken by the City of Moreno Valley as part of the proposed project:

- General Plan Amendment to amend the Land Use Element resulting in a change of land use designations for the southern portion of the project site (approximately 71.3 acres) from Residential 15, Residential 5, and Residential Agriculture to Business Park.
- General Plan Amendment to amend the Circulation Element including (1) elimination of undeveloped Quincy Street from Eucalyptus Avenue to Encilia Avenue; and (2) realignment of Encilia Avenue from its current alignment such that its westerly terminus is

located at Moreno Beach Drive instead of the current General Plan westerly terminus at Eucalyptus Avenue. The segment between Quincy Channel and Moreno Beach Drive would be classified as a Collector.

- Change of Zone resulting in a change from Business Park (BP), Business Park Mixed-Use (BPX), Residential 15 (R15), Residential 5 (R5), and Residential Agriculture (RA-2) to Light Industrial (LI) on the project site.
- Modification of the Primary Animal Keeping Overlay (PAKO) zone district per the recommended change of zone.
- Modification of the Master Plan of Trails to eliminate trail segment along the west side of the Quincy Channel north of the future Eucalyptus Avenue and add a segment along the north side of Eucalyptus Avenue from the Quincy Channel to the west boundary of the project site.
- Approval of a Master Plot Plan and five related Plot Plans.
- Tentative Parcel Map approval.
- Certification of the Environmental Impact Report.
- Final Parcel Map, public improvement agreement, and related securities approval.
- Issuance of an encroachment permit for any construction work done in any City-controlled ROW. Encroachment permit issuance requires approval of improvement plans, public improvement agreement execution with securities posted, and satisfying those conditions of approval required prior to grading.
- Approval of a Storm Water Pollution Prevention Plan (SWPPP) to accommodate site runoff during construction.
- Approval of a Preliminary Water Quality Management Plan (P-WQMP) and Final Water Quality Management Plan (F-WQMP) to mitigate for post-construction runoff flows (non-discretionary).
- Issuance of a Grading Permit that requires approval of a grading plan, approval of the final drainage study, approval of the F-WQMP, obtaining an Notice of Intent and Water Discharge Identification Number, obtaining a WQMP#, and satisfying those conditions of approval required prior to grading (non-discretionary).
- Issuance of a Building permit. The comprehensive building permit includes building, plumbing, mechanical, and electrical permits (non-discretionary).

The following approvals and permits are required by other agencies:

- Approval from the City and Riverside County Flood Control and Water Conservation District (RCFCWCD) to ensure that construction site drainage velocities are equal to or less than the pre-construction conditions and downstream water quality is not worsened.
- Approval of Quincy Channel improvements from the RCFCWCD.
- A Section 404 Permit from the U.S. Army Corps of Engineers (USACE).
- A Section 401 Water Quality Certification from the Regional Water Quality Control Board (RWQCB).
- A Section 1602 Streambed Alteration Agreement from the California Department of Fish and Game (CDFG).

- Encroachment permits from Caltrans for any construction work done in any State-controlled ROW (i.e., SR-60).

2. RESPONSE TO COMMENTS

A total of thirteen (13) comment letters on the Draft EIR were received with 10 of them from Federal, State, regional, or local agencies and 3 letters from private organizations or individuals. All 13 letters have been responded to within this document. Comments that address environmental concerns have been specifically addressed. Comments that (1) do not address the adequacy or completeness of the Draft EIR; (2) do not raise environmental issues; or (3) do request the incorporation of additional information not relevant to environmental issues, do not require a response, pursuant to Section 15088(a) of the State CEQA Guidelines.

Section 15088 of the State CEQA Guidelines, Evaluation of and Response to Comments, states:

- a) The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments received during the noticed comment period and any extensions and may respond to late comments.
- b) The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, major environmental issues raised when the lead agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail, giving the reasons that specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice.
- c) The response to comments may take the form of a revision to the draft EIR or may be a separate section in the final EIR. Where the response to comments makes important changes in the information contained in the text of the draft EIR, the lead agency should either:
 1. Revise the text in the body of the EIR; or
 2. Include marginal notes showing that the information is revised in the responses to comments.

Information provided in this volume of the Final EIR clarifies, amplifies, or makes minor modifications to the Draft EIR. No significant changes have been made to the information contained in the Draft EIR as a result of the responses to comments, and no significant new information has been added that would require recirculation of the document.

An Errata section to the EIR (Section 3.0) has been prepared to make minor corrections and clarifications to the Draft EIR as a result of City review and comments received during the public review period. Therefore, this Response to Comments document, along with the Errata is included as part of the Final EIR for consideration by the Planning Commission prior to a vote to certify the Final EIR.

2.1 LIST OF PERSONS, ORGANIZATIONS, AND PUBLIC AGENCIES COMMENTING ON THE DRAFT EIR

The persons, organizations, and public agencies that submitted comments regarding the Draft EIR through September, 2012, are listed below. A total of thirteen (13) comment letters were received. Ten of the comment letters were from Federal, State, regional, or local agencies, while three were from private organizations or individuals. Each comment letter received is indexed with a letter and number below.

Comment Letters Received Regarding the Draft EIR

A FEDERAL AND STATE AGENCIES

- A-1 California Office of Planning and Research, State Clearinghouse (September 4, 2012)**
Scott Morgan, Director State Clearinghouse
- A-2 California Department of Fish and Game (August 28, 2012)**
Jeff Brandt, Senior Environmental Specialist
- A-3 California Native American Heritage Commission (July 20, 2012)**
Dave Singleton, Program Analyst
- A-4 Pechanga Band of Luiseno Indians (September 4, 2012)**
Anna Hoover, Cultural Analyst
- A-5 Morongo Band of Mission Indians (September 10, 2012)**
Franklin Dancy, Director of Planning

B. REGIONAL AND COUNTY AGENCIES

- B-1 Eastern Municipal Water District (September 4, 2012)**
Jayne Joy, Director of Environmental and Regulatory Compliance
- B-2 Eastern Municipal Water District (September 4, 2012)**
Maroun El-Hage, Senior Civil Engineer, New Business Development

Richard Drury et al, Attorneys for LIUNA Local Union 1184

D-2 Sierra Club, San Geronio Chapter (September 4, 2012)
George Hague, Conservation Chair
Moreno Valley Chapter

D-3 Johnson & Sedlack (September 4, 2012)
Ray Johnson, AICP, Esq.

D-4 Lozeau Drury LLP (August 31, 2012)
Richard Drury et al, Attorneys for LIUNA Local Union 1184

It should be noted that this letter actually consists of four related documents, one main letter from Mr. Drury, two supporting memoranda from other individuals (Dr. Clark and Mr. Hageman), and a number of appendices as attached materials. Each of these has a separate response.

2.2 FORMAT OF RESPONSES TO COMMENTS

Aside from the courtesy statements, introductions, and closings, individual comments within the body of each letter have been identified and numbered. A copy of each comment letter and the City's responses are included in this section. Brackets delineating the individual comments and an alphanumeric identifier have been added to the right margin of the letter. Responses to each comment identified are included on the page(s) following each comment letter. Responses to comments were sent to the agencies that provided comments.

In the process of responding to the comments, there were minor revisions to the Environmental Impact Report. None of the comments or responses constitutes "significant new information" (*CEQA Guidelines* Section 15073.5) that would require recirculation of the Environmental Impact Report.

SCH#: 2008021002

Dear Jeff Bradshaw:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on August 31, 2012, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

"A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Re: ProLogis Eucalyptus Industrial Park Draft Environmental Impact Report
City of Moreno Valley, County of Riverside, SCH# 2008021002

Dear Mr. Bradshaw:

The Department of Fish and Game (Department) appreciates this opportunity to comment on the ProLogis Eucalyptus Industrial Park Draft Environmental Impact Report (DEIR). The Department is responding as a Trustee Agency for fish and wildlife resources [Fish and Game Code sections 711.7 and 1802 and the California Environmental Quality Act Guidelines (CEQA) section 15386] and as a Responsible Agency regarding any discretionary actions (CEQA Guidelines section 15381), such as a Lake and Streambed Alteration Agreement (California Fish and Game Code Sections 1600 *et seq.*), and/or a California Endangered Species Act (CESA) Incidental Take Permit (Fish and Game Code Sections 2080 and 2080.1).

Project Description and Location

The Proposed Project involves the construction of a six building warehouse facility covering an area of 2,244,635 square feet (sf). The project requires a change of land use of 71.2 acres from residential to business park and an overall zone change of 122.8 acres to light industrial. Also included in the Project is the elimination of Quincy Street from State Route 60 (SR-60) south to Cottonwood Avenue, and the completion of Eucalyptus Avenue east to Fir Avenue. The Project site is located in the eastern portion of the City of Moreno Valley, south of SR-60, east of Moreno Valley Auto Mall, and adjacent to and west of the Quincy Channel. The major cross streets are Moreno Beach Drive to the west and Redlands Boulevard to the east. A Notice of Preparation for the Project was submitted to the State Clearinghouse in 2008.

Western Riverside Multiple Species Habitat Conservation Plan (MSHCP)

The Department is responsible for ensuring appropriate conservation of fish and wildlife resources including rare, threatened, and endangered plant and animal species, pursuant to the CESA, and administers the Natural Community Conservation Plan Program (NCCP Program). On June 22, 2004, the Department issued NCCP approval and Take Authorization for the Western Riverside County MSHCP per Section 2800, *et seq.*, of the California Fish and Game Code. The MSHCP establishes a multiple species conservation program to minimize and mitigate habitat loss and the incidental take of covered species in association with activities covered under the permit.

Conserving California's Wildlife Since 1870

ProLogis Eucalyptus Industrial Park Draft Environmental Impact Report
City of Moreno Valley -- SCH# 2008021002
Page 2 of 5

In order to be considered a covered activity, Permittees must demonstrate that proposed actions are consistent with the MSHCP and its associated Implementing Agreement.

The proposed Project occurs within the MSHCP area and is subject to the provisions and policies of the MSHCP. The Project is located in the City of Moreno Valley, County of Riverside. The City of Moreno Valley is the lead agency and is signatory to the implementing agreement of the MSHCP. Compliance with approved habitat plans, such as the MSHCP, is discussed in CEQA. Specifically, Section 15125(d) of the CEQA Guidelines requires that the DEIR discuss any inconsistencies between a proposed Project and applicable general plans and regional plans, including habitat conservation plans and natural community conservation plans. An assessment of the impacts to the MSHCP as a result of this Project is necessary to address CEQA requirements. Included in the appendices is the "MSHCP Consistency Analysis and Burrowing Owl Habitat Assessment and Focused Survey for the Eucalyptus Industrial Development."

2

The Project is located in the Roche Canyon/Badlands Area Plan of the MSHCP and does not involve a Criteria Cell. The site is not adjacent to any conservation areas. MSHCP survey requirements for this area include surveys for burrowing owl. Vegetation on the site consists of ruderal, agriculture, non-native grasslands, "disturbed" mule fat, non-native woodland, unvegetated streambed and channel upland vegetation. There is a riparian stream just prior to the eastern Project boundary, and a riparian stream on the west, and southeast. Burrowing owl surveys were conducted over five days in July of 2011 and no birds were found, but suitable habitat was observed on the site.

Analysis of the Potential Project-Related Impacts on Biological Resources

CEQA Section 21068 defines "significant" as: "...a substantial, or potentially substantial, adverse change in the environment." This particular Project has the potential to have significant environmental impacts on Cooper's hawk, red-tailed hawk, coyote, desert cottontail, southern California black walnut, bladder pod, and mule fat. The Project is located in the MSHCP survey area for the burrowing owl.

3

Burrowing Owl

The site was suitable for burrowing owl, even though none were found. The applicant should submit a copy of the burrowing owl pre-construction survey (with SCH #) to the Department and notify the Department if a DBESP will be required.

4

Proposed mitigation

The mitigation proposed for upland species is to pay into the Stephens' kangaroo Habitat Conservation Plan and to pay the development fees to the MSHCP.

5

Department Concerns

The Department is concerned about three issues: 1) stream and riparian vegetation impacts, 2) the potential presence of burrowing owl, and, 3) the cumulative impact of the Project on SR-60 traffic and nearby roadways (particularly Gilman Hot Springs Road and Lamb Canyon Road). The Department recommends that the traffic analysis be revised and

6

ProLogis Eucalyptus Industrial Park Draft Environmental Impact Report
City of Moreno Valley -- SCH# 2008021002
Page 3 of 5

the Department's concerns addressed in the Final Environmental Impact Report or a subsequent CEQA document.

6

Lake and Streambed Alteration Agreement

The applicant conducted a jurisdictional delineation of State and Federal waters. There is an unnamed, eroded channel that originates in the northwest, trends southeast and exits the Project site heading south. Quincy Channel traverses the eastern boundary of the site on a north to south alignment. The applicant has filed a Determination of Biologically Equivalent or Superior Preservation (DBESP) with the Resource Conservation Agency (RCA) of the MSHCP.

Although the proposed Project is within the MSHCP, a Notification of Lake or Streambed Alteration is still required by the Department, should the site contain jurisdictional waters. Additionally, the Department's criteria for determining the presence of jurisdictional waters are more comprehensive than the MSHCP criteria in Section 6.1.2 (Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools). The Department is responsible for assessing and evaluating impacts to jurisdictional waters; typically accomplished through reviewing jurisdictional (JD) reports, supporting information, and conducting site visits. Following review of a JD, the Department may request changes to the JD. The Department may also recommend that additional project avoidance and/or minimization measures be incorporated, or request additional mitigation for project-related impacts to jurisdictional areas. The Department recommends submitting a notification early on, since modification of the proposed project may be required to avoid or reduce impacts to fish and wildlife resources. To obtain a Streambed Alteration Agreement notification package, please go to <http://www.dfg.ca.gov/habcon/1600/forms.html>.

7

The applicant completed a JD of State and Federal Waters and included the document as an Appendix. A jurisdictional delineation was conducted in 2011 and the impact analysis determined that there will be 0.362 acres of permanent impact and 0.33 acres of temporary impact to jurisdictional streams. The applicant is proposing to mitigate for 0.362 acres of permanent impacts at a 2:1 ratio or with payment of In-lieu fees to the Santa Ana Watershed Association for arundo donax removal. The JD will be reviewed by the Department to ensure consistency with the Department's regulatory policies. Any mitigation measures required by the resource protection policies of the MSHCP should be included in the CEQA document.

The Department opposes the elimination of ephemeral, intermittent, and perennial streams, channels, lakes, and their associated habitats. The Department recommends avoiding the stream and riparian habitat to the greatest extent possible. Any unavoidable impacts need to be compensated with the creation and/or restoration of in-kind habitat either on-site or off-site at a minimum 3:1 replacement-to-impact ratio, depending on the impacts and proposed mitigation. Additional mitigation requirements through the Department's Streambed Alteration Agreement process may be required depending on the quality of habitat impacted, proposed mitigation, project design, and other factors.

Analysis of Traffic Impacts

The Traffic section of the DEIR states that the project would contribute to the worsening of the unsatisfactory Level of Service (LOS) at the Redlands Boulevard/SR-60 westbound ramps and a significant impact at the intersection of Redlands Boulevard/Eucalyptus Avenue-Fir Avenue. Additionally, the SR-60 Eastbound (Pigeon Pass Road to Peacock

8

ProLogis Eucalyptus Industrial Park Draft Environmental Impact Report
City of Moreno Valley -- SCH# 2008021002
Page 4 of 5

Street, AM and PM peak hours), SR-60 Westbound (Poacock Street to Perris Boulevard, AM peak hour), and SR-60 westbound (Perris Boulevard to Anson Street, AM peak hour) are forecast to operate at an unsatisfactory level of service with the proposed Project. The traffic study also notes that there are no projects proposed for the SR-60.

The traffic section of the DEIR is limited to projects within a five mile radius and how the proposed development and other development within the five mile radius would affect local traffic conditions. The Department would like to point out that SR-60 is a major west to east linkage connecting State Route 91 (SR-91) to the Interstate 10 (I-10), as well as extending from the City of Los Angeles to the SR-91, Interstate 215 (I-215) and Interstate 15 (I-15) interchanges. There is already heavy congestion on the westbound SR-60.

The Department is interested in existing and projected future traffic flow along SR-60. Specifically, the Department is interested in an analysis of how the Project and other proposed development (which cumulatively includes 13,483,062 sf of development), will ultimately use SR-60. The analysis should include the cumulative impacts associated with future projected traffic flow along SR-60 from these developments. The Department would like to stress that the 13,483,062 sf figure does not include the World Logistics project which would add 41 million sf of warehouse facilities. This omission alone dictates that the traffic study should be revised and recirculated. The scale of these projects suggests that the Project facilities are not for local use only, but are designed as regional warehousing centers to serve the Counties of Riverside, Orange, Los Angeles, and San Bernardino. Therefore an analysis of local intersection impacts is not adequate to describe the regional impacts of these facilities on the SR-60. The analysis also does not include the Villages of Lakeview Specific Plan that involves 11,350 dwelling units near the intersection of Gilman Hot Springs Road and Ramona Expressway, or proposed residential development near the intersection of Lamb Canyon Road and SR-60.

The Department is concerned that traffic congestion on SR-60 will result in an increase in traffic on area surface streets, particularly Gilman Hot Springs Road and the Ramona Expressway. Both of these roads provide access to the Department's San Jacinto Wildlife Area (SJWA), where major development projects are proposed, but are not included in the current traffic study. The Department is very concerned about the potential cumulative impacts of commercial/industrial/warehouse facilities on nearby conserved lands. Of particular importance to the Department are the potential direct and indirect effects of the Project on the adjacent SJWA, Lake Perris Recreation Area, and Badlands area, and potential increased use of Davis Road, lighting, noise, windblown trash, vehicular emissions, traffic, and surface road runoff.

The Badlands area and the SJWA represent a substantial investment (\$80+ million) by the State in acquiring habitat for native plants, animals, and migratory waterfowl. The SJWA is a important and historic migratory stopover for waterfowl, game birds, and non-game birds in Southern California. The SJWA is also a regional destination point for bird watching. A key component of the SJWA is waterfowl and upland game hunting.

In summary, we believe the DEIR is inadequate in describing project related traffic impacts and identifying appropriate mitigation for purposes of CEQA. We appreciate the opportunity to comment on the referenced DEIR and we recommend that the DEIR be revised to

8

9

10

Sincerely,

Jeff Brandt
Senior Environmental Scientist

RESPONSE TO LETTER A-2

California Department of Fish and Game

Response to Comment 1. The commenter accurately characterizes the responsibilities of the Department and the characteristics of the proposed project.

Response to Comment 2. The commenter accurately summarizes both the CEQA requirement for an analysis of the proposed project's consistency with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) and the MSHCP policies and procedures applicable to the proposed project. The commenter also outlines the MSHCP requirement for a burrowing owl survey, and that the surveys conducted for the project showed no burrowing owl sign or observations, but the site was determined to contain suitable habitat.

Response to Comment 3. The commenter provides the definition for significant impact under CEQA but then applies it incorrectly to the project site. The detailed biological surveys prepared for the project site, as well as the Section 4.4 of the EIR on biological resources, concludes that the proposed project would not have significant impacts on the species listed by the commenter due to the lack of existing native vegetation on the site, the fact that the has been regularly disturbed by disking for weed abatement (i.e., fuel modification for fire protection), and a substantial portion of the site supports citrus trees that are not commercially harvested. Development of this site would remove an incremental amount of land that now provides foraging for the two raptor species (i.e., Cooper's hawk and red-tailed hawk) but the site does not contain any large trees that are suitable for raptor roosting or perching (i.e., the citrus trees make these activities difficult for raptors). Impacts to cottontail, bladder pod, and mule fat must be considered only incremental as a result of the loss of 122.8 acres of vacant disturbed land that supports mainly weedy non-native vegetation. The commenter provided no empirical evidence or data to support the contention that impacts to these species should be considered significant under CEQA. Finally, impacts to the drainages that support southern California black walnut were assessed and appropriate onsite and offsite mitigation will be provided, as outlined in Mitigation Measure 4.4.6.3A on 4.4-30 of the Draft EIR. These conclusions are supported by the technical studies prepared by ICF International based on the proposed warehouse development project.

ICF International also reviewed this comment and wished to add the following:

"Cooper's hawk, coyote, and southern California black walnut are fully covered species under the MSHCP and as such any potential impacts to them would be fully mitigated through the project being consistent with the MSHCP. Red-tailed hawk, desert cottontail, bladder pod, and mule fat are all widely distributed species with no threat to their continued existence in western Riverside County. The removal of 121.29 acres of foraging habitat for red-tailed hawk is judged to be less than significant under CEQA. The nesting bird mitigation measure will ensure no direct take of individuals would occur. The removal of 121.29 acres of occupied habitat for desert cottontail is judged to be a less than significant impact under CEQA. This species is widely distributed throughout western Riverside County, including many areas of development. The removal of a few bladder pod and less than an acre of occupied mule fat habitat is also judged to be a less than significant impact given these species' wide distribution w/in the county. Agreed, the project site occurs within the survey area of burrowing owl and a survey following MSHCP protocol was performed and the species was absent."

Response to Comment 4. ICF International has prepared and is processing a Determination of Biologically Equivalent or Superior Preservation (DBESP) report for review and approval by Riverside Conservation Authority (RCA) and California Department of Fish and Game (CDFG), according to the

procedures established by the MSHCP. The applicant will be preserving the Quincy Channel along the east side of the project, and will mitigate for the loss of the two minor drainage features along the western and southern portions of the site, as outlined on page 4.4-30 of the Draft EIR.

As outlined in Mitigation Measures 4.4.6.1A through C in the Draft EIR, a pre-construction survey for burrowing owl will be prepared and processed through CDFG prior to grading the site.

Response to Comment 5. As required by law, the developer will pay the established SKR mitigation and MSHCP development impact fee. ICF International adds that this is for those species covered by both the SKR HCP and the MSHCP. For species with potential for occurrence and/or confirmed present, the proposed impacts were judged less than significant under CEQA and no mitigation was necessary.

Response to Comment 6. It is understandable CDFG is concerned about impacts to stream and riparian vegetation and burrowing owl. However, the commenter does not explain why the CDFG, which is a responsible and trustee agency for biological resources in the state, is concerned with traffic issues or the traffic study. However, we believe Response 8 adequately addresses the CDFG's concerns.

In addition, ICF International adds the following information to this response:

- 1) Stream and riparian vegetation impacts – the project will impact stream and riparian vegetation that is protected under the WRC MSHCP, Clean Water Act Sections 401 and 401, and CDFG 1600 code. The project must, under the WRC MSHCP, provide mitigation for impacts (permanent and temporary) such that the compensation is equivalent or superior in preservation to that proposed for impact. A Determination of Equivalent or Superior Preservation (DBESP) report will be submitted to USFWS and CDFG to ensure the compensatory mitigation is at a minimum adequate per the WRC MSHCP. This is stated in the EIR. Under CEQA it is judged that a minimum mitigation ratio at 2:1 would provide equivalent or superior mitigation for that being impacted. Under the MSHCP, USFWS and CDFG concurrence is necessary and the mitigation ratio may be determined to be higher than 2:1. In addition, it is stated in the CEQA document that impacts to federal and state jurisdictional waters/streambeds would require permits/agreements under CWA 401 and 404 and CDFG 1600 code and that under CEQA, impacts would need to be mitigated at a 2:1 ratio to make impacts less than significant. The mitigation ratio determined during the permit/agreement processing may be determined to be higher or lower and the project proponent would be required to fulfill the higher mitigation ratio. Mitigation Measure 4.4.6.3 will be revised to read “...shall be mitigated at a minimum of a 2:1 ratio.”
- 2) The potential presence of burrowing owl – as indicated in the EIR, a focused survey was performed for this species and the species was found absent. A pre-construction survey for burrowing owl is required and stated in the EIR and is to occur within 30 days prior to ground disturbance activities. This is consistent with the WRC MSHCP. Additionally, the EIR states that if burrowing owl is found that the species would be excluded from the site through appropriate measures that USFWS and CDFG approve. These measures ensure that burrowing owl is not directly impacted by the project, that the project is consistent with the WRC MSHCP and that the project is consistent with USFWS and CDFG protocol.

Response to Comment 7. The commenter summarizes the results of the jurisdictional delineation prepared for the project by ICF International. The project will protect in place the entire Quincy Channel along the eastern boundary of the project site. The City is aware the Department opposes the elimination of minor drainage channels, as outlined in their comment, but there are times when small eroded ephemeral drainage courses must be channelized or incorporated into the overall drainage management of a site to provide effective erosion and flood control. The two smaller

ephemeral drainages along the eastern and southwestern portions of the site will be removed, but their loss will be compensated by offsite mitigation as outlined in Mitigation Measure 4.4.6.3A in the Draft EIR. The Department's subsequent Streambed Alteration Agreement process will allow for the effective transition and ultimate loss of these small drainages with minimum offsite compensation of 2:1 (note: subsequent regulatory permitting may require a different compensation ratio).

ICF International would like to add the following information to this response:

- 1) The project proponent plans on submitting an application to CDFG in the near future to ensure CDFG is involved early on in the permitting process.
- 2) The measures indicated in the CDFG comment are being incorporated into the revised DBESP. Finally, the EIR indicates that impacts to stream and riparian habitat will be mitigated at a ratio of 2:1 to provide sufficient mitigation under CEQA. The project has attempted to reduce impacts to all jurisdictional waters/streambeds. The project will install two storm drains and a bridge. The storm drains are necessary to continue supporting water volumes reaching the natural streams and the bridge is a requirement to maintain appropriate movement into and out of the project site. The ability to support on-site mitigation is limited due to the small amount of Quincy Channel that is owned by the project proponent and which is to be dedicated to the City of Moreno Valley as a condition of project approval. As such, all compensatory mitigation will occur off-site at a minimum ratio of 2:1. It is understood that further coordination with CDFG through the Streambed Alteration Agreement program will be necessary and that under the Streambed Alteration Agreement; the mitigation ratio may be higher or lower than 2:1 (as noted above).
- 3) Based on a pre-application MSHCP project meeting with CDFG, USFWS, RCA, and RWQCB that occurred on October 10, 2012, the following minor changes and clarifications will be added to the indicated mitigation measures, mainly to incorporate temporary impacts into the compensation for permanent impacts:

4.4.6.2A *As outlined in the project's Determination of a Biologically Equivalent or Superior Preservation (DBESP) report, the project applicant shall compensate for the temporary and permanent impact on and loss of jurisdictional waters and streambeds by providing a minimum 2:1 off-site replacement of equivalent riverine/riparian habitat prior to project construction. (0.36 acre impact = 0.72 acre replacement). This off-site replacement shall be accomplished through the contribution of in-lieu fees to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of riparian habitat adjacent to the tributaries of the San Jacinto River or within the Santa Ana River watershed. Documentation of acceptance of the SAWA contribution shall be provided to the City prior to issuance of a grading permit. Offsite restoration, enhancement, and/or land purchase mitigation for the drainage impacts will occur at an offsite location through one or more of the following: an USACE approved mitigation bank, through an in lieu fee mitigation program, and/or land purchase and conservation. DFG and USFWS will need to provide concurrence that this mitigation is equivalent or superior to that proposed for impact through their review and acceptance of the DBESP.*

4.4.6.2B *The project applicant shall retain qualified personnel to prepare and implement a Habitat Mitigation and Monitoring Plan (HMMP) to oversee restoration of temporarily affected areas (0.35 acre of riverine/riparian habitat) to their pre-construction contours and vegetation. The HMMP will be approved by USACE and CDFG prior to the City issuing any occupancy permits. Riparian/riverine resources that are temporarily impacted by project construction shall be returned to their preconstruction contours and hydroseeded, as outlined in the DBESP.*

NOTE: The DBESP replaces the need for a separate Habitat Mitigation and Monitoring Plan.

4.4.6.3A ~~The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE and a Section 1602 Streambed Alteration Agreement from the CDFG. Direct temporary impacts to more than 0.1 acre of jurisdictional area that are regulated by the USACE, CDFG, and RWQCB shall be mitigated at a 2:1 ratio, including enhancement and/or creation of wetlands or the contribution of in-lieu fee to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of off-site riparian habitat, as outlined in Mitigation Measure 3.3.6.2A.~~ The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE, a Section 401/Porter-Cologne Water Quality Certification from the RWQCB, and a Section 1602 Streambed Alteration Agreement from the CDFG. Offsite restoration, enhancement, and/or land purchase mitigation of jurisdictional drainage impacts will occur at an off-site location through one or more of the following: an USACE approved mitigation bank, through an in-lieu fee mitigation program, and/or land purchase and conservation.

NOTE: These mitigation measures have been revised to be consistent with the revised DBESP report, and so there will not be any conflicts between the implementation measures of the DBESP and the mitigation measures of the EIR.

Response to Comment 8. This comment states that the Traffic Impact Analysis (TIA) only looks at projects within a 5-mile radius. The 2035 conditions analyzed in the TIA were based on the RivTAM model, which includes General Plan land uses for Cities in Riverside County and SCAG forecasts outside Riverside County. Therefore, the comment that the Draft EIR only evaluates projects within a 5-mile radius is incorrect.

The commenter is interested in how the project and other proposed development will affect traffic flow on the SR-60. The analysis of 2035 conditions is based on reasonable absorption rates for General Plan Buildout of the County and based on SCAG forecasts. The background without project conditions for Year 2035 includes potential projects that are consistent with the approved General Plans.

The commenter notes that the World Logistics Center is not included as a cumulative project. Please note that the baseline used to prepare the cumulative conditions analysis in the EIR is based on the past, present and reasonably foreseeable projects at the time the Notice of Preparation (NOP) for the Draft EIR is issued. The NOP was distributed to state, regional, and local agencies on February 4, 2008. At that time, the World Logistics Center was not a planned project, so this project was not included directly as a cumulative project for opening year conditions. However, the traffic model utilized to prepare the traffic analysis does include the approved Moreno Highlands Specific Plan, which is located on the same site as the currently proposed World Logistics Center project. Furthermore, the Moreno Highland Specific Plan generates more trips than the World Logistics Center. As a result, although the World Logistics Center is not included as a cumulative project, as noted in the comment, the 2035 analysis does evaluate the effects of a larger project than the World Logistics Center.

Similarly, although the analysis does not include the Villages at Lakeview as a cumulative project directly, it is included as a Community Development zone in the RIVTAM model, which was used to forecast future volumes. The Community Development land use designation includes all uses proposed in the now rescinded EIR for the Villages at Lakeview project. The commenter also mentions a residential development near the intersection of Lamb Canyon Road and SR-60. It should be noted that Lamb Canyon Road does not intersect SR-60 and therefore it is unclear exactly where this developed uses is located or the exact size of the developed uses. However, LSA believes that the commenter is referring to a development off of SR-79 in the City of Beaumont. It is unlikely that a

residential development located approximately 16 miles from the proposed project would add cumulatively considerable trips to the project study area. Therefore inclusion of the referenced project in the cumulative project list would not be required.

The commentator is concerned about traffic on surface streets due to increased congestion on the SR-60, especially on Gilman Springs Road and Ramona Expressway. As noted in previous comments, the 2035 conditions analyzed in the TIA were based on the RivTAM model, which includes General Plan land uses for cities in Riverside County and SCAG forecasts outside Riverside County. Traffic models route trips based on available capacity and traffic volumes on roadways using the least cost approach. Using this approach, the RivTAM model also forecasts potential diversion of trips due to congested conditions on freeways. Therefore, the 2035 conditions analyzed in the DRAFT EIR accurately represent the future traffic that could be expected on area surface streets, including Gilman Hot Springs Road and the Ramona Expressway. The commenter also states that these two roadways provide access to the San Jacinto Wildlife Area (SJWA), but are not included in the traffic study. Based on local agency guidelines, intersections where the project would add more than 50 peak hour trips were included in the study area. The project would add fewer than 10 peak hour trips to Gilman Hot Springs Road and Ramona Expressway and as a result, these facilities were not included in the study area. The comment claims that potential cumulative impacts on nearby conserved lands, particularly potential direct and indirect effects of the project on the adjacent SJWA, Lake Perris Recreation Area, and Badlands Area, and potential increased use of Davis Road are not discussed in the DRAFT EIR because the project would add an insignificant number of vehicle trips in these areas. It should be noted that Davis Road is not on the City's Circulation Plan or the County of Riverside's Circulation Element. The road is not open to through traffic, and is currently gated. The gate is controlled/maintained by the California Department of Fish and Game. Even if Davis Road were open to through traffic, the small number of trips that would likely be added by the project or diverted from other facilities is minimal and is therefore not required to be analyzed.

Response to Comment 9. The commenter provides brief information on the SJWA and the resources with which the Department is concerned. This comment provides factual information about the Badlands area and the SJWA and does not require a response. The Badlands and the SJWA will not be significantly adversely impacted by the proposed project, as it is not proximate to either of these areas and only a small amount of project-related traffic is expected to use Gilman Springs Road which is adjacent to both areas.

Response to Comment 10. Based on the information in Responses to Comments A-2, Nos.7-9 above, the analysis of traffic impacts provided in the Draft EIR is based on local agency standards, relevant provisions of CEQA, data obtained the most recent version of RivTAM, and standard traffic engineering principles. The comment does not provide any additional information to reinforce the claim that the Draft EIR is inadequate in describing project related traffic impacts and in identifying mitigation measures.

July 20, 2012

Mr. Jeff Bradshaw, Associate Planner
City of Moreno Valley Community Development Department:
Planning Division
14177 Frederick Street; P.O. Box 88005
Moreno Valley, CA 92552

Re: SCH#2008021002; CEQA Notice of Completion: draft Environmental Impact Report (DEIR) for the **PROLOGIS EUCALUPTUS INDUSTRIAL PARK**; located in the City of Moreno Valley; Riverside County, California.

Dear Mr. Bradshaw:

The Native American Heritage Commission (NAHC), the State of California 'Trustee Agency' for the protection and preservation of Native American cultural resources pursuant to California Public Resources Code §21070 and affirmed by the Third Appellate Court in the case of EPIC v. Johnson (1985: 170 Cal App. 3rd 604).

This letter includes state and federal statutes relating to Native American historic properties of religious and cultural significance to American Indian tribes and interested Native American individuals as 'consulting parties' under both state and federal law. State law also addresses the freedom of Native American Religious Expression in Public Resources Code §5097.9

The California Environmental Quality Act (CEQA – CA Public Resources Code 21000-21177, amendments effective 3/18/2010) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the CEQA Guidelines defines a significant impact on the environment as 'a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ... objects of historic or aesthetic significance.' In order to comply with this provision, the lead agency is required to assess whether the project will have an adverse impact on these resources within the 'area of potential effect (APE), and if so, to mitigate that effect. The NAHC recommends that the lead agency request that the NAHC do a Sacred Lands File search as part of the careful planning for the proposed project.

The NAHC "Sacred Sites," as defined by the Native American Heritage Commission and the California Legislature in California Public Resources Code §§5097.94(a) and 5097.96. Items in the NAHC Sacred Lands Inventory are confidential and exempt from the Public Records Act pursuant to California Government Code §6254 (r).

Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries of cultural resources or burial sites once a project is underway. Culturally affiliated tribes and individuals may have knowledge of the religious and cultural significance of the historic properties in the project area (e.g. APE). We strongly urge that you

make contact with the list of Native American Contacts on the attached list of Native American contacts, to see if your proposed project might impact Native American cultural resources and to obtain their recommendations concerning the proposed project. Pursuant to CA Public Resources Code § 5097.95, the NAHC requests cooperation from other public agencies in order that the Native American consulting parties be provided pertinent project information. Consultation with Native American communities is also a matter of environmental justice as defined by California Government Code §65040.12(e). Pursuant to CA Public Resources Code §5097.95, the NAHC requests that pertinent project information be provided consulting tribal parties. The NAHC recommends *avoidance* as defined by CEQA Guidelines §15370(a) to pursuing a project that would damage or destroy Native American cultural resources and Section 2183.2 that requires documentation, data recovery of cultural resources.

3

Furthermore, the NAHC if the proposed project is under the jurisdiction of the statutes and regulations of the National Environmental Policy Act (e.g. NEPA; 42 U.S.C. 4321-43351). Consultation with tribes and interested Native American consulting parties, on the NAHC list, should be conducted in compliance with the requirements of federal NEPA and Section 106 and 4(f) of federal NHPA (16 U.S.C. 470 *et seq*), 36 CFR Part 800.3 (f) (2) & .5, the President's Council on Environmental Quality (CSQ, 42 U.S.C 4371 *et seq.* and NAGPRA (25 U.S.C. 3001-3013) as appropriate. The 1992 *Secretary of the Interiors Standards for the Treatment of Historic Properties* were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including cultural landscapes. Also, federal Executive Orders Nos. 11593 (preservation of cultural environment), 13175 (coordination & consultation) and 13007 (Sacred Sites) are helpful, supportive guides for Section 106 consultation. The aforementioned Secretary of the Interior's *Standards* include recommendations for all 'lead agencies' to consider the historic context of proposed projects and to "research" the cultural landscape that might include the 'area of potential effect.'

4

Confidentiality of "historic properties of religious and cultural significance" should also be considered as protected by California Government Code §6254(r) and may also be protected under Section 304 of he NHPA or at the Secretary of the Interior discretion if not eligible for listing on the National Register of Historic Places. The Secretary may also be advised by the federal Indian Religious Freedom Act (cf. 42 U.S.C., 1996) in issuing a decision on whether or not to disclose items of religious and/or cultural significance identified in or near the APEs and possibility threatened by proposed project activity.

5

Furthermore, Public Resources Code Section 5097.98, California Government Code §27491 and Health & Safety Code Section 7050.5 provide for provisions for inadvertent discovery of human remains mandate the processes to be followed in the event of a discovery of human remains in a project location other than a 'dedicated cemetery'.

6

To be effective, consultation on specific projects must be the result of an ongoing relationship between Native American tribes and lead agencies, project proponents and their contractors, in the opinion of the NAHC. Regarding tribal consultation, a relationship built around regular meetings and informal involvement with local tribes will lead to more qualitative consultation tribal input on specific projects.

7

Finally, when Native American cultural sites and/or Native American burial sites are prevalent within the project site, the NAHC recommends 'avoidance' of the site as referenced by CEQA Guidelines Section 15370(a).

8

If you have any questions about this response to your request, please do not hesitate to contact me at (916) 653-6251.

Sincerely,

Dave Singleton
Program Analyst

This list is applicable for contacting local Native Americans with regard to cultural resources for the proposed SCH#2008021002; CEQA Notice of Completion; draft Environmental Impact Report (DEIR) for the Prologis Eucalyptus Industrial Park Project; located in the City of Moreno Valley; Riverside County, California.

RESPONSE TO LETTER A-3

California Native American Heritage Commission

Introduction to Responses. The City has implemented the guidance received from the Native American Heritage Commission (NAHC) regarding the structure of the relationship with concerned Native American tribes and individuals during project development. In particular, the relationship with the tribes and the City regarding this project site have been ongoing since 2008, beginning with a request for a Sacred Lands File Search, and continued by providing copies of reports and other documents to interested tribes. Most recently, the City met with the Pechanga Tribe's Cultural Resources Analyst on October 9, 2012 to further discuss the SB 18 consultation process.

Response to Comment 1. The comment is introductory and states that the NAHC is the State "trustee agency" pursuant to Public Resources Code Section 21070 for the protection and preservation of the State's Native American resources. The comment also states that the letter contains state and federal statutes relating to Native American historic properties of religious and cultural significance. The second paragraph is also introductory in nature and outlines the NAHC's authority and role as a commenting agency. The NAHC's introduction in this comment is noted, and no further response is required.

Response to Comment 2. The comment states that CEQA requires that any project that causes a substantial adverse change in the significance of a historical resource, which includes archaeological resources, is a "significant effect" requiring the preparation of an EIR. A Draft EIR was prepared for the proposed project and circulated for public review on July 18, 2012. Based on the *Phase I Cultural Resources Assessment* prepared for the proposed project (Draft EIR Appendix D), the site contained no cultural or historic resources. Consequently, construction and grading of the proposed project site will not affect significant cultural or paleontological resources, resulting in less than significant impacts.

In the second part of the paragraph, the commenter recommends the NAHC Sacred Lands File (SLF) be searched, and such a search was conducted during the Cultural Resource Assessment and found that no Native American cultural resources were identified within the project area. Similarly, the Draft EIR determined that there were no cultural resources (historic or prehistoric) identified on the project site as a result of records searches or during on site reconnaissance. The comment does not contain any substantive statements or questions about the Draft EIR or the analysis therein. Therefore, no further response is necessary.

Response to Comment 3. The comment states that NAHC Sacred Sites are confidential and exempt from the Public Records Act pursuant to California Government Code Section 6254. The City acknowledges the sensitivity and confidentiality of the information contained in the cultural resources report. No records maps have been made public nor will they be made public in association with the City's consideration of the proposed project.

In the second paragraph, the comment states that pursuant to California Public Resources Code Section 5097.95, the NAHC requests that pertinent project information be provided to Native American consulting parties, and that Native American consultation is a matter of environmental justice. The comment letter states that early consultation with Native American Tribes in the area of the project site is the best way to avoid unanticipated discoveries once a project is underway. The letter includes a list of Native American contacts and recommends obtaining their recommendations concerning the proposed project.

Appendix D of the Draft EIR contains the *Phase I Cultural Resource Assessment* prepared for the proposed project in which Native American consultation was conducted. The NAHC was contacted to

determine whether any sacred sites were listed on the Sacred Lands Files for this area of Moreno Valley containing the project site. In response to the Sacred Land Record Search request, the NAHC identified fourteen Native American contacts that may have knowledge of cultural resources in the project area.

Letters were sent to all the Native American contacts provided by the NAHC in 2008. The letters notified the parties of the proposed project and requested that the tribes respond with information concerning cultural resources that might be affected.

Response to Comment 4. The comment states that consultation with Tribes and interested Native American consulting parties on the NAHC list should be conducted in compliance with the requirements of federal National Environmental Policy Act (NEPA), Sections 106 and 4(f) of the National Historic Preservation Act, and the Native American Grave Protection and Repatriation Act (NAGPRA), as appropriate.

Although the project is not a federal undertaking as defined under Section 106 of the National Historic Preservation Act (NHPA) or 36 Code of Federal Regulations (CFR) Part 800 regulations implementing Section 106, and does not use federal funds, it will require a federal Clean Water Act Section 404 permit. Therefore, the project falls under the regulatory oversight of Section 106. As described in Response to Comment A-3, No. 3 above, the City conducted consultation with thirteen local tribes and interested Native American individuals for the project. Consultation included providing those parties with pertinent project and location information.

The project is not a federal transportation project, so it also does not fall under the jurisdiction of Section 4(f) of the Department of Transportation Act of 1966. There is also no federal involvement in the project that would trigger the requirements of NAGPRA.

Response to Comment 5. The comment states that historic properties of religious and cultural significance are confidential and protected by California Government Code Section 6254. The comment further states that the confidentiality of such resources may also be protected by section 304 of the NHPA. The City acknowledges the sensitivity and confidentiality of any identified resources. The SLF and any associated records maps are not for public distribution. In addition, because the project is not a federal undertaking, it is not regulated under Section 304 of the NHPA.

Response to Comment 6. The comment identifies State laws regarding the accidental discovery of human remains. In compliance with these laws, in the unlikely event human remains are encountered during project grading, the County Coroner and the City Planning Division would be notified immediately, and no further disturbance would occur until the County Coroner makes a determination of origin and disposition. If the remains are determined to be Native American, the County Coroner would notify the NAHC, which will determine and notify the most likely descendant (MLD). Implementation of state law reduces potential impacts related to the discovery of human remains on the proposed project site to a less than significant level, and no additional mitigation is required.

Response to Comment 7. The comment states that effective consultation, in the opinion of the NAHC, is the result of an ongoing relationship between Native American tribes and lead agencies, project proponents and their contractors. The City agrees that effective consultation is desired. The City has reached out to Native American tribes through the consultation process (as detailed in the Draft EIR in Appendix D). The comment does not contain any substantive statements or questions about the Draft EIR or the analysis therein. Therefore, no further response is necessary.

Response to Comment 8. The comment states that the NAHC recommends avoidance when a project would damage or destroy Native American cultural resources. The comment further states that documentation and data recovery of such resources is required pursuant to the CEQA Guidelines. Based on the *Phase I Cultural Resources Assessment* (Draft EIR Appendix D) prepared for the proposed project, the site has a low potential for containing archeological resources due to the lack of such resources previously discovered in the surrounding area and the disturbed nature of the project site. Consequently, construction and grading of the proposed project site will have a low probability of damaging archeological resources. Impacts to archeological resources are considered to be less than significant.

Re: Pechanga Tribe Comments on the Draft EIR for the Prologis Park Moreno Valley Eucalyptus Project

Dear Mr. Bradshaw:

This comment letter is written on behalf of the Pechanga Band of Luiseño Indians (hereinafter, "the Tribe"), a federally recognized Indian tribe and sovereign government. The Tribe formally requests, pursuant to Public Resources Code §21092.2, to be notified and involved in the entire CEQA environmental review process for the duration of the above referenced project (the "Project"). The Tribe requests to be directly notified of all public hearings and scheduled approvals concerning this Project. Please also incorporate these comments into the record of approval for this Project.

1

The Tribe submits these comments concerning the Project's potential impacts to cultural resources in conjunction with the environmental review of the Project. The Tribe has reviewed the Cultural Resources Section of the Draft Environmental Impact Report and is very concerned that the City did not address any of the Tribes comments and seems to have ignored the other comments provided by Native American tribes. Both Pechanga and Soboba requested monitoring during grading activities as the City itself in the Initial Study indicated that the possibility of uncovering cultural resources during earthmoving activities was high. Further, the Tribe was not afforded the opportunity to consult with the City per SB18 requirements and as we had requested in our March 4, 2008 comment letter. This violates state law. Additionally, as written, the proposed mitigation measures are inadequate and insufficient to mitigate for unanticipated discoveries of cultural resources. Additional information is provided in our comments below.

2

Pechanga Comment Letter to the City of Moreno Valley
Re: Pechanga Tribe Comments on the Prologis Park Project
September 4, 2012
Page 2

THE CITY OF MORENO VALLEY MUST INCLUDE INVOLVEMENT OF AND CONSULTATION WITH THE PECHANGA TRIBE IN ITS ENVIRONMENTAL REVIEW PROCESS

It has been the intent of the Federal Government¹ and the State of California² that Indian tribes be consulted with regard to issues which impact cultural and spiritual resources, as well as other governmental concerns. The responsibility to consult with Indian tribes stems from the unique government-to-government relationship between the United States and Indian tribes. This arises when tribal interests are affected by the actions of governmental agencies and departments. In this case, it is undisputed that the project lies within the Pechanga Tribe's traditional territory. Therefore, in order to comply with CEQA and other applicable Federal and California law, it is imperative that the City of Moreno Valley consult with the Tribe in order to guarantee an adequate knowledge base for an appropriate evaluation of the Project effects, as well as generating adequate mitigation measures.

On this Project, the Tribe was not asked by the City of Moreno Valley for a consultation meeting. Although there was some confusion regarding the original SB18 notification in 2007, an additional SB18 consultation letter was submitted in 2008 and the Tribe responded with a request to consult in our March 4, 2008 letter. Further, LSA Associates sent out an additional consultation letter in 2011 and the Tribe again notified the City that consultation was desired. The Tribe received no further communication from the City until receipt of this DEIR document July 26, 2012. The Tribe believes that would adequate consultation have occurred, the proposed mitigation measures would be adequate and respectful of tribal requests. Further, under SB 18, the City cannot proceed with approving this Project until consultation requests by Tribes have been fulfilled. As such, moving ahead with a Planning Commission hearing at this stage would be in violation of California State law.

PECHANGA CULTURAL AFFILIATION TO PROJECT AREA

The Pechanga Tribe asserts that the Project area is part of Luiseño, and therefore the Tribe's, aboriginal territory as evidenced by the existence of Luiseño place names, *tóota yixélval* (rock art, pictographs, petroglyphs), and an extensive Luiseño artifact record in the vicinity of the Project. This culturally sensitive area is affiliated with the Pechanga Band of Luiseño Indians because of the Tribe's cultural ties to this area as well as extensive history with both this Project and other projects within the area.

The Tribe's knowledge of our ancestral boundaries is based on reliable information passed down to us from our elders; published academic works in the areas of anthropology,

¹ See e.g., Executive Memorandum of April 29, 1994 on Government-to-Government Relations with Native American Tribal Governments, Executive Order of November 6, 2000 on Consultation and Coordination with Indian Tribal Governments, Executive Memorandum of September 23, 2004 on Government-to-Government Relationships with Tribal Governments, and Executive Memorandum of November 5, 2009 on Tribal Consultation.

Pechanga Comment Letter to the City of Moreno Valley
Re: Pechanga Tribe Comments on the Prologis Park Project
September 4, 2012
Page 3

history and ethno-history; and through recorded ethnographic and linguistic accounts. Many anthropologists and historians who have presented boundaries of the Luiseño traditional territory include this region in their descriptions (Drucker 1937; Heiser and Whipple 1957; Kroeber 1925; Smith and Freers 1994), and such territory descriptions correspond with what was communicated to the Pechanga people by our elders. While historic accounts, anthropological and linguistic theories are important in determining traditional Luiseño territory; the Tribe asserts that the most critical sources of information used to define our traditional territories are our songs, creation accounts and oral traditions.

Luiseño history originates with the creation of all things at *‘éxva Teméeku*, known today as the City of Temecula, and dispersing out to all corners of creation (what is today known as Luiseño territory). It was at Temecula that the Luiseño god *Wuyóol* lived and taught the people, and here that he became sick, finally expiring at Lake Elsinore after visiting many of the hot springs located within Luiseño and Cahuilla territory. From Elsinore, the people spread out, establishing villages and marking their territories. The first people also became the mountains, plants, animals and heavenly bodies.

The Pechanga Tribe has a specific legal and cultural interest in this Project as the Tribe is culturally affiliated with the geographic area, which comprises the Project property. The Tribe has been named the Most Likely Descendent (Cal. Pub. Res. C. §5097.98) on Projects in the nearby vicinity of the proposed Project and has specific knowledge of cultural resources and sacred places near the Project site. The Tribe submitted information regarding cultural affiliation to the City in previous comment letters for this Project. We would also like the City and the DEIR consultant to know that the Project is not located within Cahuilla territory. The Tribe has previously submitted archaeological, ethnographic, ethnohistoric, oral traditions and song and linguistic information showing that Moreno Valley was indeed Luiseño territory. We would be happy to provide this information again to the City and DEIR preparers so that the cultural affiliation portions of the Cultural section of the DEIR can be updated.

The Tribe welcomes the opportunity to meet with the City of Moreno Valley to further explain and provide documentation concerning our specific cultural affiliation to lands within your jurisdiction, if so desired. In addition, the Tribe is once again requesting face-to-face, government-government consultation under SB 18, as is our legally protected right.

PROJECT IMPACTS TO CULTURAL RESOURCES

The Project is located in a highly sensitive region of Luiseño territory and the Tribe believes that the possibility for recovering subsurface resources during ground-disturbing activities is high. The Tribe has over thirty-five (35) years of experience in working with various types of construction projects throughout its territory. The combination of this knowledge and experience, along with the knowledge of the culturally-sensitive areas and oral tradition, is what

Pechanga Comment Letter to the City of Moreno Valley
Re: Pechanga Tribe Comments on the Prologis Park Project
September 4, 2012
Page 4

the Tribe relies on to make fairly accurate predictions regarding the likelihood of subsurface resources in a particular location.

5

The Tribe has reviewed the 2012 Draft Environmental Impact Report for the Prologis Industrial Park Project. In addition to not consulting with the Tribe as required by law, the City has failed to adopt appropriate and protective mitigation measures for any unknown cultural resources, under both the letter and the spirit of CEQA. Based upon the Archaeological Study, there are over 65 cultural sites within a one-mile radius and the Project is located within the Moreno Hills Complex, a well documented habitation site. Habitation sites are of the utmost importance to the Tribe because they are the last physical remains of where the ancestors lived. They contain information and data that are reflective of every aspect of tribal culture. It is well known that native village and habitation complexes enveloped large areas of land, sometimes several square miles. The Tribe agrees that the high number of recorded sites indicates a high prehistoric use area as well as the potential for identification of subsurface cultural resources on this Project. By not providing for archaeological and tribal monitoring during earthmoving, the City is a willing participant in the destruction of irreplaceable cultural sites. The Tribe has continually argued that it is vital to require an archaeological and tribal monitor at the onset of grading and for other activities such as trenching and off-site development because relying on untrained construction crews to identify cultural resources is not only inappropriate, but also untenable since they are not professional cultural resource personnel. Construction crews would not be able to identify cremations, for example or be able to distinguish human from animal bone, or how to identify what is an artifact (manipulated by human hands) or an ecofact (a product of nature).

6

Additionally, while the Tribe understands that the Project has been under citrus groves and agriculture for many years, this does not negate the possibility for cultural resources to be identified below the plow zone, approximately 16 to 24 inches. Both the Soboba and Pechanga tribes have informed the City that the possibility for cultural resources to be identified during earthmoving activities is high and yet the City and DEIR Consultant ignored our comments. The City is well aware of the Highland Fairview project, upon which cultural resources were discovered, despite the use of the land for agricultural purposes and despite the project archaeologist assuring that no resources were on the property. Further, we know of a situation in San Diego County where as many as 14 individual burials were located in what had been a long-time orange tree grove – in fact, one of the burials, a cremation, was discovered entangled with the roots of an orange tree. Thus, agricultural activities rarely touch deeply buried cultural deposits – they typically only affect those artifacts or features that lay within the plow zone. As such, the potential for subsurface resources remains a very real concern for Pechanga.

7

As the City knows from our long history together, the Pechanga Tribe involves itself in these matters because its contributions and knowledge of the natural/cultural resources is not focused on the archaeological or scientific importance of the resources, but rather in the cultural and sociological significance of the sites and places to our People. The Pechanga Tribe contends that despite the lack of identification of surface artifacts during the survey, subsurface sites and

8

Pechanga Comment Letter to the City of Moreno Valley
Re: Pechanga Tribe Comments on the Prologis Park Project
September 4, 2012
Page 5

resources, i.e. inadvertent finds, may be found throughout the development of this entire Project. As such, we request that the City take into account the Pechanga Tribe's cultural view of any such resources.

8

Since the DEIR has now been completed and distributed for public review without tribal consultation - in contravention to SB 18 - it is the Pechanga Tribe's position that this DEIR does not meet standard requirements for cultural resources impact analysis and may not meet state legal requirements for environmental review. Without consultation prior to finalization of the mitigation measures, the City is in danger of putting itself in a position of adopting deferred and arguably inadequate mitigation, which may not be permissible pursuant to CEQA. Furthermore, without consultation prior to finalization of the mitigation measures, Pechanga is unable to meaningfully participate in the CEQA process and we are being denied the rights guaranteed to Tribes by SB 18 - mainly, early and meaningful consultation to address concerns regarding impacts, both direct and indirect, to tangible and intangible cultural resources.

9

The Pechanga Tribe is not opposed to this Project; however, we are opposed to any direct, indirect and cumulative impacts this Project may have to tribal cultural resources. The Tribe's primary concerns stem from the Project's proposed impacts on Native American cultural resources. The Tribe is concerned about both the protection of unique and irreplaceable cultural resources, such as Luiseño village sites, sacred sites and archaeological items which would be displaced by ground disturbing work on the Project, and on the proper and lawful treatment of cultural items, Native American human remains and sacred items likely to be discovered in the course of the work.

10

The Tribe believes that the proposed mitigation measures as written are not sufficient, given the sensitivity of the area which was acknowledged in the archaeological study and the Initial Study, but which was inadequately addressed in the DEIR. Although the DEIR addresses procedures for inadvertent finds, the Tribe is concerned with the lack of specificity of the mitigation measures and the lack of a requirement for both archaeological and tribal monitors for the duration of the Project. While the Tribe understands that the Property has been subjected to previous disturbances, as the Project site lies within such a culturally-sensitive area, the Tribe believes that the possibility exists for the recovery of subsurface resources during earthmoving activities.

11

The Tribe has multiple concerns with the mitigation measures as they are drafted. We believe that it is premature and potentially negatively impacts the Tribe's rights under both SB 18 and the CEQA process to comment on specific mitigation measures until we are able to have our legally protected SB 18 consultation with the City. Had this occurred before the DEIR was released for review, we are certain that more protective measures would have been included that would satisfy both the Tribe and the City's concerns. That has not happened and as such, we are expressly reserving our right to provide comments on the proposed mitigation measures until after the City completes its legally mandated SB 18 consultation with Pechanga.

12

Pechanga Comment Letter to the City of Moreno Valley
Re: Pechanga Tribe Comments on the Prologis Park Project
September 4, 2012
Page 6

The Tribe reserves the right to fully participate in the environmental review process, as well as to provide further comment on the Project's impacts to cultural resources and potential mitigation for such impacts.

13

The Pechanga Tribe looks forward to working together with the City of Moreno Valley in protecting the invaluable Pechanga cultural resources found in the Project area. Please contact me at 951-770-8104 or at ahoover@pechanga-nsn.gov within the next two weeks so we can schedule our legally required SB 18 consultation to discuss the issues at hand. Thank you.

14

Sincerely,

Anna Hoover
Cultural Analyst

Cc Pechanga Office of the General Counsel
John Terrell, Planning Official

RESPONSE TO LETTER A-4

PECHANGA BAND OF LUISEÑO INDIANS

Response to Comment 1. The City acknowledges the Pechanga Band (“Tribe”) is a federally recognized Indian Tribe. The City will continue to notify the Tribe regarding the CEQA process for this project, and the Tribe will be notified of any hearings regarding this project. As requested, the Tribe’s comments and the City’s responses are incorporated into this Final EIR document and administrative record.

Response to Comment 2. According to its records, the City did contact the Tribe for consultation under SB 18 when the applicant first started processing the project in 2007-08, and the City sent a copy of the project cultural resources report at that time. The City received no further correspondence or emails regarding the project, so it believed the SB 18 consultation process for the ProLogis project was completed at that time. On July 25, 2011 a letter inquiring about additional consultation was sent to Mark Macarro and the commenter with Pechanga and no response was received (Paul Macarro is the Director of Cultural Resources). A second letter was sent on August 9, 2011 to which the commenter responded that she would work directly with the City regarding further consultation. Jeff Bradshaw with the City contacted Ms. Hoover (“commenter”) but received no follow-up from the Tribe for additional input or consultation. The revised cultural resources study was mainly an update of the original study to “bring it current” and contained no new additional information. At that time, Mr. Bradshaw considered this second round of SB 18 communication with the tribe completed as well. Separate from the SB 18 process, the Tribe has provided comments to the City during the Notice of Preparation (NOP) period and the Notice of Completion (NOC) sent out for the project under CEQA. The commenter is incorrect that the City has not incorporated concerns and comments from the Tribe into the CEQA document, or has somehow neglected the SB 18 consultation process. The City met with the Anna Hoover, Cultural Analyst for the Tribe regarding SB 18 on October 9, 2012 to address any pending questions regarding the City’s participation in the SB 18 consultation process on this project (see Appendix B in this document).

Response to Comment 3. Although there appears to be some confusion regarding the actual completion of the SB 18 consultation process, the City and the Tribe can still continue to consult effectively on the proposed project, following the guidance from the NAHC which states that “To be effective, consultation on specific projects must be the result of an ongoing relationships between the Native American tribes and lead agencies, project proponents, and their contractors.” The City believes the EIR reflects the intent and desire of the Tribe regarding monitoring of grading activities on the project site, as outlined in the tribe’s comment letter received during the Notice of Preparation (NOP) period and included in Appendix A of the Draft EIR. Mitigation Measures 4.5.6.1A through 4.5.6.1E in the Draft EIR state the following:

- 4.5.6.1A** *If cultural resources are found during grading, the applicant shall immediately retain a qualified archaeological monitor to oversee subsequent ground-altering activities (e.g., removal of debris, de-vegetation, and grading). This monitor shall ensure that any buried or previously unidentified resources are adequately identified, recorded, and evaluated in accordance with applicable standards. The archaeological monitor shall be trained in both prehistoric and historic archaeology and have the authority to temporarily redirect any ground disturbing activities affecting potentially significant cultural resources.*
- 4.5.6.1B** *Prior to the issuance of a grading permit, the local Native American representatives (Soboba, Morongo, and Pechanga) shall be notified in writing of the pending activities. If any evidence of Native American resources is discovered during grading, the archaeological monitor identified in **Mitigation Measure 4.5.6.1A** shall invite one or more Native American monitors to participate in the monitoring program. The Native American*

monitor shall work with the archaeological monitor to aid in the identification of resources and assist in the preliminary evaluation of any Native American resources.

- 4.5.6.1C** *If cultural artifacts and resources are discovered during ground disturbance activities and are historic in nature (not Native American in origin), the archaeological monitor shall make recommendations for the appropriate handling and evaluation of the resources. If cultural artifacts and resources are discovered during ground disturbance activities are determined to be of Native American origin (but not involving burials or grave goods), the archaeological monitor/consultant shall notify the applicant, City, and local Native American representatives and complete consultation for the handling of the resources. All archaeological decisions shall be at the discretion of the professional archaeologist, taking the Native American concerns into account. Work may continue on other parts of the project site while historic or unique archaeological mitigation takes place (14 Cal. Code Regs. 15065.5(f)).*
- 4.5.6.1D** *As a condition of approval, the property owner shall make all cultural resources (e.g., artifacts) discovered on site available for curation at a facility identified by the City (e.g., the UCR Archaeological Research Unit, the Western Center for Archaeology and Paleontology, or the Ya'i Heki' Regional Indian Museum). All artifacts shall be inventoried and prepared for curation per standard professional requirements. If neither repository is available to accept the collections, the cultural resources shall be temporarily curated at a facility identified through consultation with all stakeholders.*
- 4.5.6.1E** *Should resources determined to be of sacred or religious significance to Native Americans be identified within the project area, the resources shall be protected from adverse impacts until consultation between the applicant, City, the Most Likely Descendant (MLD) as determined by the Native American Heritage Commission, and the archaeological consultant, occurs. At that time, the responsibility for the care and disposition of the cultural resources shall be determined and recorded to the satisfaction of all parties involved.*

These measures are consistent with the information provided in the Pechanga NOP comment letter. However, the City desires to work cooperatively with the tribe to the greatest extent possible. Therefore, the wording of all these mitigation measures will be modified as shown below:

- 4.5.6.1A** *Prior to the issuance of a grading permit, the Project Applicant shall provide evidence to the City of Moreno Valley that a Cultural Resources Monitoring Agreement has been secured for qualified Tribal representatives, and that a professional archaeological monitor meeting Secretary of Interior standards has been retained by the Applicant to conduct monitoring of all mass grading and trenching activities and has the authority to temporarily halt and redirect earthmoving activities in the event that suspected archaeological resources are unearthed during Project construction. The Project Archaeologist and Tribal representatives shall attend the pre-grading meeting with the City and contractors to explain and coordinate the requirements of the monitoring program.*
- 4.5.6.1B** *Prior to the issuance of a grading permit, the Applicant shall provide evidence to the City of Moreno Valley that appropriate Native American representative(s), Project Archaeologist, and the Tribal representative(s) shall be allowed to monitor and have received a minimum of 30 days advance notice of all mass grading and trenching activities. During grading and trenching operations, the Tribal representatives and the project archaeological monitor shall observe all mass grading and trenching activities per the Cultural Resources Monitoring Agreement. If the Tribal representatives suspect that an archaeological resource may have been unearthed, the archaeologist, in consultation with the tribal representative, shall immediately halt and redirect grading operations in a*

100-foot radius around the find to allow identification and evaluation of the suspected resource. In consultation with the appropriate Native American Tribe(s), the archaeological monitor shall evaluate the suspected resource and make a determination of significance pursuant to California Public Resources Code Section 21083.2.

4.5.6.1C If a significant archaeological resource(s) is discovered on the property, ground disturbing activities shall be suspended 100 feet around the resource(s). The archaeological monitor and representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division shall confer regarding mitigation of the discovered resource(s). A treatment plan and/or preservation plan shall be prepared and by the archaeological monitor and reviewed by representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division and implemented by the archaeologist to protect the identified archaeological resource(s) from damage and destruction. The landowner shall relinquish ownership of all archaeological artifacts that are of Native American origin found on the Project site to the culturally affiliated Native American tribe(s) for proper treatment and disposition. A final report containing the significance and treatment findings shall be prepared by the archaeologist and submitted to the City Planning Division, the appropriate Native American tribe(s), and the Eastern Information Center at the University of California, Riverside. All cultural material, excluding sacred, ceremonial, grave goods and human remains, collected during the grading monitoring program and from any previous archaeological studies or excavations on the project site shall be curated, as determined by the treatment plan, according to the current professional repository standards and may include the Pechanga Bands curatorial facility.

4.5.6.1D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:

"If any suspected archaeological resources are discovered during ground-disturbing activities and the archaeological monitor or Tribal representatives are not present, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call the project archaeologist and the Tribal representatives to the site to assess the significance of the find."

Based on input from the tribe, the City believes these modifications will better protect any potential undiscovered cultural resources if they are present on the site. In addition, Measure 4.5.6.1B clearly allows tribal monitors to be present onsite during grading if they so desire, consistent with the City's current practices for allowing such monitoring.

In addition, although DEIR Section 4.5.5.2, *Human Remains*, concludes potential impacts of the project will be less than significant with compliance with state law, Mitigation Measure 4.5.6.1E has been added at the request of the tribe to help assure there will be no significant impacts related to the potential discovery of human remains during grading:

4.5.6.1E If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made by the Coroner. If the Riverside County Coroner determines the remains to be Native American, the California Native American Heritage Commission must be contacted within 24 hours. The Native American Heritage Commission must then immediately notify the "most likely descendant(s)" of receiving notification of the discovery. The most likely descendant(s) shall then make recommendations within 48

hours, and engage in consultations concerning the treatment of the remains as provided in Public Resources Code §5097.98.

Finally, the commenter is correct that the CEQA process cannot be completed before the SB 18 process is completed. However, the City believes the SB 18 consultation process can still be completed prior to final action on the project as specified by state law.

It should also be noted the tribe requested the following language be added to the mitigation for potential impacts to paleontological resources, so the City has agreed to add the following as Mitigation Measure 4.5.6.2D:

4.5.6.2D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:

"If any suspected paleontological resources are discovered during ground-disturbing activities, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call a qualified paleontologist to the site to assess the significance of the find. A qualified paleontologist shall evaluate the suspected resource. If the paleontologist determines that the find is not unique, construction shall be permitted to proceed. However, if the paleontologist determines that further information is needed to evaluate significance, the City of Moreno Valley shall be notified and a treatment plan shall be prepared and implemented in consultation with the City to protect the identified paleontological resource(s) from damage and destruction."

Response to Comment 4. The City acknowledges that the tribe has legitimate legal and cultural interests in the project site and surrounding areas, and appreciates the tribal history upon which these interests are based. The City believes it did participate in the SB 18 consultation process in good faith on this project twice, but the City is willing to consider additional input from the tribe regarding this property integral to the CEQA process at this point in time. On October 9 2012, Jeff Bradshaw met with Anna Hoover, Cultural Analyst with the tribe, to receive additional input from the tribe relative to this project. In any case, all of this information will be presented to the City Council for their review prior to any final action on the project, consistent with the requirements of SB 18 and CEQA.

Response to Comment 5. The project cultural resource assessment, and Section 4.5 of the Draft EIR, both acknowledge the existence of Native American resources and sites in the surrounding area. However, the study did not identify any resources actually on the project site, and the site has been previously and regularly disturbed by agricultural and weed abatement activities. In an effort to respond to remaining concerns expressed by the tribe, and based on evidence from mitigation at site on other projects in the region, the City has modified the text of Mitigation Measures 4.5.6.1A through 4.5.6.1E as shown in Response 3 above. The City understands the Tribe's ongoing and currently stated desire to have private development fund Native American monitoring on construction sites. However, the City's repeated position on this issue is not to require private funding of such monitoring, but rather to encourage private landowners to collaborate with Native American tribes regarding monitoring (i.e., private funding is not required but optional). In addition, the revised mitigation measures cited above do require ongoing coordination with the local tribes, including Pechanga.

Response to Comment 6. As outlined in the previous Response to Comment A-4, No.3, the City believes the mitigation measures included in the Draft EIR do reflect the concerns raised by the tribe during the SB 18 and EIR Notice of Preparation processes. In addition, the City believes it has participated in the SB 18 process to an appropriate degree, as described in the previous Responses to Comments A-4, No. 2 and 4 above. Appendix B of this Final EIR includes additional

correspondence and documentation from the City regarding the SB 18 process with the Pechanga tribe on this project.

Response to Comment 7. In response to the tribe's concerns about excavation of the project site, the City has modified the wording of Mitigation Measures 4.5.6.1A through 4.5.6.1E to provide for monitoring of all grading activities. In addition, the modified measures provide a way for local tribes to participate in the monitoring process.

Response to Comment 8. In response to the tribe's concerns, the City has modified the wording of Mitigation Measure 4.5.6.1A to provide for monitoring of all grading activities, and Mitigation Measure 4.5.6.1B provides a way for local tribes like Pechanga to participate in the monitoring process.

Response to Comment 9. As previously explained in Responses 2 and 4 above, the City has participated twice in the SB 18 process on this project, but is certainly willing to accept additional input from the tribe regarding potential impacts and mitigation language within the context of the CEQA process. The mitigation in the EIR, including the text changes to Measures 4.5.6.1A through 4.5.6.1E, do not defer mitigation and are clear as to what will be done and when during the development process if the project is approved. The City believes the tribes have provided input on this project under both SB 18 and CEQA, and the City will strive to implement the project mitigation as outlined.

Response to Comment 10. Section 4.5 of the EIR does evaluate the direct, indirect, and cumulative impacts of the project on cultural resources, and did incorporate information from the City's SB 18 consultation process and the letter from the Pechanga tribe received during the EIR's Notice of Preparation period (see Draft EIR Appendix A). In addition, Appendix B of this Final EIR includes additional correspondence and documentation from the City regarding the SB 18 process with the Pechanga tribe on this project.

Response to Comment 11. The City believes Section 4.5 of the EIR adequately addresses potential impacts of the project on cultural resources, and recommends mitigation measures commensurate with the level of impact expected. In addition, Mitigation Measures 4.5.6.1A through 4.5.6.1E provide additional protection for any undiscovered cultural resources that may exist on the site. The City believes the revised measures are specific, implementable, and do not defer mitigation. It is the City's long-standing policy to encourage but not require private developers to allow and/or fund monitoring of grading by Native American tribal representatives. That continues to be the City's policy on this project as well.

Response to Comment 12. As outlined in the previous responses above, the City believes it has and is participating in the SB 18 and CEQA processes as required by state law, and in a reasonable and fair manner with the Tribe. Please see Response to Comment A-4, No. 11 for additional information in this regard. However, it would not be in the interest of the Tribe to withhold additional comment on the EIR, expecting the City to delay action on the proposed project, based solely on its contention that the City had somehow failed to complete the SB 18 process – the City disagrees with that conclusion. The City encourages the Tribe to provide additional comments if necessary on the EIR and mitigation measures, noting that Measures 4.5.6.1A through 4.5.6.1E have been modified in response to concerns expressed by the Tribe.

Response to Comment 13. The City encourages the Tribe to participate fully in the CEQA process, and see Responses to Comments A-4, Nos. 11 and 12 regarding the related SB 18 process.

Response to Comment 14. The City also looks forward to continuing discussion with the tribe on this project. It should be noted that the City met with the Anna Hoover, Cultural Analyst with the tribe, on October 9 2012 regarding SB 18 which should address any lingering questions about the City's participation in the SB 18 consultation process on this project.

MORONGO
BAND OF
MISSION
INDIANS

A SOVEREIGN NATION

RECEIVED
SEP 12 2012
CITY OF MORENO VALLEY
Planning Division

September 10, 2012

Jeff Bradshaw, Associate Planner
City of Moreno Valley
Community & Economic Development Department
14177 Frederick Street
Moreno Valley, CA 92553

**SUBJECT: Notice of Availability
Prologis Eucalyptus Industrial Park Project)
Draft Environmental Impact Report**

Dear Mr. Bradshaw:

Thank you for contacting the Morongo Band of Mission Indians regarding the above referenced project. The Tribe greatly appreciates the opportunity to review the project and, respectfully, offer the following comments.

The project is outside of the Tribe's current reservation boundaries but within an area that may be considered a traditional use area or one in which the Tribe has cultural ties (e.g. Cahuilla/Serrano territory). Because the project involves a Zone Change, General Plan Amendment, master Plot Plan, Tentative Parcel Map, Plot Plans, and Environmental Impact Report for the Prologis Eucalyptus industrial Park Project the Morongo Band of Mission Indians asks that you impose specific conditions regarding cultural and/or archaeological resources and buried cultural materials on any development plans or entitlement applications as follows:

1

- o If human remains are encountered during grading and other construction excavation, work in the immediate vicinity shall cease and the County Coroner shall be contacted pursuant to State Health and Safety Code §7050.5.

2

- o In the event that Native American cultural resources are discovered during project development/construction, all work in the immediate vicinity of the find shall cease and a qualified archaeologist meeting Secretary of Interior standards shall be hired to assess the find. Work on the overall project may continue during this assessment period.

3

If significant Native American cultural resources are discovered, for which a Treatment Plan must be prepared, the developer or his archaeologist shall contact the Morongo Band of Mission Indians

4

("Tribe")¹. If requested by the Tribe, the developer or the project archaeologist shall, in good faith, consult on the discovery and its disposition (e.g. avoidance, preservation, return of artifacts to tribe, etc.).

↑
-4

If I may be of further assistance with regard to this matter, please do not hesitate to contact me at your convenience.

Very truly yours,

MORONGO BAND OF MISSION INDIANS

Franklin A. Dancy,
Director of Planning

¹ The Morongo Band of Mission Indians realizes that there may be additional tribes claiming cultural affiliation to the area; however, Morongo can only speak for itself. The Tribe has no objection if the archaeologist wishes to consult with other tribes and if the city wishes to revise the condition to recognize other tribes.

RESPONSE TO LETTER A-5

MORONGO BAND OF MISSION INDIANS

Response to Comment 1. The Draft EIR contained measures the City believes are sufficient to protect undiscovered cultural resources, including Native American artifacts. However, the City wishes to cooperate with the tribe to the extent practical, so the language of the mitigation measures related to archaeological and paleontological resources, have been modified to better address the tribe's concerns as outlined in Response to Comment A-4-3 in the previous letter from the Pechanga Tribe.

Response to Comment 2. This action is required under State law, but the City understands the tribe's desire to have the requirement reiterated in the mitigation measure. Therefore, Mitigation Measure 4.5.6.1E has been modified to address this concern as outlined in Response to Comment 3 in Letter A-4 from the Pechanga Band.

Response to Comment 3. All of the cultural mitigation measures were modified as shown to respond to this and similar comments by the Pechanga Band (see Response to Comment 3 in Letter A-4).

Response to Comment 4. The text of Mitigation Measure 4.5.6.1C was changed as shown in Response to Comment 3 in Letter A-4 from the Pechanga Band to better address the tribe's concerns.

Re. **NOA of DEIR, Prologis Eucalyptus Industrial Park
PA07-0081,82,83,84,142,158,159,160,161,162,&186**

Attn: Jeff Bradshaw, Associate Planner, City Of Moreno Valley

Dear Mr. Bradshaw:

Thank you for the opportunity to review the Notice of Availability (NOA) for the above referenced project. The project is generally described as General Plan Amendment and Zone Change from existing Business Park, to Business Park Mixed-Use, R15, R5, and RA-2 land use designations to Light Industrial for 116.99-net acres. The land use changes are required for development of six distribution warehouse facilities totaling 2,244,419 square feet with building sizes that range from 160,106 square feet to 862,035 square feet. The applicant also proposes Tentative Parcel Map No. 35679 to subdivide the project into six parcels corresponding to the six warehouse facilities. Eastern Municipal Water District (EMWD) offers the following comments:

The subject project requires water, sewer and recycled water services from EMWD. The details of said service connection points will be further detailed in a separate document, known as EMWD's Plan of Service, which is still not yet developed by the project proponent. To that end, EMWD requires dialog with the project proponent, to develop the EMWD Plan of Service, as clarified in the attached letter.

1

Again, EMWD appreciates the opportunity to comment on this project. Please forward the Final Environmental Impact Report to the attention of Helen Stratton at the mailing address shown on page one. If you have questions concerning these comments, please feel free to contact Helen Stratton at 951 928-3777, Ext. 4545, or Maroun El-Hage Ext. 4468.

2

Sincerely,

Jayne Joy
Director of Environmental and Regulatory Compliance

RESPONSE TO LETTER B-1

EASTERN MUNICIPAL WATER DISTRICT #1

Response to Comment 1. The EIR acknowledges that the project requires water, sewer, and recycled water service from EMWD. The City and the developer are aware that a Plan of Service will be needed if the project receives entitlement approval from the City.

Response to Comment 2. The Final EIR document, including the Response to Comments, will be sent to the EMWD since they commented on the Draft EIR, in accordance with CEQA Guidelines Section 15088(b).

Attn. Jeff Bradshaw, Associate Planner, City Of Moreno Valley

In order to receive water, sewer or recycled water service(s) from Eastern Municipal Water District (EMWD), the following information will be helpful to the project proponent:

EMWD requires beginning dialogue with the project proponent at an early stage in site design and development, via a one-hour complimentary Due Diligence meeting. To set up this meeting, the project proponent should complete a Project Questionnaire (form NBD-058) and submit to EMWD. To download this form or for additional information, please visit our "New Development Process" web page, under the "Businesses" tab, at www.emwd.org. This meeting will offer the following benefits:

1. Describe EMWD's development work-flow process
2. Identify project scope and parameters
3. Preliminary, high level review of the project within the context of existing infrastructure
4. Discuss potential candidacy for recycled water service

1

Following the Due Diligence meeting, to proceed with this project, a Plan Of Service (POS) will need to be developed by the developer's engineer, and reviewed/approved by EMWD prior to submitting improvement plans for Plan Check. The POS process will provide the following:

- 1- Technical evaluation of the project's preliminary design
- 2- Defined facility requirements, i.e. approved POS
- 3- Exception: for feasibility evaluation of a purchase acquisition, only a conceptual facilities assessment may be developed.

2

If you have questions or concerns, please do not hesitate to contact me.

Sincerely,

Maroun El-Hage, M/S., P.E.

RESPONSE TO LETTER B-2

EASTERN MUNICIPAL WATER DISTRICT

Response to Comment 1. The developer will prepare a Project Questionnaire (NDB-058) and contact the District to schedule a “due diligence” meeting.

Response to Comment 2. As indicated in the responses to the District’s first letter (B-1), the City and the developer are aware that a Plan of Service will be needed if the project receives entitlement approval from the City.

Draft Environmental Impact Report (Draft EIR) for the Proposed ProLogis Eucalyptus Industrial Park Project (SCH. NO. 2008021002)

The South Coast Air Quality Management District (AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final EIR.

In the project description, the lead agency proposes construction of six warehouse distribution facility buildings totaling 2,244,419 square feet with 326 total loading docks. Building sizes will range from 160,106 to 862,035 square feet on a total 122.8 acre site. Operations at the proposed industrial park will include approximately 1,989 trucks operating 24 hours per day and 7-days per week. Construction is planned to begin in the fall of 2012 and be completed as early as the last quarter of 2013, with a possible opening year by 2016.

In the Air Quality Section, the Draft EIR quantified the project’s construction and operation air quality impacts and found that those impacts exceeded the AQMD’s recommended significance thresholds. As stated in the Draft EIR, air quality in our basin exceeds federal and state standards and presents numerous health risks to those living and working here. The AQMD staff appreciates that the project therefore includes mitigation measures that have the potential to reduce emissions including building energy efficiency measures, carpooling programs, and encouragement of alternative fueled vehicles. However, the project’s air quality impacts remain substantially above AQMD thresholds after mitigation. This is due, in part, to the lack of enforceability of some mitigation measures. The AQMD staff recommends that the lead agency strengthen the project’s mitigation measures and additionally provide further clarity to portions of the air quality analysis. Details are provided in the attached comments.

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the adoption of the Final Environmental Impact Report. The AQMD staff is available to work with the Lead

Mr. Jeff Bradshaw,
Associate Planner

Operational Mitigation Measures

1. AQMD staff commends the lead agency for encouraging the use of alternatively fueled technologies to reduce the significance CO, VOC, NO_x, PM₁₀, and PM_{2.5} impacts. However, these measures are not enforceable and thus it is unclear how likely they will be implemented because tenants are only “encouraged to promote” them. AQMD staff recognizes that requiring warehouse tenants to place engine technology restrictions on their vendors presents unique challenges. Further, requiring standards for one development and not another can yield competitive inequalities. The AQMD staff therefore encourages the lead agency to work with our agency to develop a common set of measures that are enforceable and that reduce emissions to the maximum extent feasible for the many warehouse projects under consideration in the city.

Some of these measures could include:

- Requiring all on-site vehicles (hostlers, forklifts, etc.) to utilize zero or near-zero emission technology
- Requiring the installation of sufficient alternative fueling infrastructure (e.g., electric charging, CNG/LNG, hydrogen, etc.) for trucks on-site or within close proximity to the site to facilitate the use of these technologies
- Providing a phase-in schedule and goals for the introduction of zero or near-zero technology trucks (e.g., 10% by 2020, 20% by 2025, etc.) that visit warehouses
- Prohibiting the placement of loading docks or major truck routes within 500 feet of sensitive receptors

Should any of these measures be found infeasible, other measures should be considered that will reduce air quality impacts. The measures listed below have been used by other lead agencies including the City of Banning¹, Riverside County², City of San Bernardino³, and the San Pedro Bay Ports⁴, among others.

At project start, all heavy duty trucks entering the property must meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Article 4.5, Chapter 1, Section 2025.

- o If the above clean truck requirement is infeasible, a phase-in schedule should be put forth that will feasibly achieve emission reductions as soon as possible, and faster than existing regulations. Should an alternative schedule be found necessary, the AQMD staff should be consulted prior to approving the schedule.

¹ Banning Business Park <http://banning.ca.us/archives/30/July%2013,%202010%20City%20Council%20Agenda.pdf>

² Mira Loma Commerce Center http://www.rctlma.org/online/content/conditions_of_approval.aspx?PERMITNO=pp17788

³ Palm/Industrial Distribution Center <http://www.ci.san-bernardino.ca.us/civica/filebank/blobdload.asp?BlobID=11793>

⁴ Clean Trucks Program <http://www.cleanairactionplan.org/cleantrucks/>

The facility operator will maintain a log of all trucks entering the facility to ensure that on average, the daily truck fleet meets the quantities and emission standards listed in the Draft EIR. This log should be available for inspection by city staff at any time.

3

Prohibit all vehicles from idling in excess of five minutes, both on warehouse property and on streets in the General Plan Amendment area.

4

The facility operator will ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies [for example, by requiring attendance at CARB approved courses (such as the free, one-day Course #512)].

5

Limit the daily number of trucks allowed at each facility to levels analyzed in the Final EIR. If higher daily truck volumes are anticipated to visit the site, the lead agency should commit to re-evaluating the additional impacts through CEQA prior to allowing this higher activity level.

6

Limit project operations to non-refrigerated warehouse types of trucks and appurtenances (e.g., transportation refrigeration units, TRUs) included in the project description and analyzed in the Final EIR. If this equipment and associated higher emissions are anticipated to visit the site, the lead agency should commit to re-evaluating project impacts through CEQA prior to allowing this higher activity level.

7

Require at least a portion of the fleet to utilize alternative fueled technologies.

8

At a minimum, require tenants upon occupancy that do not already operate 2007 and newer trucks to apply in good faith for funding to replace/retrofit their trucks, such as Carl Moyer, VIP, Prop 1B, or other similar funds. Should funds be awarded, the tenant should also be required to accept and use them.

9

Design the warehouse/distribution center such that any check-in point for trucks is well inside the facility property to ensure that there are no trucks queuing outside of the facility.

10

Restrict overnight parking in residential areas. Establish overnight parking within the warehouse/distribution center where trucks can rest overnight.

11

Due to the large roof area associated with this project, consider installing solar roof panels to reduce emissions from fossil fuel based electrical generating technologies providing electrical power to the project site. At a minimum, buildings should be designed to allow the installation of solar panels at a later date.

12

Use street sweepers that comply with SCAQMD Rules 1186 and 1186.1.

13

Trucking Support Services

2. The project is projected to accommodate nearly 2,000 trucks on a daily basis. In addition to the project's 2.24 million square feet of warehousing, there are several other warehouse projects in the area, including a recently proposed 40+ million square foot project. The trucks from all of these warehouse operations do not currently have any facilities in this portion of the city to serve their specific needs. Trucking support services can include truck repair, fueling, and overnight parking, hotels, restaurants, banking, etc. If these services are not easily accessible to this

14

project or surrounding projects, then truckers may have no choice but to make extra trips into the surrounding neighborhoods to find these services. In other parts of the basin, these extra trips and idling in surrounding neighborhoods has led to increased emissions affecting local residents. The lead agency should address how these trucking services will be provided to truckers serving this project and the other nearby projects. Potential measures to consider include:

- Establish area(s) within the facility for repair needs.
- Post signs outside of the facility providing a phone number where neighbors can call if there is a specific issue.
- Develop, adopt and enforce truck routes both in and out of city, and in and out of facilities.
- Have truck routes clearly marked with trailblazer signs, so trucks will not enter residential areas.
- Identify or develop secure locations outside of residential neighborhoods where truckers that live in the community can park their truck, such as a Park & Ride.
- Provide food options, fueling, truck repair and or convenience store on-site to minimize the need for trucks to traverse through residential neighborhoods.
- Improve traffic flow by signal synchronization.
- Design the warehouse/distribution centers to ensure that truck traffic within the facility is located away from the property line(s) closest to its residential or sensitive receptor neighbors.

14

Equipment Not Included in Air Quality Analysis

3. The Draft EIR includes a Health Risk Assessment (HRA) that evaluates the impact from two sources, trucks and employee cars. Although the lead agency has proposed encouraging the promotion of near-zero emission yard trucks, it isn't clear if all applicable on-site equipment are accounted for and included in the health risk assessment. Equipment that is commonly found at warehouses that is not included in the HRA or the air quality analysis includes hostlers (e.g., yard trucks), diesel generators, and transportation refrigeration units (TRU's). The Final EIR should estimate the emissions from these equipment types or specifically prohibit their use onsite.

15

Health Risk Assessment Calculations

4. Several parameters used to determine potential health risks for the proposed project require further explanation or recalculation in the Final EIR. In addition to the comments below, details that should be provided in the Final EIR include the EMFAC modeling output and the dispersion modeling output. Should you have any questions regarding these parameters, please call AQMD staff at (909) 396-3244. AQMD staff notes the following items that are unclear in the HRA:

16

- o The HRA assumes that 2025 is a representative year from EMFAC2007 for the entire 70 year span of the project. Further justification is needed to

17

validate this assumption, especially considering the significantly higher emissions that are expected in the years preceding 2025, and the relatively unchanged emissions in the years following 2025.

- No emissions are calculated for onsite travel such as trucks traveling from Eucalyptus to building dock doors and back. Hostlers, diesel generators, and TRU's are also not included.
- The project description states that operations will occur 24 hours per day, 7 days per week while the HRA states that emissions will only occur 12 hours per day.
- The HRA assumes that half the trucks will travel east, while the other half travel west on Eucalyptus when exiting/entering the project site. The traffic study within the Draft EIR states that only 33% will travel west while the preponderance travel east.
- The HRA assumed that 12.5% of heavy duty trucks, 30% of medium duty trucks, and 80% of light duty trucks will use gasoline instead of diesel fuel. These values should be justified when considering the kinds of trucks that typically serve warehouses. AQMD staff recommends a default assumption of 100% diesel fueled trucks serving warehouses without further justification.
- The derivation of emission rates is unclear. For example, the HRA Emission Rate Worksheet shows a rate of 8.7E-05 g/s for heavy duty diesel trucks. AQMD staff was not able to reproduce this rate. For example, running EMFAC2007 at 70°, 50% humidity, year 2025, with a SCAQMD fleet yields an emission rate of 9.27E-05 g/s.
- It is not clear how the idling emission rate was derived.
- The effects of building downwash was included, however no mention was made that downwash does not work with volume sources in either the AERMOD or ISC dispersion model. In addition, if downwash is used in the final analysis, the building heights should match those found elsewhere in the Draft EIR. The HRA states that heights of 65 feet were used, however this is considerably taller than any building heights described in Appendix K.

18
19
20
21
22
23
24

On-Site Truck Idling Emissions

5. In the health risk effects analysis, the lead agency assumes that 1,246 heavy duty diesel trucks will operate daily at the project site. On page 4.3-17 in the Air Quality Section, the lead agency used only five minutes of idling in the emissions estimate for the health risk assessment. Although state regulations only allow five minutes of idling at any one time, trucks may idle for five minute periods several times on-site (e.g., queuing to enter the site, at the loading dock, exiting the site, etc.). AQMD staff therefore recommends an assumption of 15 minutes for on-site idling. If less than 15 minute of idling is used in the HRA, a mitigation measure should be added that requires the project proponent to limit *total* onsite idling time to the time used in the health risk assessment.

25

Truck Categorization

6. In the air quality analysis, the lead agency used the truck trip rate of 1.96 trips per 1,000 square feet of land use to estimate operational air quality impacts instead of the default CalEEMod land use model trip rate of 2.59. In addition, the lead agency assumed, as specified in the Transportation chapter of the Draft EIR, the vehicle fleet mix used to estimate truck emissions based on values recommended in the Fontana Truck Study. This study includes data for 2-axle, 3-axle, and 4+ axle trucks. Although EMFAC2007 also includes emission factors based on truck size, the splits are based however on vehicle weight, not axle. For the regional criteria pollutant calculations, the Draft EIR assumes that 2-axle and 3-axle trucks correspond to EMFAC2007 LDT1 and LDT2 vehicle classifications. LDT1 and LDT2 are for pickup trucks and are not typical of the higher emitting 2-axle and 3-axle trucks that would make deliveries at a warehouse. Based on guidance in Appendix E in the CalEEMod User Guide, 2-axle trucks should use the LHD1 classification, and 3-axle trucks should use MHD in the Final EIR. AQMD staff notes that these classifications were used for the Health Risk Assessment.

26

Construction Mitigation Measures

7. In the Draft EIR, the lead agency has determined that project regional construction impacts exceed the AQMD recommended significance thresholds. AQMD staff therefore recommends the following changes and additional mitigation measures during the projected 12 month construction period in addition to the measures proposed starting on page 4.3-23 to further reduce ROG and NOx impacts, if applicable and feasible.

27

Recommended change:

- 4.3.6.2D All clearing, grading, earthmoving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 miles per hour per SCAQMD guidelines in order to limit fugitive dust emissions.

28

Recommended addition:

- Limit the amounts of daily soil disturbance to the amounts analyzed in the EIR.
Prohibit truck idling in excess of five minutes, both on- and off-site.

29

Further, other lead agencies in the region including LA County Metro, the Port of Los Angeles, and the Port of Long Beach have also enacted the following mitigation measures. AQMD staff recommends the following measures to further reduce air quality impacts from construction equipment exhaust:

30

- Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 hp shall meet Tier 3 off-road emissions standards. In

addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

↑
30

Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations.

31

A copy of each unit's certified tier specification, BACT documentation, and CARB or AQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

32

For additional measures to reduce off-road construction equipment, refer to the mitigation measure tables located at the following website:

www.aqmd.gov/ceqa/handbook/mitigation/MM_intro.html .

33

Average Vehicle Ridership

8. Mitigation measure 4.3.6.5B lists as one of the measures the development of trip reduction plans that will achieve 1.5 average vehicle ridership for businesses with fewer than 100 employees. Because AQMD's rule 2202 has been modified⁵ to only apply to businesses with at least 250 employees, the mitigation measure should be modified to include businesses with fewer than 250 employees, rather than 100 employees.

34

⁵ <http://www.aqmd.gov/rules/reg/reg22/r2202.pdf>

RESPONSE TO LETTER B-3

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

Introduction Letter (Pages 1-2)

Response to Comment 1. The following responses address the South Coast Air Quality Management District's (District) specific comments on the air quality analysis in the Draft EIR, including the mitigation measures. The City believes the recommended mitigation measures are feasible and enforceable on future tenants of this project. The project air study does not support the commenter's contention that the main reason the project air emissions exceed the AQMD's daily thresholds is because the mitigation measures cannot be enforced. However, the City desires to address the District's recommendations to the extent feasible, so the applicant has agreed to allow the following modifications to Mitigation Measure 4.3.6.6A to incorporate the District's recommendations to eliminate "encouraged" with stronger enforceable language.

4.3.6.6A *Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of ~~20~~ 10 percent until January 1, 2014. For building permits issued after that date, new state energy standards require a 20 percent reduction from 2008 Title 24, Part 6 Energy Efficiency Standards. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. ~~Any combination of~~ The following design features including but not limited to the following list shall be used to fulfill this requirement:*

- *Buildings shall exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.*
- *Increase in insulation such that heat transfer and thermal bridging is minimized.*
- *Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.*
- *Incorporate dual-paned or other energy efficient windows.*
- *Incorporate energy efficient space heating and cooling equipment.*
- *Interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards shall be installed, as deemed acceptable by the City. Automatic devices to turn off lights when they are not needed shall be implemented.*
- *To the extent that they are compatible with landscaping guidelines established by the City, shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.*
- *Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.*
- *All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.*
- *To reduce energy demand associated with potable water conveyance, the project shall implement the following:*
 - *Landscaping palette emphasizing drought-tolerant plants;*

- *Use of water-efficient irrigation techniques; and,*
- *U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.*
- *The project shall provide secure, weather-protected, on-site bicycle storage/parking.*
- *The project shall provide on-site showers (one for males and one for females). Lockers for employees shall be provided.*
- *The project will establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce greenhouse gas (GHG) emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.*
- *The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.*
- *The project shall provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, stub outs for charging stations shall be indicated on the project building plans.*
- *Lease/purchase documents shall identify that tenants are encouraged to promote the following:*
 - *Implementation of compressed workweek schedules.*
 - *SmartWay partnership;*
 - *Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long-haul trips carried by SmartWay 1.0 or greater carriers.*
 - *Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long-haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers.*
 - *Use of fleet vehicles conforming to 2010 air quality standards or better.*
 - *Installation of catalytic converters on gasoline-powered equipment.*
 - *Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.*
 - *Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles.*
 - *Provision of preferential parking for EV and CNG vehicles.*
 - *Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.*
 - *Use of electric (instead of diesel or gasoline-powered) yard trucks.*

- *Use of SmartWay 1.25 rated trucks.*
- *Each facility operator shall provide regular sweeping of onsite parking and drive areas using street sweepers that comply with applicable SCAQMD Rules.*
- *Each facility operator shall maintain a log of all trucks entering the facility to ensure that, on average, the daily truck fleet meets applicable air quality emission standards. This log shall be available for inspection by City staff at any time.*
- *Each facility operator shall prohibit all vehicles from idling in excess of five minutes in all onsite areas.*
- *Each facility operator shall ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained and certified in diesel health effects and technologies, such as by requiring attendance at CARB-approved courses.*
- *Each facility operator which upon occupancy does not already operate 2007 and newer trucks shall in good faith be required to apply for funding to replace or retrofit their trucks such as Carl Moyer, VIP, Prop 1B or similar funds. Should funds be awarded, the tenant shall be required to accept and use them.*

Response to Comment 2. The AQMD will receive a copy of the Final EIR, with the Response to Comments, at least 10 days prior to action on the project and EIR, as required under Section 15088(b) of the State CEQA Guidelines.

Technical Evaluation (Pages 3-8)

Response to Comment 1. The recommendations made by the SCAQMD are beyond the scope of this project-level EIR. Fleet-related requirements such as these are the responsibility of state-level agencies (e.g., California Air Resources Board).”

- (1) Onsite vehicles to zero or near-zero emission technology – Mitigation Measure 4.3.6.6A requires the inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.
- (2) Alternative fueling infrastructure – These technologies do not yet represent a significant share of the warehousing truck fleet, so it is burdensome to require one particular project to provide this infrastructure when it is not known what user will locate to this site, or to what degree the future user can control their truck fleet (i.e., large corporate user may have total control, smaller user fleets may be independent truckers who cannot afford the modifications to their trucks to accommodate these fuels.
- (3) Phase-in of zero or near-zero technology – Response to Comment B-3, No. 2 below indicates that Mitigation Measure 4.3.6.6A encourages the future user of the site to participate in the SmartWay program. It should be noted that the end-user of the building is not known at this time and there is the possibility that participation in the SmartWay program may not be feasible.
- (4) Loading docks or truck routes more than 500 feet from sensitive receptors – The Draft EIR clearly describes that the closest loading dock would be 664 feet from the existing residential uses southeast of the site (Draft EIR page 4.3-17, 4th paragraph). In addition, Eucalyptus Avenue, the project’s truck route both east and west to the freeway, would be 1,500 feet at its closest point to the residential uses.

Response to Comment 2. This mitigation might be appropriate if the project warehouses were being built and used by one large warehousing company that had its own truck fleet, but it is infeasible to apply this measure to a “speculation” project where the eventual end user is not known at this time. However, the City desires to address the District’s recommendations to the extent feasible, so the applicant has agreed to allow the following modifications to Mitigation Measure 4.3.6.6A to incorporate the District’s recommendations:

4.3.6.6A *Prior to issuance of the first building permit, building and site plan designs shall ensure that the project’s energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of ~~20~~ 10 percent until January 1, 2014. For building permits issued after that date, new state energy standards require a 20 percent reduction from 2008 Title 24, Part 6 Energy Efficiency Standards. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. ~~Any combination of~~ The following design features ~~including but not limited to the following list~~ shall be used to fulfill this requirement:*

- *Buildings shall exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.*
- *Increase in insulation such that heat transfer and thermal bridging is minimized.*
- *Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.*
- *Incorporate dual-paned or other energy efficient windows.*
- *Incorporate energy efficient space heating and cooling equipment.*
- *Interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards shall be installed, as deemed acceptable by the City. Automatic devices to turn off lights when they are not needed shall be implemented.*
- *To the extent that they are compatible with landscaping guidelines established by the City, shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.*
- *Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.*
- *All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.*
- *To reduce energy demand associated with potable water conveyance, the project shall implement the following:*
 - *Landscaping palette emphasizing drought-tolerant plants;*
 - *Use of water-efficient irrigation techniques; and,*
 - *U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.*
- *The project shall provide secure, weather-protected, on-site bicycle storage/parking.*
- *The project shall provide on-site showers (one for males and one for females). Lockers for employees shall be provided.*
- *The project will establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate*

carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce greenhouse gas (GHG) emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.

- *The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.*
- *The project shall provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, stub outs for charging stations shall be indicated on the project building plans.*
- *Lease/purchase documents shall identify that tenants are encouraged to promote the following:*
 - *Implementation of compressed workweek schedules.*
 - *SmartWay partnership;*
 - *Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long-haul trips carried by SmartWay 1.0 or greater carriers.*
 - *Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long-haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers.*
 - *Use of fleet vehicles conforming to 2010 air quality standards or better.*
 - *Installation of catalytic converters on gasoline-powered equipment.*
 - *Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.*
 - *Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles.*
 - *Provision of preferential parking for EV and CNG vehicles.*
 - *Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.*
 - *Use of electric (instead of diesel or gasoline-powered) yard trucks.*
 - *Use of SmartWay 1.25 rated trucks.*
 - *Each facility operator shall provide regular sweeping of onsite parking and drive areas using street sweepers that comply with applicable SCAQMD Rules.*
 - *Each facility operator shall maintain a log of all trucks entering the facility to ensure that, on average, the daily truck fleet meets applicable air quality emission standards. This log shall be available for inspection by City staff at any time.*

- Each facility operator shall prohibit all vehicles from idling in excess of five minutes in all onsite areas.
- Each facility operator shall ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained and certified in diesel health effects and technologies, such as by requiring attendance at CARB-approved courses.
- Each facility operator which upon occupancy does not already operate 2007 and newer trucks shall in good faith be required to apply for funding to replace or retrofit their trucks such as Carl Moyer, VIP, Prop 1B or similar funds. Should funds be awarded, the tenant shall be required to accept and use them.

In addition, the City will consider application of these actions on future truck-intensive projects in the area. The District also recommended additional mitigation measures that are addressed in the following Responses to Comments B-3, Nos. 3 through 14.

Response to Comment 3. Truck log – this item has been added to Mitigation Measure 4.3.6.6.A (see Response to Comment B-3, No. 2 and Final EIR, Section 3.0, *EIR Errata and Additions*).

Response to Comment 4. Idle limits - this item has been added to Mitigation Measure 4.3.6.6A (see Response to Comment B-3, No. 2 and Final EIR, Section 3.0, *EIR Errata and Additions*).

Response to Comment 5. Log monitor training - this item has been added to Measure 4.3.6.6A (see Response to Comment B-3, No. 2 and Final EIR, Section 3.0, *EIR Errata and Additions*).

Response to Comment 6. The traffic levels projected in the EIR are considered to be conservative and protective of the environment and public health. Realistically, it is anticipated that the project traffic generation might also be considerably less than indicated in the Draft EIR, depending on the actual user(s) that locate within this project. The City believes the items outlined in Mitigation Measure 4.3.6.6A, including all the recommended additions described in Responses to Comments B-3, Nos. 2-5 and 11-13 are adequate to reduce project emissions. However, considering the volume of emissions generated and current commuter habits, it is unlikely the implementation of TDMs/TCMs described in the EIR will result in a reduction of operational project emissions to below existing localized operation emissions thresholds. Long-term air quality impacts resulting from the operation of the proposed project would remain significant and unavoidable.

Response to Comment 7. Again, the traffic levels projected in the EIR are considered to be conservative and protective of the environment and public health. The City believes the items outlined in Mitigation Measure 4.3.6.6A, including all the recommended additions described in Responses to Comments B-3, Nos. 2-5 and 11-13 are adequate to reduce project emissions to the extent practical.

Response to Comment 8. This measure would be onerous and difficult if not impossible to implement for a particular warehouse project, especially one such as this where the ultimate end user is not known. The City believes the items outlined in Mitigation Measure 4.3.6.6A, including all the recommended additions described in Responses to Comments B-3, Nos. 2-5 and Nos. 11-13 are adequate to reduce project emissions to the extent practical.

Response to Comment 9. Measure 4.3.6.6A require the project applicant to encourage the use of the SmartWay program for the leasee to reduce truck emissions over the long-term. The City believes the items outlined in Mitigation Measure 4.3.6.6A including all the recommended additions described in Responses to Comments B-3, Nos. 2-5 and 11-13 are adequate to reduce project emissions to the extent practical.

4.3.6.6A *Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of ~~20~~ 10 percent until January 1, 2014. For building permits issued after that date, new state energy standards require a 20 percent reduction from 2008 Title 24, Part 6 Energy Efficiency Standards. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. ~~Any combination of~~ The following design features ~~including but not limited to the following list~~ shall be used to fulfill this requirement:*

- *Buildings shall exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.*
- *Increase in insulation such that heat transfer and thermal bridging is minimized.*
- *Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.*
- *Incorporate dual-paned or other energy efficient windows.*
- *Incorporate energy efficient space heating and cooling equipment.*
- *Interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards shall be installed, as deemed acceptable by the City. Automatic devices to turn off lights when they are not needed shall be implemented.*
- *To the extent that they are compatible with landscaping guidelines established by the City, shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.*
- *Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.*
- *All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.*
- *To reduce energy demand associated with potable water conveyance, the project shall implement the following:*
 - *Landscaping palette emphasizing drought-tolerant plants;*
 - *Use of water-efficient irrigation techniques; and,*
 - *U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.*
- *The project shall provide secure, weather-protected, on-site bicycle storage/parking.*
- *The project shall provide on-site showers (one for males and one for females). Lockers for employees shall be provided.*
- *The project will establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce greenhouse gas (GHG) emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.*

- *The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.*
- *The project shall provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, stub outs for charging stations shall be indicated on the project building plans.*
- *Lease/purchase documents shall identify that tenants are encouraged to promote the following:*
 - *Implementation of compressed workweek schedules.*
 - *SmartWay partnership;*
 - *Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long-haul trips carried by SmartWay 1.0 or greater carriers.*
 - *Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long-haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers.*
 - *Use of fleet vehicles conforming to 2010 air quality standards or better.*
 - *Installation of catalytic converters on gasoline-powered equipment.*
 - *Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.*
 - *Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles.*
 - *Provision of preferential parking for EV and CNG vehicles.*
 - *Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.*
 - *Use of electric (instead of diesel or gasoline-powered) yard trucks.*
 - *Use of SmartWay 1.25 rated trucks.*
 - *Each facility operator shall provide regular sweeping of onsite parking and drive areas using street sweepers that comply with applicable SCAQMD Rules.*
 - *Each facility operator shall maintain a log of all trucks entering the facility to ensure that, on average, the daily truck fleet meets applicable air quality emission standards. This log shall be available for inspection by City staff at any time.*
 - *Each facility operator shall prohibit all vehicles from idling in excess of five minutes in all onsite areas.*
 - *Each facility operator shall ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained and certified in diesel health effects and technologies, such as by requiring attendance at CARB-approved courses.*

- Each facility operator which upon occupancy does not already operate 2007 and newer trucks shall in good faith be required to apply for funding to replace or retrofit their trucks such as Carl Moyer, VIP, Prop 1B or similar funds. Should funds be awarded, the tenant shall be required to accept and use them.

Response to Comment 10. The project site plan has already been checked by City staff for this component and there is sufficient stacking distance within the project.

Response to Comment 11. No residential areas are immediately accessible to the project site from the two main freeway access points (i.e., along Eucalyptus Avenue west to Redlands Boulevard and west to Moreno Beach Drive). Overnight parking of trucks in residential areas is prohibited by the City.

Response to Comment 12. The roofs of all buildings within the proposed project will be capable of supporting photovoltaic solar panels. As shown below, ProLogis has a strong history of installing solar panels on its warehouse projects:

Description	Bldg Size (SF)	Megawatts (Mw)
Ontario Airport #2	562,089	2.55
Ontario Airport #3	369,086	1.41
Ontario Airport #4	680,925	2.85
Ontario Airport #5	241,367	0.773
Rialto I-210 DC #2	1,197,051	8.6
Rialto I-210 DC #3	543,400	2.62
Vista Rialto DC #1	436,650	
Kaiser DC #2	577,905	2.25
Kaiser DC #5	757,765	4.5

	12,860,449	68.67

Response to Comment 13. This item (street sweeping) has been added to Mitigation Measure 4.3.6.6A to require compliance with applicable SCAQMD rules (refer to Response to Comment B-3, No. 2 above).

Response to Comment 14. The recommendations regarding “Trucking Support Services” are all beyond the scope of this project-level EIR. As stated in the comment, these measures are suggested as City requirements that would be applied to any truck-intensive projects in the City.

Response to Comment 15. The combination of the very conservative assumptions required of all health risk assessments with the very small amount of emissions from yard trucks (the project does not plan to use any diesel generators nor allow TRUs during normal operations) compared to the

large emissions from the many heavy-duty haul trucks idling and driving around mean that the HRA as published, which shows health risk levels less than half of the significance thresholds, adequately analyzes the risks to public health from the project operations.

Response to Comment 16. The HRA modeling only allows for one emission rate for the diesel engines to represent the entire 70-year period from opening year (2013) until 2083. The available emissions factors model (EMFAC) only has factors thru 2040. Thus, there is no information available about how the diesel emissions will change from 2040 until 2083. It is pure guesswork to predict how the diesel emissions will change over this period. To assume that the emissions during this 43 year period will not change at all is a very conservative assumption – there is a real possibility that all diesel engines will have been replaced by an alternative power source before 2083 resulting in zero diesel particulate emissions. Selecting the best year between 2083 and 2013 to represent the average is somewhat arbitrary – the median is 2048, outside the range of available factors. EMFAC incorporates expectations of technological improvements that would result in lower emissions over the period from the 1990s thru 2040, however it does not include everything – for instance it does not include the law just passed in August 2012 that sets the average mileage of cars and light trucks to 54.5 miles per gallon by 2025. While this does not include the heavy-duty trucks the HRA is focused on, it is an indication that there will be aggressive regulations in the future reducing these diesel emissions below what is in the EMFAC model. While using the emissions factors for 2040 as an average is not optimal due to the higher existing emissions, using 2013 factors as an average is unreasonably conservative also. In our best engineering judgment, 2025 is the best set of emissions factors to represent this complicated issue.

It should be noted that all of the details for calculating health risks of the proposed project were provided in Appendix B of the Draft EIR, including the EMFAC and dispersion modeling outputs. In addition, “active” CalEEMod and supporting computer files were sent to the AQMD during the EIR review period to allow for replication and verification of the HRA report results.

Response to Comment 17. Refer to Response to Comment B-3, No. 16 above.

Response to Comment 18. Refer to Response to Comment B-3, No. 16 above. The emissions for trucks idling at the load bays and for vehicle operating on the roadways were explicitly modeled. The emissions for the trucks moving the short distances from the loading docks to the driveways were included in the modeling, just without explicit emissions sources (those emissions were included with the roadway sources). Since there are no sensitive receptors between where the trucks are traveling from the loading docks to the driveway and the roadway sources, this simplification of the modeling results in the same health risk levels as a more detailed modeling with the additional emissions sources. There are no diesel generators planned and TRUs will not burn diesel fuel because any refrigerated trucks will plug in and their TRUs run off that electricity. There are also no plans for onsite diesel-powered hostlers or other diesel-powered equipment.

Response to Comment 19. The project is expected to operate 24 hour per day. Modeling the actual number of trucks that are planned to operate over 24 hours as if they operated over 12 hours results in much higher hourly emissions. Thus, the HRA is protective of human health in case there is a change in the project operations to only operate 12 hours per day.

Response to Comment 20. The vast majority (over 90 percent) of the project’s diesel particulate emissions are from the trucks idling on the project site, so adjusting the amount of trucks traveling east and west will have only a very minor effect on the HRA results. The HRA assumed a relatively equal split for east-west trip distribution so the results would not be biased relative to the closest sensitive receptor to the project site (i.e., residential southeast of site) that could otherwise result from an unequal distribution of projected versus actual project trips.

Response to Comment 21. While assuming that 100% of the trucks will be diesel is certainly worst case, it overstates the real-world condition that some trucks use gasoline. The HRA is a careful balance of assumptions, some already very conservative (such as assuming people live in one place for 70 years and stay in that house 24 hours a day for 350 days out the year). The fuel use percentages are from the URBEMIS model. These are percentages there to best represent the real-world operations for projects modeled using the URBEMIS model. Since it is not known what the actual warehouse operator will use, using this published representative fuel use percentages is the best method to model the future use. The carcinogenic health risk at the nearest residences for individuals living there for 70 years was identified in the DEIR as 4.33 in 1 million. Changing the percentage of trucks using diesel from the URBEMIS parameters to 100% would certainly increase the estimate carcinogenic health risk.

Response to Comment 22. The PM₁₀ emissions factor from EMFAC2007 at 50°, 50% humidity, 2025, SCAQMD fleet for HDT traveling at 40mph is 0.095 g/mile/truck. To derive the corresponding project emissions rate in g/sec, the g/mile rate is adjusted by the distance covered between volume sources per second. Thus, 0.095 g/mi is multiplied by 117 meter source spacing. And, since this is to convert from trucks per day to emissions per second, the result is divided by 86,400 sec/day. So, $0.095 * 117 * 0.0006214 \text{ meters/mile} / 86,400 = 8.0E-08 \text{ g/s/truck}$. With 1,246 trucks per day that are 87.5% diesel, this becomes 8.7E-05 g/s.

Response to Comment 23. The idling emissions factors were from EMFAC2007 for HDT at 0.396 g/hr. The following table lists the derivation of the individual emissions rates:

Idling Emissions of Diesel Particulate

	No. of diesel trucks per day	Minutes Idling	Idling Emission Factor	Number of Sources	Emission Rates per Source		
					g/s	lb/hr	lb/yr
Building 1	89	5	0.396	3	9.9E-06	7.9E-05	0.7
Building 2	594	5	0.396	12	1.7E-05	1.3E-04	1.2
Building 3	84	5	0.396	3	9.4E-06	7.5E-05	0.7
Building 4	234	5	0.396	5	1.6E-05	1.3E-04	1.1
Building 5	269	5	0.396	6	1.5E-05	1.2E-04	1.0
Building 6	224	5	0.396	6	1.2E-05	9.5E-05	0.83

For example, for Building 1: $89 * 87.5\% / 24 * 5 \text{ min} / 60 * 0.396 / 3,600 / 3 \text{ sources}$

Response to Comment 24. All of the emissions sources in proximity to the project building that could be affected by the building downwash are point sources, which do work correctly with building downwash. The building height used was an estimate made before the project design had progressed far enough to include the building heights described in the DEIR. The HRA has not been updated to use the planned building heights for two reasons – using a higher building height results in greater building wake affects and higher health risk levels, so is conservative. Secondly, the effects of building wake affects diminish quickly the further the residence of concern is downwind. At the distance of the nearest residence the building wake affect is making a negligible difference

Response to Comment 25. The site is designed so that there will not be any queuing while entering the site, the trucks will proceed immediately from the loading docks immediately to their truck route and vice versa. While it is possible that there will be isolated trucks that stop briefly while in transit, it is expected that the number of occurrences will be so small as to not affect the health risk assessment.

Response to Comment 26. The project trip rate used in the air quality analysis matches what was used in the project traffic study. That study explains the project trip rate selection. The conversion of these factors between EMFAC and CalEEMod is difficult, due to the nomenclature differences. The air quality study used the fleet defaults built into the CalEEMod model to characterize the project operational emissions as the most representative of the expected emissions. As the HRA did not use the same fleet assumptions as the operational air quality analysis, as noted by SCAQMD staff, the HRA used the CalEEMod classifications. ~~these fleet EMFAC adjustments were different.~~

Response to Comment 27. As detailed in Responses 28-33, the mitigation measures have been modified to include all feasible SCAQMD mitigation language suggestions. Since the effectiveness of these mitigation measures is not included in the analysis, the analysis represents a worst-case post-mitigation analysis.

Response to Comment 28. Mitigation Measure 4.3.6.2D has been modified to incorporate this clarification as follows:

4.3.6.2D *All clearing, grading, earthmoving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.*

Response to Comment 29. Mitigation Measure 4.3.6.2D has been modified to include a provisions that grading shall be stopped when instantaneous gusts exceed 25 mph to help further minimize offsite dust impacts. Restricting the number of acres grading on any one day is not reasonable. The CalEEMod calculates a total grading disturbed area many times the size of the project site based on the idea that there are multiple graders, dozers, scrapers, etc. making multiple passes during any one day. This suggested measure to limit simultaneous disturbance of the site to 5 acres per day would not change the results of the air quality modeling and projected air emissions identified in the Draft EIR and in fact may increase emissions due to the grading inefficiencies created by this restriction. By grading a smaller area it prolongs the grading process and releases dust and vehicular emissions (grading construction workers going back and forth to the site over a greater period of time and grading equipment moving around the site) into the air basin over a longer period of time. In addition, the 120-acre project generally slopes at approximately 2% from north to south. Areas on the northern half of the project will have dirt removed (cut) while areas to the south will have dirt added (fill). To achieve this will require that dirt be moved over more than 5 acres per day. To limit the grading operation to any one 5 acre area per day area would result in the same dirt being deposited and picked up many times as it is "hop scotched" to its final location rather than transporting the dirt in one move. A 5-acre daily limitation would result in more, not less, grading equipment emissions. The grading contractor is motivated to move the dirt as efficiently as possible resulting in the lowest amount of equipment run time which also results in the lowest amount of emissions. There are also logistical considerations getting construction equipment and people back and forth to the site.

Response to Comment 30. The agencies mentioned have much more control over truck operations and activities within their respective jurisdictions compared to the City of Moreno Valley. However, the City and the applicant have agreed to add this requirement into Mitigation Measure 4.3.6.2C. The measure has been amended as follows as is included in Final EIR, Section 3.0, *EIR Errata and Additions*:

4.3.6.2C *Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.*

Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 3 off-road emission standards. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

Post January 1, 2015: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

A copy of each unit's certified tier specifications, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

Response to Comment 31. The City and the applicant have agreed to include this requirement into Mitigation Measure 4.3.6.2C. The measure has been amended as indicated above in Response to Comment B-3, No. 30 and is included in Final EIR, Section 3.0, *EIR Errata and Additions*.

Response to Comment 32. The City and the applicant have agreed to include this requirement into Mitigation Measure 4.3.6.2C. The measure has been amended as indicated above in Response to Comment B-3, No. 30 and is included in Final EIR, Section 3.0, *EIR Errata and Additions*.

Response to Comment 33. Many of the activities listed in the referenced CEQA Handbook have already been incorporated or have been added to the project mitigation, as outlined in previous responses in this section regarding mitigation.

Response to Comment 34. Mitigation Measure 4.3.6.5B has been modified to include businesses with fewer than 250 employees, rather than 100 employees.

Ladies and Gentlemen: Associate Planner

Re: Industrial Park

The District does not normally recommend conditions for land divisions or other land use cases in incorporated cities. The District also does not plan check city land use cases, or provide State Division of Real Estate letters or other flood hazard reports for such cases. District comments/recommendations for such cases are normally limited to items of specific interest to the District including District Master Drainage Plan facilities, other regional flood control and drainage facilities which could be considered a logical component or extension of a master plan system, and District Area Drainage Plan fees (development mitigation fees). In addition, information of a general nature is provided.

1

The District has not reviewed the proposed project in detail and the following checked comments do not in any way constitute or imply District approval or endorsement of the proposed project with respect to flood hazard, public health and safety or any other such issue:

2

No comment.

This project would not be impacted by District Master Drainage Plan facilities nor are other facilities of regional interest proposed.

This project ^{may} involves District Master Plan facilities. The District will accept ownership of such facilities on written request of the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection and administrative fees will be required.

3

This project proposes channels, storm drains 36 inches or larger in diameter or other facilities that could be considered regional in nature and/or a logical extension of the adopted _____ Master Drainage Plan. The District would consider accepting ownership of such facilities on written request of the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection and administrative fees will be required.

This project is located within the limits of the District's Moreno Area Drainage Plan for which drainage fees have been adopted; applicable fees should be paid by cashier's check or money order only to the Flood Control District or City prior to issuance of grading permits. Fees to be paid should be at the rate in effect at the time of issuance of the actual permit.

4

An encroachment permit shall be obtained for any construction related activities occurring within District right of way or facilities. For further information, contact the District's encroachment permit section at 951.955.1266.

5

The District's previous comments are still valid.

6

GENERAL INFORMATION

This project may require a National Pollutant Discharge Elimination System (NPDES) permit from the State Water Resources Control Board. Clearance for grading, recordation or other final approval should not be given until the City has determined that the project has been granted a permit or is shown to be exempt.

7

If this project involves a Federal Emergency Management Agency (FEMA) mapped flood plain, then the City should require the applicant to provide all studies, calculations, plans and other information required to meet FEMA requirements, and should further require that the applicant obtain a Conditional Letter of Map Revision (CLOMR) prior to grading, recordation or other final approval of the project, and a Letter of Map Revision (LOMR) prior to occupancy.

8

If a natural watercourse or mapped flood plain is impacted by this project, the City should require the applicant to obtain a Section 1602 Agreement from the California Department of Fish and Game and a Clean Water Act Section 404 Permit from the U.S. Army Corps of Engineers, or written correspondence from these agencies indicating the project is exempt from these requirements. A Clean Water Act Section 401 Water Quality Certification may be required from the local California Regional Water Quality Control Board prior to issuance of the Corps 404 permit.

9

Very truly yours,

HENRY OLIVO
Engineering Project Manager

Moreno Valley, CA 92552-0805

Dear Mr. Bradshaw:

Re: Notice of Preparation of a
Draft Environmental Impact Report for
ProLogis Park Moreno Valley Eucalyptus

This letter is written in response to the Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for ProLogis Park Moreno Valley Eucalyptus. The proposed project includes a General Plan Amendment (GPA), a Change of Zone (CZ), a Tentative Parcel Map, Municipal Code Amendment, and a Plot Plan. The project site encompasses approximately 122 acres and is bounded in general by State Route 60, Quincy Street, Eucalyptus Avenue and Pettit Street in the city of Moreno Valley, County of Riverside.

The Riverside County Flood Control and Water Conservation District has the following comment:

6

The proposed project is located within the Moreno Master Drainage Plan (MDP). When fully implemented, these MDP facilities will provide flood protection to relieve those areas within the plan of the most serious flooding problems and will provide adequate drainage outlets. The DEIR should address impacts to MDP facilities within the proposed project area. To obtain further information on the MDP and the proposed facilities, please contact Dale Anderson of the District's Planning Section at 951.955.1345.

Thank you for the opportunity to review the NOP and Initial Study. Please forward any subsequent environmental documents regarding the project to my attention at this office. Any questions concerning this letter may be referred to Art Diaz at 951.955.4643 or me at 951.955.1233.

Very truly yours,

TERESA TUNG
Senior Civil Engineer

RESPONSE TO LETTER B-4

**RIVERSIDE COUNTY FLOOD CONTROL AND WATER CONSERVATION
DISTRICT**

Response to Comment 1. The City thanks the District for clarifying its role in the project review process relative to flood control issues.

Response to Comment 2. The City does not infer the District's approval or endorsement of the proposed project.

Response to Comment 3. The City and the developer understand the project improvement review and approval process. The applicant will contact the District to coordinate the design and maintenance of the Quincy Channel as needed.

Response to Comment 4. The City and the applicant understand the project is within the Moreno Area Drainage Plan and the project will pay applicable fees in this regard.

Response to Comment 5. The applicant will obtain an encroachment permit from the District if necessary for work related to the Quincy Channel.

Response to Comment 6. The City and the applicant understand the District's NOP comments on the project are still valid.

Response to Comment 7. The City and the applicant understand that the project may require an NPDES permit from the Regional Water Quality Control Board.

Response to Comment 8. The City and the applicant understand that a CLOMR and/or a LOMR may be required for this project – one or both will be obtained if necessary as part of the subsequent development review process if the project is approved.

Response to Comment 9. The City and the applicant understand that a 1602 Agreement will be needed with Fish and Game, a 401 Certification will be needed from the Regional Water Quality Control Board, and a 404 permit may be required from the U.S. Army Corps of Engineers. The applicant would obtain the necessary permits in this regard subsequent to approval of the proposed entitlements.

SUBJECT: Notice of Availability (NOA) of a Draft Environmental Impact Report for the Prologis Eucalyptus Industrial Park Project in Moreno Valley

Dear Mr. Bradshaw:

Thank you for the opportunity to review and comment on the Notice of Availability (NOA) of a Draft Environmental Impact Report (DEIR) for the Prologis Eucalyptus Industrial Park Project proposed on approximately 122.8 acres generally located south of and adjacent to State Route (SR)-60, east of the Moreno Valley Auto Mall and adjacent to and west of the Quincy Channel. As described in the DEIR, the project consists of the development of six distribution warehouse facilities totaling 2,224,419 square feet. Associated with this project is a General Plan Amendment to change the land use designation of 71.3 acres of the project site from Residential (R15, R5, and R2) to Business Park (BP) so the entire site would then be designated Business Park (BP).

City of Riverside staff has reviewed the DEIR and offers the following comments:

- The proposed General Plan Amendment will change the land use designation of 71 acres from residential to a business park designation allowing for large warehouse distribution facilities which will result in a substantial increase in truck trips beyond what is currently anticipated in the Moreno Valley General Plan. The County Transportation Uniform Mitigation Fee (TUMF) model is based on the existing Moreno Valley General Plan and as such did not account for this major change of 71 acres to distribution warehousing facilities. As a result, payment of TUMF does not sufficiently mitigate traffic impacts of the proposed project. 1
- The traffic analysis section of the DEIR is limited in scope as it only analyzes localized traffic impacts within Moreno Valley at 17 intersections, most of which are within a mile radius of the project site, yet the project involves a large warehouse development (over 2.2 million square feet) that will generate substantial truck traffic. Taken together, passenger vehicle and truck traffic is equivalent to over 7,500 passenger vehicle trips a day in terms of traffic impact. The DEIR needs to analyze project impacts regionally, 2

considering cumulative impacts of significant truck traffic that will be added with the proposed project along with traffic that will be generated by other projects in Moreno Valley including the proposed RPT Centerpointe West Project (1.28 million square-foot warehouse development) and the a pending EIR for the World Logistics Center – over 40 million square feet of warehouse distribution facilities. These cumulative impacts to the City of Riverside have not been fully analyzed and are potentially significant.

2

- Another regional impact that has not been appropriately evaluated in the DEIR includes the impacts generated by vehicles (those that would normally travel west along the SR-60 Freeway toward I-125/SR-91 interchange). Motorists will find the “path of least resistance” when the freeways are congested and take routes on City of Riverside arterials such as Van Buren and Alessandro Boulevards to get to the SR-91 Freeway. The DEIR shows that project trips will travel south from the project site to Cottonwood Street and Alessandro Boulevard then travel west towards the I-215 Freeway and Riverside. Beyond the I-215 Freeway, a percentage of these project trips will utilize Alessandro or Van Buren Boulevards to access SR-91 Freeway. As a result, the DEIR needs to fully evaluate the spill-over effect on these streets within the City of Riverside to determine how much traffic will be added along these two key corridors, the level of impact to the City of Riverside and identify appropriate mitigation. Specific mitigation or fair share contribution toward mitigation (beyond TUMF) may be needed to address impacts to the City of Riverside.

3

- The DEIR finds that segments of the SR-60 Freeway (both westbound and eastbound) currently operate at an unacceptable level of service (LOS). The project is cumulatively significant and will worsen the existing unacceptable LOS on freeway segments. The DEIR also states that “neither the project applicant nor the City of Moreno Valley have jurisdiction over the Caltrans facilities; therefore, implementation of improvements to the freeway mainline cannot be guaranteed. Additionally, the RTIP has no projects programmed on the SR-60 within the study area and Caltrans does not have a mechanism for development projects to contribute to improvements on State highways. Given this significant unavoidable impact which cannot be mitigated, the impacts will spill over onto other roadways including City of Riverside streets as discussed above, further emphasizing the need to further analyze and mitigate the spill-over impacts to the City of Riverside.

4

- In addition to primary concerns related to unmitigated traffic impacts to the City, as described above, the DEIR finds that the project will result in an excessive number of impact areas (a total of five including transportation/traffic) with significant unavoidable environmental impacts where a statement of overriding considerations is needed. The impact areas found to have significant impacts include Aesthetics, Agricultural Resources, Air Quality, Land Use and Planning, and Transportation/Circulation. These impacts are excessive and as a result the proposed General Plan Amendment to add 71 acres of warehouse distribution facilities is inappropriate and other project alternatives need to be further considered to reduce the number of significant impacts.

5

City of Riverside staff appreciates Moreno Valley's consideration of the comments provided in this letter. Please forward any updated environmental documents to the City of Riverside Planning Division for further review. Should you have any questions regarding this letter, please feel free to contact Doug Darnell, AICP Senior Planner, at (951) 826-5219 or ddarnell@riversideca.gov.

G:\Planning Special Projects\General Plan\Agency Comments\Other_Cities\City_of_Moreno_Valley\PSP12-0110-Prologis Eucalyptus Industrial Park\Comment Letter.doc

RESPONSE TO LETTER C-1

CITY OF RIVERSIDE

Response to Comment 1. The comment has accurately summarized the characteristics of the proposed project. It is correct that the project proposes a change in land use 71 acres of land from residential uses to warehousing uses. As noted on Page 18 of the traffic study, currently 5 percent of the project site is designated as R2 Residential, 2 percent as R5 Residential, 41 percent as R15 Residential, and the remaining 34 percent as Business Park/Light Industrial. Table E of the Traffic Study (DEIR Table 4.11.E on page 4.11-15 of the DEIR) illustrates a comparison between the trip generation of the site as presently zoned, and the trip generation of the proposed project. As can be seen in Table E, compared to the present zoning, the project produces 6,702 fewer trips per day, with 885 fewer trips in the a.m. peak hour and 939 fewer trips in the p.m. peak hour. Please note that these trips are PCE trips, so the effects of trucks have been included in the trip generation. Therefore, the commenter is mistaken in the statement that the project increases the number of trips. On the contrary, the proposed project actually reduces the future number of PCE trips compared to approved land uses on the site. The comment also asserts that payment of the TUMF does not sufficiently mitigate the traffic impacts of the proposed project. The Mitigation Measures identified in Section 4.11.6.4.E of the DEIR outline the specific improvements required to mitigate the direct and cumulative impacts of the project. This section also identifies where the required improvements are programmed into the DIF and TUMF. In cases where the improvements are not programmed, the project would be responsible to implement the improvements, as outlined in Section 4.11.6.4.E. As a result, the impacts of the project will be fully mitigated prior to issuance of the Certificate of Occupancy by the City, either through payment of the DIF, TUMF, or by a fair-share participation in improvements that are not included in these funding programs.

It should be noted that the Reduced Intensity Alternative (less intensive modified plan) evaluated in Section 4 of this document would substantially reduce traffic generation and therefore warehouse traffic impacts (4 warehouse building with approx. 30% less traffic) compared to the 6 warehouse buildings of the Proposed Project. The reader is referred to Section 4 of this document for more information regarding that alternative land plan.

Response to Comment 2. The City selected the intersections for analysis in accordance with the guidelines established by the City's Traffic Impact Analysis Preparation Guide (i.e., 50 or more peak hour trips within a five mile radius) and as accepted and required by the City of Moreno Valley in their Traffic Impact Assessment (TIA) guidelines. It should be noted that this is the same criteria for selection of a study area in the City of Riverside Traffic Impact Analysis Preparation Guide. It should also be noted that the project does not add more than 50 trips at intersections farther than those included in the analysis. In addition, Response to Comment C-1, No. 1 above demonstrates the proposed project actually reduces the number of PCE trips that would be generated on the project site from the previously considered project. Since the World Logistics Center and RPT Centerpointe West projects were initiated after the NOP for this project went out, the trips from these two projects are not required to be and have not been included in this analysis. See also Response to Letter A-2, Comment No. 8. In addition, see Response No. 1 above regarding the proposed less intensive modified plan evaluated in Section 4 of this document.

Response to Comment 3. The comment states that the redistribution of traffic caused by the project was not appropriately analyzed in the DEIR - this statement is incorrect. The 2035 analysis was prepared using forecasts from the RivTAM traffic model, which distributes traffic according to the "path of least resistance", as requested in the comment. The select zone assignment prepared for the project shows that approximately 5 percent of project traffic, equating to fewer than 50 trips, would utilize Alessandro and Van Buren Boulevards in the City of Riverside. Changes in the distribution of traffic within the City of Riverside due to the influence of the project were not evaluated, as these

roadways and intersections do not meet the criteria for inclusion into the project study area. An explicit analysis of “spill-over” traffic, as requested in the comment, is not required by the traffic study guidelines adopted by the Cities of Moreno Valley or Riverside, or the County of Riverside. The comment also asserts that the TUMF program may not adequately mitigate project impacts due to “spill-over” traffic. This comment is also incorrect. The TUMF Nexus Study prepared by Parsons Brinckerhoff in October 2009 relied upon traffic forecasts from the RivTAM traffic model. As noted previously, the RivTAM traffic model assigns traffic based on the “path of least resistance”. Additionally, the General Plan land use planned for the project site, and included in the RivTAM, would generate more trips than the proposed project. As a result, the forecasts prepared for the TUMF Nexus Study would be a more conservative estimate of “spill-over” traffic than would be experienced with the project, and the projects programmed in the TUMF would be adequate to mitigate project impacts.

Response to Comment 4. The RIVTAM traffic model was used to generate forecast traffic volumes for no project and with project condition. The methodology utilized by the RivTAM traffic model to assign trips to the roadway network minimizes travel time and delay for trip origins and destinations within the model network. As such, if a faster route was observed, then a significant diversion of trips should have been seen on these routes. However, significant diversion of traffic was not observed between the no-build and build conditions. Furthermore, the modeling indicated that diversion of trips on to surface streets under without and with project conditions are anticipated to be minimal (a maximum diversion of 7 peak hour PCE trips is forecast at on Alessandro Boulevard). Please note that compared to the present zoning, the project produces 6,702 fewer trips per day, with 885 fewer trips in the a.m. peak hour and 939 fewer trips in the p.m. peak hour, and based on the model runs, the trips on surface streets in the City of Riverside are generally lower under conditions where the proposed zone change is approved.

Response to Comment 5. The commenter is correct that the project involves a General Plan Amendment and Zone Change, and the Draft EIR does identify a number of significant impacts for the proposed project. The purpose of an EIR is to disclose potential impacts of the project to the public and to decision makers. Utilizing the information provided in the DEIR, the decision makers will determine whether the benefits of the project outweigh the environmental impacts of the project.

It should be noted that the less intensive modified plan evaluated in Section 4 of this document would substantially reduce traffic generation and therefore warehouse traffic impacts (4 warehouse building with approx. 30% less traffic) compared to the 6 warehouse buildings of the Proposed Project. The reader is referred to Section 4 of this document for more information regarding that alternative land plan.

Response to Comment 6. The City of Moreno Valley will keep the City of Riverside informed regarding the review process for this project, and the City of Riverside will have an opportunity to review these responses prior to action on the ProLogis project.

Re: Comment on Draft Environmental Impact Report for ProLogis Eucalyptus Industrial Park (State Clearinghouse No. 2008021002)

Dear Mr. Bradsahw:

I am writing on behalf of Laborers International Union of North America, Local Union No. 1184, and its members living in Riverside County ("LIUNA Local Union No. 1184") regarding the Draft Environmental Impact Statement ("DEIR") for the ProLogis Eucalyptus Industrial Park, State Clearinghouse No. 2008021002 ("Project").

On Tuesday, August 28, 2012, we made a request that the City of Moreno Valley ("City") extend the comment period for the DEIR due to substantial information requiring additional time for review and comment. You responded today, August 29, 2012 that you respectfully decline to grant the request for additional time.

Today, we sent you an email requesting Appendix L. Appendix L is referenced in the DEIR. In pertinent part, the DEIR states:

Mitigation Measures. The potential mitigation measures identified by the City's General Plan have been deemed infeasible by the property owner under current economic conditions. In addition, supplementary analysis of the project site and local economic conditions indicates that continued citrus production and/or the raising of row crops would not be economically feasible on the project site (*see Appendix L*).

(DEIR, p. 4.2-8) (emphasis added). The DEIR does not contain an Appendix L.

1

Jeff Bradshaw
City of Moreno Valley
August 29, 2012
Page 2 of 2

The current comment period closes on Tuesday, September 4, 2012, and the City has failed to provide access to a critical document referenced in the DEIR that is required by law to be made available to the public during the entire DEIR comment period. The City is in violation of CEQA's Section 21092(b)(1) requirement which mandates that "all documents referenced in the draft environmental impact report or negative declaration" be available for review and "readily accessible" during the entire comment period. PRC § 21092(b)(1). Even if the requested document were to be made available to the public today, there is insufficient time for the public to review and comment on this document at this time.

Accordingly, we request that the City extend the comment period for the ProLogis Eucalyptus Project until at least forty-five (45) days from the date that the City makes available all documents referred to in the DEIR.

Given the shortness of time before the current comment deadline, please contact me as soon as possible with your response to this request. Feel free to call me at (510) 836-4200 should you have any questions.

Sincerely,

Richard T. Drury
Christina Caro
Brooke O'Hanley
Lozeau Drury LLP
Attorneys for LIUNA Local Union No. 1184

1

RESPONSE TO LETTER D-1

LOZEAU DRURY, LLP (8/29/12)

Response to Comment 1. As explained to the commenter on the telephone and via email by Jeff Bradshaw on August 28, 2012, the reference to Appendix L was a typographical error – it should have referred to Appendix E which contains the material on “agricultural resources” requested by the commenter. The material in Appendix E is clearly labeled “Agricultural Resources” in the Table of Contents, so the Draft EIR does not need to be recirculated. This correction will be noted in Section 3 of this document (*EIR Errata and Additions*) as shown below. Appendix E was available along with the entire DEIR and all DEIR appendices for the duration of the 45-day public review period. In addition, the comment has not resulted in any change in the impact judgment contained in the DEIR regarding agricultural resources and that impacts were identified as significant and unavoidable.

Mitigation Measures. *The potential mitigation measures identified by the City’s General Plan have been deemed infeasible by the property owner under current economic conditions. In addition, supplementary analysis of the project site and local economic conditions indicates that continued citrus production and/or the raising of row crops would not be economically feasible on the project site (see Appendix L E).*

RE: ProLogis Eucalyptus Industrial Park project's Draft Environmental Impact Report (DEIR).

The Sierra Club appreciates this opportunity to comment on this DEIR. We hope to read your responses in the FEIR which do fully answer our comments, concerns, suggestions and questions. Most of our concerns are about Global Warming, Climate Change, Greenhouse Gas Pollution and Air Pollutant emissions. These concerns can be read below and we expect this project to do everything possible to mitigate these problems in our non-attainment area. The Sierra Club understands that “the applicant has indicated the building will be designed to qualify for certification under the Leadership in Energy and Environmental Design (LEED) program, but there are no plans to submit the project to actual LEED certification.” (p 3-12) We do not understand why you do not match the Gold LEED certification recently agreed to by the Alessandro Business Center warehouse in the City of Riverside or even the LEED Silver of nearby Skechers and West Ridge Commerce Center warehouses. In fact your words do not guarantee anything about even reaching the lowest level of LEED certification. The City needs to require you to hire a LEED expert and then require you to become LEED certified--hopefully higher than just certified. You could pay less than \$1,000 this year and lock in current LEED standards for your building. Through the installation of solar panels and other verified LEED ideas you could avoid generating air pollutants with the electricity you consume. This warehouse and all warehouses need to be required to have their roofs built to accommodate the maximum number of solar panels. You are now able to sell excess energy back and earn money as well as do right for our non-attainment area. The DEIR states that “the proposed project would unavoidably contribute to the significant cumulative air quality impacts.” (p 1-28) The DEIR also indicates that the “cumulative impacts associated with diesel particulate matter are considered significant and unavoidable”. (p 1-29) The Sierra Club does not believe it is totally unavoidable. The fact you are given a cafeteria list of mitigations to chose from shows that there is more that could and should be done to protect the health of area residents. These need to be required of the project and not just implemented “where feasible” or some other weasel words like “will be considered”. Why isn't there a requirement to exceed current Title 24 at time of construction by at least 25% instead of just “exceed” Title 24? Agreeing to require all of your

off road construction equipment meet or exceed Tier III standards would also significantly help our non-attainment city and county.

2

Continuing to pave over Prime Agricultural lands as well as those of Local and State Importance must be mitigated. Having locally grown products also cuts down on the Climate Change problems mentioned in this letter. The FEIR must show the impacts of losing the citrus groves on Climate Chang/Green house Gas/ Air Quality or it will be inadequate. Recently a developer donated \$100,000 to the Riverside Land Conservancy to help mitigate for the loss of Ag Lands. The San Jacinto Basin Resource Conservation District is another entity which would use your monetary donation to mitigate the loss of important Ag lands as well as the loss of lands for raptor foraging. It is therefore incorrect to say that it is "significant and unavoidable". (p 1-15) The impact to Quincy Channel and other watercourses need to be dealt with at the site and not some far distance place. What will you do to reduce direct and indirect edge effects, habitat fragmentation, and reduced habitat quality during construction as well as at build out? You pay little attention to the loss of what could be Moreno Valley's last significant citrus grove with all its biological value and the FEIR needs to rectify that inadequacy. Please consider how your project will seriously mitigate your impacts to Agriculture, nesting and foraging. The San Jacinto Wildlife Area and nearby lands -- which includes this project's--have more than 20 species of raptors. The Sierra Club would differ with the DEIR that the State-listed Swainson's hawk would not likely use the site, because we see them in this valley. The project's land should not be disced or graded for at least six months prior to doing the Burrowing Owl survey otherwise many will believe you are just making it difficult on this special animal as well as making it more likely it will be listed as endangered. The project's impacts on adjacent lands also need to be analyzed, because of the noise. vibration, fumes and lighting created during the construction as well as operation of this project will impact the Burrowing Owl. You should also make sure your parking provides significant drought tolerant shade trees - not palm trees- and ample reserved spaces for several forms of cars using alternative fuels. The parking lot for cars also needs to be made of porous material to help with ground water recharge and to lessen run off.

3

4

5

6

7

8

9

10

The Sierra Club did not see World Logistic Center on your Cumulative Project List (p 3-16). We do not believe all of your analysis have included this massive project. The FEIR will be inadequate unless this and all other projects are part of the analysis in each area of the FEIR. The projects distance from homes and land zoned for homes needs to be easily understood as well as all the paths trucks could take to the warehouse. This project is only across an intersection form existing homes. Most literature on toxic diesel emissions relate how sensitive receptors need to be at least 1,500 feet from warehouses, roads that diesel trucks use and diesel truck parking areas. How will you accomplish this with the existing residents. The FEIR needs to show all adjacent zoning within at least 2,000 feet. The Sierra Club believes that it will show many lands zoned for residential use which this project will make very unhealthy. What mitigations will be made to these residentially zoned lands and to the project to reduce the direct, indirect and cumulative impacts of more than 2,000,000 sq ft of warehousing? How will you protect the warehouse workers from the long term health affects of breathing toxic diesel emissions throughout their workday and employment? What equipment will you make sure is electric instead of diesel or gasoline in order to lessen pollution and better protect the workers--this includes gardening equipment? The FEIR needs to explain how noise barriers used during construction and use of the warehouse could lessen impacts identified. Impacts to our local

11

12

13

14

streets as well as our very crowded freeways need to be explained so the average citizen will understand. The FEIR-not just appendices- needs to show the length of trips the diesel trucks will be taking when driving to and from the warehouse as well as their routes. We need to know the maximum number of tucks which will use the warehouses/project each workday and not just after the first year, but when all the warehouses/project are being used to its maximum capacity during peak times of the year. Your traffic analysis will be inadequate unless it addresses the July 2012 judgement of the Friends of the Northern San Jacinto Valley and Sierra Club vs County of Riverside concerning the Villages of Lakeview project which is incorporated by reference. Judge Waters mentions the same five-mile radius used in this project was not adequate for traffic and related impact like air quality under CEQA. (p 7 Statement of Decision) The decision makers have a right to know the cumulative impacts before they vote, that the section of SR 60 passing through Moreno Valley will become a parking lot with significant pollution. How will this project’s traffic impact the health of those living near SR60? The FEIR will be inadequate unless this project analyzes all the impacts caused to the Moreno Valley Auto Mall. Simply paying into a pot of money which may not be used in the impacted part of Moreno Valley does not mitigate your traffic.

15
16
17

I. THE DEIR MUST ADEQUATELY ADDRESS THE IMPACTS OF GLOBAL WARMING AND CLIMATE CHANGE

As a potential significant impact, the Final EIR (FEIR) must more thoroughly evaluate alternatives and mitigation measures that would reduce the Project’s greenhouse gas emissions. Curbing greenhouse gas emissions to limit the effects of climate change is one of the most urgent challenges of our time. Fortunately, the California Environmental Quality Act (“CEQA”), Cal. Pub. Res. Code §§ 21000 et seq., 14 Cal. Code Regs. § 15000 et seq. (“Guidelines”), set forth a clear and mandatory process to address the Project’s greenhouse gas and global warming impacts. This letter sets forth how this analysis should be completed.

18

A. THE DEIR MUST ADEQUATELY SET FORTH THE THREAT OF GREENHOUSE GAS POLLUTION AND GLOBAL WARMING

The FEIR must discuss the grave threats posed by global warming to California and the world. Current scientific consensus on climate change has now determined that the link between greenhouse gas emissions and global warming is highly certain. In California, elected leaders, through Executive Order S-03-05 and the California Global Warming Solutions Act of 2006 (AB 32), have also squarely linked greenhouse gases with global warming. In order to conform to CEQA’s informational mandates and properly inform the public and decision makers of the significance of the Project’s contribution to greenhouse gases, the DEIR must first adequately discuss the threat posed by greenhouse gas emissions and avoid minimizing or discounting the severity of global warming’s impacts. *See* Guidelines § 15151. *See, e.g., Laurel Heights Improvement Ass’n v. Regents of Univ. of Cal.* (“Laurel Heights I”), 47 Cal.3d 376, 392 (1988) (EIR is intended “to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action.”); Guidelines § 15151 (requiring an FEIR be detailed, complete, and reflect a good faith effort at full disclosure). A discussion of global warming impacts need not be lengthy, but should, at a minimum, convey the magnitude of the threat posed by global warming to humans and the

environment. For the City’s convenience, a scientific background on global warming and the specific threats posed to California is provided below.

18

i. Scientific Background on Climate Change

There is no longer credible scientific dispute that the climate is warming. In its most recent assessment, the Intergovernmental Panel on Climate Change (“IPCC”) concluded that “[w]arming of the climate is unequivocal, as is now evident from observations of increases in global average air and ocean temperatures, widespread melting snow and ice, and rising mean sea level.” (IPCC 2007a). Expressed as a global average, surface temperatures have increased by about 0.74°C over the last hundred years, with 11 of the 12 warmest years on record having occurred in the past 12 years (IPCC 2007a). In September 2007, Arctic sea ice plummeted to a record-low level not anticipated by most climate models until 2050, leading scientists to predict that the Arctic could be ice-free in summer by 2030 (National Snow & Ice Data Center 2007).¹ Other observed consequences of the warming climate include sea level rise, increased frequency of droughts, floods, and heat waves and substantial increases in the duration and intensity of hurricanes (IPCC 2007a).

The IPCC now states with “very high confidence” that most of the warming observed over the past 50 years is the result of human generation of greenhouse gases, including carbon dioxide, methane, and nitrous oxide² (IPCC 2007a). The rapid warming observed since the 1970s has occurred in a period when the increase in greenhouse gases has dominated over all other factors (IPCC 2007a). The largest known contribution to global warming is from carbon dioxide (IPCC 2007a). Fossil fuel combustion is responsible for more than 75% of human caused carbon dioxide emissions with the remainder due to land-use change (primarily deforestation) (IPCC 2007a). The global atmospheric concentration of carbon dioxide has increased from a pre-industrial value of about 280 parts per million (ppm) to 379 ppm in 2005, a level that has not been exceeded during the past 650,000 years (during which carbon dioxide concentrations remained between 180 and 300 ppm). (IPCC 2007a; Canadell et al. 2007). In 2006, carbon dioxide concentrations reached a new high of 381.2 ppm (World Metrological Organization 2007). As greenhouse gas concentrations increase, more heat reflected from the earth’s surface is absorbed by these greenhouse gases and radiated back into the atmosphere and to the earth’s surface.³ Consequently, the higher the level of greenhouse gas concentrations, the larger the degree of warming experienced.

19

At current growth rates and continued reliance on fossil fuels, atmospheric concentrations of carbon dioxide would likely exceed 1,000 ppm by the end of the century, resulting in an average global temperature increase of more than 5°C (United Nations Foundation & Sigma XI 2007). This is equivalent to the change in temperature since the last ice age – an era in which Europe and North America was under more than one kilometer of ice (United Nations

¹ Based on the startling loss of sea ice in 2007, some scientists have predicted that “the Arctic Ocean could be nearly ice-free at the end of the summer by 2012.” Seth Borenstein, *Ominous Arctic Melt Worries Experts*, Associated Press, Dec. 11, 2007.

² IPCC, 2007: *Summary for Policymakers*, in CLIMATE CHANGE 2007: THE PHYSICAL SCIENCE BASIS, CONTRIBUTION OF WORKING GROUP I TO THE FOURTH ASSESSMENT REPORT OF THE INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE at 4 (Susan Solomon et al. eds., Cambridge Univ. Press 2007) at 2-3. “Very high confidence” is defined at “at least a 9 out of 10 chance of being correct.” *Id.* at 3 n.7.

³ Greenhouse gases have a warming effect because, when solar radiation is reflected by the earth, greenhouse gases capture this thermal radiation and reradiate it back to earth, much like the effect of a common garden greenhouse resulting in the “greenhouse effect.”

Foundation & Sigma XI 2007). The growing consensus among climate scientists is that the threshold for dangerous climate change, whereupon a potential “tipping point” is reached and ecological changes become dramatically more rapid and out of control, is estimated at a temperature increase of around 2°C from pre-industrial levels, or an atmospheric concentration of carbon dioxide of approximately 450 ppm (United Nations Foundation & Sigma XI 2007; IPCC 2007c). In 2006, Dr. James E. Hansen, Director of the NASA Goddard Institute for Space Studies, and NASA’s top climate scientist, stated: “In my opinion there is no significant doubt (probability > 99%) that . . . additional global warming of 2° C would push the earth beyond the tipping point and cause dramatic climate impacts including eventual sea level rise of at least several meters, extermination of a substantial fraction of the animal and plant species on the planet, and major regional climate disruptions” (Hansen et al. 2006). More recently however, given the recent unpredicted and extreme rate of loss of arctic ice observed in 2007, Dr. Hansen concluded that “the safe upper limit for atmospheric CO₂ is no more than 350 ppm” (McKibben 2007). Moreover, according to Hansen, just 10 more years of “business-as-usual” global emissions will make it difficult, if not impossible, to keep atmospheric concentrations of greenhouse gases at levels necessary to avoid a temperature increase above 2°C (Hansen et al. 2007).

Keeping the climate within the 2°C threshold requires significant reductions in the world’s greenhouse gas emissions. To reach this objective, it is estimated that developed countries would have to target an emissions peak between 2012 and 2015, with 30 percent cuts by 2020 and 80 percent cuts from 1990 levels by 2050 (United Nations Foundation & Sigma XI 2007). In recognition of need for immediate action, California has committed itself through Executive Order S-3-05 and the California Global Warming Solutions Act to reduce the state’s emissions to 1990 levels by 2020 and by 80% reductions from 1990 levels by 2050. Ca. Health & Safety Code § 38550; Cal. Executive Order S-3-05 (2005).

The costs of taking no action to reduce greenhouse gas emissions far outweigh the costs of stabilizing emissions. The Stern Review of the Economics of Climate Change, a comprehensive report commissioned by the British government, recently concluded that allowing current emissions trajectories to continue unabated would eventually cost the global economy between 5 to 20 percent of GDP each year within a decade, or up to \$7 trillion, and warned that these figures should be considered conservative estimates (Stern 2006). By contrast, measures to mitigate global warming by reducing emissions were estimated to cost about one percent of global GDP each year, and could save the world up to \$2.5 trillion per year (Stern 2006). The Stern Report determined that if no action is taken to control greenhouse gas emissions, each ton of CO₂ emitted causes damage worth at least \$85 (Stern 2006).

ii. Impacts to California from Global Warming

Climate change poses enormous risks to California. Scientific literature on the impact of greenhouse gas emissions on California is well developed.⁴ The California Climate Change Center (“CCCC”) has evaluated the present and future impacts of climate change to California and the project area in research sponsored by the California Energy Commission and the California Environmental Protection Agency (Cayan et al. 2007). The severity of the impacts facing California is directly tied to atmospheric concentrations of greenhouse gases (Cayan et al. 2007; Hayhoe et al. 2004). According to the CCCC aggressive action to cut greenhouse gas

⁴ Additional reports issued by California agencies are available at <http://www.climatechange.ca.gov>, and IPCC

emissions today can limit impacts, such as loss of the Sierra snow pack to 30%, while a business-as-usual approach could result in as much as a 90% loss of the snowpack by the end of the century. As aptly noted in a report commissioned by the California EPA:

Because most global warming emissions remain in the atmosphere for decades or centuries, the choices we make today will greatly influence the climate our children and grandchildren inherit. The quality of life they experience will depend on if and how rapidly California and the rest of the world reduce greenhouse gas emissions (Cayan et al. 2007).

Some of the types of impacts to California and estimated ranges of severity – in large part dependent on the extent to which emissions are reduced – are summarized as follows:

- A 30 to 90 percent reduction of the Sierra snowpack during the next 100 years, including earlier melting and runoff.
- An increase in water temperatures at least commensurate with the increase in air temperatures.
- A 6 to 30 inch rise in sea level, before increased melt rates from the dynamical properties of ice-sheet melting are taken into account.
- An increase in the intensity of storms, the amount of precipitation and the proportion of precipitation as rain versus snow.
- Profound impacts to ecosystem and species, including changes in the timing of life events, shifts in range, and community abundance shifts. Depending on the timing and interaction of these impacts, they can be catastrophic.
- A 200 to 400 percent increase in the number of heat wave days in major urban centers.
- An increase in the number of days meteorologically conducive to ozone (O₃) formation.
- A 55 percent increase in the expected risk of wildfires (Cayan et al. 2007).

By providing details as to the ranges of proposed impacts, and indicating that the higher-range of impact estimates are projected if greenhouse gas emissions continue to increase under a “business as usual” scenario, decision-makers and the public will be better informed of the magnitude of the climate crisis and the urgency with which it must be addressed.

Finally, the DEIR should also include a brief discussion of other laws to address climate change, including California’s mandate to reduce emissions to 1990 levels by 2020 and goal of further reducing emissions to 80% below 1990 levels by 2050. Achievement of state mandated emissions reductions will be severely impeded if agencies across the state continue to approve *new* projects without incorporating measures to reduce the added emissions created by these.

20

B. The EIR the Project Must Include an Inventory and Analysis of the Project’s Projected Greenhouse Gas Emissions

The first step in determining a project’s greenhouse gas pollution impact is to complete a full inventory of all emissions sources. In conducting such an inventory, all phases of the proposed project must be considered. *See* 14 Cal. Code Regs. § 15126. A basic requirement of CEQA is that “[a]n EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences.” 14 Cal. Code Regs. § 15151. The greenhouse gas inventory for a project must include a complete analysis of all of a project’s substantial sources of greenhouse gas emissions, from building materials and construction emissions to operational energy use, vehicle trips, water supply and waste disposal.

21

A greenhouse gas inventory for the project must include the project's direct and indirect greenhouse gas emissions. *See* 14 Cal. Code Regs. § 15358(a)(1) (Indirect or secondary effects may include effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems.). Consequently, a complete inventory of a project's emissions should include, at minimum, an estimate of emissions from the following:

- Fugitive emissions of greenhouse gases, such as methane, from the proposed project;
- Emissions during construction from vehicles and machinery;
- Manufacturing and transport of building materials;
- Electricity generation and transmission for the heating, cooling, lighting, and other energy demands of the project;
- Water supply and transportation to the project;
- Vehicle trips and transportation emissions generated by the project;
- Wastewater and solid waste storage or disposal, including transport where applicable; and
- Outsourced activities and contracting.

Methodologies are readily available to inventory the emissions from the proposed project. In its recent white paper, CEQA & Climate Change, Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act (Jan. 2008), the California Air Pollution Control Officers Association (CAPCOA) set forth methodologies for analyzing greenhouse gas pollution (CAPCOA 2008). The California Office of Planning and Research ("OPR") has also released technical guidance on the preferred approach for analyzing greenhouse gas emissions and climate change entitled "Technical Advisory, CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act Review" (California OPR 2008). OPR also provides references to methodologies to quantify greenhouse gas emissions. In addition to the methodologies set forth by CAPCOA and OPR, ICLEI's Clean Air/Climate Protection (CACP) software allows cities to calculate emissions reductions, track and quantify emission outputs, and develop emissions scenarios to inform the planning process.⁵ As noted in the ICLEI Climate Action Handbook, "Expertise in climate science is not necessary" to conduct an emissions inventory and compare this inventory against a forecast year (ICLEI). "A wide range of government staff members, from public works to environment and facilities departments, can conduct an inventory" (ICLEI). ICLEI also provides technical assistance and training to local government using the CACP software. It is incumbent on the City to "disclose all it can" about project impacts and educate itself on methodologies that are available to measure project emissions. *Berkeley Keep Jets Over the Bay Comm. v. Board of Port Comm'rs* ("Berkeley Jets"), 91 Cal. App. 4th 1344, 1370 (2001).

As with any other project under CEQA, the baseline used for analyzing the impacts of a project is the existing on the ground environmental conditions at the time of the NOP. *See Environmental Planning & Information Council v. County of El Dorado (EPIC)*, 131 Cal.App.3d 350, 355 (1982) (effect of general plan amendment must be compared against actual

⁵ ICLEI's Clean Air/Climate Protection software is available at <http://www.cacpsoftware.org/> ICLEI-Local Governments for Sustainability is an international association of more than 650 local governments. Cities, counties, towns and villages around the world are members of ICLEI. ICLEI's mission is to improve the global environment through local action. On the issue of global warming, for example, ICLEI provides resources, tools, peer networking, best practices, and technical assistance to help local governments measure and reduce greenhouse gas emissions in their communities.

environment, not assumptions in existing general plan). Accordingly, the DEIR should compare emissions from existing conditions with those that would result from the development of the project, as well as those that would occur under any proposed alternative scenarios. Because the Project envisions development over a long period, the EIR should also provide data on the trajectory for emissions in the planned community and under each proposed alternative in five-year increments.

21

Without a complete inventory, the DEIR cannot adequately inform the public and decision-makers about the Project’s impacts. Similarly, without a complete inventory and analysis of greenhouse gas emissions that will result from the project, there is simply no way that The EIR can then adequately discuss alternatives, avoidance, and mitigation measures to reduce those impacts.

C. THE EIR MUST ADDRESS THE IMPACT GLOBAL WARMING WILL HAVE ON THE PROJECT

California’s temperatures are expected to rise “dramatically” over the course of this century (Cayan 2007). These factors will impact the planned project, as well as exacerbate its own environmental impacts.

The rise in temperatures resulting from global warming will create a more conducive environment for air pollution formation (Cayan 2007). This will intensify the adverse effects the proposed project will already have on air quality in the project area and threaten residents’ health (Cayan 2007).

Significantly for the state, as well as the project area, is global warming’s impact on water supply. The IPCC specifically identified the American West as vulnerable, warning, “Projected warming in the western mountains by the mid-21st century is very likely to cause large decreases in snowpack, earlier snow melt, more winter rain events, increased peak winter flows and flooding, and reduced summer flows” (IPCC 2007b). Recently, researches found that an increase in atmospheric greenhouse gases has contributed to a “coming crisis in water supply for the western United States” (Barnett 2008). Using several climate models and comparing the results, the researches found that “warmer temperatures accompany” decreases in snow pack and precipitation and the timing of runoff, impacting river flow and water levels (Barnett 2008). These researchers concluded with high confidence that up to 60 percent of the “climate related trends of river flow, winter air temperature and snow pack between 1950-1999” are human-induced.

22

(Barnett 2008). This, the researchers wrote, is “not good news for those living in the western United States” (Barnett 2008).

The California Center on Climate Change has also recognized the problem global warming presents to the state’s water supply and predicts that if greenhouse gas emissions continue under the business-as-usual scenario, this snowpack could decline up to 70-90 percent, affecting winter recreation, water supply and natural ecosystems (Cayan 2007). Global warming will affect snowpack and precipitation levels, and California will face significant impacts, as its ecosystems depend upon relatively constant precipitation levels and water resources are already under strain (Cayan 2007). The decrease in snowpack in the Sierra Nevada will lead to a decrease in California’s already “over-stretched” water supplies (Cayan 2007). It could also potentially reduce hydropower and lead to the loss of winter recreation (Cayan 2007). All of this means “major changes” in water management and allocation will have to be made (Cayan 2007). Thus, global warming may directly affect the City’s ability to supply clean, affordable water to the residents, or force the City to change how it will utilize water, and it may also impact other

activities outside the project area, such as agriculture.

Scientists indicate that climate change will also exacerbate the problem of flooding by increasing the frequency and magnitude of large storms, which in turn will cause an increase in the size and frequency of flood events (NRDC 2007). The increasing cost of flood damages and potential loss of life will put more pressure on water managers to provide greater flood protection (NRDC 2007). At the same time, changing climate conditions (decreased snowpack, earlier runoff, larger peak events, etc.) will make predicting and maximizing water supply more difficult (NRDC 2007). These changes in hazard risk and water supply availability must be considered during environmental review.

Water quality, in addition to water quantity and timing, will also be impacted. Changes in precipitation, flow, and temperature associated with climate change will likely exacerbate water quality problems (NRDC 2007). Changes in precipitation affect water quantity, flow rates, and flow timing (Gleick 2000). Shifting weather patterns are also jeopardizing water quality and quantity in many countries, where groundwater systems are overdrawn (Epstein 2005). Decreased flows can exacerbate the effect of temperature increases, raise the concentration of pollutants, increase residence time of pollutants, and heighten salinity levels in arid regions (Schindler 1997).

These are only examples of how global warming will impact the proposed project and intensify the environmental impacts the project will already have. It is not an exhaustive list. Thus, when assessing the impact of the Project on air quality, water supply, flood hazards, and biological resources, the EIR must take into account global warming. To ignore the impact of global warming on the Project and the resources impacted by the Project would significantly understate Project impacts.

22

D. THE PROJECT'S GREENHOUSE GAS IMPACTS ARE CLEARLY SIGNIFICANT

The greenhouse gas emissions generated by a project of this size and scope will have a clearly significant cumulative impact. An impact is considered significant where its “effects are individually limited but cumulatively considerable.” Guidelines \square 15065(a)(3). Climate change is the classic example of a cumulative effects problem; emissions from numerous sources combine to create the most pressing environmental and societal problem of our time. *Ctr. for Biological Diversity*, 508 F.3d 508, 550 (9th Cir. 2007) (“the impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis that NEPA requires agencies to conduct.”); *Kings County Farm Bureau v. City of Hanford*, 221 Cal. App. 3d 692, 720 (1990) (“Perhaps the best example [of a cumulative impact] is air pollution, where thousands of relatively small sources of pollution cause a serious environmental health problem.”). While a particular project’s greenhouse gas emissions represent a fraction of California’s total emissions, courts have flatly rejected the notion that the incremental impact of a project is not cumulatively considerable because it is so small that it would make only a de minimis contribution to the problem as a whole. *Communities for a Better Environment v. California Resources Agency*, 103 Cal.App.4th 98, 117 (2002); see also *Kings County Farm Bureau*, 221 Cal. App. 3d at 720 (“[p]erhaps the best example of [a cumulative impact] is air pollution, where thousands of relatively small sources of pollution cause a serious environmental health problem.”). In addition, there is nothing speculative about the fact that higher levels of greenhouse gas pollution will lead to greater impacts, which is why the State of California has prioritized greenhouse gas pollution reductions under AB 32. Moreover, in the analogous context of the National Environmental Policy Act (NEPA), the Ninth Circuit has already rejected the argument

23

that “global warming is too speculative to warrant NEPA analysis.” *Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*, 508 F.3d at 554.

In addition, lack of established significance thresholds does not excuse an agency from its obligation under CEQA to determine the significance of a Project’s impacts. CEQA routinely calls for an agency to evaluate impacts in the absence of thresholds or to exercise its individual discretion in determining the significance of an impact. *See, e.g., Protect the Historic Amador Waterways*, 116 Cal. App. 4th at 1111 (agency required to assess potential impact not listed in CEQA checklist). The development of significance thresholds is “encouraged” and not a prerequisite for an impact analysis. Guidelines □ 15064.7. Indeed, as noted in the CAPCOA white paper on CEQA and Climate Change, “[t]he absence of a threshold does not in any way relieve agencies of their obligations to address GHG emissions from projects under CEQA” (CAPCOA 2008). In fact, CEQA may require additional analysis even if a project meets an adopted standard, if other evidence indicates the project may nonetheless have a significant impact. *See Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners*, 91 Cal.App.4th 1344, 1380-82 (2001).

As the lead agency, CEQA requires the City to determine the significance of the Project’s emissions with or without established significance thresholds. Guidelines □ 15064. CAPCOA provides various means by which a lead agency can determine the significance of project emissions (CAPCOA 2008). Importantly, a universally adopted methodology is *not* necessary to analyze project impacts. *Berkeley Keep Jets*, 91 Cal.App.4th at 1370 (“the fact that a single methodology does not exist...requires the [respondent] to do the necessary work to educate itself about the different methodologies that *are* available.”).

“The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data.” Guidelines □ 15064(b). Any determination of whether there is a fair argument that the project may have a significant impact must include the consideration of the California Global Warming Solutions Act of 2006 (AB 32), wherein the State of California recognized that “global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California” and required that existing levels of greenhouse gases be reduced to 1990 levels by 2020. Health & Safety Code □□ 38501(a), 38550. Because AB 32 establishes that existing greenhouse gas levels are unacceptable and must be substantially reduced within a fixed timeframe, any additional emissions that contribute to existing levels frustrate California’s ability to meet its ambitious and critical emissions reduction mandate. Ignoring emissions from smaller sources would be neglecting a major portion of the greenhouse gas inventory.

In accordance with the scientific and factual data, the City should adopt a zero significance threshold for the Project’s greenhouse gas emissions. As noted by the Ninth Circuit in *Center for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*:

[W]e cannot afford to ignore even modest contributions to global warming. If global warming is the result of the cumulative contributions of myriad sources, any one modest in itself, is there not a danger of losing the forest by closing our eyes to the felling of the individual trees?

508 F.3d 508, 550 (9th Cir. 2007). Accordingly, the City must unequivocally consider Project emissions to be a potentially significant impact.

E. THE EIR MUST ANALYZE AND ADOPT ALL FEASIBLE MITIGATION MEASURES TO REDUCE THE PROJECT’S GREENHOUSE GAS EMISSIONS

23

24

In addition to thoroughly evaluating project alternatives, because it is clear that the project’s greenhouse gas emissions will cumulatively contribute to global warming, “the EIR must propose and describe mitigation measures that will minimize the significant environmental effects that the EIR has identified.” *Napa Citizens for Honest Gov’t v. Napa County Bd. of Supervisors*, 91 Cal.App.4th 342, 360 (2001). CEQA requires that agencies “mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so.” Pub. Res. Code § 21002.1(b). Mitigation of a project’s significant impacts is one of the “most important” functions of CEQA. *Sierra Club v. Gilroy City Council*, 222 Cal.App.3d 30, 41 (1990). Therefore, it is the “policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures which will avoid or substantially lessen the significant environmental effects of such projects.” Pub. Res. Code § 21002. Importantly, mitigation measures must be “fully enforceable through permit conditions, agreements, or other measures” so “that feasible mitigation measures will actually be implemented as a condition of development.” *Federation of Hillside & Canyon Ass’ns v. City of Los Angeles*, 83 Cal.App.4th 1252, 1261 (2000).

24

To the extent that the project moves forward as planned, there are many mitigation measures the City can consider, as described below. This is not an exhaustive list and the EIR should explore these and all other feasible mitigation measures that will reduce the project’s greenhouse gas emissions (CAPCOA 2008; California Office of the Attorney General 2008).

i. Land Use Measures Reducing Traffic Flow

The development plan for the proposed project should incorporate public transit into the project design and should attempt to facilitate the use of public transit. (California Office of the Attorney General 2008). Additionally, the FEIR should analyze ways of including pedestrian and bicycle only streets and plazas within the development and create routes that will allow residents to reach the commercial center, schools and parks by public transportation, bicycling and walking.

25

ii. Land Use and Energy

The FEIR should consider mitigation measures that will ensure the planned community will use energy efficiently and conservatively. In doing so, it should analyze incorporating “green building” in the development. Green buildings are those buildings that lower energy consumption, use renewable energy, conserve water, harness natural light and ventilation, use environmentally friendly materials and minimize waste (Commission for Environmental Cooperation 2008).

Buildings create environmental impacts throughout their lifecycle, from the construction phase to their actual use to their eventual destruction (Commission for Environmental Cooperation 2008). In the United States, buildings account for 40 percent of total energy use, 68 percent of total electricity consumption, and 60 percent of total non-industrial waste (Commission for Environmental Cooperation 2008). Buildings also significantly contribute to the release of greenhouse gases. In the U.S. they account for 38 percent of total carbon dioxide emissions (Commission for Environmental Cooperation 2008). More specifically, residential buildings cause up to 1,210 megatons of carbon dioxide, while commercial building create approximately 1,020 megatons (Commission for Environmental Cooperation 2008). This is because buildings require a lot of energy for their day to day operations. Most of the coal-fired

26

power plants – one of the biggest sources of greenhouse gas emissions – slated for development in the United States will supply buildings with the energy they need. In fact, 76 percent of the energy these plants produce will go to operating buildings in the U.S. (Commission for Environmental Cooperation 2008).

Using green building techniques, however, can substantially reduce buildings' influence in increasing greenhouse gas emissions. Green buildings help reduce the amount of energy used to light, heat, cool and operate buildings and substitute carbon-based energy sources with alternatives that do not result in greenhouse gas emissions (Commission for Environmental Cooperation 2008). Currently green buildings can reduce energy by 30 percent or more and carbon emissions by 35 percent. (Commission for Environmental Cooperation 2008). The technologies available for green building are already in wide-use and include "passive solar design, high-efficiency lighting and appliances, highly efficient ventilation and cooling systems, solar water heaters, insulation materials and techniques, high-reflectivity building materials and multiple glazing (IPCC 2007c). Additionally, the U.S. Green Building Council (USGBC), a private, nonprofit corporation, has established a nationwide green building rating system, called Leadership in Energy and Environmental Design ("LEED"). The LEED standard supports and certifies successful green building design, construction and operations. It is one of the most widely used and recognized systems, and to obtain LEED certification from the USGBC, project architects must verify in writing that design elements meet established LEED goals.

Specific mitigation for the greenhouse gas emissions generated by the Project's energy consumption include, but are not limited to:

- Analyzing and incorporating the U.S. Green Building Council's LEED (Leadership in Energy and Environmental Design) or comparable standards for energy efficient building during pre-design, design, construction, operations and management.
- Designing buildings for passive heating and cooling, and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.;
- Designing buildings for maximum energy efficiency including the maximum possible insulation, use of compact florescent or other low-energy lighting, use of energy efficient appliances, etc.
- Reducing the use of pavement and impermeable surfaces;
- Requiring water re-use systems;
- Installing light emitting diodes (LEDs) for traffic, street and other outdoor lighting
- Limiting the hours of operation of outdoor lighting
- Maximizing water conservation measures in buildings and landscaping, using droughttolerant plants in lieu of turf, planting shade trees;
- Ensure that the Project is fully served by full recycling and composting services;
- Ensure that the Project's wastewater and solid waste will be treated in facilities where greenhouse gas emissions are minimized and captured.
- Installing the maximum possible photovoltaic array on the building roofs and/or on the project site to generate all of the electricity required by the Project, and utilizing wind energy to the extent necessary and feasible;
- Installing solar water heating systems to generate all of the Project's hot water requirements;
- Installing solar or wind powered electric vehicle and plug-in hybrid vehicle charging stations to reduce emissions from vehicle trips.

iii. Mitigation Related to Project Construction

26

12

27

- Utilize recycled, low-carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials;
- Minimize, reuse, and recycle construction-related waste;
- Minimize grading, earth-moving, and other energy-intensive construction practices;
- Landscape to preserve natural vegetation and maintain watershed integrity;
- Utilize alternative fuels in construction equipment and require construction equipment to utilize the best available technology to reduce emissions.

27

iv. Transportation Mitigation Measures

- Encourage and promote ride sharing programs through such methods as a specific percentage of parking spaces for ride sharing vehicles;
 - Create a car sharing program within the planned community;
 - Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system;
 - Provide necessary facilities and infrastructure to encourage residents to use low or zero-emission vehicles, for example, by developing electric vehicle charging facilities and conveniently located alternative fueling stations;
- Provide a shuttle service to public transit within and beyond the planned community;•
 Incorporate bicycle lanes and routes into the planned community’s street systems.

28

v. Carbon Offsets

After all measures have been implemented to reduce emissions in the first instance, remaining emissions that cannot be eliminated may be mitigated through offsets. Care should be taken to ensure that offsets purchased are real (additional), permanent, and verified, and all aspects of the offsets must be discussed in the FEIR. As demonstrated by the Office of the Attorney General offsets are a feasible CEQA mitigation measures⁶ once all feasible mitigation measures have been adopted to reduce the Project’s carbon footprint and produce energy using renewable sources.

29

II. THE EIR MUST CONSIDER A REASONABLE RANGE OF ALTERNATIVES

The EIR must consider a meaningful analysis of reasonable alternatives to the Project in order to lessen or avoid the Project’s significant impacts. CEQA mandates that significant environmental damage be avoided or substantially lessened where feasible. Pub. Res. Code □ 21002; Guidelines □□ 15002(a)(3), 15021(a)(2), 15126(d). A rigorous analysis of reasonable alternatives to the project must be provided to comply with this strict mandate. “Without meaningful analysis of alternatives in the EIR, neither courts nor the public can fulfill their proper roles in the CEQA process.” *Laurel Heights Improvement Ass’n v. Regents of University of California*, 47 Cal.3d 376, 404 (1988). Moreover, “[a] potential alternative should not be excluded from consideration merely because it ‘would impede to some degree the attainment of the project objectives, or would be more costly’ even when that alternative includes Project development on an alternative site. *Save Round Valley Alliance v. County of Inyo*, 157 Cal. App.

30

⁶ The California Attorney General’s Office has adopted CEQA settlements calling for the auditing, reduction, and offsetting of greenhouse gas emissions related with a Project demonstrating that offsets are a feasible way to reduce a Project’s negative environmental effects on global warming. See <http://ag.ca.gov/newsalerts/release.php?id=1466&category=global%20warming> See generally <http://ag.ca.gov/globalwarming/ceqa.php>

4th 1437, 1456-57 (2007) (quotations omitted). In analyzing the no-project alternative, the EIR must discuss the need for this project and whether the uses that would potentially utilize the Project can be accommodated in existing areas. As CAPCOA states in its white paper, one way local governments can avoid significant increases in greenhouse gas emissions and help solve the problem of global warming is to “facilitate more efficient and economic use of the lands” already developed within the community (CAPCOA 2008). Reinvesting in existing communities is “appreciably” more efficient than new development and may even result in a net reduction of greenhouse gases (CAPCOA 2008). The EIR should consider an alternative that relies more on higher-density mixed commercial/residential development projects on existing disturbed lands in order to support the reduction of vehicle trips, promote alternatives to individual vehicle travel, and encourage efficient delivery of services and goods (Office of the California Attorney General 2008).

30

An analysis of alternatives should also quantify the estimated greenhouse gas emissions, quantified impacts to biological resources, water resources including water quality and water availability, and traffic resulting from each proposed alternative. The no project alternative where the existing General Plan and zoning is implemented is the most appropriate use of these lands. Much more comparisons and analysis needs to be done with these alternatives. Where is the alternative which mentions agricultural uses in total or part? The quality of this land is such that even I could become a successful farmer.

CONCLUSION

Thank you for your attention to these comments. Moreno Valley needs to make sure that this and other environmental documents are also in Spanish. The 2010 census shows that 55% of our residents are Latino with almost 25% foreign born. It is a social justice issue which needs to be corrected. Since your Notice of Preparation (NOP) is more than four years old, the Sierra Club believes you should start again with a new NOP and recirculate the DEIR in English/Spanish. We look forward to working with the City to assure that the FEIR conforms to the requirements of CEQA and to make sure that all significant impacts to the environment are thoroughly analyzed, mitigated or avoided. I hope the FEIR will fully address the concerns found within this letter including the direct, indirect, cumulative and growth inducing impacts of this massive warehouse project as I did not see that within the DEIR. How will this project which is adjacent to lands zoned for housing impact Moreno Valley’s General Plan and land use? The Sierra Club does not believe this General Plan amendment and zone change is in the best interest of our City. The Sierra Club wishes to be placed on the mailing list for all future meetings, notices and documents regarding this project. Please mail these to Sierra Club, San Gorgonio Chapter, Moreno Valley Group, 26711 Ironwood Ave, Moreno Valley, CA. 92555.

31

Thank you,

George Hague

RESPONSE TO LETTER D-2

SIERRA CLUB

Response to Comment 1. The City believes the following responses address the comments submitted by the Sierra Club relative to this EIR on all the topics indicated. Short-term and long-term project specific and cumulative effects of the proposed project on air quality are evaluated in Section 4.3, *Air Quality* (pages 4.3-1 through 4.3-38) in the Draft EIR. Greenhouse gas emissions and climate change were evaluated in Section 4.13, *Global Climate Change* (4.13-1 through 4.13-22) in the Draft EIR. Where the proposed project's impacts were determined to be significant mitigation was provided to lessen those impacts. It was determined that even with the implementation of feasible mitigation measures the proposed project will have a significant and unavoidable impact on short-term construction air quality, long-term operational air quality impacts, cumulative air quality, and cumulative greenhouse gas emissions.

The concerns raised by the commenter have been responded to in the following Response to Comments 1 through 31. Any comments that were raised by the commenter that resulted in additions or revisions to the language in the Draft EIR are provided in Section 3.0, *Errata and Additions*, of this Final EIR.

Lastly, the commenter inaccurately suggests that the project should be required to obtain a LEED Silver or Gold rating as a form of mitigation of significant impacts associated with air pollution and greenhouse gas emissions. The process of obtaining a LEED rating is not mitigation. The specific green building features that are part of the LEED rating equation can reduce air pollution and greenhouse gas emissions impacts by minimizing and reducing the quantity of emissions associated with operations of a building. To clarify, Section 3.5.3, Green Building Construction, in the Project Description states that "The applicant has indicated the buildings will be designed to qualify for certification under the Leadership in Energy and Environmental Design (LEED) program, but there are no plans to submit the project for actual LEED certification at this time due to cost and time delay factors." (EIR page 3-12). The applicant will formally apply for LEED Certified status, but the ultimate determination of the level of compliance is up to the LEED organization and cannot be guaranteed with any certainty at this point in time, since the final engineering will not occur until after certification of the EIR.

Response to Comment 2. See Response No. 1 above regarding LEED certification. In addition, the applicant has agreed that the project will be constructed to accommodate solar photovoltaic panels in the future. Additional information in this regard is found in the responses to the comments by the South Coast Air Quality Management District (Letter B-3).

The opinions stated by the Sierra Club regarding the significance of project and cumulative air quality impacts are unsubstantiated. The air quality analysis in the EIR includes a detailed analysis showing that the cumulative impacts are unavoidable. The "cafeteria list" of mitigation measures listed in Mitigation Measure 4.3.6.5B is included to minimize the air quality impacts from the area and energy emissions. As described in EIR Section 4.3.6.5, page 4.3-34: *"Although implementation of Mitigation Measures 4.3.6.5A through 4.3.6.5B may reduce vehicle trips associated with the proposed project, it is not possible to quantify the reduction in the amount of emissions that may occur. Considering the volume of emissions generated and current commuter habits, it is unlikely the implementation of TDMs/TCMs will result in a reduction of operational project emissions to below existing SCAQMD thresholds. Application of Leadership in Energy and Environmental Design (LEED) standards and green building design principles could reduce emissions from building operations such as heating and cooling; however, such standards and principles would not reduce emissions of CO, ROG, NO_x, PM₁₀, and PM_{2.5} to below SCAQMD thresholds. No other feasible mitigation measures have been identified to reduce the operational emissions of CO, ROG, NO_x, PM₁₀, and PM_{2.5} to a less than*

significant level.” Further, the commenter mixed the short-term construction impacts with the long-term operational impacts – the majority of the comment above is about long-term operational impacts, however the last sentence is about short-term construction impacts and would not help reduce long-term emissions. The emissions control measures listed in Mitigation Measures 4.3.6.2A through 4.3.6.2M are adequate to reduce the short-term construction measures. However, the City and the applicant have agreed to add the Tier III requirement into Mitigation Measure 4.3.6.2C. The measure has been amended as follows as is included in Final EIR, Section 3.0, *EIR Errata and Additions*:

4.3.6.2C *Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.*

Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 3 off-road emission standards. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

Post January 1, 2015: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

A copy of each unit's certified tier specifications, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

However, several air quality related mitigation measures have been modified as a result of discussion in the Final EIR (refer to Final EIR, Section 3.0 *EIR Errata and Additions*). The list of mitigations included in the Air Quality section are qualified by “where feasible” because the EIR can only require a project to implement feasible mitigation measures, and at this time it is not possible to determine mitigation measure feasibility. The determination will only be possible once operations have begun and will have to be determined by the project operator in cooperation with the City. Additionally, mandating that the construction process exceed Title 24 by a particular percentage makes the mitigation measure infeasible – there is no way to determine by what percentage the construction operations exceed Title 24.

The modified measures are also in the Mitigation Monitoring and Reporting Plan in Section 4.0 in the Final EIR to ensure they are implemented

Response to Comment 3. As documented in Section 4.2 of the Draft EIR, farming is no longer a viable economic activity in this portion of Riverside County, and the General Plans of the County and City both identify land uses that will a transition from historical agricultural land to appropriate suburban land uses. This proposed project represents a step in that anticipated transition.

This commenter also states that a developer recently donated \$100,000.00 to the Riverside Land Conservancy to help mitigate for the loss of agricultural lands but fails to appropriately cite the

information and identify the basis for determining the amount of agricultural lands lost in relation to this monetary amount. In discussion with Gail Egenes, Executive Director of the Riverside Land Conservancy, the agency does not have any established program to purchase agricultural easements or lands. Also, in consultation with the National Conservation Easement Database, Riverside County does not have any established agricultural easements.¹

Contributions to Riverside County Land Conservancy or the San Jacinto Basin Resource Conservation District by private land owners are laudable but are not required as part of a City or regional mitigation plan for loss of agricultural land. Therefore, the decision whether to make any contributions in this regard would be at the discretion of the developer in consultation with the City. For additional detailed analysis on this issue, see Responses 22 and 23 in the letter from Johnson & Sedlack (D-3). Since there is no feasible mitigation available, the impact has been identified as significant and unavoidable, and the City will have to adopt a Statement of Overriding Considerations as part of its Findings on the EIR prior to action on the project.

The project's greenhouse gas (GHG) emission assessment assumes the citrus groves are not present onsite, which we consider to be a "worst case" estimate of greenhouse gases related to the proposed project. The Draft EIR determined that GHG impacts would be less than significant with implementation of the proposed mitigation, and this information does not alter that conclusion.

The project site likely provides some amount of raptor foraging habitat, as outlined on page 4.4-2 of the Draft EIR. However, there are few large trees suitable for raptor perching and roosting (i.e., the citrus trees do not contribute much in this regard), and the site is proximate to human activity at its southeast and northwest corners, as well as SR-60 along its northern boundary. Therefore, the value of the project site for raptor foraging is marginal at best. The DEIR concluded project impacts on raptor foraging were less than significant with implementation of Mitigation Measure 4.4.6.1A to address impacts on nesting birds (DEIR page 4-29). In addition, any incremental cumulative impact on raptor foraging would be mitigated by the project's payment of the MSHP fee.

Response to Comment 4. Section 4.4 of the Draft EIR fully evaluates and minimizes impacts to the Quincy Channel, the main onsite drainage feature. The offsite mitigation for onsite impacts is mainly for removal of the two degraded erosional drainage channels along the west and southwest portions of the site. As shown on the project site plan (Figure 1.2 in the Draft EIR), the project would protect the Quincy Channel essentially intact (only 0.04 acre permanent impact and 0.03 acre temporary impact) along the eastern boundary of the project site. The impacts are outlined in Table 4.4.D of the EIR and the planned improvements are shown in Figures 1.2, 3.6.B, and 3.6.F, and Appendix K-3 A-1 Master Architectural Plan which shows the channel and bridge notes.

Response to Comment 5. There is no empirical evidence presented that would support the contention that the citrus groves on the project site provide significant biological habitat. The orchard property and the trees are subject to human disturbance on a regular basis, and are immediately adjacent to the SR-60 Freeway. The trees are maintained such that they provide minimal or no potential for roosting or perching by raptors, although some songbirds may utilize them and the fruit to some degree. A detailed biological assessment was prepared for the project to document consistency with the County's MSHCP, of which the City is a signatory. It came to a similar conclusion (i.e., the site has very low value as biological habitat).

Response to Comment 6. Impacts related to agriculture and raptor foraging are addressed in Sections 4.2 and 4.4 of the Draft EIR, and in Responses 3 and 5 above.

¹ <http://nced.conservancyregistry.org/browse/map>, accessed October 4, 2012.

Response to Comment 7. The observation of Swainson's hawk in the general vicinity of the project site does not change the fundamental conclusion that impacts of the project on biological resources are less than significant with the proposed mitigation. Payment of the MSHCP impact fee will also help contribute to preservation of raptor foraging lands as habitat lands are purchased under the plan.

Response to Comment 8. The site would need to continue to be disked for weed abatement and fuel modification per City Fire Department requirements. Since the site is not actively tilled, this clearing would take place mainly once a year. Mitigation Measures 4.4.6.1B and 4.4.6.1C require a pre-construction burrowing owl survey and establish what actions must be taken if the burrowing owl is found on-site during the pre-construction surveys that are in accordance with the Burrowing Owl Consortium 1993 Burrowing Owl Survey Protocol and Mitigation Guidelines¹ and referred to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) survey instructions² to complete the pre-construction burrowing owl survey.

Response to Comment 9. All of the topics mentioned in the comment were addressed in the Draft EIR and are addressed in specific responses to this letter. Impacts to burrowing owl were addressed in Section 4.4 of the Draft EIR (biological resources), including mitigation for pre-construction surveys. The Draft EIR did look at direct and indirect impacts of the project relative to noise, vibration, odors (fumes?), and light during both construction and operation of the proposed warehouse buildings. Mitigation Measure 4.3.6.5B and 4.3.6.6A require the planting of shade trees in parking areas to reduce heat load on cars and buildings. Alternative fuels for onsite vehicles are addressed in Mitigation Measure 4.3.6.6A.

Response to Comment 10. There is no City-wide general requirement for parking areas of warehouse projects to use porous pavement, which create their own water quality issues with percolation of runoff directly from parking areas into the ground, rather than collecting runoff into detention basins, especially low flows which can have the most concentrated pollutants.

Response to Comment 11. CEQA requires an analysis of cumulative impacts from projects that are "on the books" at the time the baseline for the EIR is established (i.e., recently approved or proposed at the time of issuance of the Notice of Preparation). The cumulative project list does not include the World Logistics Center (WLC) because it was not a proposed project when the Notice of Preparation (NOP) was released for this project EIR (i.e., "baseline" conditions are typically established at the time the NOP is released). Even though that project is now on the City's "horizon", no traffic study or other technical information were available for evaluation relative to the cumulative impacts of this proposed project when the EIR for this project was prepared.

Response to Comment 12. The Draft EIR clearly identifies that... "The nearest existing sensitive land uses are single-family residences located approximately 50 feet southeast of the southern boundary of the project site, approximately 395 feet southeast of the proposed warehouse buildings, and approximately 664 feet southeast of the proposed loading docks." (Draft EIR page 4.3-17, 4th paragraph). The commenter may be confused by the terms used to characterize the spatial relationship of the project to the existing residences. The residences are 50 feet from the project's property line, but the Project Description (e.g., Figure 1.2 clearly shows there are several large detention basins in the southern portion of the site that will act as a buffer and separate truck activities of the project from the residences. As stated in the EIR and demonstrated on the project site plan, the residences would be 395 feet from the closest proposed warehouse building, and 664 feet from the closest proposed loading dock. As shown in the air quality analysis and health risk assessment of the EIR, this distance is sufficient to protect the health of the residents near to the project.

¹ <http://www2.ucsc.edu/scpbrg/burrowingowls.htm>.

² http://www.tlma.co.riverside.ca.us/epd/documents/survey_protocols/burrowing_owl_survey_instructions.pdf.

All recommendations for locating warehouses some safe distance (which varies depending on the author) are all conditioned with the concept “unless a site-specific health risk assessment is performed.” This EIR did include such a health risk assessment, which shows that, even with all the very conservative assumptions required, there will not be a significant health risk to any sensitive receptors (residents, schools, medical facilities, etc.) from project-related air emissions.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Response to Comment 13. The commenter is correct in pointing out there are other residential uses in the area. However, they are over 250 feet north across the SR-60 Freeway from the project site, and are not downwind of the site based on regional prevailing wind patterns. As stated on page 4.3-17 of the DEIR, “...receptors were placed in a general grid extending in all directions to characterize the risk level surrounding the project site. Meteorological data from the Perris area were utilized to represent the conditions at the project site.” These features of the HRA insure that the health risk levels to all individuals in the region of the project site were adequately considered. The SCAQMD’s methodology for preparing health risk assessments requires an examination of impacts at the closest sensitive receptor to identify the worst case conditions. Therefore, it is neither required nor would it be helpful to show potential health risk levels of all residential zoning within 2,000 feet of the site.

As outlined in Response 12 above, the existing residences would be 664 feet from the closest truck loading dock, which would be the closest main source of truck-related air pollutants including diesel particulate matter. The project HRA used a worst case estimate of 25 meters (minimum 82.5 feet) to calculate potential health risks from new project warehousing, therefore, the actual exposure would likely be lower than that identified in the HRA, which showed that the project would create a maximum health risk of 1 additional cancer case in a million near the southwest corner of the site (or 10 times lower than the significance threshold of 10 in a million). As shown in Figure 4.3.3 of the Draft EIR, expected health risks further from the project site, including residences to the north across the freeway, are much less than 1 in a million.” Therefore, existing housing north of the freeway would likely be exposed to a much higher health risk from ongoing traffic along SR-60 than would be generated by the proposed project.

Worker Health. A detailed health risk assessment (HRA) was prepared for the proposed project and included in Appendix B of the Draft EIR (LSA March 2012). The HRA examined the short-term and long-term potential health effects from project-related emissions of toxic air pollutants (TAP) in the exhaust of diesel-powered delivery trucks on existing surrounding sensitive receptors, including single- and multifamily residences. Onsite workers will be protected by the requirements established by the Occupational Safety and Health Administration (OSHA) and are not considered sensitive receptors in accordance to the California Air Resources Board (CARB). The CARB defines “sensitive” land uses, as homes, medical facilities, daycare centers, schools, and playgrounds but not on-site workers.

According to the HRA prepared for the proposed project, “*The operations expected to occur at this facility will not emit any toxic chemicals in any significant quantity other than vehicle exhaust. While there may be other toxic substances in use on site, compliance with State and federal handling regulations will bring emissions to below a level of significance. Due to the lack of data, precise evaluation of vehicle exhaust impacts is not feasible; however, based on the limited amount of TAC from vehicle exhaust associated with the project operations in relation to background levels, the impact is not expected to be significant.*” (Section 5.4.2, *Operational Health Risk Impacts*, page 44).

The responsibility of the health of workers of the proposed project is to OSHA. The following is from the OSHA website (<http://www.osha.gov/as/opa/worker/employer-responsibility.html>):

Employer Responsibilities

Employers have certain responsibilities under the Occupational Safety and Health Act of 1970. The following list is a summary of the most important ones:

- Provide a workplace free from serious recognized hazards and comply with standards, rules and regulations issued under the OSHA Act.
- Examine workplace conditions to make sure they conform to applicable OSHA standards.
- Make sure employees have and use safe tools and equipment and properly maintain this equipment.
- Use color codes, posters, labels or signs to warn employees of potential hazards.
- Establish or update operating procedures and communicate them so that employees follow safety and health requirements.
- Provide medical examinations and training when required by OSHA standards.
- Post, at a prominent location within the workplace, the OSHA poster (or the state-plan equivalent) informing employees of their rights and responsibilities.
- Report to the nearest OSHA office within 8 hours any fatal accident or one that results in the hospitalization of three or more employees.
- Keep records of work-related injuries and illnesses. (Note: Employers with 10 or fewer employees and employers in certain low-hazard industries are exempt from this requirement.)
- Provide employees, former employees and their representatives access to the Log of Work-Related Injuries and Illnesses (OSHA Form 300).
- Provide access to employee medical records and exposure records to employees or their authorized representatives.
- Provide to the OSHA compliance officer the names of authorized employee representatives who may be asked to accompany the compliance officer during an inspection.
- Not discriminate against employees who exercise their rights under the Act.
- Post OSHA citations at or near the work area involved. Each citation must remain posted until the violation has been corrected, or for three working days, whichever is longer. Post abatement verification documents or tags.
- Correct cited violations by the deadline set in the OSHA citation and submit required abatement verification documentation.

With this OSHA protection, the employees of the proposed project will not be subject to unhealthful conditions.

The results of the conservative HRA modeling were shown in Table R (Table 4.3.F in the Draft EIR) for carcinogenic and chronic inhalation health risks at the sensitive receptors. Even with the conservative modeling technique used, assuming that an individual stays outdoors at his or her residence 24 hours per day for 70 years, which is the State-required period of time that all HRAs must assess, the nearest sensitive receptor would be exposed to an unmitigated inhalation cancer risk of no more than 4.3 in 1 million, less than the State's threshold of 10 in a million. The highest worker exposure occurs at the east boundary of the facility just south of Eucalyptus Avenue (see Draft EIR Figure 4.3.1). Based on the conservative nature of the assumptions used in this study, the health risk levels cited in the DEIR in Table 4.3.F on page 3.4-17 are likely higher than are actually expected to occur. This assessment demonstrates that no significant health risk would occur from project-related truck traffic, and no mitigation is necessary. Much of the construction equipment used is not powered by electricity (i.e. grading equipment, bull dozers, etc.) is not available as electric equipment. Therefore, it is not practical to set a percentage requirement for the amount of construction equipment that must be powered by electricity. In addition, a percentage based requirement would not translate well to construction equipment. For example, it would not seem logical to base the calculation on the number of pieces of equipment since the size and emissions of equipment vary significantly.

Again, OSHA has programs that the project operator is required to comply with to protect warehouse workers from the long term health effects of breathing toxic diesel emissions throughout their workday and employment.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Response to Comment 14. The noise impact analysis for the proposed project evaluated potential noise impacts from construction and project operations, and did not identify any significant noise impacts. Therefore, no noise barrier or other mitigation measures are required. For related discussion of noise impacts, see also Response to Comments 80 through 93 in Letter D-3 from Johnson & Sedlack. In addition, Mitigation Measure 4.3.6.6A was modified and Mitigation Measure 4.3.6.6B was added to address construction equipment and vehicles operating for the project (see Final EIR, Section 3.0, *EIR Errata and Additions*). Modifications are as follows:

4.3.6.6A *Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of ~~20~~ 10 percent until January 1, 2014. For building permits issued after that date, new state energy standards require a 20 percent reduction from 2008 Title 24, Part 6 Energy Efficiency Standards. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and review and approved by the City. The following design features, including but not limited to the following list, shall be used to fulfill this requirement:*

- *Buildings shall exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.*
- *Increase in insulation such that heat transfer and thermal bridging is minimized.*

- *Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.*
- *Incorporate dual-paned or other energy efficient windows.*
- *Incorporate energy efficient space heating and cooling equipment.*
- *Interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards shall be installed, as deemed acceptable by the City. Automatic devices to turn off lights when they are not needed shall be implemented.*
- *To the extent that they are compatible with landscaping guidelines established by the City, shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.*
- *Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.*
- *All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.*
- *To reduce energy demand associated with potable water conveyance, the project shall implement the following:*
 - *Landscaping palette emphasizing drought-tolerant plants;*
 - *Use of water-efficient irrigation techniques; and,*
 - *U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.*
- *The project shall provide secure, weather-protected, on-site bicycle storage/parking.*
- *The project shall provide on-site showers (one for males and one for females). Lockers for employees shall be provided.*
- *The project will establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce greenhouse gas (GHG) emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.*
- *The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.*
- *The project shall provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, stub outs for charging stations shall be indicated on the project building plans.*
- *Lease/purchase documents shall identify that tenants are encouraged to promote the following:*
 - *Implementation of compressed workweek schedules.*
 - *SmartWay partnership.*

- *Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long-haul trips carried by SmartWay 1.0 or greater carriers.*
- *Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long-haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidated trips carried by SmartWay 1.0 or greater carriers.*
- *Use of fleet vehicles conforming to 2010 air quality standards or better.*
- *Installation of catalytic converters on gasoline-powered equipment.*
- *Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.*
- *Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles.*
- *Provision of preferential parking for EV and CNG vehicles.*
- *Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.*
- *Use of electric (instead of diesel or gasoline-powered) yard trucks.*
- *Use of SmartWay 1.25 rated trucks.*
- *Each facility operator shall provide regular sweeping of onsite parking and drive areas.*
- *Each facility operator shall maintain a log of all trucks entering the facility to ensure that, on average, the daily truck fleet meets the quantities and emissions standards. This log shall be available for inspection by City staff at any time.*
- *Each facility operator shall prohibit all vehicles from idling in excess of five minutes in all onsite areas.*
- *Each facility operator shall ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained and certified in diesel health effects and technologies, such as by requiring attendance at CARB-approved courses.*
- *Each facility operator upon occupancy that do not already operate 2007 and newer trucks shall in good faith apply for funding to replace or retrofit their trucks such as Carl Moyer, VIP, Prop 1B or similar funds. Should funds be awarded, the tenant shall be required to accept and use them.*

Response to Comment 15. Many of the very detailed portions of the various environmental impact analyses are placed in the appendices so that the EIR is easier to read and understand. All details are available for the reviewer. Trip lengths are not considered, as trip lengths do not affect the operation of traffic at various locations. The passenger vehicle and truck trip assignment figures provided in the DEIR show the number of passenger vehicle and truck trips at each intersection, and therefore indicate the routes that project trips are expected to utilize. The trip generation provided in the DEIR section would be for the project at its full capacity. The project trip generation analyzed in the analysis would be a typical weekday trip generation for the project. It is standard traffic engineering practice and the practice required by Cities and the County to analyze the project trips occurring during the weekday peak hours, as this is generally the period when the worst traffic is experienced on the adjacent streets. In addition, the trip generation analysis does not assume only

some initial level of operation. The full operation of the project is analyzed so that the effects of the project on the existing environment are disclosed, as required by CEQA. Trips generated by the project under opening year are likely to be less than those included in the analysis. All of the details for calculating health risks of the proposed project were provided in Appendix B of the Draft EIR, including the EMFAC and dispersion modeling outputs. The details of the project traffic routing are discussed in detail in the traffic analysis and the truck trip length on DEIR page 4.3-32. In addition, "active" CalEEMod and supporting computer files were sent to the AQMD during the EIR review period to allow for replication and verification of the HRA report results. In addition, Mitigation Measure 4.3.6.6A was modified (see above) to address these types of equipment (see Final EIR, Section 3.0, *EIR Errata and Additions*).

Response to Comment 16. All of the details for calculating health risks of the proposed project were provided in Appendix B of the Draft EIR, including the EMFAC and dispersion modeling outputs. In addition, "active" CalEEMod and supporting computer files were sent to the SCAQMD during the EIR review period to allow for replication and verification of the HRA report results.

The Villages of Lakeview project included over 2,800 acres consisting of 11,350 dwellings, a mixed-use town center including some 500,000 square feet of retail, office and commercial uses, public facilities including four schools and a library, and nearly 1,000 acres of open space/conservation areas. The court found that the EIR analysis of traffic impacts was inadequate because it did not study how an additional 85,000 car trips would affect two local freeways. The only fault the court found in the project's relationship to the General Plan was that traffic congestion standards would be exceeded¹. The proposed project reduces the intensity of the trip generation compared to the General Plan, and as shown in the analysis, doesn't change traffic congestion standards.

This EIR evaluates traffic impacts at intersections with more than 50 trips and freeway segments within a 5 mile radius where the project has more than 100 peak hour trips, as required by the traffic study guidelines adopted by the City of Moreno Valley as well as the County of Riverside. Please note that the 50 and 100 trip thresholds were not questioned in the Lakeview judgment. East of Redlands Boulevard, the project adds less than 100 peak hour trips to freeway facilities, therefore, the study area is consistent with the Friends decision. West of Pigeon Pass Road, project traffic is more than 100 trips. However, traffic volumes on the freeway west of Pigeon Pass Road are higher than those to the east of Pigeon Pass Road. Since the number of lanes is the same, and the segments east of Pigeon Pass Road are forecast to operate at unsatisfactory conditions under future conditions without the project, the segments to the west would also operate at unsatisfactory conditions (higher volumes and same capacity). Therefore, to the freeway segments west of Pigeon Pass Road, the project will not create a direct impact but add to unsatisfactory conditions.

It should also be noted that the referenced case is a Superior Court, not an appellate court decision, and thus does not have the power of an appellate decision.

Response to Comment 17. It is not clear what the commenter is asking. This project is not the Moreno Valley Auto Mall but if the commenter is asking if the cumulative impacts of the Moreno Valley Auto Mall in combination with this project (Eucalyptus Industrial Park) were considered, yes they were for both air quality and traffic on the SR-60. The DEIR includes (1) a description of the circulation system from both a local and regional perspective and list the pages; (2) screening criteria were used to determine the appropriate intersections and segments to include in the analysis, based on whether there was a potential or impacts and what the criteria were; and (3) that freeway impacts were studied in the EIR (list the pages) and the findings and pages on which the freeway analysis findings are listed. The EIR evaluates traffic impacts at intersections with more than 50 trips, and

¹ From Courthouse News Service, May 29, 2012.
<http://www.courthousenews.com/2012/05/29/46884.htm> accessed September 17, 2012.

freeway segments within a 5 mile radius where the project has more than 100 peak hour trips. For freeway segments, the traffic analysis states that the project will add to unsatisfactory conditions but not create unsatisfactory conditions by itself. East of Redlands Boulevard, the project adds less than 100 peak hour trips to freeway facilities, therefore, the study area is consistent with the Friends decision. West of Pigeon Pass Road, since project traffic is more than 100 trips. However, traffic volumes on the freeway west of Pigeon Pass Road are higher than those to the east of Pigeon Pass Road. Since the number of lanes is the same, and the segments east of Pigeon Pass Road are forecast to operate at unsatisfactory conditions under future conditions without the project, the segments to the west would also operate at unsatisfactory conditions (higher volumes and same capacity). Therefore, to the freeway segments west of Pigeon Pass Road, the project will not create a direct impact but add to unsatisfactory conditions. Since the project does not create a direct significant impact at freeway segments where the project traffic is a higher percentage of the total freeway traffic, it can be said with certainty that the project will not create a direct impact at locations where the project traffic is a lower percentage of the total freeway traffic. Therefore, as described in the Response to Comment 13, as shown in Figure 4.3.3 of the DEIR, expected health risks further from the project site, including residences to the north along the freeway, are much less than 1 in a million.

A review of existing traffic volumes on the freeway reveals that the existing traffic volumes on segments beyond a 5-mile radius that were not analyzed and where the project has more than 100 peak hour trips are significantly higher than at the segments that were analyzed in the EIR. Since in 2035 all freeway segments analyzed operate at unsatisfactory levels of service in at least one peak hour, it can be said with certainty that segments with traffic volumes higher than those analyzed will also operate at unsatisfactory levels of service. Moreover, as the distance from the project site increases, project traffic on the freeway segments reduce. Since the project does not create a direct significant impact at freeway segments where traffic volumes are low and project contribution higher, it can be said with certainty that the project will not create a direct impact at locations where background traffic volumes are higher and project trips lesser. It is understood that the project will have a cumulative impact at all freeway segments where the background (without project) traffic volumes result in an unsatisfactory level of service. As stated in the DEIR Section 4.11.7, *Cumulative Impacts*, page 4.11-40, the addition of project traffic would be considered a cumulative impact. Review of the RTIP indicates that there are no projects programmed on SR-60 within the study area. Furthermore, neither the project applicant nor the City has jurisdiction over Caltrans facilities; therefore, implementation of improvements to the freeway mainline cannot be guaranteed. Furthermore, Caltrans does not have a mechanism for development projects to contribute to improvements on State Highways.

Response to Comment 18. The commenter states that global warming poses a grave threat to California and the Draft EIR is obligated to discuss the threats posed by greenhouse gas emissions for the public and decision makers. Page 4.13-1 through 4.13-6 in the Draft EIR (Section 4.13, *Global Climate Change*) provides the background information related to climate change requested in this comment.

The Draft EIR: discusses the existing greenhouse gas/climate change setting including the main gases of concern; provides the current emissions inventory at the global, US, and State levels; gives a detailed description of what global warming is and the effects that result, all of which could be considered the “threat of greenhouse gas pollution and global warming.” The EIR attempts to present a non-sensational, balanced description based on the best information available. Section 4.13.2 describes the entire regulatory setting, including all applicable federal, State and City of Moreno Valley regulations and policies. The DEIR’s GHG analysis is consistent with the requirements of CEQA (specifically CEQA Guidelines Section 15064.4, 15125(d), 15126.4(c), 15130(B).

Response to Comment 19. The comment summarizes international and national concerns about global climate change and greenhouse gas emissions which are also discussed in the DEIR in Section 4.13.1.1 on page 4.13-2.

Response to Comment 20. The comment summarizes concerns within the State of California about global climate change and greenhouse gas emissions which are also discussed in the DEIR in Section 4.13.1.1 on page 4.13-2.

Response to Comment 21. Section 4.13.6 of the Draft EIR includes a complete, detailed inventory and analysis of the project's short-term construction and long-term operational greenhouse gas emissions. The EIR states the project's greenhouse gas emissions and discusses the significance of these emissions without attempting to minimize the impact by subtracting whatever existing greenhouse gas emissions there might be from the project site. Section 4.13.7 discusses the cumulative impacts of the project's greenhouse gas emissions.

The greenhouse gas impact study provided emissions from both construction and operation periods. During the construction period, emissions from both equipment exhaust and other area sources were calculated. During the operational period, emissions associated with vehicular (including automobiles and trucks) trips, water and energy usage, waste treatment, and other known sources have been calculated and identified in the study. If the commenter is suggesting that an exhaustive "life-cycle" inventory of the project's greenhouse gas emissions be prepared, the State Office of Planning and Research provided guidance on this issue and clarified that a life-cycle analysis is not required.¹

Response to Comment 22. According to the greenhouse gas impact study, "*Global climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans along with other significant changes in climate (such as precipitation or wind) that last for an extended period of time. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred to "global warming" because it helps convey that there are other changes in addition to rising temperatures.*" The Draft EIR did analyze the project's effects on greenhouse gas emissions which is a component of global climate change or global warming (Section 4.13 Global Climate Change, pages 4.13-1 through 4.13-22).

In addition the California Green Building Code requires mandatory measures to be implemented on all new construction projects that consist of a wide array of green measures concerning project site design, water use reduction, improvement of indoor air quality, and conservation of materials and resources. The "Cal Green Building Code" refers to compliance with Title 24, Part 6 energy efficiency measures. Additionally, it encourages 15 percent energy use reduction over the amount required in Part 6. The Cal Green Building Code prescribes a wide array of measures that would directly and indirectly result in reduction of GHG emissions from the Business as Usual Scenario. The mandatory measures that are applicable to nonresidential projects include site selection, energy efficiency, water efficiency, materials conservation and resource efficiency, and environmental quality measures.

The Climate Change technical report included in the EIR Appendix B does include a discussion of the impacts that climate change could have on the project. The conclusion is that there are not expected to be any significant impacts. If the commenter is suggesting that the DEIR should provide a more detailed analysis of global warming on the proposed project, there is a recent CEQA Case, *Ballona Wetlands Land Trust v. City of Los Angeles and Ballona Ecosystem Education Project v City of Los Angeles*, No.B231965 (Cal. Ct. App 2d Dist., November 9, 2011), where the opponents claimed that the EIR was inadequate because it did not analyze the effects of sea rise due to global warming on the project. The Court held that CEQA did not require the EIR to analyze this risk, concluding that

¹ Transmittal of the Governor's Office of Planning and Research's Proposed SB97 CEQA Guidelines Amendments to the Natural Resources Agency, California Governor's Office of Planning and Research, April 13, 2009, page 2.

“the purpose of an EIR is to identify the environmental effects of the project on the environment and not the significant effects of the environment on the project.” The court reasoned: “[w]e believe that identifying the environmental effects of attracting development and people to an area is consistent with CEQA’s legislative purpose and statutory requirements, but identifying the effects on the project and its users of locating the project in a particular environmental setting is neither consistent with CEQA’s legislative purpose nor required by CEQA statutes.” Although an analysis of the effects of global climate change on the project is not required, one was provided on page 4.13-3 of the DEIR (Section 4.13.1.3, *Effects of Global Warming*).

Response to Comment 23. The opinion of the Sierra Club that “The project’s greenhouse gas impacts are clearly significant” is noted, but contrary to the detailed climate change analysis included in the EIR. The EIR does include a detailed significance discussion and conclusion at the end of Sections 4.13.5, 4.13.6, and 4.13.7.

The SCAQMD and other air quality agencies agree that GHG and climate change should be assessed as a potentially significant “cumulative impact” rather than a “project-specific” impact. SCAQMD is considering the adoption of a numeric plan-level efficiency target of 6.6 MTCO₂E per service population.

The intent of CEQA is to determine the significant effects of a project on the environment and provide feasible and reasonable mitigation to reduce impacts to less than significant. In instances where the impact of the project cannot be reduced to less than significant and it is determined the impact is significant and unavoidable, the Lead Agency, must adopt a Statement of Overriding Considerations that finds (1) under Public Resources Code Section 21081(a)(3), and CEQA Guidelines Section 15091(a)(3), that specific economic, legal, social technological, or other considerations, including provisions of employment opportunities to highly trained workers make infeasible the mitigation measures or project alternatives identified in the Final EIR; and (2) under CEQA Guidelines section 15092(b), that the remaining significant effects are acceptable due to overriding concerns described in the CEQA Guidelines Section 15093. CEQA does have a provision as stated above that an impact can be significant and unavoidable if the City makes findings as to why it is willing to accept the significant impact; therefore, it was not CEQA’s intent to not allow any tolerance for impacts on the environment as long a good faith effort is made to reduce the impacts where reasonable.

In addition, the Draft EIR analyzed the cumulative effects of the project on greenhouse gas emissions (Section 4.13.7 Cumulative Impacts, page 4.13-25). The EIR further determined that, while it is not possible to determine whether the project individually will have a significant impact on global warming or climate change, it will contribute to cumulative GHG emissions in California. Cumulatively, the build out of the proposed project would contribute approximately 79,000 metric tons of CO₂e per year. The mitigation measures discussed in the project-level impact analysis of GHG emissions indicated the measures would substantially reduce the project’s emissions of greenhouse gases, however, without the necessary science and analytical tools, it is not possible to determine with certainty whether the project’s emissions of greenhouse gases will be cumulatively considerable, within the meaning of CEQA Guidelines Sections 15065(a)(3) and 15130. The CARB is currently in the process of designing regulations to monitor, limit, and ultimately reduce California GHG emissions but there are as yet no adopted standards for assessing the significance of cumulative impacts from projects.

Cumulatively, the emissions from electricity production would comprise approximately 2.8 percent of the project’s total CO₂e emissions. Water usage and solid waste disposal emissions comprise approximately 14 percent of the project’s total CO₂e emissions while the emissions from vehicle exhaust would comprise approximately 84 percent of the project’s total CO₂e emissions. The emissions from vehicle exhaust are controlled by the State and Federal governments and are outside the control of the City. The remaining CO₂e emissions are primarily associated with building systems. The proposed project is required to comply with existing State and Federal regulations regarding the energy efficiency of buildings, appliances, and lighting, which would reduce the project’s electricity demand. The new

buildings constructed in accordance with current energy efficiency standards would be more energy efficient than older buildings.

The Draft EIR (Section 4.3) made a determination that the proposed project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases and no mitigation is required. However, it was determined that the proposed project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment and mitigation was proposed to reduce these project-specific effects to less than significant (Draft EIR, page 4.3-21 through 4.3-26).

With implementation of the strategies and programs described previously, the project is consistent with the strategies to reduce California's emissions to the levels proposed in Executive Order S-3-05. However, given the uncertainty of data and appropriate methodology to accurately analyze, and the inability to quantify the reduction achieved through implementation of strategies and programs previously identified, the proposed project's GHG emission contribution would result in a cumulative impact regarding global climate change and the cumulative impacts of the proposed project on global climate change are considered to be significant and unavoidable.

In summary, the City believes all known emissions during construction and operations of the proposed project have been identified and calculated. The preparer of the greenhouse gas impact study has followed the guidelines provided by the OPR and California Air Pollution Controls Officers Association (CAPCOA) and has provided an adequate analysis. It is the City's opinion that the study has disclosed the impacts of the proposed project adequately and mitigated the impacts of greenhouse gas emissions where applicable (Draft EIR Section 4.13, *Global Climate Change*, pages 4.13-1 through 4.13-26).

Response to Comment 24. Section 4.13.6 includes mitigation measures 4.13.6.1A, 4.13.6.1B, and 4.13.6.1C which include many feasible mitigation measures to be implemented to minimize greenhouse gas emissions. As stated in Response 23, all known emissions during construction and operations of the proposed project have been identified and calculated. The preparer of the greenhouse gas impact study has followed the guidelines provided by the OPR and CAPCOA and has provided an adequate analysis. It is the City's opinion that it has disclosed the impacts of the proposed project adequately and mitigated the impacts of greenhouse gas emissions where applicable (Draft EIR Section 4.13, *Global Climate Change*, pages 4.13-1 through 4.13-26).

Response to Comment 25. The proposed project would certainly take advantage of public transit (i.e., bus service) when it becomes available to the area, most likely along the realigned Eucalyptus Avenue. The project would be required to install bus turnouts as directed by the Riverside Transit Authority (RTA) (e.g., RTA Route 35) and future workers would no doubt take advantage of bus service in the project area. The closest existing RTA Bus Route in the area is Route 35 with a bus stop at the WalMart Super Center at Moreno Beach Drive west of the project site and within walking distance.¹ The commenter requests that the project create routes to facilitate access to commercial centers, schools and parks for residents, however, this is an industrial project, not a residential development, so there will not be residents who need access to those facilities.

The project provides for the relocation of the Quincy Channel multi-purpose trail and will provide sidewalks along Eucalyptus Avenue, as required by the City. When completed, Eucalyptus Avenue will be wide enough (72-foot curb-to-curb) to allow bicycles to travel safely east and west to the rest of the City. Pedestrians will also be able to travel west along Eucalyptus Avenue to the shopping and services along and off of Moreno Beach Drive.

¹ <http://www.riversidetransit.com/home/images/stories/DOWNLOADS/ROUTES/035.pdf> accessed December 17, 2012.

Response to Comment 26. The comment states the “FEIR should consider mitigation measures that will ensure the planned community will use energy efficiently and conservatively.” The proposed project is a logistics distribution warehouse not a planned community with a residential component. As stated in the Draft EIR, page 3-2: “The proposed project includes the construction and operation of a warehouse facility comprising six buildings consisting of a total of approximately 2,244,638 square feet.” Nonetheless, the project will be required to comply with the state’s new Green Building Code, which has significantly increased energy, water, and resource conservation features required of new buildings over previous building codes” Second, the project Mitigation Measures, as presented in the Draft EIR and as modified in this Final EIR, will substantially reduce energy, water, and other resource consumption by this project. Many of these measures will also help reduce the potential production of excessive air pollution and greenhouse gas emissions related to this project, as outlined in Sections 4.3 Air Quality and 4.13 Global Climate Change of the Draft EIR. For example, Mitigation Measure 4.3.6.5A requires that the project implement transportation demand management strategies such as preferential parking for employee vanpooling/carpooling, bicycle parking facilities (such as bicycle lockers and racks), bus turnouts, and other strategies to reduce vehicle miles traveled. Mitigation Measure 4.3.6.5B requires that the project applicant incorporate twenty-one (21) energy-efficiency and low-air pollution emission methods into the project design and building construction including but not limited to:

- *Low-emissions water heaters;*
- *Central water-heating systems;*
- *Energy-efficient appliances;*
- *Increased insulation;*
- *Automated controls for air conditioners;*
- *Energy-efficient parking lot lighting;*
- *Lighting controls and energy-efficient lighting;*
- *Low-VOC interior and exterior coatings during project repainting;*
- *On-site improvements such as sidewalks or pedestrian walkways to promote pedestrian activity and reduce the amount of vehicle trips;*
- *Installation of skylights and energy-efficient lighting that exceeds California Title 24 standards where feasible, including electronic dimming ballasts and computer-controlled daylight sensors in the buildings;*
- *Shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and building shall be planted at the proposed project site;*
- *Fans to assist natural ventilation, centralized water and space conditioning systems, high efficiency individual heating and cooling units, and automatic setback thermostats. Incorporating drought-tolerant plants into the landscaping palette; and*
- *Use of water-efficient irrigation techniques;*
- *Energy-efficient low-pressure sodium parking lot lights or lighting equivalent as determined by the City;*
- *Buildings shall be oriented north-south where feasible;*
- *Implement an on-site circulation plan in parking lots to reduce vehicle queuing;*
- *Develop a trip reduction plan to achieve 1.5 average vehicle ridership (AVR) for businesses with fewer than 100 employees or multitenant worksites;*
- *Include bicycle parking facilities such as bicycle lockers and racks;*

- *Include showers for bicycling employees use; and*
- *Construct on-site pedestrian facility improvements such as building access that is physically separated from street and parking lot traffic and walk paths.*

Mitigation Measure 4.13.6.1A requires that the project applicant incorporate four (4) energy-efficiency and water-efficiency methods into the project design including but not limited to:

- *Utilize exterior window treatments for efficient energy conservation;*
- *Utilize water-efficient fixtures and appliances, including but not limited to low-flow faucets, dual-flush toilets minimizing water consumption by 20 percent from the Building Standards Code baseline water consumption;*
- *Prepare a Commissioning Plan that includes commissioning by a Commissioning Authority for all building systems (e.g., heating, ventilation, and air-conditioning [HVAC], irrigation systems, lighting, and water heating); and*
- *Restrict watering methods (e.g., prohibit systems that apply water to non-vegetated surfaces) and control runoff;*

Mitigation Measure 4.13.6.1B requires that the project applicant incorporate twelve (12) energy-efficiency methods into the project design and construction including but not limited to:

- *Use locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project;*
- *Use “Green Building Materials,” such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project;*
- *Limit unnecessary idling of construction equipment;*
- *Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment;*
- *Design the project building to exceed the California Building Code (CBC) Title 24 energy standard, including, but not limited to, any combination of the following:*
 - *Increase insulation such that heat transfer and thermal bridging is minimized.*
 - *Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.*
 - *Incorporate ENERGY STAR or better rated windows, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment.*
- *Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping;*
- *Install efficient lighting and lighting control systems. Use daylight as an integral part of the lighting systems in buildings.*
- *Install light-colored “cool” roof and cool pavements.*
- *Install energy-efficient heating and cooling systems, appliances and equipment, and control systems.*
- *Install solar or light-emitting diodes (LEDs) for outdoor lighting.*

Mitigation Measure 4.13.6.1C requires that the project applicant incorporate six (6) greenhouse gas emission and waste reduction methods into project operations including but not limited to:

- *Use less than 3,900 Global Warming Potential (GWP) hydrofluorocarbon (HCF) refrigerants or natural refrigerants (ammonia, propane, carbon dioxide [CO2]) for refrigeration and fire suppression equipment;*
- *Provide vegetative or man-made exterior wall shading devices for east-, south-, and west facing walls with windows;*
- *Devise a comprehensive water conservation strategy appropriate for the project and its location. The strategy may include the following, plus other innovative measures that may be appropriate:*
 - *Install drought-tolerant plants for landscaping.*
 - *Use reclaimed water for landscape irrigation within the project. Install the infrastructure to deliver and use reclaimed water.*
 - *Install water-efficient irrigations systems, such as weather-based and soil-moisture-based irrigation controllers and sensors for landscaping according to the California Department of Water Resources Model Efficient Landscape Ordinance.*
- *Provide employee education about reducing waste and available recycling services.*

Information on the project’s LEED certification is presented in the previous Response to Comments D-2, Nos. 1 and. 2. The other measures suggested in this comment have already been evaluated in this EIR, and most have already been incorporated into the project Mitigation Measures. For example, the project will provide an alternative fuel station, shading of parking areas, energy efficient lighting both inside and outside, etc. The City believes compliance to at least 10 percent less than current energy codes included in the Green Building Code, and the project mitigation measures as proposed in the Draft EIR and as modified in this Final EIR, are sufficient and reduce the energy use of this project to the greatest extent practical and feasible, as required under CEQA.

The comment suggests that thirteen (13) additional measures to reduce greenhouse gas emission be included. The Draft EIR already incorporates or includes eight of the measures and the remaining six measures are not included or are infeasible. An explanation of these measures including where they are already included or incorporated in the Draft EIR or why they are not included or are infeasible is provided in Table A as follows:

Table A: Comparison of Sierra Club Suggested Measures to Project EIR Mitigation Measures

Suggested Mitigation Measure to Reduce Greenhouse Gas Emissions	Response
1. Analyzing and incorporating the U.S. Green Building Council’s LEED (Leadership in Energy and Environmental Design) or comparable standards for energy efficient building during pre-design, design, construction, operations and management.	Included. The project description (see Draft EIR p 3-14) recognizes the trend towards “Green Building” in the state, and the applicant for the proposed project will apply for the Leadership in Energy and Environmental Design (LEED) Core & Shell rating program. LEED is a voluntary, consensus-based standard to support and certify successful green building design, construction, and operations.
2. Designing buildings for passive heating and cooling, and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.	Included. A similar mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on pages 4.3-33 and 4.3-34.
3. Designing buildings for maximum energy efficiency including the maximum possible insulation, use of compact florescent or other	Included. Similar mitigation measures are already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on pages 4.3-33 and 4.3-34

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park
City of Moreno Valley

Suggested Mitigation Measure to Reduce Greenhouse Gas Emissions	Response
low-energy lighting, use of energy efficient appliances, etc.	and Mitigation Measure 4.3.6.6A on pages 4.3-35 and 4.3-36 and Section 4.13 Global Climate Change of the Draft EIR under Mitigation Measures 4.13.6.1A, 4.13.6.1B, and 4.13.6.1C on pages 4.13-20 and 4.13-21.
4. Reducing the use of pavement and impermeable surfaces.	Included where appropriate. Impermeable surfaces will be installed where appropriate, but it is not feasible to use impermeable surfaces in the truck parking area since a soft permeable surface will not support the weight of a large truck.
5. Requiring water re-use systems.	Infeasible. Reclaimed water is not available to this area of the City yet, so a “purple” pipe system is not required to be installed as part of this project.
6. Installing light emitting diodes (LEDs) for traffic, street and other outdoor lighting.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.13.6.1B on page 4.13-21.
7. Limiting the hours of operation of outdoor lighting.	Not Included. The future facility operator is not known at this time since the developer is building a spec building. The City cannot burden the future, unknown operator with this limitation provided the operation complies with all applicable City ordinances regarding night lighting. .
8. Maximizing water conservation measures in buildings and landscaping, using drought tolerant plants in lieu of turf, planting shade trees.	Included. Similar mitigation measures are already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-34 and Section 4.13 Global Climate Change of the Draft EIR under Mitigation Measures 4.13.6.1A, 4.13.6.1B, and 4.13.6.1C on pages 4.13-20 and 4.13-21.
9. Ensure that the Project is fully served by full recycling and composting services.	Included. A similar mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6B on page 4.3-37. Infeasible. The proposed industrial warehouse project will not generate any compost materials, with the exception of trimmings from landscape vegetation and scraps from employee meals. The landscape service provided will be responsible for removal of trimmed vegetation to an off-site receiving facility. Scraps from employee meals will not be generated in enough quantities to warrant an on-site composting facility, so such a system is not required to be installed as part of this project.
10. Ensure that the Project’s wastewater and solid waste will be treated in facilities where greenhouse gas emissions are minimized and captured.	Infeasible. The site is served by public entities for wastewater and solid waste. Neither the City nor the project proponent has control over those facilities.
11. Installing the maximum possible photovoltaic array on the building roofs and/or on the project site to generate all of the electricity required by the Project, and utilizing wind energy to the extent necessary and feasible.	Partially Included. The proposed project does not have a specific end user at this point, but the building design will allow for future installation of solar photovoltaic for the entire building and solar hot water heating for the office area.
12. Installing solar water heating systems to generate all of the Project’s hot water requirements.	Not Included. The proposed project does not have a specific end user at this point, but the building design will allow for future installation of solar photovoltaic and solar hot water heating for the office area.
13. Installing solar or wind powered electric vehicle and plug-in hybrid vehicle charging stations to reduce emissions from vehicle trips.	Included. A similar mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6B on page 4.3-36.

Response to Comment 27. The commenter is confusing the proposed project, which involves industrial warehouses, with a residential project. All known emissions during construction and operations of the proposed project have been identified and calculated (Draft EIR Section 4.13, Global Climate Change, pages 4.13-1 through 4.13-26). Feasible mitigation measures, including several identified in the list provided by the commenter, have been already included as mitigation for the project and are identified in the Draft EIR. In addition, the mitigation measures shown as “Incorporated” in the Table C have been added to the Final EIR (Section 3.0 Errata and Additions) as suggested by the commenter. The changes to the Draft EIR do not result in the identification of a new or more severe significant impact and has no material effect on the findings of the EIR. Table B below contains each of the greenhouse gas reduction measures suggested for inclusion by the commenter and if it is already included, if will be added mitigation as part of the Final EIR, or if will not be included and why.

The comment suggests that five (5) additional measures to reduce air quality and greenhouse gas emissions during project construction be included. The Draft EIR already incorporates or includes two of the measures and the remaining three measures are not included or are infeasible. An explanation of these measures including where they are already included or incorporated in the Draft EIR or why they are not included or are infeasible is provided in Table B as follows:

Table B: Comparison of Sierra Club Suggested Measures to Project EIR Mitigation Measures

Mitigation Related to Construction	
1. Utilize recycled, low-carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials.	Included. A similar mitigation measure is already included in Section 4.13 Global Climate Change of the Draft EIR under Mitigation Measure 4.13.6.1B on page 4.13-20.
2. Minimize, reuse, and recycle construction-related waste.	Not Included. The project is required to comply with Policy 6.7.6 of the Chapter 9 of the City’s General Plan: Require building construction to comply with the energy conservation requirements of Title 24 of the California Administrative Code. The applicant will attempt to divert at least 50% of construction waste, and would apply for LEED credit if they achieve that goal.
3. Minimize grading, earth-moving, and other energy-intensive construction practices.	Infeasible. The entire site must be graded to accommodate the building structures and parking lots.
4. Landscape to preserve natural vegetation and maintain watershed integrity.	Infeasible. The site contains very little natural/native vegetation, only associated with the Quincy Channel, which will be preserved onsite.
5. Utilize alternative fuels in construction equipment and require construction equipment to utilize the best available technology to reduce emissions.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measures 4.3.6.2B and 4.3.6.2J on page 4.3-24.

Response to Comment 28. Many of these proposed measures appear to apply to a residential “planned community” rather than an industrial warehouse project, so it is assumed they were mistakenly excerpted from another document (e.g., shuttle service, car sharing service, encouraging residents to use low or zero emission vehicles, etc.).

Measure 4.3.6.5A requires ridesharing, and the project will provide a vehicle charging station (Measure 4.3.6.6A). In addition, the project will take advantage of transit when transit services are extended through the project along Eucalyptus Avenue by the RTA.

It should be noted that the commenter made very similar comments on the Vogel Industrial Project EIR recently processed by the City, and many of the mitigation measures incorporated into that project were incorporated into this project. However, Table C, below summarizes the measures recommended by the commenter compared to the actual measures provided in the Draft EIR and this Final EIR.

The comment suggests that six (6) additional measures to reduce air quality and greenhouse gas emissions from project vehicles be included. The Draft EIR already incorporates or includes two of the measures and the remaining four measures are not included or are infeasible. An explanation of these measures including where they are already included or incorporated in the Draft EIR or why they are not included or are infeasible is provided in Table C as follows:

Table C: Comparison of Sierra Club Suggested Measures to Project EIR Mitigation Measures

Transportation Mitigation Measures	
1. Encourage and promote ride sharing programs through such methods as a specific percentage of parking spaces for ride sharing vehicles.	Included. Similar mitigation measures are already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5A on pages 4.3-33 and Mitigation Measure 4.3.6.6A on page 4.3-36.
2. Create a car sharing program within the planned community;	Not Included. The suggested mitigation measure applies to a planned community and is therefore inappropriate. As noted in Mitigation Measure 4.3.6.2J (Draft EIR page 4.3-25), documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs. However, the applicant will provide a bulletin board that will facilitate posting of ridesharing information and requests by project workers.
3. Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system.	Not Included. The suggested mitigation measure applies to a residential neighborhood and is therefore inappropriate. However, Mitigation Measure 4.3.6.2J on page 4.3-24 requires alternative fuel vehicles onsite.
4. Provide necessary facilities and infrastructure to encourage residents to use low or zero-emission vehicles, for example, by developing electric vehicle charging facilities and conveniently located alternative fueling stations.	Included. The mitigation measure the comment suggests refers to “residents”, and this project proposes warehousing not a residential development. However, a similar mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.
5. Provide a shuttle service to public transit within and beyond the planned community.	Not required. The RTA serves the general project area and may require bus stops to be installed as service is needed to the project or other nearby areas. Therefore, the site is serviced by the RTA and no further actions are necessary.
6. Incorporate bicycle lanes and routes into the planned community’s street systems.	Not required. Bicycle access to and from the project would use Eucalyptus Avenue, and pedestrians would be able to access the site on the planned multi-purpose trail on the north side of Eucalyptus Avenue. It should be noted the proposed project is warehousing, not a planned community.

Response to Comment 29. The use of carbon offsets is infeasible because:

- The cited precedent is a negotiated settlement for a major oil refinery in Contra Costa County, rather than a warehouse development in Riverside County;
- The cited precedent was for the period prior to 2012;

- California has not established any generally applicable standards for requiring offsets for GHG emissions; and
- Most cities and counties in California have not required offsets for GHG emissions on projects of the scale of the proposed project.

Using such carbon offsets to mitigate for cumulative impacts is fraught with uncertainty. As the comment implies (“... offsets purchased are real...”), but there is considerable controversy regarding whether offsets that are available today will actually mitigate this cumulative effect.

First, it requires an accurate measure of the emissions to be offset and the offsets to be provided. That calculation turns out to be riddled with uncertainty on both ends. As noted above in the example cited by the commenter, this initial offset of \$7 million for the Rodeo refinery was later reduced to \$4.4 million due to revised calculations of GHG emissions. The UN's Intergovernmental Panel on Climate Change found a margin of error of 10% with measuring emissions from making cement or fertilizer; 60% with the oil, gas and coal industries; and 100% with some agricultural processes.

Second, the provision of offsets requires an accurate measure of the carbon saved elsewhere. Most of the earliest offset projects involved planting trees, which naturally ingest carbon, a complex and unpredictable process which forbids accurate measurement.

Finally, the very idea of offsetting relies on the concept that a carbon reduction would not have occurred in the natural order of commercial life. For example, one of the biggest UK companies that sells offsets, Climate Care, distributed 10,000 energy-efficient light bulbs in a South African township; offered the carbon reductions as offsets; and then discovered that an energy company was distributing the same kind of light bulbs free to masses of customers, including their township, so the reduction would have happened anyway.

To accurately calculate the amount of credit for each of the above actions, the offset program must make a number of critical assumptions:

- What is the baseline of emissions for the existing facilities that would be retrofitted to reduce their energy consumption? Would they ultimately be retrofitted in any case, thus limiting the actual resulting reduction in GHG emissions?
- Is the development of the alternative energy source actually dependent on the external funding provided by the offset? Or is the alternative energy developer simply achieving another subsidy?
- How much extra energy (and GHG emissions) is required to construct the alternative energy facility? What period of time should this be amortized over? For example, the development of the California High Speed Rail Project is estimated to reduce energy consumption in the long run. However, the extra energy involved with construction is estimated to have a 40 year payback.

As such, the actual amount of mitigation provided by an offset program can be speculative, based upon the actual performance of the program.

There is a global marketplace for fossil fuel energy based upon a market between buyers and sellers. The sellers, those who own the sources and production of fossil fuel energy, have a powerful economic interest to keep and increase their income stream from the production of fossil fuels.

To the extent that the actions cited above as potential offset measures, in combination with other conservation measures, reduce the demand for fossil fuels in the countries where they are implemented, the owners of these fossil fuel supplies will still want to preserve and enhance their income as much as possible. And there is a large unmet need (unmet as defined by consumer actions) for increased energy consumption in developing countries. For example the average annual energy consumption of a citizen of China or sub-Saharan Africa, at 4.5 metric tons, is far less than that of the average US citizen, at 20 metric tons. To the extent that the US and other countries reduce energy consumption based upon energy efficiency measures, the owners of fossil fuel resources will seek to sell the same energy, perhaps at a lower price, to the less developed countries. If the energy is sold at a lower price, then more energy would need to be sold to generate the same income, and the resulting energy consumption and GHG emissions could actually increase.

In conclusion, the City concludes that compliance to at least 10 percent less than current energy codes included in the Green Building Code, and the project mitigation measures as proposed in the Draft EIR and as modified in this Final EIR, are sufficient and reduce the energy use of this project to the greatest extent practical and feasible, as required under CEQA. There are no established laws or regulatory guidelines requiring contributions toward carbon offsets. In addition, there is uncertainty regarding the efficacy, reliability and legal standing of carbon off-sets at this time. For this reason, such mitigation is considered to be infeasible. The analysis in the Draft EIR concludes that greenhouse gas emission impacts of the project will be less than significant with implementation of the recommended mitigation measures, despite protestations of the commenter and others to the contrary.

Response to Comment 30. The commenter is correct in stating that the EIR must contain a “reasonable” [emphasis added] range of alternatives to the proposed project that avoid or lessen the significant impacts to the proposed project (Pub. Res. Code §21002; CEQA Guidelines §§ 15002(a)(3), 15021(a)(2), 15126.6(d)). According to CEQA Guidelines §15126.6(a) “[A]n EIR need not consider every conceivable alternative to a project. An EIR is not required to consider alternatives which are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason. [Citizens of Goleta Valley v. Board of Supervisors (1990) 52 Cal.3d 553 and Laurel Heights Improvement Association v. Regents of the University of California (1988) 47 Cal.3d 376].”

The Draft EIR does include an analysis of a reasonable range of alternatives to the proposed project (Draft EIR, Section 6.0 Alternatives, pages. 6-1 to 6-40) in compliance with CEQA. The Draft EIR discusses the No Project Alternative (Section 6.3.2.1) and an Off-Site Alternative (Section 6.3.2.4) as suggested by the commenter.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

The EIR did look at a higher density mixed commercial residential development. As described on page 6-24 of the Draft EIR, the Mixed Commercial/Office/Residential Alternative (Alternative 4) would result in the development of commercial, office and residential uses on the project site resulting in development of 548 multiple-family residential units, 138 single-family residential units, 441,000 square feet of commercial uses, and 441,000 square feet of office uses.

As described on page 6-31 of the Draft EIR:

Under the Alternative 4, impacts related to short-term construction-related air quality would be similar to the proposed project as the same amount of land would be disturbed and the same mix of equipment would be utilized. Long-term operational-related air quality emissions would be increased in magnitude when compared to the project and would remain significant and unavoidable. Because of the increase in vehicle trips under this alternative, impacts to the operation of local roadways and intersections would be proportionally greater than what was identified for the proposed project. Long-term traffic impacts would remain significant and unavoidable. Traffic-related noise would be increased in magnitude but would be similarly mitigated like the proposed project and would remain less than significant.

Because this alternative would also require a Zone Change and General Plan Amendment, land use impacts would be similar to the proposed project. This alternative would result in the development of office uses that would generate permanent jobs, which may require workers who are not current residents of the City. Combined with the residential component, the office use would increase the total number of people that would be added to the City's population. This alternative would have greater demands on public services and recreation. However, the payment of fees and dedication of parkland would reduce these impacts to a less than significant level. This alternative would increase the amount of water utilized and increase the amount of wastewater and solid waste that would be generated on site. Similar to the proposed project, adherence to wastewater and solid waste requirements would reduce these impacts to a less than significant level. In the event that water is not available for development envisioned under this alternative, impacts to water resources would be significant and avoidable. Under this alternative, some of the proposed project objectives would not be met as warehouse uses would not be built. However, development of this alternative would provide new employment opportunities for residents of Moreno Valley.

The Draft EIR does analyze the various alternatives impacts on greenhouse gas emissions (Table 6.F page 6-10) biological resources, water resources including water quality and water use (Table 6.C on page 6-9) and traffic (Table 6.B page 6-9). In addition, detailed analysis for each of the alternatives is included in Section 6 of the Draft EIR as it relates to the environmental issues listed by the commenter.

An agricultural alternative was not considered because the site has been planned by the City since 1987 for suburban intensity land uses. In addition the current General Plan does not include any agricultural designations. The City allows agricultural uses in all land use designations as an interim use until such time as the land is developed per the vision identified in the General Plan. One of the goals stated in the City's recent General Plan is the "...orderly conversion of agricultural lands." Therefore, an agricultural use as a long-term alternative is not practical and does not require analysis as a separate alternative. However, it should be noted that Alternative 3 does incorporate 27 acres of land that would be used for agriculture to provide a less intense buffer in the southeastern portion of the site. No further analysis is necessary and the comment does not change the conclusion in the Draft EIR.

Response to Comment 31. The commenter is correct in stating that a large segment of the population of Moreno Valley is Hispanic or Latino. However, because a person is Hispanic or Latino does not automatically mean that they only speak Spanish. There is no legal requirement to translate the environmental documents or the notices into other languages. It is not the policy of the City to require project applicants to incur the added expense of having project environmental documents or public notices translated into Spanish. The City is also not required to incur the expense of providing a Spanish translator at public meetings. The commenter is free to provide a Spanish translator at its costs. In addition, neither the State CEQA Statutes nor the State CEQA Guidelines require or even suggest providing such notices.

Contrary to the assertion of the commenter, the City believes the Draft EIR does identify and analyze the potential direct, indirect, and cumulative impacts of the proposed warehouse project. The City believes the EIR, including the Draft EIR, Final EIR, and supporting appendices and materials, comply with the requirements of CEQA, and that the Final EIR has adequately addressed the various comments raised by this and other commenters on the EIR.

The Sierra Club, San Gorgonio Chapter, is already on the mailing list for this project, as previously requested.

RE: Comments on Prologis Eucalyptus Industrial Park Draft Environmental Impact Report (SCH No. 2008021002)

Greetings:

On behalf of the Sierra Club, Moreno Valley Group, and Residents for a Livable Moreno Valley, I hereby submit these comments on the Prologis Eucalyptus Industrial Park Draft Environmental Impact Report (EIR). (SCH No. 2008021002)

General Comments:

The California Environmental Quality Act (CEQA) was adopted as a disclosure and transparency document. The theory is that by providing a document that adequately describes the environmental consequences of a project to decision makers and the public, the decision makers will make a rational decision based upon the true environmental consequences of the project and if they do not, the electorate can hold them accountable for their decisions. The core of this statutory structure is the adequacy of the document as an informational document.

Unfortunately, the Draft EIR for this Project fails as an informational document. The Project Description in the EIR is inadequate, misleading, and internally inconsistent. CEQA requires that an EIR contain an accurate, complete, and consistent description of a proposed project so that decision-makers and the public can properly and fully assess the project's environmental

consequences. (California Code of Regulations, Tit. 14 §15124; *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 192-193.) The Description here fails to divulge important information such as all adjacent land uses. (See, e.g., *Figure 3.2* identifying only a few Surrounding land uses; also, Section 3.0 of Draft EIR) The Description is also inconsistent with statements within the Description itself and elsewhere in the EIR. For example, the Executive Summary states that the amendment to the Master Plan of Trails will either relocate the trail “and/or” eliminate the planned trail segment, whereas the Project Description states that the both elimination and relocation will occur. The Project description also fails to depict all known future projects adjacent or near to the project site. By failing to provide an adequate Project Description, the EIR fails as an informational document.

2

The EIR misleads decision makers and the public as to the extent and severity of the Project’s environmental impacts. The analysis and evaluation of project impacts within the EIR do not evince adequacy, completeness, or a good faith effort at full disclosure. (California Code of Regulations, Tit. 14 § 15003(i).) The conclusions and findings of the EIR are completely unsupported by substantial evidence within that document. The Draft EIR is almost constantly conclusory, and does not provide the analysis or examination required by CEQA to inform the public and decision makers of the analytical pathway taken from facts to conclusions. The EIR also fails to undertake and/or defers studies needed to determine the severity and extent of environmental effects, and whether or not such effects may be mitigated below a level of significance. Furthermore, the EIR is misleading by stating that the EIR evaluated the project as operating 24/7 where, in fact, the specific studies within the EIR evaluate operation in shorter time frames.

3

CEQA also requires that where feasible mitigation exists which can substantially lessen the environmental impacts of a project, **all feasible mitigation** must be adopted. (California Code of Regulations, Tit. 14 § 15091.) In this way CEQA goes beyond its informational role to require that projects substantively lessen their negative effects on the environment. It is critical to proper drafting of an EIR that all feasible mitigation measures be required of a project. This has not been done with this Project. For instance, the EIR fails to require *any* mitigation for the project’s significant impacts to agricultural resources. Additionally, while most of the project’s environmental effects will be a result of its use as a distribution center and corresponding traffic and air quality impacts, no direct mitigation is required to reduce these impacts. With regards to air quality impacts from operational traffic, the EIR improperly concludes without evidence or reasoning that no mitigation is feasible. Regarding traffic effects, the EIR relies entirely on TUMF and DIF programs and concludes that significant effects will be either immediately or promptly reduced by these programs. To the contrary, a significant amount of the streets impacted are not currently planned or funded for improvements, and given the underfunding of these programs and fails to require any direct improvements without finding direct improvements to be infeasible.

4

5

Moreover, all mitigation measures required in the EIR must be fully enforceable, certain to occur, and not deferred. (Public Resources Code § 21081.6; Cal. Code of Regulations, Tit. 14 §§ 15074.1, 15097.) This Project fails to ensure that all feasible mitigation will occur with this Project and instead provides vague, uncertain, and unenforceable approximations of mitigation measures. The Project also defers mitigation extensively with regards to impacts to/from, for instance, biology, culture, hydrology/drainage, among others.

6

The choice of the environmentally superior alternative in the EIR is also not supported by substantial evidence in the record or the evaluation of those alternatives. The EIR concludes that Alternative 3, the Reduced Intensity Alternative, is the environmentally superior alternative where Alternative 5, the Off-Site Location Alternative, would ultimately result in fewer significant impacts. Nonetheless, the EIR does not find either Alternative 3 or Alternative 5 to be infeasible. As both of these alternatives satisfy most project objectives and significantly reduce project impacts, one of these environmentally superior alternatives must be implemented in lieu of the project if the project is approved.

7

For these and the reasons detailed below, the EIR fails to comply with CEQA and must be substantially supplemented, amended, and recirculated.

Project Summary:

The proposed development project would result in the construction and operation of approximately 2,244,638 square feet of distribution warehouse uses on 122.8 acre site. The project site is located adjacent to and south of SR-60, east of Moreno Valley Auto Mall, and adjacent to and west of the Quincy Channel in the eastern portion of Moreno Valley. The project will construct 6 buildings with a maximum height of 50 feet with 326 truck docks. The project will also construct 372 truck parking spaces and 1,110 auto parking spaces; 9 driveways; a bridge over Quincy Channel; a new “Eucalyptus Avenue” through the project site; a new roadway “B Street” between buildings 3 and 4; new storm drain, sewer, and water lines; and other related development.

8

Land uses of the project site presently consist of citrus groves and vacant land. There are also three natural drainage features onsite including two ephemeral channels to the southwest and Quincy Channel along the eastern portion of the property. Existing land uses adjacent to the project site are stated to include presently vacant land to the east and south, SR-60 to the north and residential uses north across that highway, Moreno Valley Auto Mall and Moreno Valley Fire Station No. 58 to the northwest, and single-family residential uses approximately 50 feet southeast of the project site. However, any of the surrounding lands are not mentioned or mapped in the EIR as having a use or, alternatively, being vacant or put to agricultural use. The Project description fails to adequately and accurately depict these adjacent land uses.

The Project will require the following discretionary entitlements, among others, from the City:

General Plan Amendment to change the land use designation of 71.3 acres of the Project site from Residential (R15, R5, and R2) to Business Park.

General Plan Amendment to amend the Circulation Element to (1) eliminate the undeveloped Quincy Street from Eucalyptus Avenue to Encilia Avenue; (2) realign Encilia Avenue such that its western terminus is Moreno Beach Drive rather than its current terminus at Eucalyptus; and (3) classify the segment between Quincy Channel and Moreno Beach Drive as a Collector.

Zone Change of the entire site (122.8) acres from Business Park (BP), Business Park/Mixed Use (BPX), Residential 15 District (R15), Residential 5 District (R5) and Residential Agriculture 2 (RA-2) to Light Industrial (LI). The Zone Change will also redraw the boundary of the Primary Animal Keeping Overlay (PAKO) District which would remove 12.2-acres (part of the RA-2 Zone) from the City's PAKO-designated land.

Amendment to the City's Master Plan of Trails to eliminate the trail segment along the west side of the Quincy Channel north of the Future Eucalyptus from SR-60 to Fir Avenue; and/or relocate the Eucalyptus Avenue trail to the north side of Eucalyptus Avenue.¹

8

The Project will require the following entitlements, among others, from other agencies:

Approval of Quincy Channel Improvements from the Riverside County Flood Control and Water Conservation District

A Section 404 permit from the US Army Corps of Engineers

A Section 401 Water Quality Certification from the Regional Water Quality Control Board

A Section 1602 Streambed Alteration Agreement from the California Department of Fish and Game.

The EIR finds that the Project will result in significant and unavoidable impacts to/from aesthetics, agriculture, air quality, land use/ planning, and traffic/transportation. All other potentially significant impacts are found to be mitigated below a level of significance.

Aesthetics

9

¹ Note: the description of this amendment changes in the EIR, resulting in an inconsistent project description.

Within Table 1.C, Impact 4.1.6.1 states that, “A less than significant impact related to this issue would occur.” This statement is incorrect, unsupported by the narrative, and unsupported by the third column finding that it is a “significant and unavoidable” impact.

9

The project would result in significant and unavoidable individual and cumulative impacts to existing visual character or quality of the site and its surroundings; scenic vistas of the Box Springs Mountains and Russell Range; and scenic resources and scenic highways. The project’s impacts to scenic views and views from SR-60 also conflict with General Plan Policies and Objectives. (*See, e.g.* Objective 7.7, 7.7.4, 7.7.5) Despite these significant aesthetic impacts, no mitigation has been incorporated into the project to reduce or avoid these impacts such as substantially limiting the height of buildings; widely dispersing buildings; and/or creating wide setbacks and buildings screened from the roadway/residences. These mitigation measures are feasible and should be incorporated into the project.

10

At page 4.1-1, the EIR states that the closest residence to the project is 200 feet southeast of the project site. This statement conflicts with the Project Description and other parts of the EIR that place the closest residence at 50 ft.

11

At page 4.1-5, Objective 2.5 and Policy 2.5.1 do not pertain to aesthetics. The EIR lists these policies and then finds that the project is consistent with these policies. However, the EIR wrongly fails to evaluate the project’s inconsistency with most other listed policies. (*See, p.4.1-9, compare, 4.1-21.*)

12

With regards to impact 4.1.5.1- Light and Glare, the EIR does not seem to consider additional light and glare from the *project’s* additional traffic and presumed operation 24/7. Furthermore, the EIR does not consider impacts to nighttime views. Impacts to an from lighting are potentially significant and unmitigated.

With regards to lighting, the following should be required of the project:

- Maximum wattage for light bulbs on the exterior of the project of 250 watts;
- All lighting must be designed with full cutoffs to fully shield light fixtures.
- A further reduction of permitted light trespass or spillover lighting onto adjacent properties to a maximum of 0.25 foot candle maintained lighting measured from within five (5) feet of any property line. The existing City standard is 0.50 foot candle.
- The inclusion of lighting height limits of a maximum of 30 feet, except within 100 feet of a residential use, where lighting shall be reduced to a height of 20 feet and walkway/courtyard lighting to a maximum of 12 feet in height.
- The addition of lighting curfews for outdoor lighting requiring all lighting to be reduced by 50 percent beginning at 10:00 p.m. until dawn.

13

Signage is not evaluated in the EIR even though the EIR implies that the project will have signage. (EIR p. 4.1-20-21) The EIR fails to evaluate all aesthetic impacts by failing to account for light/glare and view impacts from any signs installed for the project.

14

The project description states that the maximum height of the buildings will be 50 feet (Table 3.B); however the aesthetics section does not evaluate the impacts from the two out of six buildings with a maximum height of 50 feet. Instead, the aesthetics evaluation considers the average height of 39 feet and height at the corners of 43 feet. (e.g. p. 4.1-19) The aesthetics evaluation thereby fails to divulge the real aesthetic impacts of the project to views and the visual character and quality of the site and its surroundings.

15

The EIR states that there will be a 395 foot setback between the closest building and residences. However, this does not demonstrate at least a 250-ft buffer or setback between “industrial uses” and “residential uses,” only the buildings themselves.

16

The EIR concludes that, “the project appears to be consistent with the various Municipal Code requirements for the proposed land uses outlined in Section 4.1.2 related to landscaping, setbacks parking, storage, etc.” without in any way evaluating how or why the project is consistent with the requirements.

17

Agricultural Resources

Within Table 1.C (Environmental Summary), Impact 4.2.6.1 states that, “The proposed project would not conflict with an existing agricultural zone” and that “Impacts are less than significant.” However the narrative does not support this finding, the Impact is listed under the title “Significant Impacts” and the level of significance after mitigation states that impacts will be significant and unavoidable. This discrepancy must be corrected to provide the public and decision-makers with an accurate depiction of project impacts.

18

Impacts to the PAKO are not mentioned in the Environmental Summary; rather only the RA-2 zone designation is mentioned. Removing 12 acres from the PAKO designated land in the City must be mentioned in the Summary. Furthermore, the finding that this conflict and conversion of land is less than significant is unsupported where the 12 acres represents .4% of the PAKO-designated land in the City. This impact may also be cumulatively considerable and yet was not considered within the discussion of cumulative impacts.

19

The project would convert 82.5 acres of “Prime Farmland” and 39.8 acres of “Farmland of local importance” to non-agricultural uses. Table 1.C Impact 4.2.6.2 also lists “(5.3 acres)” but fails to identify any designation for these 5.3 acres. The summary table also only states that the conversion of state designated Prime Farmland is significant; any impact to Farmland of Local Importance is disregarded.

20

The project would convert a site currently actively involved in agricultural operation. The project site also has a significant LESA score, further demonstrating its importance and the significant impact of this project to agriculture. However, this score is misstated throughout the EIR as 83 (Table 1.C Impact 4.2.6.3), 85.30 (Table 4.2.A), and 85.07 (p. 4.2-10). The project would also have a cumulatively considerable agricultural impact.

21

No mitigation is required to reduce the individually and cumulatively significant adverse impacts of this project to agriculture. While the EIR identifies many mitigation measures that may be implemented, it fails to require any mitigation. The fact that the General Plan EIR found

22

mitigation to be infeasible on a citywide scale does not mean that project level mitigation here is infeasible.

Mitigation measures identified by the Dept. of Conservation to reduce agricultural impacts include:

- The purchase of agricultural conservation easements;
- Transfer of development rights;
- Acquisition of farmland by the city or county;
- mitigation banking;
- the establishment of “urban limits,” greenbelts, and buffers;
- the payment of in-lieu fees sufficient to a purchase and maintain farmland conservation easements;
- and planning tools such as clustering development, use of density bonuses, and limiting “leapfrog” development.

The EIR refers to these as “tools” to mitigate the loss of agricultural land. The EIR does not find that it is infeasible to implement these mitigation measures.

While the measures regarding planning within the purview of the City may have been determined to be infeasible, ***the EIR does not provide evidence to support the finding of infeasibility with regard to project-level mitigation including the purchase or transfer of development rights, conservation easements, or donation of funds to assist in the preservation of agricultural lands.*** These measures must be required as mitigation. In particular, the purchase of a permanent agricultural conservation easements of land of at least 2:1 of equal quality is feasible and must be required to mitigate for impacts from the direct and growth inducing/cumulative loss of agricultural land. This may alternatively be accomplished by the donation of mitigation fees to a local, regional, or statewide organization that provides for acquisition and stewardship of agricultural conservation easements. Such mitigation is not found to be infeasible.

See, Attached Exhibit A, “Zero Sum Game: The Debate Over Off-Site Agricultural Mitigation Measures” by Joshua Safran, Vermont Journal of Environmental Law, Volume 6 2004-2005, explaining the benefits of mitigation and feasibility of such measures.

Air Quality

The EIR assumes that the Moreno Valley Unified School District has abandoned plans to locate several schools in close proximity to the project. However, Resolution No. 2007-08-81 did not abandon these sites but merely gave the superintendent the authority to do so and to enter into an agreement to that effect. There is no evidence in the EIR that any such abandonment of these sites actually occurred. As Resolution 2007-08-81 merely expressed an intention and did not formally abandon these school sites, the failure of the EIR to consider these potential sensitive receptors in the project vicinity with regards to air quality impacts and elsewhere in the EIR is unsupported.

The EIR fails to disclose all Moreno Valley General Plan Policies relevant to air pollutant emissions. Such omitted policies and objectives include:

- Ultimate Goal VII: achieve a community which “Emphasizes public health and safety...”
- Goal 6.1: “To achieve acceptable levels of protection from natural and man-made hazards to life, health, and property.”
- Objective 7.5 “Encourage efficient use of energy resources.”
- Policies 7.5.1; 7.5.2; 7.5.5 regarding energy efficiency.

25

Health Risks

The EIR finds, contrary to the evidence in the record, that the project’s Health Risk impacts would be less than significant. Nevertheless, the project will result in significant cumulative health risks, discussed below, and mitigation must be incorporated to reduce such impacts.

26

With regards to operational emissions, the Health Risk Assessment² (HRA) modeled emissions as if all trucks and cars moving onsite were located only on Eucalyptus Avenue, not driving to or from the buildings elsewhere onsite. The HRA thereby minimizes impacts where vehicles will be driving onsite closer to receptors and residences. The HRA also assumed that the buildings would have a height of 65 feet where, in fact, the buildings will be of varying height up to 50 feet with an average height of 39 feet and height at the corners of 43 feet. While this assumption may be beneficial to determine any wake effect, it may be detrimental if the EIR assumes that some emissions are blocked by the buildings.

27

Further, the HRA assumes operation 350 days per year. This is not the 24/7 evaluation that the EIR claims occurred for all project impacts.

28

The Environmental Summary Table 1.C states that the project would increase cancer risks at existing sensitive receptors by no more than 1.1 in 1 million, and at future development by 3 in 1 million. This is contradicted by the Air Quality Analysis and Air Quality section of the EIR, which puts project-related health risks increases of at up to 4.33 cancers in 1 million at residences to the north; it is not apparent that the closest residences to the southeast were evaluated or what the impact to those residences would be. Again, the Environmental Summary and EIR fail to accurately depict project effects. Furthermore, this risk is measured at a distance further than actual existing sensitive receptors (25 meters versus 50 feet) so that the actual health risk may be higher than predicted.

29

Furthermore, according to the EIR, **this increase in cancer risk would add to an existing cancer risk of over 250 in 1 million (the rate for parts of Riverside County), well over the threshold of 10 in 1 million.** However, the EIR fails to actually evaluate and quantify present or expected health risks at nearby sensitive receptors with the project. The EIR fails as an informational document by failing to evaluate and quantify actual health risks with and without the project.

30

² The HRA refers to the Air Quality Analysis, EIR App. B, p. 43-47.

The health risk assessment also evaluates worker health with a standard work schedule. This should be clarified in the EIR, especially where the EIR states that it evaluates impacts as to operation 24/7.

31

With regards to operational emissions, the EIR and HRA use projected 2025 emissions as a “median point for emission rates.” This again provides an emission estimate and health risk lower than that which would be seen with current emission rates. The EIR fails as an informational document by using the future emissions factors where health risks should be measured based on current emission.

32

With regards to construction health risks, the EIR evaluates construction as occurring 22 days per month for 4 months, where construction will actually occur for almost a year and may occur 7 days a week. The claim that this evaluation is “conservative” is unsupported by the record.

33

The health risks from this project will be a result of primarily diesel PM. In addition to cancer risks, diesel PM is known to cause immune system effects; reproductive, developmental, and endocrine effects; nervous system effects; and lung health problems, as recognized by the County in the General Plan. Immune system effects include increased allergic inflammatory responses and suppression of infection fighting ability. Diesel PM has also been associated with reproductive effects such as decreased sperm production, changes in fetal development, low birth weight and other impacts. Diesel PM exposure may also cause impairment to the central nervous system. (See, Exhibit C, *The Health Effects of Air Pollution on Children*, Michael T. Kleinman, Ph.D, Fall 2000, <http://aqmd.gov/forstudents/health_effects_on_children.html#WhyChildren>; Exhibit D, *Diesel and Health in America: the Lingering Threat*, Clean Air Task Force, February 2005, <http://www.catf.us/resources/publications/files/Diesel_Health_in_America.pdf>, Exhibit E, “Dirty Air Triggers More Heart Attacks than Cocaine,” Kate Kelland, Reuters 2011, and “Air Pollution Worse than Cocaine for Triggering Heart Attacks, says study,” Press Association 2011.)

34

SCAQMD has stated with regards to the health effects from diesel PM:

“Diesel particles consist mainly of elemental carbon and other carbon-containing compounds... Diesel particles are microscopic...Due to their minute size, diesel particles can penetrate deeply into the lung. There is evidence that once in the lung, diesel particles may stay there for a long time.

In addition to particles, diesel exhaust contains several gaseous compounds including carbon monoxide, nitrogen oxides, sulfur dioxide and organic vapors, for example formaldehyde and 1,3-butadiene. Formaldehyde and 1,3-butadiene have been classified as toxic and hazardous air pollutants. Both have been shown to cause tumors in animal studies and there is evidence that exposure to high levels of 1,3-butadiene can cause cancer in humans...

35

Diesel emissions may also be a problem for asthmatics. Some studies suggest that children with asthma who live near roadways with high amounts of diesel truck traffic

have more asthma attacks and use more asthma medication.

Some human volunteers, exposed to diesel exhaust in carefully controlled laboratory studies, reported symptoms such as eye and throat irritation, coughing, phlegm production, difficulty breathing, headache, lightheadedness, nausea and perception of unpleasant odors. Another laboratory study, in which volunteers were exposed to relatively high levels of diesel particles for about an hour, showed that such exposures could cause lung inflammation.” (*The Health Effects of Air Pollution on Children, supra.*)

35

Furthermore, infants, children, and the elderly are more susceptible to diesel PM and its associated health impacts. Given this project’s potential close proximity to residential uses, this increased susceptibility is extremely relevant. With regards to infants and children, increased susceptibility to TACs and diesel PM exists for a variety of reasons. Children are generally more active than adults, have higher respiration rates, and inhale more pollutants deeper into the lung. Children also have more lung surface area in proportion to their body size and inhale more air pound for pound when compared to adults, taking in 20 to 50 percent more air and associated air pollutants than adults. When compared to adults, children spend more active time outdoors in polluted air environments and exert themselves harder than adults when playing outside. Importantly, this exposure to high pollutant levels in children occurs while their lungs are still developing, and therefore has more severe impacts on this sensitive group. (*The Health Effects of Air Pollution on Children, supra.*)

36

This increased susceptibility to air pollutant emissions for children has resulted in the California EPA Office of Environmental Health Hazard Assessment (“OEHHA”) weighting cancer risk by a factor of 10 for exposures to carcinogens from birth to two years old, and by a factor of 3 for exposures from 2 years old to 15 years old. (Exhibit F, *Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures*, California EPA OEHHA Air Toxicology and Epidemiology Branch, April 2009, p. 3. <http://www.oehha.ca.gov/air/hot_spots/pdf/TSDCPFApril_09.pdf>) It is unclear that these increased risks were accounted for in the EIR. Additionally, recent studies conducted by SCAQMD’s Brain and Lung Tumor and Air Pollution Foundation have found a specific connection between exposure to diesel PM and brain cancer in children. (Annual Meeting of the Brain & Lung Tumor and Air Pollution Foundation, April 2, 2010, <<http://www.aqmd.gov/hb/2010/April/100425a.htm>>)

37

In addition to an increased risk of cancer, the effects of diesel PM on children include slowed lung function and growth, increased emergency room visits, increased incidences of asthma and bronchitis, crib death, asthma respiratory infections, allergic symptoms, and asthma hospitalizations. (*Diesel and Health in America: the Lingering Threat, supra.*)

The EIR, in evaluating health risks, failed weight potential cancer and non-cancer impacts from the project. Impacts to children and the elderly near the project may be elevated in comparison to the risks stated in the EIR.

See also, Attached Exhibit B, “Appendix G, Emissions Inventory Methodology and Results,”

California Air Resources Control Board. This study is a comprehensive re-evaluation of the heavy duty diesel truck emissions inventory for California and contains EMFAC modeling methodology to estimate vehicle emissions.

37

Exhibit G is also instructive. The “Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning: a Reference for Local Governments within the South Coast Air Quality Management District,” May 6, 2005, details the harms of air pollution on health and public welfare and provides guidance on how harms may be measured and minimized.

38

The attached Exhibit H, “Good Neighbor Guidelines for Siting New and/or Modified Warehouse/Distribution Facilities,” WRCOG Regional Air Quality Task Force, September 12, 2005, provides additional guidance for reducing impacts from diesel PM through the use of buffers and other methods that should be considered in re-evaluating project impacts and mitigation measures/alternatives to the proposed project.

39

Attached Exhibit I provides calculation methods for PM 2.5, “Final-Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds,” October 2006.

40

Air Quality Management Plan Inconsistency

The EIR contemplates that “it is uncertain if [the project] is consistent with the AQMP.” In fact, the project is *inconsistent* with the AQMP as it has not been considered in the General Plan. The statement that it is uncertain if the project is consistent is not supported by the facts in the EIR.

41

Construction

It is not clear whether the EIR considers construction emissions from all sources or merely construction equipment at 4.3.6.2. For instance, it is unclear whether the fugitive dust emissions or the importation of 200 cubic yards of soil during grading and 339,561 cubic yards of fill during excavation were considered in the construction air quality evaluation. If only construction equipment was considered, then the EIR is deficient for failing to consider emissions from all construction sources.

42

Additionally, the EIR does not disclose the actual peak daily emissions should construction phasing overlap. At least two construction phases (architectural coatings and paving) are expected to overlap. Also, no phasing of construction is required of the project. (*See*, App. B p. 23) Phasing as projected must be required and/or the EIR must disclose actual peak daily emissions with the overlap of construction phases.

43

With regards to exceedances of localized significance thresholds, the EIR separately considers emissions from different phases of construction. Again, any overlap must be considered and the phasing must be required so that further overlap of phasing, and associated additional pollutant emissions, do not occur. Furthermore, it does not appear that any phases other than grading and architectural coating were considered; impacts from site preparation, building construction, and paving are conspicuously absent. The EIR is again flawed as an informational document.

44

Diesel construction equipment is evaluated for use at a maximum 8 hours per day but as few as 6 hours per day. There is no requirement that this be the maximum operating time for equipment,

45

and this surely is not the evaluation of project effects at 24/7 operation that the EIR purports to examine. Furthermore, while mitigation for noise impacts allegedly limits construction-related activities that would result in “high noise levels” to occur between set hours, **this still permits construction for up to 14 hours per day; there is no such limit for non-high noise level activities; and written approval may be obtained to permit any construction 24/7.**

45

(MM4.9.6.1D) The limitation of 8 hours per day for use of construction equipment is unreasonable and not supported by facts in the EIR. Construction equipment use 24/7 must be considered.

Similarly, the Air Quality Analysis considers a maximum daily disturbed acreage of 4 acres in order to evaluate construction LST impacts. This assumption is not supported by the potential to construct the project 24/7 until completion. The LST analysis also looks at 25 meters, rather than the 50 feet distance to the nearest sensitive receptors. (Air Quality Analysis p. 26) LST impacts are understated as a result of these discrepancies.

46

Odors are determined to be insignificant as a result of the fact that they would not occur after construction. (Air Quality Analysis p. 27) However, where construction would occur for almost a year, this assumption of only a short-term impact is erroneous. Odors from equipment during construction is a significant and unmitigated impact that is not disclosed in the EIR.

47

LSTs for project operation are also flawed as the evaluation considers a 5 acre site at 25 meters. Neither the Air Quality Analysis nor the EIR cite the source or reasoning for considering only 5 acres of the project site for evaluating LSTs during project operation. Impacts are understated.

48

With regards to mitigation measures for construction air quality impacts:

All construction equipment staging areas should be located at least 1000 feet from sensitive receptors. (Mitigation Measure (“MM”) 4.3.6.2A.)

49

With regards to MM4.3.6.2B, “Power sources” is vague; as is “clean-fuel generators.” If electric power poles or a certain type of generator is meant, those alternatives must be explicitly stated.

50

MM 4.3.6.2C does not go far enough by requiring only Tier II equipment and only during the rough/mass grading phase, and only inclusive of rubber-tired dozers and scrapers. It is feasible to require Tier III or higher equipment for all phases of construction and for all equipment where technologically available.

51

MM 4.3.6.2D is not a mitigation measure but California law. The public and decision-makers are deceived by the incorporation of this and other laws in the Mitigation Measure sections of the EIR so that it looks like much more mitigation is being required of the project that is actually occurring.

52

MM 4.3.6.2H is likewise not a mitigation measure. It is feasible to require, as mitigation, that the construction equipment be maintained in good condition and in proper tune, and that construction equipment always be prohibited from idling for 5 minutes or more. It is feasible to not limit this mitigation to “smog season.”

53

MM 4.3.6.2I is not a mitigation measure but a CARB requirement. 54

MM 4.3.6.2J is uncertain and unenforceable, as it merely requires that documents have “notations”, not that any mitigation occur. The bullet points are further uncertain and unenforceable where they require mitigation only where “feasible”. 55

Regarding MM 4.3.6.2K, no mitigation is certain to occur without the addition of a time limit for responding to air quality issues. It is feasible to require response and resolution within 24 hours. 56

MM 4.3.6.2L merely requires the posting of signs, not that truck drivers turn off engines when not in use or that trucks not idle for more than 3 minutes. 57

At MM 4.3.6.3A, the word “should” must be changed to “shall” to ensure enforceability. As written, the measure is vague and unenforceable. 58

Operational Impacts

Operation of the project will have significant impacts to CO, ROG, NOX, PM10, and PM2.5. However not all feasible mitigation has been required of the project. Moreover, the EIR baselessly concludes that no feasible mitigation exists for impacts from mobile sources and fails to require any mitigation for this project’s enormous mobile source emissions. For instance, mobile source emissions will account for 1,800 lbs/day of the project’s total 1,801.1 lbs/day of CO, well over three times the 550 lbs/day threshold. Likewise, mobile source emissions will account for 2,000 lbs/day of the project’s total 2,001.3 lbs/day of NOX, over thirty-six times the 55 lbs/day threshold. (See, Table 4.3.L at EIR p. 4.3-33) The EIR and Air Quality Analysis nevertheless conclude without reason what emissions from project related truck exhaust is “outside the control of this project” and therefore there is no mitigation available to reduce these air quality impacts. (See, e.g. Air Quality Analysis p. 1) To the contrary, feasible mitigation exists to reduce operational air quality impacts as detailed below and including, for example, requiring Smartway carriers for project operation. 59

With regards to Mitigation for Operational Air Quality impacts, MM4.3.6.5A and 4.3.6.5B are vague, uncertain, and unenforceable. While alternatives and performance standards are allowable, these measures do not demonstrate that any mitigation will be required of the project or that they will in any way require all feasible mitigation. It is feasible to require each of the alternatives listed as mitigation for the project. Accordingly, the following mitigation measures must be incorporated to reduce operational air quality impacts:

- Preferential parking for employee vanpooling/carpooling
 - Bicycle parking facilities
 - Bus turnouts
 - Require construction of buildings to exceed Title 24 requirement by 20 + percent.
 - Install low-emissions water heaters
 - Install central water heating systems
- 60

- Require use of energy-efficient appliances
- Require increased insulation
- Require use of automated controls for air conditioners
- Require use of energy-efficient parking lot lighting.
- Require use of lighting controls and energy –efficient lighting.
- Require use of low-VOC interior and exterior coatings during any project repainting.
- Require on-site improvements such as sidewalks or pedestrian walkways to promote pedestrian activity and reduce the number of vehicle trips.
- Require installation of skylights and energy-efficient lighting that exceeds current California Title 24 standards where feasible, including electronic dimming ballasts and computer-controlled daylight sensors in the buildings.
- Require planting of shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and building shall be planted at the proposed project site to minimize the heat island effect and thereby reduce the amount of air conditioning required.
- Require installation of fans to assist natural ventilation,
- Require installation of centralized water and space conditioning systems or, alternatively, high efficiency individual heating and cooling units
- Require installation of automatic setback thermostats.
- Require the incorporation of the following to reduce energy demand associated with potable water conveyance through the following methods:
 - Require incorporation of drought-tolerant plants into the landscaping palette; and
 - Require incorporation of water-efficient irrigation techniques.
- Require installation of energy-efficient low-pressure sodium parking lot lights or equivalent as determined by the City;
- Require that buildings be oriented north-south;
- Require implementation of an on-site circulation plan in parking lots to reduce vehicle queuing;
- Require applicant to develop a trip reduction plan to achieve 1.5 average vehicle ridership (AVR) for businesses with fewer than 100 employees or multi-tenant worksites;
- Require project to include bicycle parking facilities such as bicycle lockers and racks;
- Require project to include showers for bicycling employees use;
- Require construction of on-site pedestrian facility improvements including building access that is physically separated from street and parking lot traffic and walk paths.

60

Likewise, all alternatives listed at MM 4.3.6.6A are feasible and each must be incorporated into the project as below:

- Buildings shall exceed current California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling.
- Increase in insulation such that heat transfer and thermal bridging is minimized.
- Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.

Incorporate dual-paned or other energy-efficient windows.

Incorporate energy-efficient space heating and cooling equipment.

Interior and exterior energy-efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards shall be installed.

Install automatic devices to turn off lights when they are not needed.

Shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.

Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.

All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design, and shall incorporate renewable electricity systems.

The project shall implement a landscaping palette emphasizing drought tolerant plants.

The project shall implement use of water-efficient irrigation techniques.

The project shall implement EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.

The project shall provide secure, weather protected, on-site bicycle storage/parking.

The project shall provide on-site showers (one for males and one for females).

Lockers for employees shall be provided.

The project shall establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.

The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.

The project shall provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, stub outs for charging stations shall be indicated on the project building plans.

Lease/purchase documents shall require the implementation of the following mitigation measures by contract specification:

- Implement compressed workweek schedules.
- SmartWay partnership: Achieve at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long haul trips carried by SmartWay 1.0 or greater carriers.
- Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers.
- Require that all fleet vehicles conform to 2010 air quality standards or better.

60

- Install of catalytic converters on all gasoline-powered equipment.
- Include to the greatest extent feasible electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.
- Establish and encourage use of carpool/vanpool programs through methods such as vouchers.
- Require a charge for parking fees for single-occupancy vehicles.
- Provide preferential parking for EV and CNG vehicles consisting of at least 15% of parking stalls.
- Require use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance where technologically feasible.
- Require use of only electric (instead of diesel or gasoline-powered) yard trucks.
- Require that all trucks within the fleet be SmartWay rated 1.25.

60

Also, the Air Quality Analysis fails to list all thresholds of significance, specifically threshold 3(c): whether the project would result in any cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard. (Air Quality Analysis, App.B, p. 19.)

61

Cumulative Impacts

As discussed above, **the EIR failed to substantively evaluate the potential cumulative health risk impacts to sensitive receptors near the project, instead citing a CARB Map identifying a carcinogenic risk of over 250 in 1 million in the Riverside area. It is entirely possible that the risk is substantially higher in the project vicinity.** Without actual analysis of this matter, the public and decision-makers are denied disclosure of the project's cumulative health risk impacts, and the EIR fails as an informational document.

62

Likewise, the EIR fails to substantively and quantitatively evaluate cumulative impacts from project construction and operation. While the EIR concedes that such impacts will be substantial and unmitigated, the EIR omits any discussion or divulgence of the severity of such effects.

63

Biological Resources

Mitigation Measure 4.4.6.1A will reduce impacts to migratory bird species, however these impacts are only minimally discussed in the EIR. The Environmental Summary likewise fails to mention impacts to migratory birds or passerine birds. Furthermore, the Environmental Summary states that this mitigation measure will reduce impacts to burrowing owls, not migratory birds. It should be clarified that MM4.4.6.1A will reduce potentially significant impacts to migratory nesting birds, not burrowing owls.

64

The distance maintained from burrowing owl dens of 160 feet during the non-breeding season and 250 during the breeding season is not sufficient. A recent "Staff Report on Burrowing Owl Mitigation" by the Department of Fish and Game found that the following distances from nesting sites are required for low, medium, and high disturbance activities. ("Staff Report on Burrowing

65

Owl Mitigation,” State of California Natural Resources Agency, Department of Fish and Game March 7, 2012, <<http://www.dfg.ca.gov/wildlife/nongame/docs/BUOWStaffReport.pdf>>, p.9-10)

Time of Year	Low Disturbance	Medium Disturbance	High Disturbance
April 1-Aug 15	200 meters	500 meters	500 meters
August 16-Oct 15	200 meters	200 meters	500 meters
Oct 16- Mar 31	50 meters	100 meters	500 meters

The DFG staff report also provides updated guidance on passive relocation of burrowing owls which must be reviewed and incorporated into any mitigation. (*Id.* at p.10-11) The Staff report also found that if lesser buffers are permitted, a “broad-scale, long-term, scientifically-rigorous monitoring program” must be implemented to ensure that burrowing owls are not detrimentally affected by alternative approaches. (*Id.* at p. 10) Here, lesser buffers are required without implementing any rigorous monitoring to ensure that significant impacts do not occur. There is also no consideration of potential impacts from construction to burrowing owls on neighboring sites where disturbance may occur within 500 meters of burrows. Mitigation may be needed for potential impacts to burrowing owls on neighboring sites.

65

The EIR’s relied upon “Burrowing Owl Survey Protocol and Mitigation Guidelines”, California Burrowing Owl Consortium from 1993 is outdated given the guidance documents presently available for mitigating for impacts to the burrowing owl. The EIR and mitigation measures must be updated to account for these recent studies and guidance for mitigating impacts to the Burrowing Owl.

The following recommended mitigation measures must be implemented to reduce impacts to Burrowing Owls:

1. Where habitat will be temporarily disturbed, restore the disturbed area to pre-project condition including decompacting soil and revegetating. Permanent habitat protection may be warranted if there is the potential that the temporary impacts may render a nesting site (nesting burrow and satellite burrows) unsustainable or unavailable depending on the time frame, resulting in reduced survival or abandonment.
2. Mitigate for permanent impacts to nesting, occupied and satellite burrows and/or burrowing owl habitat such that the habitat acreage, number of burrows and burrowing owls impacted are replaced based on site-specific analysis and accounting for natal area,

home range, foraging area, and other factors influencing burrowing owls and burrowing owl population persistence in the project area.

3. Mitigate for permanent impacts to nesting, occupied and satellite burrows and burrowing owl habitat with (a) permanent conservation of similar vegetation communities (grassland, scrublands, desert, urban, and agriculture) to provide for burrowing owl nesting, foraging, wintering, and dispersal (i.e., during breeding and non-breeding seasons) comparable to or better than that of the impact area, and (b) sufficiently large acreage, and presence of fossorial mammals.

4. Alternatively, where a burrowing owl population appears to be highly adapted to heavily altered habitats such as golf courses, airports, athletic fields, and business complexes, permanently protecting the land, augmenting the site with artificial burrows, and enhancing and maintaining those areas may enhance sustainability of the burrowing owl population onsite. Maintenance includes keeping lands grazed or mowed with weed eaters or push mowers, free from trees and shrubs, and preventing excessive human and human-related disturbance (e.g., walking, jogging, off-road activity, dog-walking) and loose and feral pets (chasing and, presumably, preying upon owls) that make the environment uninhabitable for burrowing owls

65

5. Permanently protect mitigation land through a conservation easement deeded to a nonprofit conservation organization or public agency with a conservation mission, for the purpose of conserving burrowing owl habitat and prohibiting activities incompatible with burrowing owl use. If the project is located within the service area of a Department approved burrowing owl conservation bank, the project proponent may purchase available burrowing owl conservation bank credits.

6. Fund the maintenance and management of mitigation land through the establishment of a long-term funding mechanism such as an endowment.

The project will also have significant impacts to riparian/riverine habitat which is not adequately mitigated through the uncertain and deferred mitigation measures at MM 4.4.6.2A and 4.4.6.2B. Mitigation Measure 4.4.6.2A alleges to require the offsite replacement of habitat at a 2:1 ratio; however, the measure only requires contribution of in lieu fees to the SAWA and does not ensure that the fees will be used for the acquisition of equivalent habitat. The required mitigation is uncertain to occur.

66

Mitigation Measure 4.4.6.2B improperly defers mitigation by requiring the preparation and implementation of a Habitat Mitigation and Monitoring Plan to oversee restoration of temporarily effected areas to pre-construction contours and vegetation. Deferred mitigation is only permissible where, for practical reasons, it is not feasible to prescribe specific mitigation measures in the EIR. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 94.) The EIR does not demonstrate that it is infeasible to presently prepare this plan. Moreover, this Plan is not subject to any performance standards or alternatives. MM4.4.6.2B thereby improperly defers mitigation, and impacts to riparian/riverine habitat are significant and unmitigated.

67

The proposed project also will permanently impact federally protected wetlands and jurisdictional waters. Again, this impact is inadequately and uncertainly mitigated through the uncertain mitigation measures at MM 4.4.6.3A. Mitigation Measure 4.4.6.3A alleges to require mitigation at a 2:1 ratio. However, the measure only requires contribution of in lieu fees to the SAWA and does not ensure that the fees will be used for the acquisition of equivalent wetlands. This mitigation is uncertain and inadequate.

68

The Cumulative Impact analysis with regards to biological impacts fails to consider impacts deemed to be individually significant, instead focusing on impacts offset by the MSHCP. Specifically, the EIR fails to evaluate the cumulative impacts to burrowing owls and migratory nesting birds; riparian and riverine habitat; and protected wetlands/waters. The EIR fails as an informational document by failing to consider the project's cumulative effects in these areas.

69

The Determination of Biologically Equivalent or Superior Preservation Report (EIR App. C) suggests mitigation measures for edge treatments including lighting and noise, but fails to discuss or evaluate these potential impacts from lighting and noise on biology. (p. 4-6)

70

Cultural Resources

With regards to archaeological resources, the project is located within the Moreno Hills Complex, an area of archaeological sites. Sixty-five archaeological sites and 22 historic buildings have been documented within a one mile radius of the project. The EIR gives short shrift to the potential archaeological impacts of the project given its high likelihood of containing archaeological and native American resources. It is not apparent that the Luiseno or Cahuilla Indians were consulted with regards to potential onsite resources as part of the cultural resource research for the project.

71

Mitigation measures for prehistoric cultural/archaeological resources are insufficient and uncertain to mitigate for impacts. MM 4.5.6.1A provides only for temporarily redirecting ground disturbance, not for halting any disturbance in the event that such a halt is necessary. Further, the archaeological monitor should be one determined to be qualified by the city, not merely one selected by the applicant. At MM 4.5.6.1B and 4.5.6.1C, no authority is given to the Native American monitor beyond aiding and recommending to the archaeologist. These measures must require consensus between the Native American monitor and archaeologist in order to ensure that impacts to Native American archeology is adequately mitigated below a level of significance. At MM 4.5.6.1D, it is unclear what will become of artifacts after any temporary curation, and vague who "stakeholders" refers to.

72

With regards to paleontological impacts, the project site has been identified as having a high potential to contain significant paleontological resources. Mitigation for paleontological impacts is improperly deferred, requiring the preparation of a Paleontological Resource Impact Mitigation Program in the future rather than divulging the details of the mitigation measure in

73

the EIR. The EIR states no reason why this program cannot be presently prepared for review by the public and decisionmakers. The remaining mitigation measures for paleontological impacts allow for only the rapid salvage of fossils/bone, not for the halting of excavation while proper recovery is conducted. It is uncertain who selects the qualified paleontological monitor; such monitor should be independently selected by the City. It is uncertain that there is a museum repository available for permanent curation and storage of any paleontological resources. Overall, the mitigation for paleontological impacts is uncertain and deferred. Impacts to paleontological resources remain potentially significant.

73

The EIR selects a too small area to evaluate cumulative impacts to cultural resources, evaluating on impacts within the City of Moreno Valley. There is no explanation of why the City boundaries were chosen for this cumulative impact analysis. The cumulative impact section fails entirely to evaluate and analyze impacts, instead concluding without reasons that any such impacts will be less than significant. This conclusion is unsupported by evidence in the EIR.

74

Hydrology and Water Quality

The Project would result in storm water flows over double the existing cubic feet per second and at a substantially increased volume. Despite this acknowledgement, the EIR improperly defers preparation of the Final Hydrology Study with supporting engineering calculations without reason. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 94.) There is insufficient evidence without this study to conclude that impacts may be reduced below a level of significance.

75

Likewise, the cumulative impact analysis relies on the capability to mitigate project effects below a level of significance, where this ability has not been demonstrated as a result of deferred study. Additionally, the cumulative impact analysis limits consideration of cumulative impacts to the City of Moreno Valley where there is no support for limiting within this area. To the contrary, as the site is located in the Santa Ana River Basin, cumulative impacts to these area watersheds must be considered.

76

Hazards/Hazardous Materials

Appendix F demonstrates that the last soil sampling was conducted in 2003-2004. Any findings with regards to the presence of hazards or hazardous materials onsite is therefore outdated. The site has persisted in agricultural use and may since have been exposed to additional pesticides or other hazardous materials. Additional study concerning whether such materials exist onsite must be undertaken.

77

Land Use/Planning

The project will result in significant impacts to land use/ planning for a myriad of reasons. Nonetheless, the evaluation of impacts to/from land use and planning omit consideration and

78

divulgence of several project effects. For instance, discussion of the RTP fails to mention any potential effect from moving or omitting the trail segment, or from the fact that the only mitigation provided for traffic impacts consists of the payment of in lieu fees. The discussion of the RTP also fails to discuss conflicts with the “improve air quality and promote energy efficiency” section of the RTP. Rather, the EIR references other sections and states that the project is consistent with the RTP. This conclusion is not supported by the EIR or narrative reasoning therein. Hence, while the EIR is right to conclude that the project will result in significant impacts to land use/ planning, the EIR fails to provide adequate information concerning such effects.

78

With regards to cumulative impacts, the EIR acknowledges that the Project may create an over-supply of warehousing space in the city cumulative with only WestRidge. It is not clear whether this assessment also accounts for the other planned or proposed industrial warehousing in the City. Nevertheless, the addition of potentially unneeded warehousing space and loss of up to 584 multi-family residential units which may have contributed to the affordable housing supply is significant and supports project denial. (See also, for instance, “*Moreno Valley: Sketchers’ warehouse has caused net job loss,*” <<http://www.pe.com/business/business-headlines/20120201-moreno-valley-skechers-warehouse-has-caused-net-job-loss.ece>>)

79

Noise

The noise impact section of the EIR is fatally flawed and causes the EIR to fail as an informational document. The EIR fails to measure noise impacts against the actual thresholds of significance and with regards to all project noise sources.

80

The EIR notes that the nearest proposed residential uses are 25 feet to the south of the project site, but states that trucks will operate approximately 280 feet from those proposed residences at loading/unloading areas. There is no evidence in the EIR that this distance of 280 feet is required or evidence that the distance of the **loading areas** is equal to the distance of **truck operation**. To the contrary, the EIR states that the nearest internal driveways are approximately 5 ft. from the southern boundary of the project, and about 30 feet from future residences. The EIR nevertheless utilizes a 280 foot distance from sensitive receptors. This distance is contradicted in the EIR. (See, p. 4.9-23, 4.9-4).

81

The EIR arbitrarily creates a threshold for significance for noise of a 3dbA increase, stating that only this level of increase is considered potentially significant and that a 3 dbA change is used as a threshold of significance. This 3dbA change is **not** a threshold of significance adopted by the City of Moreno Valley. (Guidelines § 15064.7) Furthermore, the statement that only audible changes in existing ambient or background noise levels are considered potentially significant is unsupported except by further conclusory statements in the EIR.

82

The EIR also wrongly measures noise at the nearest sensitive receptors instead of at the property

83

line. The property line is the proper locale for measuring the project's noise impact and increases in ambient noise levels.

83

The EIR wrongly concludes that the project will not result in a substantial increase in ambient noise levels in the project vicinity above levels existing without the project with regards to long term traffic noise. The project will, in fact, result in noise increases of **up to 13.6 dBA compared to existing levels (Table 4.9.G) and up to 13.3 dBA in 2012.**³ **These increases are significant.** The conclusion that these increases are less than significant is not based on the threshold of significance, the data of the EIR, or any other facts or evidence. The EIR therefore wrongly concludes that traffic noise impacts will be less than significant.

84

Moreover, the EIR separates out operational noise into three sections where such noise and impacts would all occur during operation: Traffic Noise, Long-Term Operational Noise, and Noise Impacts to Adjacent Future Development. In so doing, the EIR fails to evaluate Operational Noise as a whole from all sources; and fails to evaluate all operational noise based upon the **two unique thresholds of significance.** The EIR fails to consider the potential exposure of persons to, or generation of, noise levels in excess of standards established in the General Plan, Municipal Code, or other standards, from traffic or to future residents. The EIR also fails to evaluate the total noise increases from project operation above existing levels. The EIR fails as an informational document by failing to consider these potentially significant effects.

85

In Section 4.9.5.5, in addition to failing to consider impacts from project traffic in consideration of whether the project exposes people to or generated noise above applicable noise standards, the EIR relies heavily on noise attenuation and shielding from the buildings. This attenuation is not certain, however, especially where noise is considered only at the ground level and, again, only at the nearest off-site residential uses rather than the property line. This section also utilizes 75dBA Lmax and 65 dBA without discussion of the General Plan's acceptable residential exterior noise of 65 and interior noise of 45 dBA CNEL.

86

Section 4.9.5.6 does not evaluate noise level increases in the project vicinity above existing levels as alleged. Instead, almost each subsection looks to noise standards, a separate threshold of significance. The project may increase ambient noise with or without exceeding noise standards. This EIR again fails to act as an accurate or adequate informational document.

87

The EIR finds that short-term construction noise impacts will be potentially significant but mitigated below a level of significance through compliance with permitted hours (MM 4.9.6.1D). This conclusion is not supported by the EIR where the project will result in a substantial temporary increase in ambient noise in the project vicinity, and compliance with project hours

88

³ Note: there is a discrepancy throughout the EIR concerning what year constitutes "Opening Year". For example, the Noise Study has Opening Year at 2012, while the Traffic Study puts Opening Year at 2016 where both concern traffic and daily trips. The EIR is internally inconsistent and provides decision-makers and the public with erroneous information by failing to accurately and consistently evaluate project effects.

will not reduce any increases in ambient noise. Moreover, though the EIR does not state the level of existing noise onsite and in the project vicinity (another flaw of the EIR), the EIR concludes that construction of the project will significantly increase noise to 91 dBA Lmax. There is no evidence that any of the other mitigation measures listed will reduce this noise below a level of significance.

88

Furthermore, the EIR does not at all evaluate construction noise impacts/ temporary impacts with regards to the potential exposure of persons to, or generation of, noise levels in excess of standards established in the General Plan, Municipal Code, or other standards.

89

MM 4.9.6.1D is also uncertain as written approval may be obtained to completely override any such requirement. This does not demonstrate that the City if committed to mitigation.

90

Not all feasible mitigation has been required of the project. The following additional mitigation must be incorporated into project construction:

1. Temporary noise barriers must be installed during project construction.
2. Where technically feasible, utilize only electrical construction equipment
3. During construction, the developer shall require that all contractors turn off all construction equipment and delivery vehicles when not in use and prohibit idling in excess of 3 minutes.
4. Require the use of rubberized asphalt for construction of all roadways and parking areas.
5. Maintain quality pavement conditions that are free of bumps, pot holes, pavement cracks, differential settlement in bridge approaches or individual pavement slabs, etc.
6. Ban heavy trucks near vibration and noise sensitive uses.

91

Lastly, cumulative noise impacts were found to be less than significant based on the above-detailed uncertain mitigation measures and incomplete evaluation of noise impacts. Cumulative noise impacts should be considered significant up to and until such a time that complete and accurate analysis of the project's individual noise impacts as completed and mitigation is demonstrated to be certain, enforceable, and able to reduce impacts below a level of significance.

92

Exhibits J-N provide guidance on calculating noise effects, the potential health risks from noise, and methods for minimizing and mitigating for noise impacts.

93

Transportation/Traffic

Project trip generation estimates are based on the ITE rates for buildings under 200k sq. ft. and Moreno Valley rates for buildings over 200k sq. ft. The EIR does not state why a single trip generation rate calculation method was not used.

94

Additionally, this section of the EIR, in addition to others, attempts to minimize project effects by comparing the proposed project's impacts to those which would potentially be caused by build-out onsite in the manner proposed by the General Plan, rather than assessing the impact of

95

the proposed project on the environment compared to *existing physical conditions onsite*. (Guidelines § 15126.2(a); *See, e.g. EIR Table 4.11.E*) By comparing the proposed project to a potential land use on site instead of the existing use which has minimal, if any, traffic generation, the EIR fails as an informational document.

95

Also, as with the remainder of the EIR, the Transportation/Traffic section fails to evaluate impacts in relation to the actual thresholds of significance. For example, the first threshold: whether the project would cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system; is evaluated only with regards to whether the project would exceed an LOS standard. (*See, p. 4.11-15 - 4.11-16.*) Whether there may be a substantial increase in vehicle trips or volume to capacity ratio on roads is never considered.

96

It is not clear that the design features or incompatible uses evaluation accounted for future residences near the project site. Likewise, the dismissal of potential impacts to schools is flawed for the reasons detailed above. Impacts from a great number of trucks sharing the roadway with passenger vehicles also does not appear to have been considered as a potentially incompatible use where such vehicles would doubtless share access to at least SR-60 in addition to other roadways.

97

Also, there is minimal discussion of conflicts with adopted plans/ policies supporting alternative transportation, such as those listed at pages 4.11-11 through 4.11-13. Moreover, the conclusion that the project will have a less than significant impact with regards to conflicts with adopted plans/ policies supporting alternative transportation is unsupported given the project's proposal to eliminate the planned trail segment on Quincy Ave from SR-60 to Fir Ave.

98

Page 4.11-18 states that the City Trails Commission has accepted the amendment to the Master Plan of Trails to relocate the Eucalyptus Avenue Trail to the north side of Eucalyptus and/or eliminate the planned trail segment on Quincy Ave from SR-60 to Fir Ave. This is inconsistent with the remainder of the EIR which states that such an amendment will need to be approved as part of the project. Moreover, it unclear if only relocation of the trail, only elimination of the plan trail segment, or both portions of the proposed amendment were accepted by the City Trails Commission.

99

The tables delineating The Project's LOS impacts make no attempt at quantifying delay once it exceeds 100 seconds. (Tables 4.11.F, 4.11.G, 4.11.H, 4.11.I, 4.11.J) While acknowledged as LOS F, the Tables fail to divulge how extensive these delays may be.

The Project will result in unacceptable LOS as stated in the EIR as follows:

100

Impact	Number of Unsatisfactory Intersections	Number of Unsatisfactory Freeway Segments	Number of Unsatisfactory Freeway Ramps

Existing (2011) with Project	2	3	0
Opening Year (2016) With Project	3	4	0
Opening Year (2016) Cumulative With Project	8	6	0
Future Year (2035) With Project	12	9	9
General Plan Buildout With Project	13	Not Evaluated	Not Evaluated

Despite these impacts, the project does not require any additional mitigation at these intersections or roadways beyond contribution to the DIF and TUMF.

The EIR finds that impacts to intersections and roadway segments within the DIF and TUMF programs will be reduced below a level of significance despite the fact that many of these improvements are not yet funded and will likely not be funded or constructed for some time. Nonetheless, the EIR finds that impacts will be mitigated to less than significant at all significantly impacted roadway segments and intersections other than the SR-60 segments and ramps. The fact that an improvement is part of the DIF or TUMF program does not ensure that it will soon be planned or funded, and surely does not ensure that it will be planned, funded, and built by project opening or other future years evaluated in order to reduce impacts to less than significant. Mitigation is therefore uncertain, and the reasoning that “impacts would remain significant and unavoidable until such improvements are constructed” used elsewhere in the EIR’s reasoning applies.

In fact, the roadways reliant on TUMF funds are not presently scheduled for improvement nor are the improvements funded. (See, e.g., *2011 Annual Report, Transportation Uniform Mitigation Fee Program*, Western Riverside Council of Governments, “Five Year Transportation Improvement Program,” <http://www.wrcog.cog.ca.us/downloads/AnnualReport_for_web.pdf>, p.39, See, also, <<http://www.wrcog.cog.ca.us/downloads/2012CentralZoneTIP020612.pdf>> [detailing funded expenditures in the Central Zone]) Furthermore, TUMF improvements can take up to 9 years to become a reality from a local jurisdiction developing a project to completion of construction. (*2011 Annual Report, Transportation Uniform Mitigation Fee Program, supra*, p.7) Project prioritization, programming, and allocation of funds may also be a barrier to improvements on the roadways impacted by this project. (*2011 Annual Report,*

100

Transportation Uniform Mitigation Fee Program, supra, p.10) The EIR’s conclusion that project transportation impacts on local roadways and intersections is less than significant after mitigation is simply not supported by evidence and the realities of these fair share programs.

100

With regards to DIF funding, the EIR does not demonstrate that all impacts to city streets will be reduced below a level of significance or that adequate funding exists or will exist for needed improvements.

101

Mitigation requiring direct funding and completion of improvements at impacted roadways and intersections must be required of the project unless demonstrated to be infeasible. As the project currently stands, not all feasible mitigation has been required of this project to reduce traffic related impacts below a level of significance, and mitigation is uncertain and deferred.

102

Additionally, **the 2016 Opening Year Baseline is inconsistent with the opening year found elsewhere in the EIR.** For example, the Noise section of the EIR relied on an opening year of 2012. This discrepancy must be resolved.

103

Utilities and Service Systems

The EIR states that the Badlands landfill has a closure date of 2024 in some places and **2016** in other places, yet concludes under either assumption that there will be adequate capacity. (*Compare, e.g.*, p. 4.12-1 and p. 4.12-5) This assumption is not based on evidence in the record, particularly if the project has an opening year of 2016 and the landfill has a closing year of 2016, in which case a finding of adequate capacity is entirely contradicted by the EIR. The project will thus have a significant and unmitigated impact to solid waste disposal which is not disclosed in the EIR.

104

With regards to water supply, the EIR spends a great deal of time evaluating water demand compared to general plan build-out, but gives only a short mention of demand compared to *existing site condition*, as required by CEQA. The EIR is misleading with regards to the project’s water supply impacts.

105

GHGs

The EIR concludes that the project would not significantly conflict with applicable plans, policies, or regulations for reducing GHGs. However, many of the “consistency” determinations are unsupported by the project and the record. For instance, the EIR finds that the project is consistent with the City’s encouragement to install solar power, yet the project will not install any solar panels. Similarly, the EIR finds that the project is consistent with the aim to construct zero net energy buildings where this project will not be zero net energy. Other applicable policies are not discussed beyond stated conclusions. This portion of the EIR is highly conclusory and not supported by reasoning or evidence.

106

The EIR states that the project will have a LEED score of 20 out of 69. Table 4.13.D demonstrates that 55 out of 69 points are not infeasible. At least these potentially feasible measures must be implemented to mitigate for this project's enormous air quality and GHG impacts.

107

Compliance with GHG emission reduction strategies is not demonstrated as the mitigation measures for GHG impacts are uncertain and deferred. For instance, MM 4.13.6.1A merely requires compliance with state law required by Title 24.

108

MM 4.13.6.1B does not require all feasible mitigation and is vague. There is no amount stated by which the project must exceed Title 24; it is feasible to require that the project exceed Title 24 standards by at least 30%.

109

MM 4.13.6.1C does not ensure that water use efficiency will be met, as it merely requires that some water conservation strategy be implemented.

110

The project will nevertheless have a significant impact **that the EIR wrongly finds to be individually insignificant after mitigation. The project will emit 79,000 mtpy CO₂e, far above and beyond SCAQMD's 10,000tpy CO₂e threshold.** Despite finding such emissions to be significant, the EIR concludes that GHG emissions will be less than significant individually because the project's impacts alone would not cause or significantly contribute to climate change or have a substantial effect on consumption of fuels. The EIR wrongly evaluates GHG emissions on a global scale, where SCAQMD's quantitative threshold demonstrates the project exceeds that threshold of significance and the EIR does not demonstrate that the project complies with, at least, regional GHG reduction planning. Individual GHG impacts should be deemed significant and unmitigated.

111

Likewise, the EIR concludes on no factual basis that the project will not have a cumulatively significant impact on GHGs, despite finding exceedence of the SCAQMD threshold. The EIR's evaluation on a global scale is again improper.

112

Alternatives

The EIR concludes that Alternative 3, the Reduced Intensity Alternative, is the Environmentally Superior Alternative. Alternative 3 would, according to the EIR, have significant impacts to Aesthetics, Agriculture, Land Use, Air Quality, and Transportation. On the other hand, Alternative 5- the Off-site Location alternative, would only result in significant impacts to Agriculture, Air Quality, and Transportation; impacts to Aesthetics and Land Use would be eliminated or reduced below a level of significance. Hence, while both of these alternatives would reduce subsets of these project effects, the Off-site alternative is environmentally superior to the reduced intensity alternative.

113

Where there is an environmentally superior alternative that significantly decreases the significant impacts of the Project then that alternative must be approved rather than the Project if that alternative is feasible, even if the alternative would impede to some degree the attainment of the

114

project objectives, or would be more costly. [(PRC§ 21002; *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 597, State CEQA Guidelines § 15126.6(b)] Here, both Alternative 3 and Alternative 5 will meet most project objectives and significantly reduce or eliminate environmental impacts. If the project is approved, one of these alternatives must be adopted in lieu of the project as proposed.

114

Conclusion

Thank you for your consideration of these comments and the attached and/or referenced material.

Sincerely,

Raymond W. Johnson
JOHNSON & SEDLACK

RESPONSE TO LETTER D-3

JOHNSON & SEDLACK

Response to Comment 1. The commenter provided some brief information about the purposes of CEQA. No response is necessary.

Response to Comment 2. The commenter's opinions on the quality of the environmental assessment that was done will be forwarded to the decision-makers for their consideration. The City disagrees with the commenter's generalized assertions regarding the adequacy of the Draft EIR. The comment that the conclusions in the EIR are not based in fact is erroneous. The Draft EIR is based on the findings of technical studies that were prepared for the project that were included in their entirety in the appendices to the Draft EIR. Those studies are all listed in Section 2.2.4, *Technical Reports*, of the Draft EIR, and listed separately in the appropriate impact assessment sub-section of Draft EIR Section 4, Impact Analysis (Sections 4.1 through 4.13). The project description and subsequent analysis in the EIR explain that the trail segment north of the realignment of Eucalyptus Avenue will be eliminated because it does not go anywhere, as it was planned when an undercrossing of the SR-60 was envisioned, but which has been eliminated from the General Plan and supporting planning documents and maps. Rather, the proposed trail will follow Eucalyptus Avenue with a leg south of Eucalyptus along the Quincy Channel, which will connect the trail to existing trails to the west and south. This information is not inconsistent in the EIR document.

In addition, the commenter is incorrect, Table 3.C and Figure 3-4 (in Section 3.8, *Cumulative Projects*) in the Project Description do accurately describe and show the locations of cumulative projects being evaluated in the EIR.

The EIR has provided accurate information about the proposed project and cumulative projects and therefore does not fail as an informational document.

Response to Comment 3. The City disagrees with the opinions of the commenter – The City believes the findings of the EIR are supported by substantial evidence and the EIR is an adequate informational document upon which the decision-makers can base their decisions. The responses below document the ways the EIR provides substantial evidence and complies with the requirements of CEQA.

Regarding the evaluation of environmental impacts, the Initial Study prepared for the proposed project was comprehensive and determined that impacts on forest resources, geology and soils, mineral resources, public services, and recreation would be less than significant with the implementation of mitigation requiring further analysis in an EIR. Those specific mitigation measures are identified in the Initial Study, Section 2.0 of the EIR and are also included in the Mitigation Monitoring and Reporting Plan (MMRP) attached to the Final EIR. The City formally initiated the environmental process with circulation of an NOP along with the Initial Study, which it sent to responsible agencies and interested individuals for a 30-day review period from February 4 to March 6, 2008. At the close of the public review period, the City had received 22 letters on the NOP. The NOP disclosed that an EIR would be prepared and the issues that would be addressed included: aesthetics (views and lighting), agricultural resources, air quality, biological resources, cultural and paleontological resources, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, population and housing, traffic and circulation, utilities and service systems, and global climate change (i.e., Sections 4.1 through 4.13 in the Draft EIR). The commenter is in error that the Draft EIR did not address some of these topics. All of these potential impacts were addressed in appropriate sections of the DEIR.

In addition, the technical studies prepared in support of the DEIR analyses that address temporal-related impacts did allow for 24/7 operation. For example, the traffic study was based on peak-hour impacts assuming worst case conditions (i.e., not 24-hour operation), so 24/7 operation would actually lower peak hour traffic impacts. The project traffic data is the basis for the noise assessment, likewise allow for 24/7 operation. Similarly, page 13 of the project noise assessment states...

"These noise levels represent the worst-case scenario, which assumes that no shielding is provided between the traffic and the location where the noise contours are drawn. The specific assumptions used in developing these noise levels and model printouts are provided in Appendix A. Tables F, H, J, and L show that project-related traffic noise level increases would be 2.6 dBA or less along most roadway segments analyzed, except along Eucalyptus Avenue between Auto Mall Drive and Redlands Boulevard. This range of noise level changes is small and is not perceptible by the human ear. The portion of Eucalyptus Avenue with traffic noise increases greater than 3 dBA has no noise-sensitive uses (auto mall, commercial use, and vacant land only) directly adjacent to it."

Response to Comment 4. DEIR pages 4.2-8 and 4.2-9 clearly explain why mitigation for loss of agricultural land is not feasible on a local or regional basis, based on historical and current economic conditions related to agricultural crops in this portion of Riverside County. This conclusion is supported by the project-specific analysis provided in Appendix E of the DEIR.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Response to Comment 5. The commenter is incorrect – there are a number of measures recommended to offset anticipated traffic and air quality impacts of the project. These are described in their appropriate impact assessment sections (4.3 and 4.13, respectively) and summarized in Table 1.C of the Executive Summary. As outlined in Section 4.4.6, it is infeasible and ineffective to implement operational mitigation on future warehouse users that do not have specific tenants or end-users identified (Draft EIR, page 4.3-37), but Mitigation Measure 4.3.6.6A did address trucking and other activities on the site to the extent practical. In addition, the City has specifically identified the TUMF and DIF programs as the legally established method of mitigating respective regional and local traffic (i.e., road and intersection) impacts. In addition, the project traffic report specifically identifies a number of roadway and intersection improvements that will not be improved through the TUMF or DIF programs for which the proposed project would be responsible, as outlined in Mitigation Measures 4.11.6.4D, 4.11.6.4E, and 4.11.6.4F.

Response to Comment 6. The commenter's opinion that the mitigation measures in the EIR are vague, uncertain, unenforceable, and/or deferred is not based in fact, nor does the commenter provide any examples to support this contention. As detailed in the following responses, appropriate and enforceable mitigation of the project's significant individual and cumulative impacts have been identified in the Draft EIR. The City believes the mitigation measures recommended in the Draft EIR are appropriate based on the identified impacts of the project. However, certain measures or portions of measures suggested by the commenter (such as for air quality) have been incorporated in the Final EIR to clarify their implementation or help further reduce potential impacts. However, these changes or additions do not change the conclusions or overall analysis in the Draft EIR, as outlined in Final EIR Section 3.0, *Errata and Additions*. All mitigation measures that are in the Draft EIR, and mitigation language changed as a result of responses to comments by this commenter as well as the Sierra Club, have been included in the MMRP (Section 4.0 of the Final EIR) to ensure that they are being implemented.

Response to Comment 7. The City believes the alternatives analysis (Section 6.0 of the Draft EIR) is in compliance with *CEQA Guidelines* Section 15126.6(a), because the Draft EIR describes “a range of reasonable alternatives to the project, or to the location of the project which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project.” The EIR need not consider every conceivable alternative; rather it must consider a reasonable range of potentially feasible alternatives to the project, or to the location of the project, which would avoid or substantially lessen significant effects of the project, even if “these alternatives would impede to some degree the attainment of the project objectives, or would be more costly” (*CEQA Guidelines* Section 15126.6(b)). The discussion of project alternatives must “include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project.” The alternatives are to “substantially lessen the significant effects of the project”, not to satisfy the actual mitigation required.

The comment notes that the Draft EIR identifies Alternative 3, the Reduced Intensity Alternative, as the environmentally superior alternative but that Alternative 5, the Off-Site Location Alternative, would result in fewer significant impacts than Alternative 3 and therefore should have been identified as the environmentally superior alternative. It should be noted that Table 6.M contains a typographical error by omitting a “Significant” indication (“S”) under Alternative 5 relative to consistency with the AQMP. The text analysis of this issue in Section 6.3.5.3 (DEIR page 6-32) indicates air quality impacts of the project on another location would still be significant as it would still be inconsistent with the AQMP. This error has been corrected in Section 3, *EIR Errata and Additions*, of this document.

As detailed in the Draft EIR Tables 6.K, page 3-39, Alternative 3 reduces the severity of project-related air quality impacts and is the only alternative that eliminates the significant agricultural impacts. However, reduced, long-term air quality impacts would remain significant after mitigation for this alternative in the same way as the project. Alternative 5 would produce the same level of air pollution as the proposed project. Alternative 3 would reduce the volume of daily traffic trips when compared to the proposed project; however, such impacts would remain significant and unavoidable until roadway improvements are completed. Alternative 5 would generate the same level of traffic trips as the proposed project. Alternative 5 would eliminate impacts associated with land use and planning as this alternative would not require a Zone Change or General Plan Amendment. Alternative 5 would also eliminate the significant population/housing impacts and the significant aesthetic impacts; however, it would likely not reduce the significant agricultural impacts of the project compared to Alternative 3.

The remaining environmental issues would ultimately be similar to the proposed project through adherence to existing standards and mitigation measures. Though the Off-Site Location Alternative is located in a different part of the City, the amount of development under this alternative would remain the same as the proposed project, and it would satisfy all of the identified project objectives. In addition, the potential offsite location is not under the control of the project applicant, so it is problematic if development of the project could actually occur on an alternative site. Based on a review of all the potential impacts, the Draft EIR concluded that the Reduced Intensity Alternative appears to be the environmentally superior alternative for the project site (see Draft EIR page 6-39).

Under the environmentally superior alternative, the proposed project objectives are met but less square footage of warehouse uses would be built. However, Alternative 3 is the only alternative that would reduce the significant impacts to agricultural resources compared to the proposed project and therefore it results in a substantive environmental benefit in comparison to the proposed project. The environmentally superior alternative (reduced density) will result in reduced air pollution and greenhouse gas (GHG) emissions but the significance of these impacts remain significant and unavoidable for air quality, global climate change, and traffic in the same manner as the proposed project. The significant and unavoidable project impacts associated with GHG emissions and traffic

cannot be reduced to less than significant though reduction in the size of the project. The significant and unavoidable project impacts associated with air quality can be eliminated if the project is reduced to approximately 90,000 square feet (based on a linear reduction in the project's 990 pounds per day of operational NO_x emissions to below the 55 pounds per day threshold).

Under Alternative 5, all of the project objectives are met and it reduces two impacts to less than significant that were determined to be significant and unavoidable for the proposed project (consistency with the General Plan and Aesthetics), (see Draft EIR Section 6.5 Comparison of Project Alternatives, Table 6.M, pages 6-39 and 6-40.) The DEIR does correctly conclude that Alternative 5 is also environmentally superior to the proposed project (i.e., fewer significant impacts than the proposed project), however, the commenter incorrectly concludes that, because Alternative 5 meets most project objectives, it must be approved instead of the proposed project. Alternative 3 also reduces significant impacts of the proposed project, and is the only alternative that will reduce impacts to agricultural resources. The commenter claims that this information requires recirculation of the DEIR to identify Alternative 5 as the Environmentally Superior Alternative, but that is not correct - Alternative 3 is the Environmentally Superior Alternative.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Response to Comment 8. The commenter states that the EIR must be substantially supplemented, amended, and recirculated. The responses provided to the various comments submitted on the Draft EIR, including those of this commenter, indicate the information in the EIR is adequate and the EIR does not need to be recirculated. The rest of this comment summarizes characteristics of the project and related project approvals, so no response is necessary. One of the comments is regarding the status of vacant land around the project site. It does not appear any of the land surrounding the project site is presently being utilized for agriculture, although the area in general has been used for dry farming in the past. The current onsite and offsite land uses are described in detail in Section 4.8, *Land Use and Planning*.

Response to Comment 9. The commenter is correct, the conclusion of the paragraph will be corrected as follows to reflect the determination that impacts to views are significant:

Impact 4.1.6.1 Existing Visual Character or Quality of Site and Its Surroundings:
Implementation of the proposed project would replace the undeveloped character of the project site with an urban setting containing warehouse uses. Therefore, the change in the character of the site would be recognizable and would constitute a permanent alteration of the existing visual character of the project site. Although the visual characteristic of the project site would change, the proposed project would replace the existing vacant parcel with an attractive, well designed development through the use of architectural elements, landscaping, and design of the project site. In addition, the proposed project would be designed and constructed per applicable City Municipal Code and General Plan standards. Despite these requirements, a less than significant impact related to this issue would occur.

This will be corrected in Final EIR, Section 3.0, *EIR Errata and Additions*, but this modification does not change the overall conclusion of the EIR that this impact is significant.

Response to Comment 10. The EIR did conclude that the project would fundamentally change views of the project area, but the line-of-sight analyses of each building (Draft EIR, Figure 3.7A through 3.7F) demonstrate that the proposed buildings, including Building 2, will not completely block

views of the Mt. Russell Range or Box Springs Mountain due to their planned heights and setbacks from the freeway (Building 2) and nearby residences (Building 6). The Conservation Element objectives and policies referred to by the commenter encourage the following:

- Objective 7.7** Where practicable, preserve significant visual features significant views and vistas.
- Policy 7.7.4** Gilman Springs Road, Moreno Beach Drive, and State Route 60 shall be designated as local scenic roads.
- Policy 7.7.5** Require development along scenic roadways to be visually attractive and to allow for scenic views of the surrounding mountains and Mystic Lake.

Overall views of the upper slopes of the Mt. Russell Range, views of the Box Springs Mountains, the Badlands will be maintained from the SR-60 and surrounding residential areas, although some views of Mt. Russell and Box Springs Mountain may be partially obscured by the proposed development. Views from Gilman Springs Road and Moreno Beach will not be adversely affected by the project due to the distances involved of project buildings from these roadways. The Project Description and supporting materials demonstrate that the proposed buildings will be attractive and not eliminate important views in the surrounding areas. Therefore, the project does not significantly conflict with this General Plan objective or policies.

Mitigating the project by substantially changing the size, location, and/or heights of the buildings would prevent the project from providing logistics-type warehousing uses on this site. Lowering the heights of the buildings would render them unable to accommodate high cube warehouse users, and making smaller, more spread out buildings would eliminate a major reason for proposing a logistics-type warehousing project on this site (i.e., large buildings with ready freeway access). Interior heights of 30-40 feet are needed for these types of uses, which result in a maximum building height of approximately 50 feet. Note that only two of the buildings (#2 and #3) will be 50 feet in height, the other buildings will have a maximum height of 44 feet. For these reasons, these types of mitigation are not feasible for this type of project. The Project Description (Section 3.0 in the DEIR) indicates that the southern-most building will be almost 400 feet from the closest existing residences to the southeast (i.e., separated by several detention basins), and will be visually screened by landscaping. These project design features will help buffer the residences from the proposed warehouses.

It is at the discretion of the City to approve or disapprove this requested General Plan Amendment. If the City approves the project, it will have to adopt a Statement of Overriding Considerations and demonstrate that the various benefits of the project (e.g., economic, employment) outweigh or override its significant environmental impacts.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast. This alternative plan would substantially reduce visual impacts for the residences southeast of the project site.

Response to Comment 11. The Project Description does state that...*Existing single-family residential uses are located approximately 50 feet southeast of the southeastern corner of the project site.* (Draft EIR page 3-1). However, the commenter is incorrect regarding project distances and conclusions drawn from those errors. That reference is to the property boundary only, and not to buildings or truck-use areas proposed for the project. The reference of 200 feet on page 4.1-1 of the Draft EIR should actually be 50 feet to the property boundary, as outlined below, and will be corrected in Final EIR, Section 3.0, *EIR Errata and Additions*.

The Draft EIR clearly states that...*“The nearest existing sensitive land uses are single-family residences located approximately 50 feet southeast of the southern boundary of the project site, approximately 395 feet southeast of the proposed warehouse buildings, and approximately 664 feet southeast of the loading docks.”* (Draft EIR page 4.3-17, 4th paragraph). The commenter may be confused by the terms used to characterize the spatial relationship of the project to the existing residences. *The residences are 50 feet from the project’s property line, but Figure 1.2 and the Project Description (page 3-7) indicated there will be several large detention basins in the southern portion of the site that will act as a buffer and separate truck activities of the project from the residences to the southeast. As stated in the DEIR and demonstrated on the project site plan, the residences would be 395 feet from the closest proposed warehouse building, and 664 feet from the closest proposed loading dock.* We hope this clarification resolves the commenter’s concern in this regard.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast. Warehouse buildings under the less intensive modified plan are 1,515 feet from the nearest existing residential neighborhood (southwest), and 1,636 feet from the existing neighborhood at the southeast corner. The less intensive modified plan also provides a 250-foot buffer between the nearest warehouse truck court and future residential uses.

Response to Comment 12. The commenter is correct, General Plan Objective 2.5 and its polices do not directly relate to community aesthetics, but the analysis in Section 4.1.6 clearly focuses on the other objectives and policies that are more directly related to aesthetics.

Response to Comment 13. The commenter is incorrect, the Draft EIR does address potential lighting impacts (Draft EIR, Section 4.1.5.1, *Light and Glare*), but determines that the impacts will be less than significant with implementation of the project as proposed, and with implementation of the City’s Municipal Code relative to industrial lighting. Night time views are discussed, since that is when nighttime lighting would be visible. The main reason these impacts will be less than significant is that the actual buildings of the project will be almost 400 feet away from the closest residence (to the southeast). The project plans show walls around the southwest corner and along the southern boundary of the project, which will block lights from vehicles in these areas adjacent to Buildings 5 and 6. Security lighting for the building would be on during all nighttime hours (i.e. overnight) but would also be shielded by walls and compliance with the City’s Municipal Code requirements for night lighting of non-residential buildings (see below). With the proposed setback, walls, landscaping, and potential lighting impacts will be less than significant, as indicated in the Draft EIR.

All development in the City, which includes light generated from warehouse buildings and parking lots, is required to adhere to lighting requirements contained in the City’s Municipal Code (Section 9.08.100 Lighting), which states that any outdoor lighting associated with nonresidential uses shall be shielded and directed away from the surrounding residential uses. Such lighting shall not exceed one-half foot-candle at all property lines and shall not blink, flash, oscillate, or be of unusually high intensity or brightness. Lighting in parking areas and drive aisles must be at least 1.0 foot-candle and cannot exceed a maximum of 8 foot-candles. Adherence to the City’s Zoning Code would ensure that any building or parking lighting would not significantly impact adjacent uses. Therefore, impacts associated with this issue are less than significant, and no mitigation is required, so the additional measures recommended by the commenter are not needed.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR

(and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast. This alternative plan would substantially reduce lighting impacts for the residences southeast of the project site.

Response to Comment 14. Page 4.1-20 of the Draft EIR clearly states...*"The City's Municipal Code (Section 19.05 and Table 9.05.040-8) establishes the number, location, height, and style of signage permitted within industrial zones. The submittal and approval of signs are required for all development in the City; therefore, it is reasonable to conclude that all on-site signs are internally compatible and consistent with the City's current signage standards. Adherence to City requirements would result in a less than significant visual impact in this regard. The existing General Plan and zoning designations for the site show low density residential."* Therefore, the commenter's statement about the EIR not evaluating impacts of signage is not correct.

Response to Comment 15. Yes, the commenter is correct that Table 3.B indicates a maximum building height of 50 feet for buildings 2 and 3, but the commenter fails to note that the line-of-sight analyses and renderings for these buildings (Building 2 = Figures 3.7B, 3.8B, and 3.8C, Building 3 = Figures 3.7C and 3.8D) clearly show these buildings would have a maximum height of 50 feet. The line-of-sight analyses show that the proposed Building 2 may impact views from the freeway of the lower slopes of Mt. Russell, but would not eliminate views of the upper slopes and open land to the southeast. Similarly, Building 3, and to some degree Building 6, may limit views from the nearby residential areas (to the southeast) toward Box Springs Mountain, but views of Mt. Russell, the Badlands, and open land to the east would remain. It should be noted that the EIR concluded that loss of views and other visual impacts would be significant.

Response to Comment 16. The reader should refer to Response to Comment D-3, No. 11 above regarding distances from the project and nearby residences.

Response to Comment 17. The commenter suggests that evaluation of the project's consistency with land use development requirements was not addressed and therefore the statement "the project appears to be consistent with the various Municipal Code requirements for the proposed land uses outlined in Section 4.1.2 related to landscaping, setbacks parking, storage, etc." is not supported. The quote from the Draft EIR was making the simple factual conclusion that the proposed project will be required to adhere to all applicable development standards contained in the City's Municipal Code, similar to any project in any municipality.

Response to Comment 18. The commenter is correct, the text of the paragraph will be corrected to reflect the determination in the environmental analysis in Section 4.2.5.1 under No Impact/Less than Significant Impacts, but the conclusions shown in the table reflect the correct conclusions (i.e., this agricultural impact is less than significant).

This has been corrected in Final EIR, Section 3.0, *EIR Errata and Additions*, but this minor editorial correction does not change the overall conclusion of the EIR that this impact is significant.

Response to Comment 19. The commenter is correct, and Response to Comment D-3, No. 18 above shows how the text in Table 1.C of the Executive Summary will be modified to account for this loss. This will be corrected in Final EIR, Section 3.0, *EIR Errata and Additions*, but this modification does not change the overall conclusion of the EIR that this impact is significant.

The loss of 0.4 percent of the PAKO as a result of this project is a minimal amount of change and does not constitute a significant impact, as indicated in the DEIR, Section 4.2.5.1 Conflict with Existing Zoning or a Williamson Act Contract, page 4.2-6.

Response to Comment 20. The commenter is correct, Farmland of Local Importance will be added to the text in Table 1.C, as shown below. In addition, the “(5.3 acres)” reference is a fragment should have been removed from the text because it does not refer to a formal agricultural designation.

Impact 4.2.6.2 Conversion of State Designated Farmland: *The project site is designated as 67 percent Prime Farmland (82.5 acres) and 12 percent (39.8 acres) as Farmland of Local Importance (5.3 acres). While farmland conservation measures have been implemented in other areas of the State, neither the City of Moreno Valley nor Riverside County maintains a program that developers and property owners can participate in to offset agricultural resource impacts; therefore, the conversion of State designated Prime Farmland is a significant impact.*

This will be corrected in Final EIR, Section 3.0, *EIR Errata and Additions*, but this modification does not change the overall conclusion of the EIR that this impact is significant. The significance conclusion for each type of farmland is included in DEIR Section 4.2.6.1 Conversion of State Designated Farmland, pages 4.2-6 through 4.2-10.

Response to Comment 21. The commenter is correct, the correct LESA score for the project site is 85.3, as shown in Table 4.2.A – the other references will be corrected in Final EIR, Section 3.0, *EIR Errata and Additions*, however, these corrections do not change the overall conclusion of the EIR that this impact is significant. It should be noted that all of these scores represent a significant impact.

The Draft EIR already recognizes that the project would contribute to a cumulative impact on agricultural resources and concludes the following:

“The cumulative effect of development in the region will continue to result in the conversion of agricultural lands to non-agricultural uses. Because agricultural land, including Prime Farmland, is a finite resource, the conversion of 122.8 acres of farmland to industrial uses, combined with planned and future development in the City and region, represents a cumulative impact to agricultural operations and resources, and the proposed project’s contribution to this cumulative impact through the conversion of 122.8 acres of farmland is cumulatively considerable.” (Draft EIR page 4.2-11)

Response to Comment 22. The potential mitigation measures identified in this comment are not considered to be feasible by the City of Moreno Valley as determined in the City’s General Plan EIR. As identified in the Draft EIR (Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-13), *“Williamson Act contracts are entered into voluntarily by property owners and the City cannot force owners to participate in this program. The City does have the ability to encourage property owners to participate in Williamson Act programs; however, this is expected to result only in temporary preservation of agricultural land since property owners have the option of non-renewal of these contracts at any time after the ten-year contract period ends. The land would then be available to be developed with urban uses.*

Providing protection for ongoing agricultural activities from new developments, such as requiring buffers between agricultural operation and new development or requiring the notification and disclosure of agricultural activities to the purchasers adjacent properties will not permanently protect agricultural land.

The purchase or transfer of development rights, purchase of conservation easements, or donation of funds to assist in the conservation of agricultural land would need to be implemented to ensure the preservation of agricultural land. As stated previously, the City anticipates the conversion of agricultural land within the City and does not set aside land for permanent preservation. The City expects that the majority of the land within the City will be converted to urban uses, although some agriculture will continue as interim uses, as allowed by the City’s Development Code for all zoning categories. Moreno Valley has determined that these measures are economically infeasible based on

the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. Furthermore, these measures are contrary to the City's vision (as stated in its General Plan) for the project site; therefore, they are not feasible and alternative mitigation has not been identified." Table B below contains the suggested mitigation measures by the commenter. The responses determine whether the Draft EIR contains the mitigation measure, if the mitigation will be added mitigation as part of the Final EIR, or if it will not be included and why.

Table B: Evaluation of Potential Agricultural Mitigation

Suggested Mitigation Measure	Response
1. The purchase of agricultural conservation easements	<p>Not Feasible. Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. The site has been planned for developed uses since 1987, the City has recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth and the current General Plan does not include any agricultural designations; therefore mitigation for the loss of agricultural land is not required.</p> <p>An easement does not compensate for the impact by replacing or providing substitute resources or environments (i.e., the easement would not create any new farmland where no farmland presently exists). See Fourth District Court of Appeal, <i>Cherry Valley Pass Acres and Neighbors v. City of Beaumont</i> (2010) 190 Cal.App.4th 316 (<i>Cherry Valley</i>)</p>
2. Transfer of development rights	<p>Not Feasible. Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable.</p>
3. Acquisition of farmland by the city or county	<p>Not Feasible. Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. No mechanism for the mitigation of impacts to State-designated Farmland and/or existing agricultural operations has been enacted by either the City of Moreno Valley or the County of Riverside. Rather, the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations.</p>
4. Mitigation banking	<p>Not Feasible. Neither the City of Moreno Valley nor the County have a mechanism in place for mitigation banking. The site has been planned for developed uses since 1987, the City has recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth and the current General Plan does not include any agricultural designations; therefore mitigation for the loss of is not required. In addition, there is not any agricultural zoned land in the City for the City or County to purchase.</p>

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park
City of Moreno Valley

Suggested Mitigation Measure	Response
5. The establishment of "urban limits," greenbelts, and buffers	Not Feasible. Will not result in permanent protection of agricultural lands. There is no mechanism for the mitigation of impacts to State-designated Farmland and/or existing agricultural operations has been enacted by either the City of Moreno Valley or the County of Riverside. Rather, the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations. Section 4.2.6.1 of the DEIR also outlines why local or regional mitigation in this regard is infeasible.
6. The payment of in-lieu fees sufficient to a purchase and maintain farmland conservation easements	Not Feasible. Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. An easement does not compensate for the impact by replacing or providing substitute resources or environments (i.e., the easement would not create any new farmland where no farmland presently exists). See (Fourth District Court of Appeal, <i>Cherry Valley Pass Acres and Neighbors v. City of Beaumont</i> (2010) 190 Cal.App.4th 316 (<i>Cherry Valley</i>)) In addition, there is not any agricultural zoned land in the City for the City or County to purchase and there is no existing fee program for farmland in the City.
7. Planning tools such as clustering development, use of density bonuses, and limiting "leapfrog" development	Not Feasible. Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. In addition the project is an industrial project on a site that has been planned for developed uses in the City's General Plan since 1987. This is not a residential project; therefore, clustering of development is not a feasible option on an industrial project. The proposed mitigation is not applicable. The project won't promote "leapfrog" development since the area surrounding the project site is developed.

Comment No. 3 in the letter from the Sierra Club (D-2) stated that..."a developer recently donated \$100,000.00 to the Riverside Land Conservancy to help mitigate for the loss of agricultural lands but fails to appropriately cite the information and identify the basis for determining the amount of agricultural lands lost in relation to this monetary amount." In discussion with Gail Egenes, Executive Director of the Riverside Land Conservancy, the agency does not have any established program to purchase agricultural easements or lands. Also, in consultation with the National Conservation Easement Database, Riverside County does not have any established agricultural easements.¹

Contributions to Riverside County Land Conservancy or the San Jacinto Basin Resource Conservation District by private land owners are laudable but are not required as part of a City or regional mitigation plan for loss of agricultural land. Therefore, the decision whether to make any contributions in this regard would be at the discretion of the developer in consultation with the City.

The Fourth District Court of Appeal, *Cherry Valley Pass Acres and Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316 (*Cherry Valley*) addressed a challenge to an EIR for a project that would convert agricultural land to residential uses. Though recognizing the potential for mitigation in the form of agricultural "conservation easements, Williamson Act preserve status, or temporary protection or conservation plans," the EIR noted the long-term trend in agricultural land conversion in the region and concluded that mitigation was not feasible, and the court upheld the City's determination regarding the feasibility of mitigation. The court also examined the City and County General Plans,

¹ <http://nced.conservationregistry.org/browse/map>, accessed October 4, 2012.

which acknowledged that development pressures were constraining the continued viability of agriculture and included the expansion of housing, commercial and industrial land uses. The court then determined that the project was compatible with these planning documents. The court concluded that given the particular circumstances surrounding the project, such mitigation was infeasible and therefore was not required to be adopted. The project site for the project addressed in the ProLogis EIR has been planned for developed uses since 1987, and the City has recognized in the General Plan that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth and the current General Plan does not include any agricultural designations; therefore mitigation for the loss of is not feasible and the EIR concludes that impacts are significant and unavoidable.

The trend of the reduction in agriculture in the Inland Empire is discussed in *Assessing the Economic and Market Trends Affecting Agriculture in the Western Inland Empire* prepared by Justin L. Adams, Ph.D. of Chang & Adams Consulting, September 2011 and *Economic Viability of Agriculture in the East Inland Empire* report prepared by CBRE Consulting, March 18, 2009. Both reports are provided in Appendices B and C to the Final EIR. This reduction in “farming” is due to pressures of the growth in the demand for housing and development and the transportation and warehousing sector; increased restrictions on water deliveries for agricultural uses after several consecutive drought seasons; higher wages in other industries in the region; strong agricultural competition from the southern Central Valley for dairies; increased regulatory pressures from air quality and local jurisdictions regarding particulate matter emissions and land use adjacency issues; and the trend in Riverside and San Bernardino Counties is for agricultural operations to continue to shift to places like Kern County regardless independent of land use policy due to the economic issues.

As stated in the Draft EIR, mitigation measures must be feasible and fully enforceable through permit conditions, agreements, or other legally binding considerations. To be feasible, mitigation must be capable of being accomplished in a successful manner within a reasonable period of time, taking into account the economic, environmental, legal, social, and technological factors. Identification as to the infeasibility of mitigation measures suggested by the commenter has been provided in the Draft EIR. No mechanism for the mitigation of impacts to State-designated Farmland and/or existing agricultural operations has been enacted by either the City of Moreno Valley or the County of Riverside. Rather, the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations. The City allows agricultural uses in all land use designations as an interim use until such time as the land is developed per the vision identified in the General Plan. One of the goals stated in the City’s recent General Plan is the “...orderly conversion of agricultural lands.” The proposed project is a continued extension of development in the surrounding area to the east and west (industrial/commercial/business park). The proposed project does not interfere with the ability of other adjacent properties to be used for agricultural production should the property owner wish to do so.

The potential mitigation measures identified by the City in its General Plan EIR and California Department of Conservation (CDC), which are listed in the Draft EIR (Section 4.1.6.1 Conversion of State Designated Farmland, pages 4.2-7 through 4.2-9), are not considered to be feasible by the City of Moreno Valley as determined in the City’s General Plan EIR. Providing protection for ongoing agricultural activities from new developments, such as requiring buffers between agricultural operation and new development or requiring the notification and disclosure of agricultural activities to the purchasers adjacent properties will not permanently protect agricultural land. As identified in the Draft EIR, the City supports agriculture as an interim use within the City and no land is dedicated or designated for agricultural use or agricultural preservation within the City’s jurisdiction. Land in the project area is classified as containing prime agricultural soils, but the City’s General Plan does not designate these lands, including the project site, for preservation through the establishment of urban limits, greenbelts, and buffers that might result in permanent protection of agricultural land as none exists within the City. Areas where agriculture land use designations may exist that are outside of the

City limits cannot be preserved by the City of Moreno Valley as they are outside of the City's jurisdiction. The City's General Plan has acknowledged the analysis and conclusions of the County General Plan that mitigation for the loss of agricultural land is economically and practically infeasible due to ongoing costs to maintain agriculture in this area (see Appendix E in the Draft EIR).

As stated previously, the City anticipates the conversion of agricultural land within the City and does not set aside land for permanent preservation. The City expects that the majority of the land within the City will be converted to urban uses, although some agriculture will continue as interim uses, as allowed by the City's Development Code for all zoning categories. The City of Moreno Valley has determined that these measures are economically infeasible based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. Furthermore, these measures are contrary to the City's vision (as stated in its General Plan) for the project site; therefore, they are not feasible and alternative mitigation has not been identified.

Response to Comment 23. Response to Comment D-3, No. 22 outlines the City's position regarding the infeasibility of mitigation for loss of agricultural land. The City has repeatedly concluded that development projects within the City that remove agricultural land, even if that land carries a "significant" designation for farmland, cannot be mitigated at the local level and all the recommended measures would render the project financially infeasible, therefore the measures are infeasible. The assessment in Appendix E of the Draft EIR provides additional documentation why continued agriculture is not feasible in the Moreno Valley area.

It should also be noted that the research referred to by the commenter was conducted in the state of Vermont, so its information is not directly applicable to the California economy or local conditions affecting the viability of agriculture within a particular region. Nor does it take into account currently poor economic conditions in California

Response to Comment 24. According to Sergio San Martin of Facilities Planning for MVUSD, the Eucalyptus and Redlands sites have been abandoned.¹ The other two sites at Nason and Ironwood and Ironwood and Quincy have not yet been officially abandoned but are no longer being actively considered for the construction of new schools. It is at the School Board's discretion as to whether these two sites are abandoned, however; MVUSD staff has been directed to explore other potential sites. Therefore, it is no longer reasonably foreseeable that these two sites will be developed as future schools.

Response to Comment 25. The commenter referred to the following General Plan Policies allegedly relevant to air pollutant emissions. The following assesses the consistency of the project with those stated policies:

¹ *Resolution No. 2007-08-81*, Moreno Valley Unified School District Board of Education, approved April 15, 2008.

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park
City of Moreno Valley

General Plan Goals, Objectives, and Policies	Project Consistency
<p>Ultimate Goal VII: achieve a community which “Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards....”</p>	<p>The comment erroneously quotes an ultimate goal contained in the General Plan that addresses public safety issues such as police, fire, emergency and animal services and protection from natural hazards such as flooding. This goal is not associated with air quality. However, Sections 4.6 (Hazards) of the DEIR and the Initial Study for the project (Public Services) demonstrate that the proposed project will not result in any significant impacts to public health or safety as outlined in this goal.</p>
<p>Goal 6.1: To achieve acceptable levels of protection from natural and man-made hazards to life, health, and property.</p>	<p>The comment erroneously quotes a goal that addresses the Safety Element of the General Plan. This goal is not associated with air quality; however, various sections of the DEIR demonstrate that the proposed project will not result in any significant impacts to public health or safety from natural or man-made hazards, as outlined in this goal.</p>
<p>Objective 7.5: Encourage efficient use of energy resources.</p> <p>Policy 7.5.1: Encourage building, site design, and landscaping techniques that provide passive heating and cooling to reduce energy demand.</p> <p>Policy 7.5.2: Encourage energy efficient modes of transportation and fixed facilities, including transit, bicycle, equestrian, and pedestrian transportation. Emphasize fuel efficiency in the acquisition and use of City-owned vehicles.</p> <p>Policy 7.5.5 Encourage the use of solar power and other renewable energy systems.</p>	<p>The comment cites three policies within General Plan Objective 7.5. Consistency and/or applicability of these policies is as follows:</p> <p>General Plan Policy 7.5.1 will be applied to the project through implementation of Mitigation Measures 4.3.6.5B page 4.3-33 and 4.3-34, 4.3.6.6A page 4.3-35, 4.13.6.1B page 4.13-20, and 4.13.6.1C page 4.13-21.</p> <p>General Plan Policy 7.5.2 is related to alternative modes of transportation. The City considers this policy to be beyond the scope of this project-level EIR, because this is a citywide issue for the City to address and not this development project. The project has no control over the fuels used in City-owned vehicles.</p> <p>General Plan Policy 7.5.5 will be applied to the project through implementation of Mitigation Measure 4.3.6.6A page 4.3-35.</p>

The analysis demonstrates that the project is consistent with the two applicable General Plan goals, objectives, and policies cited in the comment. The three other goals, objectives, and policies cited in the comment are not applicable to the project and this project-level EIR; however, the project is consistent with Ultimate Goal VII and Goal 6.1 as outlined above. This analysis does not raise significant new issues, nor does it change the conclusions of the EIR regarding significant impacts.

Response to Comment 26. It is not clear what “record” the commenter is referring to. Perhaps the commenter is referring to the various Multiple Air Toxics Exposure Studies (MATES) performed by the SCAQMD over the last two decades? If so, these only document that the air quality is unhealthy in the majority of the South Coast Air Basin, they say nothing about any particular project’s contribution to the level of toxic air contaminants in a region. The HRA included in the EIR examines the potential affect the project could have on the level of toxic air contaminants in the region of the project site and the resulting change in health risk levels and, as shown in the DEIR, Table 4.3.F on page 4.3-17in the DEIR, shows them to be all less than significant.

Response to Comment 27. The HRA modeled emissions from vehicles idling at all the project buildings and traveling along the roadways thru the project site and into the surrounding area as

described on Page 4.3-17 of the DEIR. While the modeling does not include dedicated emissions sources for the short distances from the loading docks along the building and the driveways onto Eucalyptus Avenue, the emissions sources that were included in the modeling for the truck movements include all emissions from vehicles as they travel. Thus, the HRA does not minimize any impact from project operations. The model incorporates building structures into the atmospheric propagation simulation only to determine changes to the propagation pattern due to disturbances in the flow from passing over buildings. The principal effect is that pollutant concentrations are higher from the building wake affect than they would be if the building was ignored. Changing the building height from 65 to 39 feet would only change the pollutant concentrations within 50 feet of so downwind of each building. There would be no change at the distance of any of the residences. Therefore, the analysis in the DEIR is conservative and protective of human health.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Response to Comment 28. The standard assumption for all HRAs, per the OEHHA, is that the 70-year lifetime risk assessment assumes that individuals would be away from the location of interest for 15 days out of the year, even though the on-site operations would occur over 365 days per year. The 350 days per year the comment refers to applies to the people living nearby, not to the project operations. This is what is meant by a full lifetime exposure in any HRA.

Response to Comment 29. The Environmental Summary Table 1.C was not updated properly and now is consistent with the results described in Section 4.3 Air Quality (refer to the Final EIR Errata). This update has no effect on any significance conclusions in the DEIR (refer to the Final EIR Errata). Both the Air Quality Analysis and Air Quality section of the EIR describe the health risks to existing and future residents separately and clearly. The peak cancer risk to existing residents to the north is identified in Table R of the Air Quality Analysis and in Table 4.3.F of the Air Quality section of the Draft EIR as 4.33 in 1 million. Section 4.3.5.4 of the EIR shows the peak cancer risk to future residents of a project proposed on the southern project boundary as 4.3 in 1 million. The threshold is 10 in one million so the 4.3 in 1 million does not exceed the threshold of significance.

The Draft EIR clearly identifies that ...*"The nearest existing sensitive land uses are single-family residences located approximately 50 feet southeast of the southern boundary of the project site, approximately 395 feet southeast of the proposed warehouse buildings, and approximately 664 feet southeast of the proposed loading docks."* (Draft EIR page 4.3-17, 4th paragraph). The commenter may be confused by the terms used to characterize the spatial relationship of the project to the existing residences. The residences are 50 feet from the project's property line, but the Project Description (e.g., Figure 1.2) clearly shows there are several large detention basins in the southern portion of the site that will act as a buffer and separate truck activities of the project from the residences. As stated in the EIR and demonstrated on the project site plan, the residences would be 395 feet from the closest proposed warehouse building, and 664 feet from the closest proposed loading dock. We hope this clarification resolves the commenter's concern in this regard.

Additionally, the HRA was conducted using a grid of receptors covering about a mile in all directions from the center of the project site, as described on page 4.3-17 of the DEIR. Therefore, the project effects on health risk levels were determined at all locations throughout the region including the existing residence with the maximum health risk level and the proposed residence with the maximum health risk level, either of which may or may not be the closest to the project site.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Response to Comment 30. The EIR is tasked with determining the impact of the project on the environment, thus the HRA does this also. The ambient cancer risk is quite high for all of southern California, but this is independent of the project's operations. The HRA in the EIR identifies how the project's operational emissions will affect the health risk levels by the project's contribution to the ambient health risk. The following limits for maximum individual cancer risk (MICR), cancer burden and non-cancer acute and chronic hazard indices (HI) from project emissions of TACs have been established for the Basin:

- **MICR and Cancer Burden.** MICR is the estimated probability of a potential maximally exposed individual contracting cancer as a result of exposure to TACs over a period of 70 years for residential and 40 years for worker receptor locations. The MICR calculations include multipathway consideration, when applicable. Cancer burden is the estimated increase in the occurrence of cancer cases in a population subject to a MICR of greater than or equal to one in one million (1.0×10^{-6}) resulting from exposure to TACs.

The total increase in MICR that is the sum of the calculated MICR values for all TACs emitted from the project will not result in any of the following:

- (A) An increased MICR greater than 10 in 1 million (1.0×10^{-5}) at any receptor location (assumes the project will be constructed with T-BACT); or
- (B) A cancer burden greater than 0.5.

- **Chronic HI.** This is the ratio of the estimated long-term level of exposure to a TAC for a potential maximally exposed individual to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

The cumulative increase in total chronic HI for any target organ system due to total emissions from the project will not exceed 1.0 at any receptor location.

- **Acute HI.** This is the ratio of the estimated maximum one-hour concentration of a TAC for a potential maximally exposed individual to its acute reference exposure level.

The cumulative increase in total acute HI for any target organ system due to total emissions from the project will not exceed 1.0 at any receptor location.

The DEIR concludes that the project contribution to the existing TAC conditions will be less than significant, as described on page 4.3-17 and shown in Table 4.3.F.

Response to Comment 31. The HRA includes an assessment of the health risks to workers using standard OEHHA assumptions, including an 8 hour workday and a 40 year work career for workers, which likely results in an over-estimate of cancer risk. Thus, the assumptions in the analysis are conservative and err on the side of overestimating impacts.

See also Response No. 13 in the letter D-2 from the Sierra Club.

Response to Comment 32. The HRA modeling only allows for one emission rate for the diesel engines to represent the entire 70-year period from opening year (2013) until 2083. The available emissions factors model (EMFAC) only has factors thru 2040. Thus, there is no information available about how the diesel emissions will change from 2040 until 2083. It is pure guesswork to predict how the diesel emissions will change over this period. To assume that the emissions during this 43-year

period will not change at all is a very conservative assumption – there is a real possibility that all diesel engines will have been replaced by an alternative power source before 2083 resulting in zero diesel particulate emissions. Selecting the best year between 2083 and 2013 to represent the average is somewhat arbitrary – the median is 2048, outside the range of available factors. EMFAC incorporates many of the regulations some expectations of technological improvements that result in lower emissions over the period from the 1990s thru 2040, however it does not include everything – for instance it does not include the law just passed in August 2012 that sets the average mileage of cars and light trucks to 54.5 miles per gallon by 2025. While this does not include the heavy-duty trucks the HRA is focused on, it is an indication that there will be aggressive regulations in the future reducing these diesel emissions below what is in the EMFAC model. While using the emissions factors for 2040 as an average is not optimal due to the higher existing emissions, using 2013 factors as an average is unreasonably conservative also. In our best engineering judgment, 2025 is the best set of emissions factors to represent this complicated issue.

Response to Comment 33. While the project construction may continue for longer than 4 months, the ultra-conservative screening HRA included in the EIR focuses on the emissions from the very large diesel-powered equipment involved in the project construction. As shown in Table E of the Air Quality Analysis, the Site Preparation phase is expected to continue for 18 days and the Grading phase for 44 days, totaling about 3 months. The use of the very large diesel-powered equipment will be intense for these two phases and then drop off dramatically during the remainder of the construction process. Thus, assuming that the use of these very large diesel-powered equipment will occur continuously for 4 months is a conservative representation of the total construction process and appropriate for this screening-type of HRA.

Response to Comment 34. The staffs of the Air Resources Board (ARB) and the Office of Environmental Health Hazard Assessment (OEHHA) have been evaluating diesel exhaust since 1989 under California’s air toxics program, for potential identification as a toxic air contaminant (TAC). Diesel exhaust entered the AB 1807 process in October 1989 and has undergone an extensive evaluation. Diesel exhaust was entered into the process because it has potential cancer and non-cancer health effects and widespread exposure in California. The International Agency for Research on Cancer (IARC) had listed diesel exhaust as a “probable” human carcinogen and the U.S. Environmental Protection Agency (U.S. EPA) had begun an evaluation of both the cancer and non-cancer health effects. The ARB and the OEHHA gave priority to the evaluation of diesel exhaust because it met the TAC program criteria related to potential risk of harm to public health, amount of emissions, exposure and use, and persistence in the atmosphere.¹ All HRAs that include diesel PM as a TAC of concern consider all recognized health impacts.

Response to Comment 35. See Response to Comment D-3, No. 34 above.

Response to Comment 36. The HRA included the concept from the OEHHA indicating that both the prenatal and postnatal life stages can be, but are not always, much more susceptible to developing cancer than the adult life stage. The HRA included age sensitivity factors (ASFs) for these age windows that vary by chemical, gender and species, thus the analysis accounted for impacts to the entire population, children and adults. ASFs for prenatal, postnatal, and juvenile exposures are complicated by the limited database of chemicals and studies available for analysis, and the broad distribution of results for different chemicals. The EPA and OEHHA have proposed to apply a default ASF of 10 for the third trimester to age 2 years, and a factor of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood (adults 16 and older need no adjustment factor), and applied these to all carcinogens, regardless of the theorized mode of action. Thus, for the 70-year cancer assessment in the Draft EIR, the cancer risk adjustment factor (CRAF) used was $1.7 [(10 \times 2.25/70) + (3 \times 14/70) + 54/70 = 1.7]$.

¹ CARB, 1998, *Proposed Identification Of Diesel Exhaust As A Toxic Air Contaminant*.

Response to Comment 37. See Response to Comment D-3, No. 36 above. The Air Quality Analysis described the inclusion of the cancer risk adjustment factor as prescribed by the ARB and OEHHA.

Response to Comment 38. The HRA in the EIR overview in Section 4.3 Air Quality, details in the Air Quality technical report in Appendix B, followed all current guidance from the EPA, ARB, OEHHA and other state agencies to insure that the health of all residents and other sensitive receptors affected by construction and operational emissions from the project are protected. Source: EPA, *Air Toxics Strategy*, July 1999; ARB, *AB 2588 Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines Regulation*, August 27, 2007; OEHHA, *Air Toxics Hot Spots Program Risk Assessment Guidelines*, August 2003; SCAQMD, *Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*, August 2003.

Response to Comment 39. As the EIR found that all impacts from project-related diesel PM are less than significant without the use of "buffers and other methods"; none of these are necessary to protect the health of all residents and other sensitive receptors affected by construction and operational emissions from the project.

Response to Comment 40. Comment noted. The exhibit cited is the SCAQMD guidance document *Final-Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds*, which is provided for the Localized Significance Threshold (LST) portion of the air quality analysis. The air quality analysis in the DEIR cited this resource and complied with it.

Response to Comment 41. The EIR discusses consistency in detail. It says "*the proposed project would require a General Plan Amendment that would change the General Plan designations for a portion of the project site from Residential to Business Park/Light Industrial. The project also proposes an amendment to the Circulation Element of the General Plan.*" and "*Implementation of the proposed project would require a zone change from Business Park (BP), Business Park Mixed Use (BPX), Multi-Family Residential (R-15), Suburban Residential (R-5), and Residential Agriculture (RA-2) to Light Industrial for the entire 122.8 acres.*" "*Because the project site is located in a nonattainment air basin for ozone, PM10 and PM2.5, the proposed project's emission of ozone precursors (CO, ROG, and NOX), PM10 and PM2.5 would contribute to the existing nonattainment status in the Basin. Thus, according to the SCAQMD Consistency Criterion No. 1, the proposed project is not consistent with the AQMP.*"

Response to Comment 42. Table 4.3.I of the Draft EIR has a note stating "includes both fugitive and exhaust sources" and the conceptual grading plan for the project indicates that the earthwork will be largely balanced on site and only 200 cubic yards of soil importation is expected. This small amount of soil import will require minimal truck trips which are included in the general construction vehicle calculations.

Response to Comment 43. While no phasing of construction is required of the project, normal construction operations are conducted in phases – grading cannot begin until site preparation is completed, building construction cannot begin until grading is completed, etc. As shown in Table E of the Air Quality Technical Report in Appendix B, the construction analysis conservatively assumed that the building construction, architectural coating and paving phases could all overlap. The peak daily emissions shown in Table 4.3.I of the DEIR reflect this conservative assumption. Note that the DEIR concluded that construction air quality impacts remained significant and unavoidable with mitigation."

Response to Comment 44. Section 5.1.4 of the air quality technical study (Draft EIR Appendix B) clearly explains that guidance provided by SCAQMD was followed in which all construction phases were considered in the LST analysis. See the Response to Comment 43 concerning construction phasing. As described in the Air Quality Technical Report in the DEIR Appendix B, Section 5.1.4, the grading phase was determined to be the construction phase of concern for the LST analysis by

following the SCAQMD guidance on applying CalEEMod modeling results to LST analyses; *Fact Sheet for Applying CalEEMod to Localized Significance Thresholds*, available at www.aqmd.gov/ceqa/handbook/lst/CalEEModguidance.pdf.

Response to Comment 45. While the DEIR analyzes project operational emissions assuming that the project could operate 24 hours per day, 7 days per week, the construction of the project will not occur 24 hours per day. As pointed out by the commenter, noise regulations alone restrict construction operations to 14 hours per day. Current project plans are to build the project following a typical daily construction schedule, which is what is built into the CalEEMod model and was used in the air quality analysis.”

Response to Comment 46. See Response to Comment D-3, No. 44 above.

Response to Comment 47. SCAQMD Rule 402 regarding nuisances states: “A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.” Construction operations do not typically result in Rule 402 violations, due to the subjective nature of odor and the need for such odor to ‘cause injury, detriment, nuisance, or annoyance to any considerable number of persons’. There is nothing about the proposed project construction that is expected to result in any odor other than those associated with typical construction operations.

Response to Comment 48. LST screening analyses use SCAQMD provided tables for significance determination. The tables provided include data for 1, 2 and 5 acre project sites. The LST emissions thresholds grow larger with larger site areas; using an LST threshold for an area smaller than the actual area (5 acres verses 121 acres) results in lower emissions thresholds than would occur if the entire site was considered. In other words, a 5-acre project is allowed to emit up to 270 lbs/day of NO_x. A 121 acres project would be allowed a much higher daily NO_x emission rate. Thus, using the 5 acre threshold for the proposed project site is conservative.

Response to Comment 49. Based on the results of the air quality study for the project, the mitigation measure as written in the DEIR specifies “...*contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors.*” Presumably the commenter is suggesting that this distance should be increased to 1,000 feet. The 200-foot distance was selected after analysis in the project air study determined that construction impacts could be reduced to less than significant levels through imposition of this setback. The commenter has provided no evidence or substantiation why this distance should be increased to 1,000 feet.

Response to Comment 50. The mitigation measure states “...*power sources (e.g., power poles)*”. Clean fuel is a standard phrase used to describe fuels that release fewer emissions when used in internal combustion engines compared to standard fuels. A “clean-fuel generator” is a generator configured to burn a clean fuel, thus releasing fewer emissions than a generator burning standard fuels.

Response to Comment 51. Mitigation Measure 4.3.6.2C has been updated to specify Tier III equipment for all phases of construction and for all equipment where technologically available.

Response to Comment 52. The text of the mitigation measure states that it is “per SCAQMD guidelines”, showing that this is a requirement for all projects. It is included for completeness and for monitoring purposes.

Response to Comment 53. The commenter first states that Mitigation Measure 4.3.6.2H is not a mitigation measure then allows that the bulk of the measure is a proper mitigation measure. However, the measure has been amended as follows:

4.3.6.2H *The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and ~~during smog season (May through October)~~ by shall not allowing construction equipment to be left idling for more than five minutes (per California law).*

Response to Comment 54. The text of the mitigation measure states that it is "as required by the California Air Resources Board (CARB)", showing that this is a requirement for all projects. It is included for completeness and monitoring purposes.

Response to Comment 55. Notations to construction documents are how a specified change to the normal construction methods and procedures are documented and to support enforcement. Without notations, no one onsite during construction knows what action or procedure should be enforced. However, in Mitigation Measure 4.3.6.2J has been amended to take out "notations and "where feasible" has been changed to "if available" or "where available" because it is not certain at the time the mitigation is implemented whether the types of fuels and/or construction equipment specified will be available.

4.3.6.2J *Grading plans, construction specifications and bid documents shall also include the following ~~notations requirements~~:*

- *Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty;*
- *Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads;*
- *Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect;*
- *The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;*
- *The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours;*
- *High-pressure injectors shall be provided on diesel construction equipment ~~where feasible if available~~;*
- *Engine size of construction equipment shall be limited to the minimum practical size;*
- *Substitute gasoline-powered for diesel powered construction equipment where ~~feasible gasoline powered equipment is available~~;*
- *Use electric construction equipment where ~~feasible~~ it is practical to use such equipment;*
- *Install catalytic converters on gasoline-powered equipment where ~~feasible~~ this type of equipment is available;*

- *Ride-sharing program for the construction crew ~~shall be encouraged and shall be supported by contractor(s) via incentives or other inducement;~~*
- *Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;*
- *Lunch vendor services shall be ~~provided~~ allowed on site during construction to minimize the need for off-site vehicle trips; and*
- *All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered.*

Response to Comment 56. Mitigation Measure 4.3.6.2K has been revised to include a response time.

4.3.6.2K *Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on site. In coordination and cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM₁₀ (fugitive dust) generation or other construction-related air quality issues within 24 hours.*

Response to Comment 57. Mitigation Measure 4.3.6.2H requires construction equipment to limit idling, Measure 4.3.6.2L only requires signs be posted so that equipment operators are aware of the limit.

Response to Comment 58. The word “should” has been removed and replaced with “shall” in Mitigation Measure 4.3.6.3A.

4.3.6.3A *Prior to the issuance of grading permits, the project applicant shall require by contract specifications that all trucks hauling dirt, sand, soil, or other loose materials are to be covered or ~~should~~ shall maintain at least 2 feet of freeboard in accordance with the requirements of California Vehicle Code (CVC) Section 23114 (freeboard means vertical space between the top of the load and top of the trailer).*

Response to Comment 59. The project has no ability to affect the control of emissions from mobile sources as these are entirely under the control of State and federal authorities. The only means available to the project to affect mobile source emissions is to reduce their use, either by reducing numbers of vehicles or the distance they drive. The project does discuss these options but concludes that due to the magnitude of the calculated emissions, neither of these means that are available would reduce mobile emissions sufficiently to even approach the emissions thresholds. Thus, while mitigation is proposed (Mitigation Measures 4.3.6.5A and 4.3.6.5B) to reduce the numbers of vehicles and the distance they drive no quantification of the emissions reductions was attempted.

Specific air quality mitigation suggestions provided by the commenter are addressed in Response to Comment 60, below.

Response to Comment 60. See also Response to Comment D-3, No. 59 above. In addition, a number of activities requested by the SCAQMD have been incorporated into the mitigation measures for air quality (see Final EIR, Section 3.0, *EIR Errata and Additions*).

Feasible mitigation measures, including several identified in the list provided by the commentor, have been already included as mitigation for the project and are identified in the Draft EIR. The Table

below contains each of the mitigation measures suggested for inclusion by the commentor and if it is already included in the Draft EIR, if will be added mitigation as part of the Final EIR, or if will not be included and why. Mitigation Measures 4.3.6.5B and 4.3.6.6A are intended to be suggestions for the developer to choose from to reduce energy consumption by 10% above Title 24 standards (refer to Response to Comment D-3, No. 109, below).

Table A: Comparison of Suggested Mitigation Measures to Project Mitigation

Suggested Mitigation Measure	Response
1. Preferential parking for employee vanpooling/ carpooling	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.
2. Bicycle parking facilities	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33 and Mitigation Measure 4.3.6.6A on page 4.3-36.
3. Bus turnouts	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5A on page 4.3-33.
4. Install low-emissions water heaters	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
5. Require construction of buildings to exceed Title 24 by 20+ percent	Not Included. The EIR indicates the project will exceed Title 14 energy standards by 10 percent which is considered adequate for this type of building and based on the most recent changes to the State Green Building Code, including Title 24. This mitigation is discussed in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.
6. Install central water heating systems	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
7. Require use of energy-efficient appliances	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
8. Require increased insulation	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
9. Require use of automated controls for air conditioners	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
10. Require use of energy-efficient parking lot lighting.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
11. Require use of lighting controls and energy – efficient lighting.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
12. Require use of low-VOC interior and exterior coatings during any project repainting.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33 and Mitigation Measure 4.3.6.4A on page 4.3-31.
13. Require on-site improvements such as sidewalks or pedestrian walkways to promote pedestrian activity and reduce the number of vehicle trips.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
14. Require installation of skylights and energy-efficient lighting that exceeds current California Title 24 standards where feasible,	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park

Suggested Mitigation Measure	Response
including electronic dimming ballasts and computer-controlled daylight sensors in the buildings.	
15. Require installation of fans to assist natural ventilation.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
16. Require planting of shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and building shall be planted at the proposed project site to minimize the heat island effect and thereby reduce the amount of air conditioning required.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.
17. Install central water heating systems	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
18. Require use of energy-efficient appliances	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
19. Install low-emissions water heaters	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
20. Require planting of shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and building shall be planted at the proposed project site to minimize the heat island effect and thereby reduce the amount of air conditioning required.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33 and Mitigation Measure 4.3.6.6A on page 4.3-35.
21. Require installation of centralized water and space conditioning systems or, alternatively, high efficiency individual heating and cooling units.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
22. Require installation of automatic setback thermostats.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33.
23. Require the incorporation of the following to reduce energy demand associated with potable water conveyance through the following methods: <ul style="list-style-type: none"> • Require incorporation of drought-tolerant plants into the landscaping palette; and • Require incorporation of water-efficient irrigation techniques. 	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.
24. Require installation of energy-efficient low-pressure sodium parking lot lights or equivalent as determined by the City;	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-34.
25. Increase in insulation such that heat transfer and thermal bridging is minimized.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35
26. Limit air leakage through the structure or within the heating and cooling distribution	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under

FINAL EIR - RESPONSE TO COMMENTS

system to minimize energy consumption.	Mitigation Measure 4.3.6.6A on page 4.3-35
27. Incorporate dual-paned or other energy-efficient windows.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35
28. Incorporate energy-efficient space heating and cooling equipment.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35
29. Interior and exterior energy-efficient lighting which exceeds the California Title 24	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35.
30. Energy Efficiency performance standards shall be installed.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35 for water heating and space heating.
31. Install automatic devices to turn off lights when they are not needed.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35.
32. Shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-33 and Mitigation Measure 4.3.6.6A on page 4.3-35.
33. Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35.
34. All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design, and shall incorporate renewable electricity systems.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-35.
35. The project shall implement a landscaping palette emphasizing drought tolerant plants.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-34 and Mitigation Measure 4.3.6.6A on page 4.3-36.
36. The project shall implement use of water-efficient irrigation techniques.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5B on page 4.3-34 and Mitigation Measure 4.3.6.6A on page 4.3-36.
37. The project shall implement EPA Certified WaterSense labeled for equivalent faucets and high-efficiency toilets (HETs).	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.
38. The project shall establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.	Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.

Suggested Mitigation Measure	Response
<p>39. The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.</p>	<p>Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36.</p>
<p>40. Lease/purchase documents shall require the implementation of the following mitigation measures by contract specification:</p> <ul style="list-style-type: none"> • SmartWay partnership: Achieve at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long haul trips carried by SmartWay carriers. • Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay carriers. • Install of catalytic converters on all gasoline-powered equipment. • Include to the greatest extent feasible electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets. • Establish and encourage use of carpool/vanpool programs through methods such as vouchers. • Require a charge for parking fees for single-occupancy vehicles. • Provide preferential parking for EV and CNG vehicles consisting of at least 15% of parking stalls. • Require use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance where technologically feasible. • Require use of only electric (instead of diesel or gasoline-powered) yard trucks. • Require that all trucks within the fleet be SmartWay rated. 	<p>Included. This suggested mitigation measure is already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.6A on page 4.3-36. Note that because the end user is not known at this time, the developer can only commit to language in the lease/purchase documents.</p>

Response to Comment 61. Threshold 3(c) is discussed in Section 4.3.6.2 of the Air Quality section (page 4.3-22).

Response to Comment 62. Threshold 3(c) is discussed in Section 4.3.6.2 of the Air Quality section (page 4.3-22).

Response to Comment 63. The analysis was done in compliance with SCAQMD methodology (SCAQMD California Environmental Quality Act (CEQA) Air Quality Handbook [SCAQMD 1993]). The SCAQMD thresholds have been developed in recognition of air district ambient conditions. EIR Section 4.3.7 discusses the cumulative air quality impacts of project construction and operations in detail. Other than the Moreno Valley Auto Mall and the Wal-Mart center to the west of the project site, the project site region is currently residential, farmland or undeveloped. The majority of the land uses that would go into a cumulative analysis are not sufficiently documented to allow a comprehensive quantitative evaluation of cumulative impacts. The project traffic study includes what data is available for these proposed projects when projecting future cumulative traffic impacts and this data is included in the air quality analysis of CO Hotspots, thus to the extent possible, the EIR does quantitatively assess cumulative impacts.

Response to Comment 64. The commenter is incorrect; the potential impacts to birds are discussed at length in Section 4.4.6.1 (Biological Resources) of the Draft EIR. Loss of the project site will incrementally impact migratory and passerine birds, but the EIR clearly indicates a lack of resources on the project site to support birds (i.e., no onsite standing water sources, no trees sufficient for perching or nesting, regular disturbance by human activity, and disking for weed abatement). Migratory birds and passerine birds are not considered significant biological resources on this site, so they were not mentioned in the Executive Summary. Development of this site would incrementally reduce foraging opportunities on this site for raptors, passerine, and migratory bird species. However, there are thousands of acres of dry farm agricultural land, Mystic Lake, and the San Jacinto Wildlife Area east of the project site that would provide significant foraging resources for birds compared to the project site.

Regarding Mitigation Measure 4.4.6.1A, the introduction to the “Mitigation Measures” section clearly states the following measures have been identified to reduce the significance of potential impacts to migratory bird species and the burrowing owl. Mitigation Measure 4.4.6.1A clearly addresses nesting (migratory) birds, which measures 4.4.6.1B and 4.4.6.1C clearly address impacts to burrowing owls.

Response to Comment 65. The CDFG’s 2012 “Staff Report on Burrowing Owl Mitigation” supersedes its 1995 Staff Report, not the Burrowing Owl Consortium’s “Burrowing Owl Survey Protocol and Mitigation Guidelines,” which has been commonly followed for burrowing owl surveys and mitigation since released in 1993. The CDFG continues to list the Burrowing Owl Consortium’s 1993 guidelines on its internet page of “Survey and Monitoring Protocols and Guidelines” (http://www.dfg.ca.gov/wildlife/nongame/survey_monitor.html). The CDFG’s 2012 Staff Report indicates that its recommended setback buffers are “general guidelines” and “should be adjusted to address site-specific conditions.” Mitigation measure 4.4.6.1C follows the Burrowing Owl Consortium’s recommendation of a 160-foot buffer during the non-breeding season and a 250-foot buffer during the breeding season. The CDFG’s comments on the Draft EIR regarding burrowing owl (letter from Jeff Brandt, CDFG, to Jeff Bradshaw, City of Moreno Valley, August 28, 2012) do not indicate concern or disagreement with these buffer distances. In addition the site is subject to the provisions of the Western Riverside County MSHCP, in which burrowing owl relocation requires project-specific approval from CDFG. If burrowing owls are found on the site, they will be moved only with CDFG approval. Mitigation measure 4.4.6.1C indicates that if burrowing owls are found on “the project site or immediate vicinity,” the avoidance measures of 4.4.6.1C, including the buffers, will be taken. This will ensure that burrowing owls that may be found adjacent to the project site are not harmed by project-related activities. Impacts to burrowing owl habitat are covered under the MSHCP

providing that the project follows MSHCP requirements. For burrowing owl, these requirements include conducting burrowing owl surveys and relocating burrowing owls found within impact areas. Mitigation for impacts to burrowing owl habitat is required only if the project site is within the MSHCP Criteria Area or if the project site and adjacent habitat support three or more pairs of burrowing owls. The project site is not within the MSHCP Criteria Area. A focused burrowing owl survey was conducted and the site was not found to support any burrowing owls. Burrowing owl mitigation is therefore focused on avoiding take of individual burrowing owls that may move onto the site rather than on burrowing owl habitat preservation or restoration.

Response to Comment 66. The commenter is incorrect, Sections 4.4.6.2 and 4.4.6.3 of the Draft EIR clearly identifies the potential impacts of development on the 3 onsite drainage features, including the Quincy Channel. The mitigation measures do not defer mitigation, but rather specify who, when, and how the implementation of the measures will occur, as required by CEQA.

Regarding SAWA, the commenter is being argumentative. SAWA is a separate governmental unit from the City of Moreno Valley, so the City cannot “force” SAWA to use impact fees for specific purposes. However, it is the express goal of SAWA to use in lieu fee contributions for drainage impacts to acquire/maintain riparian/riverine habitat within the Santa Ana River basin. In fact, they are the most appropriate organization to collect and administer use of these fees, since they were formed specifically to help improve water quality and riparian/riverine habitat along the Santa Ana River and its tributaries. It should also be noted the offsite mitigation language relative to SAWA has been modified to reflect the most current implementation measures of the project DBESP report.

Response to Comment 67. The commenter is incorrect, Section 4.4.6.2 of the Draft EIR clearly identifies the impacts of development on the 3 onsite drainage features, including the Quincy Channel, and also specified the onsite protection of the Quincy Channel and the minimum amount of offsite mitigation required to offset the loss of the other two erosional drainage features.

Mitigation Measure 4.4.6.2B only provides more specific guidance of implementing Mitigation Measure 4.4.6.2A and for subsequent permitting of these actions. These measures do not defer mitigation, but rather specify when and how the implementation of the measures will occur, as required by CEQA.

Response to Comment 68. The commenter is incorrect. The project does not impact federal wetlands, as clearly demonstrated by Table 4.4.D in Section 4.4.6.3 of the Draft EIR. The table shows that the project will have minimal impacts on non-wetland land under the jurisdiction of the Army Corps or Regional Water Quality Control Board (0.054 acre temporary and 0.051 acre permanent), and also relatively small impacts to land under the jurisdiction of the State Department of Fish and Game (0.35 acre temporary, 0.36 acre permanent). Mitigation Measure 4.4.6.3A requires the project to obtain the appropriate federal and/or state permits for these impacts, subject to subsequent permitting approval processes by these agencies. As previously discussed in Responses to Comments D-3, Nos. 66 and 67 above, the proposed mitigation in the EIR will make sure impacts on these drainage features are less than significant. The commenter has provided no data or material supporting his opinion to the contrary. To reflect the most current implementation measures of the project DBESP, Mitigation Measures 4.5.6.2A, 4.5.6.2B, and 4.5.6.3A were modified based on comments by CDFG.

Response to Comment 69. Section 4.4 of the Draft EIR concluded that all potential impacts of the project on biological resources were either less than significant, or could be reduced to less than significant levels by implementing the recommended mitigation measures. The commenter provided no data or support to his opinion as to why the less than significant impacts of the project would contribute to significant cumulative impacts. This conclusion is incorrect, especially in light of the regional protection for biological resources provided by the MSHCP.

Response to Comment 70. The design of the proposed project is consistent with the edge treatment measures identified in the DBESP document (see Draft EIR Appendix E). This conclusion is supported by the analysis of indirect impacts in the MSHCP consistency analysis report (also in Draft EIR Appendix E). Based on these analyses, lighting and noise will not have significant impacts on any biological resources, and the commenter has not provided any empirical data or evidence to support his opinion in this regard.

“The MSHCP was conceived, developed, and is being implemented specifically to address the direct, indirect, cumulative, and growth-related effects on covered species resulting from build out of planned land use and infrastructure, including the proposed project.” (DEIR page 4.4-9). In addition, page 4.4-32 of the DEIR states that...”Project construction will contribute to the incremental loss of mule fat scrub and non-native grassland in the region, including potential habitat for some special status species. Cumulative impacts potentially include habitat fragmentation, increased edge effects, reduced habitat quality, and increased wildlife mortality. The MSHCP provides a comprehensive approach to the regional conservation of these habitats and, as a regional plan, serves to provide mitigation for cumulative impacts to covered species. Project compliance and consistency with the MSHCP ensures that any cumulative impacts to covered species are effectively mitigated. Special status species that are not covered by the MSHCP also benefit from the surveys, conservation, and other measures of the MSHCP because they occupy many of the same habitats. Therefore, the proposed project will not make a significant contribution to any cumulatively considerable impacts to biological resources.” The EIR does examine these impacts, and determines that compliance with the MSHCP will be sufficient to mitigate any potential impacts in this regard. The EIR clearly demonstrates that, other than the Quincy Channel, there are no important biological resources in the immediate vicinity of the project site, so potential indirect impacts are negligible. In addition, the EIR concluded that the design of the project, implementation of project mitigation, and payment of MSHCP mitigation fees, would be sufficient to reduce potential biological impacts of the project to less than significant levels.

Response to Comment 71. Moreno Hills Complex is not an accepted term according to the Office of State Historic Preservation. “District” is the most appropriate term; however, no such District has been formally established. What is being suggested in the comment is commonly referred to as the “landscape approach” but lacking the designation of a District no landscape considerations can be applied (although the Pechanga increasingly apply the landscape approach in their dealings with cities and developers).

Response to Comment 72. Most municipalities require that archaeologists meet either County of Riverside or Secretary of the Interior qualifications. Letter A-4 (Response to Comment 2) from the Pechangua Band of Luiseno Indians clarifies the procedures to be taken under Mitigation Measures 4.5.6.1A through 4.5.6.1E. This letter also repeated the City’s position that while it encourages developers to work with the tribes, it does not require developers to hire Native American monitors. Since the status of Native American monitors cannot be clarified at this point, their level of authority is undefined. This letter also clarifies the curation procedures that will be carried out as artifacts are recovered and leaves with the tribes the decision regarding whether or not to curate or re-bury on the project. Mitigation Measure 4.5.6.1A has been revised requiring the monitor meet Secretary of Interior standards. Mitigation Measure 4.5.6.1B has been revised to require that work cease in that area if a resource is found.

Again, note that the wording of Mitigation Measures 4.5.6.1A through 4.5.6.1E have been modified as shown in Response 3 in Letter A-4 from the Pechanga Band to address concerns of both Native American groups regarding archaeological mitigation.

Response to Comment 73. The mitigation for paleontological resources is not deferred and is commonly used as standard mitigation when there are potential paleontological resources onsite that may be uncovered during excavation activities. The City of Moreno Valley requires that the

paleontologists meet the standards of Riverside County and the Society for Vertebrate Paleontology. The San Bernardino County Museum in Redlands is well equipped to accept and curate paleontological specimens.

Response to Comment 74. Without an accepted, defined District using a landscape approach does not work either since there are no accepted boundaries for determining a cumulative area. Based on ethnographic studies we could use a 800 sq. km area or greater, but a more realistic cumulative boundary might be what is inside the 1-mile diameter of the record search area. The cumulative “universe” or boundary assumed for potential cumulative impacts for cultural resources is the City limits, as this is the largest area under control of the lead agency, and this area is supported as appropriate for a cumulative analysis in the City’s General Plan EIR as well. Regardless, the EIR clearly concludes, the proposed project will not have a significant impact on cultural resources and will not have a cumulative impact on cultural resources whether the cumulative area is the City limits or the entire ethnographic region.

Response to Comment 75. The commenter is incorrect – the project hydrology study clearly shows that post-development flows will be equal or less than pre-development conditions with construction and maintenance of the proposed detention basins. Each building area will have its own basin, and the four basins across the southern boundary of the site will help assure that offsite flows will not exceed existing runoff volumes. The Final Hydrology Study is required by the City development review process to more accurately characterize drainage conditions based on the final building and property development plans. However, the final plans must be consistent and are based on the draft hydrology plan included in Appendix G-1 of the Draft EIR. Therefore, potential flooding impacts will be less than significant, as indicated in Sections 4.7.5.2 and 4.7.5.3 of the Draft EIR.

Response to Comment 76. As demonstrated in Response to Comment D-3, No. 75 above, the commenter is incorrect - the project will not cause significant drainage or flooding impacts. The project hydrological analysis clearly shows that offsite runoff in the post-development condition will not exceed pre-development conditions for downstream land uses. Therefore, the project is not expected to make any contributions to cumulatively considerable flooding impacts in this area.

The analysis in Section 4.7, *Hydrology and Water Quality*, of the DEIR also determined that the project would not result in significant water quality impacts either onsite or for downstream properties, so the project is also not expected to make any contributions to cumulatively considerable water quality impacts in this area.

Response to Comment 77. While it is correct that soil sampling last occurred in 2004, the commenter is incorrect that this requires additional soil testing. The site has lain fallow since that time, and the only farming that has occurred in the non-citrus portions of the site have been dry farming which does not require the application of pesticides or other agricultural chemicals. In fact, the site has not even been dry farmed for several years, and the onsite ruderal vegetation has only been managed for weed abatement purposes. In addition, the citrus trees have not been commercially harvested, nor have they been irrigated or maintained as a commercial activity (i.e., no pesticides or other agricultural chemicals applied). The commenter has provided no evidence why the 2004 soil samples need to be updated. For the purposes of CEQA review, the City considers the information provided in the Draft EIR to be accurate.

Response to Comment 78. The commenter is incorrect; the Draft EIR does address removing the trail segment along the Quincy Channel north of Eucalyptus Avenue. When this trail segment was first proposed, there was an under-crossing of the SR-60 planned that would allow a trail connection to be constructed along the Quincy Channel north of the freeway. Since that time, the City has eliminated that potential under-crossing, which means the segment of the trail along the channel north of Eucalyptus Avenue would not connect to any other trail. Therefore, the ProLogis project is proposing the trail follow the north side of Eucalyptus Avenue when it is realigned through the proposed project.

There would then be a continuous trail up the Quincy Channel from the south to Eucalyptus Avenue, then the trail would go east and west along the north side of Eucalyptus Avenue. A similar trail improvement was required of the Westridge project approved just east of the proposed project. The EIR discusses potential conflicts with the “improve air quality and promote energy efficiency” section of the RTP in Section 4.8.7 of the Land Use and Planning chapter, page 4.8-18.

Response to Comment 79. It is true the project will remove some amount of potential affordable housing, and it will add more warehousing in this portion of the City. The project would also contribute to more warehousing City-wide (i.e., the southern portion of the City has an industrial specific plan). However, the comments regarding the significance of the impact are the opinion of the commenter and will have to be decided by the City Council. If the City decides to approve this project, it would have to adopt a Statement of Overriding Considerations to document that the benefits of the project (e.g., employment, revenues) outweigh the significant impacts of the project, as required by CEQA.

Table 3.C clearly identifies 6.65 million square feet of industrial projects in eight locations within the City (Sites 5, 6, 8-13). This list does include the WestRidge and Highland Fairview Corporate Park (“Skechers”) projects, but does not include World Logistics Center project of 41.6 million square feet of industrial space because that project was not proposed when the Notice of Preparation for this ProLogis project was prepared in 2008, which is the baseline time at which cumulative projects are established for an EIR analysis.

Response to Comment 80. The noise impact study was conducted based on applicable City noise standards, including those identified in the City’s Municipal Code and General Plan Noise Element indicated on pages 4.9-5 through 4.9-9 in the DEIR, and provided disclosure of potential noise impact areas. Specific comments on the noise study are addressed in Responses 81-93.

Response to Comment 81. The dominant on-site noise generating activity is the truck maneuvering during the loading/unloading operations at the loading docks. These noise-generating activities include trucks moving in the loading dock, idling, unloading or loading, moving out of the loading dock, and leave the site. The noise impact analysis was based on the site plan and land use assumptions for the proposed LADP development to determine that the closest distance between the loading/unloading area and the future residences to the south. This distance is approximately 280 feet. Other activities associated with the trucks on-site would be traveling at slow speed (15 mph) to get in and out of the site or to move to the designated parking area. This activity generates much lower noise level and last much shorter time when compared to the activities occurring within the loading dock area. Therefore, evaluating the potential truck-related noise within the loading dock area represents the worst case scenario.

It should be noted that noise from on-site operations, including loading/unloading and onsite maneuvering, have been adequately evaluated at the nearest noise-sensitive land uses and no significant noise impacts were identified. Similarly, even though individual truck noise from trucks driving on public streets is not regulated by the local governments (city or county), project-related traffic noise level increases along roadway segments in the project vicinity were shown to be less than 3 dBA and would not be perceptible by the human ear.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Response to Comment 82. The 3 dBA increase was not identified in the noise impact analysis as a threshold on page 4.9-2 in the DEIR. Rather, it was stated that “audible impacts that refer to

increases in noise levels noticeable to humans generally refer to a change of 3 dB or greater, since this level has been found to be barely perceptible in exterior environment. It should be noted that, every doubling of the sound energy from the source would result in a 3 dBA increase in sound level. This would mean that, given everything else remains the same, the traffic volume needs to be doubled to cause an increase of 3 dBA in traffic noise. For noise level changes that are not perceptible by the human ear, they would not cause any audible change and would therefore not result in any significant noise impacts. The City's noise thresholds were identified in DEIR Section 4.9.2, Existing Policies and Regulations (pages 4.9-5 to 4.9-8), where an exterior noise level of 60 to 65 dBA CNEL/Ldn and an interior noise level of 45 dBA CNEL/Ldn were identified for residential uses, as well as a maximum source land use noise level for residential uses is 60 dBA during daytime hours (7 a.m. to 10 p.m.) and 55 dBA during the nighttime hours (10 p.m. to 7 a.m.). For commercial source land uses, the maximum noise level is 65 dBA during daytime hours and 60 dBA during nighttime hours. (Source: Chapter 11.80.030, Table 11.80.030-2, City of Moreno Valley Municipal Code, City of Moreno Valley).

Response to Comment 83. The City's Municipal Code, Table 11.80.030-2, Maximum Sound Levels for Source Land Uses states that, "...restricts noise levels above 55 dBA at night and 60 dBA during the day in residential areas, when measured at a distance of 200 feet or more from the real property line of the source of the sound if the sound occurs on privately owned property, ..." Therefore, it is clear that the City's Municipal Code specifically indicates that measurement of the source noise levels would be "at a distance of 200 feet or more from the real property line of the source of the sound". For this project, the nearest residences are at a distance of 664 feet or more from the project (sound source) site. Evaluating the noise level at the nearest residential uses meets the City's definition specified in the Municipal Code.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast. This alternative plan would substantially reduce noise impacts from warehousing for the residences southeast of the project site.

Response to Comment 84. The City's noise thresholds for transportation sources were identified in the DEIR Section 4.9.2, Existing Policies and Regulations (pages 4.9-5 to 4.9-8), where an exterior noise level of 60 to 65 dBA CNEL/Ldn and an interior noise level of 45 dBA CNEL/Ldn were identified for residential uses. For industrial land uses, the City identifies 70 dBA CNEL as the acceptable exterior noise threshold. Most of the roadway segments in the project vicinity would have up to 2.0 dBA increase in traffic noise as a result of the project-related traffic. This range of traffic noise level increases would not be perceptible by the human ear in an outdoor environment. The only exception is along Eucalyptus Avenue between Moreno Beach Drive and Redlands Boulevard, where the project-related traffic noise level increases would be from 2.5 to 13.6 dBA under the Existing With Project Conditions and from 4.5 to 13.3 dBA under the 2012 With Project Conditions. Since this segment of the road goes or will go through industrial land uses and vacant land, the City's noise standard for industrial land uses of 70 dBA CNEL was used. The 70 dBA CNEL noise contour would be confined to within the roadway right-of-way, therefore, there would be no significant traffic noise impact on land uses along the road.

Response to Comment 85. The City has separate noise standards regulating mobile (traffic) and stationary (on-site operational activity) noise sources in its General Plan Noise Element and Municipal Code. Therefore, noise from different sources is analyzed based on the noise regulations applicable to the activity generating it. The City's noise standards regulating traffic noise are those from the General Plan Noise Element in terms of the 24-hour weighted community noise equivalent level (CNEL) to protect residents during the more sensitive evening and nighttime hours from noise

exposure. The CNEL noise metric is averaged and weighted over a 24-hour period, so it is not practical or feasible to combine the CNEL with the short-term, intermittent noise events associated with stationary sources such as truck loading/unloading activities or activity in the parking lot. Chapter 9.03.040 of the City's Planning and Zoning Code states that in all residential districts, air conditioners, heating, cooling, and ventilating equipment and all other mechanical lighting or electrical devices shall be operated so that noise levels do not exceed 60 dBA (L_{dn}) at the property line. The City's Municipal Code, Section 9.10.140, specifies that all commercial and industrial uses shall be operated so that noise created by any loudspeaker, bells, gongs, buzzers, or other noise attenuation or attracting devices shall not exceed 55 dBA at any one time beyond the boundaries of the property. Chapter 11.80.030, Table 11.80.030-2, City of Moreno Valley Municipal Code, sets a maximum source land use noise level for residential uses as 60 dBA during daytime hours (7 a.m. to 10 p.m.) and 55 dBA during the nighttime hours (10 p.m. to 7 a.m.). For commercial source land uses, the maximum noise level is 65 dBA during daytime hours and 60 dBA during nighttime hours. The City does not have noise standards regulating stationary sources such as on-site loading/unloading activities, therefore, the percentile exceedance levels (L_n) recommended in the State's Modal Community Noise Ordinance, which represent the noise levels that were exceeded for N percent of the time during the one-hour analysis period, are used in the analysis (DEIR, page 4.9-21 under Long-term Operational Noise Impacts for Truck Loading/Unloading Operations) Because the adjacent future development had no final plans available at the time the noise impact study was conducted, the future potential noise impact from on-site operations was evaluated separately using the best assumptions available at the time the noise impact analysis was conducted. The closest possible loading/unloading area was used for on-site operations adjacent to the future planned residential uses.

Response to Comment 86. Please refer to Responses to Comments D-3, Nos. 84 and 85 above for traffic noise impact analysis. Also, please refer Response to Comment D-3, No. 85 on the use of separate noise standards from different noise sources. Please refer to the Response to Comment D-3, No. 83 on the noise level analyzed at the nearest residential property line, rather than the project's own property line. The proposed on-site building would function as a noise barrier for receivers on the opposite side of the noise source. As a rule-of-thumb, a noise barrier that blocks the line-of-sight between the noise source and the receiver would provide at least a 5 dBA in noise reduction (Based on Caltrans Technical Noise Supplement (TeNS, Caltrans, November 2009), for every 2 feet increase in barrier height, an additional 1 dBA noise reduction would be achieved). Since the building would be at least 10 feet above ground and is much higher than the barrier height that barely blocks the line-of-sight, it would provide noise attenuation higher than 5 dBA.

Response to Comment 87. The noise impact analysis evaluated existing and future ambient noise level increases by the project-related traffic on roadway segments in the project vicinity, and determined that no significant noise impacts would occur, partly since the majority of the roadway segments would not have noise level increases that are audible in the outdoor environment and partly since there are no sensitive land uses along the roadway segments with relatively large project-related traffic and the projected noise levels would not exceed the exterior noise standards for the land uses along these segments (industrial uses and vacant land). The City's noise thresholds for transportation sources were identified in 4.9.2, Existing Policies and Regulations (Pages 4.9-5 to 4.9-8), where an exterior noise level of 60 to 65 dBA CNEL/ L_{dn} and an interior noise level of 45 dBA CNEL/ L_{dn} were identified for residential uses, For industrial land uses, the City identifies 70 dBA CNEL as the acceptable exterior noise threshold. Most of the roadway segments in the project vicinity would have up to 2.0 dBA increase in traffic noise as a result of the project-related traffic. This range of traffic noise level increases would not be perceptible by the human ear in an outdoor environment. The only exception is along Eucalyptus Avenue between Moreno Beach Drive and Redlands Boulevard, where the project-related traffic noise level increases would be from 2.5 to 13.6 dBA under the Existing With Project Conditions and from 4.5 to 13.3 dBA under the 2012 With Project Conditions. Since this segment of the road goes or will go through industrial land uses and vacant land, and the noise standard for industrial land uses, the 70 dBA CNEL noise contour would be confined to within the roadway right-of-way and would not impact these industrial land uses, there

would be no significant noise impact on land uses along the road. Therefore, no significant traffic noise impacts would occur. Similarly, for on-site operational noise sources, even though the ambient noise level would increase as a result of the project operations, no noise-sensitive land uses would be exposed to noise levels that exceed the City's noise standards for such uses.

Response to Comment 88. Please refer to the response for Response to Comment D-3, No. 87 for the existing noise levels in the project vicinity. The City's General Plan Noise Element (or any other Element) does not have noise level restrictions specified for construction activity. The City's Municipal Code, Chapter 11.80.030, prohibits grading activities between the hours of 8:00 p.m. and 7:00 a.m. and prohibits construction activities from 8:00 p.m. to 6:00 a.m. during the week and between 8:00 p.m. and 7:00 a.m. on weekends and holidays. However, it does not specify any upper noise limits for construction activity. Compliance with the construction hours specified in the City's Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code, mitigation measures 4.9.6.1A through 4.9.6.1D have been identified to reduce the noise levels that would expose nearby sensitive receptors to high construction noise.

It should be noted that the noise levels obtained from the 1987 edition of Noise Control for Buildings and Manufacturing Plants (Bolt, Beranek & Newman, 1987) represent a conservative analysis for construction equipment. Because of technology advancement, most current day construction equipment emits lower noise levels compared to the 1987 version.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast. This alternative plan would substantially reduce noise impacts from warehousing for the residences southeast of the project site.

Response to Comment 89. The City's General Plan Noise Element (or any other Element) does not have noise level restrictions specified for construction activity. Policy 6.5.2 only states that construction activities shall be operated in a manner that limits noise impacts on surrounding uses. The City's Municipal Code, Chapter 11.80.030, prohibits grading activities between the hours of 8:00 p.m. and 7:00 a.m. and prohibits construction activities from 8:00 p.m. to 6:00 a.m. during the week and between 8:00 p.m. and 7:00 a.m. on weekends and holidays. However, it does not specify any upper noise limits for construction activity. Compliance with the construction hours specified in the City's Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code, Mitigation Measures 4.9.6.1A through 4.9.6.1D have been identified to reduce the noise levels that would expose nearby sensitive receptors to high construction noise.

Response to Comment 90. Please refer to Response to Comment D-3, No. 89 above on construction activity meeting the City's requirements identified in its Municipal Code and to limit noise closest to the existing residences. Mitigation Measure 4.9.6.1D has been amended as follows:

4.9.6.1D. *During all-project site construction activities at Building 6 (i.e., closest to existing residences), the construction contractor shall limit all construction-related activities ~~that would result in high noise levels~~ to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and holidays, unless written approval is obtained from the City Building Official or City Engineer for specific construction activities that must be conducted outside of the permitted time periods.*

For activities that would be conducted inside the building/structure and would not result in any noise annoyance to off-site land uses, they can occur outside of the hours specified in the Municipal Code.

Response to Comment 91. According to the project noise assessment, none of these measures would be required for noise mitigation purposes.

No significant construction noise impacts would occur if construction of the proposed project would occur within the permitted hours of 6:00 a.m. to 8:00 p.m. of any working day, and within the permitted hours of 7:00 a.m. and 8:00 p.m. on weekends and federal holidays. Compliance with the construction hours specified in the City's Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code. Mitigation Measures 4.9.6.1A – 4.9.6.1D were identified in the Draft EIR to ensure that the City's noise standards are implemented.

As indicated in the noise impact study, no noise barriers would be required during project construction (DEIR, page 4.9-26 under Construction Noise Impact nor are they required during operation of the proposed project (DEIR, page 4.9-24 under Combined Noise Levels from On-site Stationary Sources). The proposed project will comply with all mitigation measures identified and comply with applicable federal, State, and City guidelines.

Response to Comment 92. The noise impact analysis has evaluated the project's cumulative impacts from both mobile and stationary sources. For example, based on all available information and provided future projected traffic noise along roadway segments in the project vicinity under the Project Buildout (2035) and General Plan Buildout conditions. As shown in Tables 4.9.J through 4.9.M on pages 4.9-15 to 4.9-20 of the DEIR, project-related traffic noise level increases under these two scenarios would be 1.3 dBA or less and the proposed land uses would not be significantly impacted by the future traffic noise in the project vicinity. Furthermore, on DEIR pages 4.9-20 through 4.9-24, with a worst-case scenario of all on-site stationary noise sources occurring at the same time with their maximum noise level, the maximum noise level measured at 200 feet from the project's southern boundary would be 55 dBA L_{max} . Although this "combined" noise level is not likely to occur due to the intermittent nature of these noise events, if it occurs, it would still not exceed the City's 55 dBA L_{max} nighttime standard for residential uses. Therefore, no significant cumulative noise impacts were identified, either from mobile or from stationary noise sources.

Response to Comment 93. After review, the LSA Noise Assessment Group determined that none of these references provide additional relevant information to determine the project's noise impacts in a more accurate or appropriate manner. All project-related mobile and stationary noise sources have been evaluated and compared to noise standards applicable to these different noise sources. No additional or overlapping noise analysis is required to confirm the findings in the noise impact analysis.

Response to Comment 94. The City of Moreno Valley uses a more restrictive, higher truck generating rate for high cube warehouses (buildings over 200 KSF). The total trip generation of the project used in the analysis is higher than that if the analysis was purely based on ITE rates.

Response to Comment 95. The commenter is incorrect - the analysis does not use a plan to plan comparison and uses the trips from the proposed project in the analysis. The "Without Project" analyses for all scenarios are based on conditions where the proposed site is vacant. Therefore, the comparison between without and with project conditions is comparing no development on site with the proposed project. An existing plus project analysis has also been included which evaluates the impacts of the project on existing physical conditions.

Response to Comment 96. LOS is a metric used by traffic engineers throughout the state to evaluate traffic conditions. LOS is based on delay and is a function of traffic volumes and capacity at intersections. Section 4.11.1.3 of the DEIR explains the concept of LOS. In addition, the Traffic Study also includes v/c ratios as requested by the commenter.

Response to Comment 97. In terms of traffic, most of the trips are using the SR-60 freeway. The routes from the project to the SR-60 freeway do not pass through existing and future residential areas or schools with the proposed change to the Circulation Element. An examination of school locations in the area did not show any schools with direct access to the freeway. The entire traffic analysis is based on the concept of Passenger Car Equivalents (PCE) which converts trucks to an equivalent number of passenger cars to correctly evaluate impacts of trucks which can be larger and slower than passenger cars. The traffic impacts of trucks sharing the road with passenger vehicles have been adequately analyzed.

Response to Comment 98. The following table provides an analysis of the project's consistency with, or the inapplicability of, the various transportation-related policies cited on pages 4.11-11 to 4.11-14 of the Draft EIR. Please note that this additional information does not result in identification of new or severe impacts.

City General Plan Policies/Objectives	Project Consistency
Community Development Element	
Policy 2.2.17: Discourage nonresidential uses on local residential streets that generate traffic, noise, or other characteristics that would adversely affect nearby residents.	As identified on page 4.11-37 in the Draft EIR, the project proposes to eliminate the planned Quincy Street connection to the north of proposed Eucalyptus Avenue. Elimination of the Quincy Street connection creates a physical barrier between the proposed project's industrial uses and the nearby residential uses, and will help to segregate and prevent truck traffic from entering future residential streets.
Circulation Element	
Objective 5.1: Create a safe, efficient, and neighborhood-friendly street system.	The project is an industrial development and as such does not fall under a "neighborhood" as used in the General Plan. The project will construct roadways along its frontage to City standards. See response to Policy 2.2.17.
Policy 5.1.1: Plan access and circulation of each development project to accommodate vehicles (including emergency vehicles and trash trucks), pedestrians, and bicycles.	Access and circulation for the project will accommodate vehicles (including emergency vehicles and trash trucks), pedestrians, and bicycles.
Policy 5.1.2: Plan the circulation system to reduce conflicts between vehicular, pedestrian, and bicycle traffic.	The project will construct roadways and sidewalks to City Standards. The City Standards are developed to create safe conditions.
Policy 5.1.3: Require adequate off-street parking for all developments.	The project provides off street parking based on City standards.
Policy 5.1.4: Driveway placement shall be designed for safety and to enhance circulation wherever possible.	The project will construct driveways to City Standards. The City Standards are developed to create safe conditions.
Policy 5.1.5: Incorporate Americans with Disabilities Act (ADA) and Title 24 requirements in roadway improvements as appropriate.	City Standards include both ADA and Title 24 requirements
Policy 5.1.6: Design new developments to provide opportunity for access and circulation to future adjacent developments.	Adjacent vacant land will be provided access.
Objective 5.2: Implement access management policies.	Roadways will be constructed per City Standards that incorporate various access

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park
City of Moreno Valley

City General Plan Policies/Objectives	Project Consistency
	management policies.
Policy 5.2.1: Locate residential units with access from local streets. Minimize direct residential access from collectors. Prohibit direct single-family driveway access on arterials and higher classification roadways.	See the response above for Objective 5.2. This policy is inapplicable to the proposed industrial project.
Policy 5.2.2: Feed short local streets into collectors.	See the response above for Objective 5.2. This policy is inapplicable to the proposed industrial project.
Policy 5.2.3: Encourage the incorporation of traffic-calming design into local and collector streets to promote safe vehicle speeds.	See the response above for Objective 5.2. This policy is inapplicable to the proposed industrial project.
Objective 5.3: Maintain LOS C on roadway links, wherever possible, and LOS D in the vicinity of SR-60 and high employment centers.	As identified on page 4.11-5 in the Draft EIR, the traffic study prepared for the project utilized a level of service standard of LOS D for all City intersections and roadways analyzed in the traffic study, with the exception of Moreno Beach Drive/Cottonwood Avenue, at which the level of service standard of LOS C was used. For all signalized ramp terminus intersections on SR-60, the level of service standard of between LOS C and LOS D was used. As identified on pages 4.11-31, 4.11-32, 4.11-33, 4.11-35, and 4.11-37 in the Draft EIR, all impacts to City intersections are mitigated to less than significant levels with mitigation.
Policy 5.3.1: Obtain right-of-way and construct roadways in accordance with the designation shown on the General Plan Circulation Element Map and the City street improvement standards.	The project will be required to construct adjacent half street sections in accordance with City street improvement standards. Although the project will not construct Encilia Avenue, the project will preserve right-of-way along the south project boundary to allow Encilia Avenue to be constructed in the future in accordance with the designation shown on the General Plan Circulation Element Map and the City street improvement standards.
Policy 5.3.5: Ensure that new development pays a fair-share cost to provide local and regional transportation improvements and to mitigate cumulative traffic impacts. For this purpose, require new developments to participate in Transportation Uniform Mitigation Fee (TUMF), the Development Impact Fee Program (DIF), and any other applicable transportation fee programs and benefit assessment districts.	As identified on pages 4.11-31, 4.11-32, 4.11-33, and 4.11-35 in the Draft EIR, the project applicant shall implement transportation improvements, either through fees paid to the City of Moreno Valley based on the City's DIF system and the County's TUMF program, or through a fair-share contribution to the City of Moreno Valley.
Policy 5.3.6: Where new developments would increase traffic flows beyond the LOS C (or LOS D, where applicable), require appropriate and feasible mitigation measures as a condition of approval. Such measures may include extra right-of-way and improvements to accommodate left-turn and right-turn lanes at intersections, or other improvements.	See response to Objective 5.3. All impacts to City intersections are mitigated to less than significant levels with mitigation.
Policy 5.3.7: Provide consideration to projects that have overriding regional or local benefits that would be desirable even though the LOS standards cannot be met. These projects would be required to analyze traffic impacts and mitigate such impacts to the extent that it is deemed feasible.	See response to Objective 5.3. All impacts to City intersections are mitigated to less than significant levels with mitigation. Impacts to freeway ramps and freeway segments cannot be mitigated and would remain significant and unavoidable until such time that

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park
City of Moreno Valley

City General Plan Policies/Objectives	Project Consistency
	improvements are constructed. Caltrans does not have a mechanism for development projects to contribute to improvements on State Highways and the City has no control over when and how regional freeway improvements will be constructed.
Objective 5.4: Maximize efficiency of the regional circulation system through close coordination with State and regional agencies and implementation of regional transportation policies.	As identified on page 4.11-30 in the Draft EIR, the traffic study includes analysis of regional transportation facilities. These facilities are funded by the Transportation Uniform Mitigation Fee (TUMF), which establishes jurisdictional fair-share contributions for regional transportation facilities (e.g., freeway interchanges, regional arterials, and railroad grade separations) in western Riverside County. The following improvements within the project area are included in the TUMF program: <ul style="list-style-type: none"> • SR-60/Moreno Beach Drive Interchange reconstruction • SR-60/Redlands Boulevard Interchange reconstruction
Policy 5.4.1: Coordinate with Caltrans and the Riverside County Transportation Commission (RCTC) to identify and protect ultimate rights-of-way, including those for freeways, regional arterial projects, transit, bikeways, and interchange expansion.	See response to Objective 5.4-4.
Policy 5.4.2: Coordinate with Caltrans and the RCTC regarding the integration of Intelligent Transportation Systems (ITS) consistent with the principles and recommendations of the Inland Empire Regional ITS Architecture Project.	See response to Objective 5.4-4.
Objective 5.5: Maximize efficiency of the local circulation system by using appropriate policies and standards to design, locate, and size roadways.	Roadways for the project have been sized per the City's General Plan Circulation Element. A General Plan Amendment is being processed to address the location of Encilia Avenue.
Policy 5.5.3: Prohibit points of access from conflicting with other existing or planned access points. Require points of access to roadways to be separated sufficiently to maintain capacity, efficiency, and safety of the traffic flow.	Project driveways are spaced to provide sufficient sight distances to maintain the capacity, efficiency and safety of traffic flow.
Policy 5.5.4: Wherever possible, minimize the frequency of access points along streets by the consolidation of access points between adjacent properties on all circulation element streets, excluding collectors.	The project consolidates driveways wherever possible.
Policy 5.5.5: Design streets and intersections in accordance with the Moreno Valley Municipal Code.	The project will be required to construct adjacent half street sections in accordance with City street improvement standards.
Policy 5.5.8: Whenever possible, require private and public land developments to provide on-site and off-site improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development project shall be undertaken to identify project impacts to the circulation	See response to Objective 5.3 and Policy 5.3.6.

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park
City of Moreno Valley

City General Plan Policies/Objectives	Project Consistency
system. The City may require developers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.	
Policy 5.5.9: Design curves and grades to permit safe movement of vehicular traffic per applicable Caltrans and Moreno Valley standards.	The project will be required to construct adjacent half street sections in accordance with City street improvement standards, including appropriate curve radii standards.
Policy 5.5.10: Provide adequate sight distances for safe vehicular movement at all intersections and driveways.	The project will be required to construct adjacent half street sections in accordance with City street improvement standards, including appropriate site distance provisions.
Objective 5.8: Encourage development of an efficient public transportation system for the entire community.	This objective is inapplicable to the proposed industrial project, because this is an objective oriented to an efficient public transportation system within the City, and is larger than a project level initiative. The project will provide bus bays in the area where RTA requests them.
Policy 5.8.1: Support the development of high-speed transit linkages, or express routes, that would benefit the citizens and employers of Moreno Valley.	See the response above for Objective 5.8. This policy is inapplicable to the proposed industrial project.
Policy 5.8.4: Ensure that all new developments make adequate provision for bus stops and turnout areas for both public transit and school bus service.	The project will provide bus bays in the area where RTA requests them.
Objective 5.10: Encourage bicycling as an alternative to single occupant vehicle travel for the purpose of reducing fuel consumption, traffic congestion, and air pollution.	This objective is inapplicable to the proposed industrial project, because this is an objective oriented to promoting bicycling within the City and is larger than a project level initiative. However, the project will provide bike lanes on Eucalyptus Avenue and also provides bike parking to facilitate alternative transportation should employees desire to bike to work.
Policy 5.10.1: Bikeways shall link residential neighborhood areas with parks, employment centers, civic and commercial areas, and schools.	The project provides bike parking to facilitate alternative transportation should employees desire to bike to work.
Objective 5.11: Eliminate obstructions that impede safe movement of vehicles, bicyclists, and pedestrians.	The project will construct roadways based on City standards, which consider all modes of travel and their safety.
Policy 5.11.2: Driveways shall be designed to avoid conflicts with pedestrian and bicycle travel.	The project will construct driveways to City Standards. The City Standards are developed to create safe conditions.
Program 5-1: Periodically review current traffic volumes, traffic collision data, and the pattern of urban development to coordinate, program, and as necessary revise the planning and prioritization of road improvements.	This program is inapplicable to the proposed industrial project, because this is a program for the City to review traffic data for the purposes of revising the transportation plan and for prioritizing roadway improvements within the City.
Program 5-2: Periodically reassess the goals, objectives and policies statements of the Circulation Element and propose amendments, as necessary.	This program is inapplicable to the proposed industrial project, because this is a program for the City to reassess the Circulation

FINAL EIR - RESPONSE TO COMMENTS
ProLogis Eucalyptus Industrial Park
City of Moreno Valley

City General Plan Policies/Objectives	Project Consistency
	Element as necessary.
Program 5-3: Develop a comprehensive strategy to ensure full funding of the circulation system. The strategy will include the DIF, TUMF, and other funding sources that may be available to the City. In addition, the creation of benefit assessment districts, and road and bridge fee districts may be considered where appropriate.	This program is inapplicable to the proposed industrial project, because this is a program for the City to develop a comprehensive strategy to ensure full funding of the circulation system using the DIF, TUMF, other funding sources, benefit assessment districts, and road and bridge fee districts.
Program 5-4: Develop a multi-year transportation infrastructure improvement program that, to the extent feasible, phases the construction of new projects in advance of new development.	This program is inapplicable to the proposed industrial project, because this is a program for the City to develop a multi-year transportation infrastructure improvement program.
Program 5-5: The above-referenced program will prioritize circulation improvement projects to be funded from DIF, TUMF and other sources. Prioritization to consider the following factors: (a) Traffic safety; (b) Congestion relief; (c) Access to new development; and (d) Equitable benefit.	This program is inapplicable to the proposed industrial project, because this is a program for the City to develop a multi-year transportation infrastructure improvement program with prioritized circulation improvements.
Program 5-6: Conduct studies of specified arterial segments to determine if any additional improvements will be needed to maintain an acceptable LOS at General Plan build-out. Generally, these segments will be studied as new developments are proposed in their vicinity. Measures will be identified that are consistent with the Circulation Element designation of these roadway segments, such as additional turn lanes at intersections, signal optimization by coordination and enhanced phasing, and travel demand management measures. The study of specified arterial segments will be required to identify measures to maintain an acceptable LOS at General Plan build-out for at least one of the reasons discussed below: (a) Segments will need improvement, but their ultimate volumes slightly exceed design capabilities. (b) Segments will need improvements but require inter-jurisdictional coordination. (c) Segments would require significant encroachment on existing adjacent development if built out to their Circulation Element designations.	This program is inapplicable to the proposed industrial project, because this is a program for the City to conduct studies of specified arterial segments to determine if any additional improvements will be needed to maintain an acceptable level of service at General Plan build-out.
Program 5-7: Establish traffic study guidelines to deal with development projects in a consistent manner. The traffic study guidelines shall include criteria for projects that propose changes in the approved General Plan land uses.	This program is inapplicable to the proposed industrial project, because this is a program for the City to establish traffic study guidelines. The City has traffic study guidelines and the analysis was conducted in accordance to these guidelines.
Program 5-13: Implement Transportation Demand Management (TDM) strategies that reduce congestion in the peak travel hours. Examples include carpooling, telecommuting, and flexible work hours.	Similar mitigation measures are already included in Section 4.3 Air Quality of the Draft EIR under Mitigation Measure 4.3.6.5A on page 4.3-33, Mitigation Measure 4.3.6.5B on page 4.3-34, and Mitigation Measure 4.3.6.6A on 4.3-36.

Response to Comment D-3, No. 78 above explains why the project is proposing to remove the Quincy Channel trail link north of Eucalyptus Avenue (it does not connect to any trail to the north). The trail is proposed to be realigned through both the ProLogis and the WestRidge (located to the east of ProLogis project) projects to follow the north side of Eucalyptus Avenue, and then connect up to the Quincy Channel trail south of Eucalyptus Avenue. There would then be a continuous trail along the Quincy Channel from the south to Eucalyptus Avenue, then the trail would go east and west along the north side of Eucalyptus Avenue. A similar trail improvement was required of the Westridge project.

Response to Comment 99. It is correct that the Trails Commission has accepted the amendment to the Master Plan of Trails. However, the Trails Commission is not an approval body, and approval from the City Council will be required because the Master Plan of Trails is part of the General Plan.

Response to Comment 100. Beyond a delay of 100 seconds, the HCM analysis methodologies fail to accurately reflect increased delays. For future conditions, background traffic growth will lead to congestion and cumulative impacts. As development occurs, fees will be collected to improve the circulation system to accommodate growth in traffic. The project generates fewer trips than the current land use designation for the site. Therefore, the planned improvements included in the DIF and TUMF should be sufficient to mitigate cumulative impacts from this project, as other cumulative development occurs. As stated in Section 4.11.6.4, the project will mitigate its impacts to the existing plus project conditions, per CEQA.

Response to Comment 101. The City's DIF includes the General Plan Roadway system. Since the project generates less trips than those anticipated in the General Plan, the ultimate General Plan Roadway system will be sufficient to accommodate project traffic. As new development occurs, fees will be collected to improve the circulation system to accommodate growth in traffic. As stated in Section 4.11.6.4, direct project impacts will be mitigated by the project.

Response to Comment 102. As stated in Section 4.11.6.4, of the DEIR, the project will mitigate its direct impacts to intersections based on the Existing Plus Project analysis. Cumulative impacts will be mitigated by payment of TUMF, DIF and fair-share contributions.

Response to Comment 103. Potential project-related traffic noise impacts are determined based on the worst-case scenario, which is typically the build-out year that has the highest traffic volumes. Traffic noise impacts for the opening year are presented to show interim year project-related increases, which were found to be small and less than significant. Since overall traffic volumes would be higher in 2016 when compared to the overall traffic volumes in 2012, project-related contribution would be even smaller in 2016 compared to 2012. Therefore, the use of 2012 as the opening year would not affect the findings in the noise impact analysis since project-related traffic noise level increases in 2016 would be smaller than those identified in 2012. Noise impacts associated with on-site stationary sources, such as loading/unloading operations, would not be affected by the difference in opening year because they are analyzed with project buildout conditions for the worst case scenario on potential noise impacts on adjacent land uses. Therefore, no significant effect would occur for the difference in opening year in the noise impact analysis.

Response to Comment 104. The latest information from the County is that the Badlands landfill will close in 2024 not 2016, so the references to 2016 will be changed (see below). Therefore, the project will not have a significant impact on solid waste disposal services because the landfill will have adequate capacity to accommodate the proposed project's waste stream.

4.12.1.7 Cumulative Impacts to Solid Waste Services (Draft EIR p.4.12-5)

AB 939 mandates the reduction of solid waste disposal in landfills. While the Badlands Sanitary Landfill has an estimated closure date of ~~2016~~ 2024, as previously identified, the City's waste hauler will also use other County landfills in the area (e.g., Lamb Canyon Landfill and El Sobrante Landfill). The estimated closure date of the Lamb Canyon Landfill is 2023 and the estimated closure date of the El Sobrante Landfill is 2030. With planned expansion activities of landfills in the project vicinity and projected growth rates contained within the City's General Plan EIR, sufficient landfill capacity would exist to accommodate future disposal needs through City build out in 2030. Therefore, build out of the City General Plan would not create demands for solid waste services that would exceed the capabilities of the County's waste management system. Consequently, cumulative impacts associated with solid waste within the City would be considered less than significant.

Response to Comment 105. The commenter is incorrect. A comprehensive Water Supply Assessment was prepared for this project, which was extensively discussed in Section 4.12.2.6.2 of the Draft EIR. That analysis evaluated available water supplies compared to current and future projected conditions under a variety of scenarios (i.e., various drought conditions). That analysis determined there were sufficient supplies of water available to serve the project over a 20-year time frame.

Response to Comment 106. The project will install infrastructure to support solar power, which is all the City is encouraging, thus the consistency statement. The applicant has agreed to obtain LEED Certified status meaning that the buildings will be much closer to zero net energy (which includes both operational energy consumption and the life cycle of building materials) than were buildings constructed in the past, thus they are consistent with the aim of zero net energy. The Draft EIR discusses the existing greenhouse gas/climate change setting including the main gases of concern; current emissions inventory at the global, US, and State levels; a detailed description of what global warming is and the effects that result, all of which could be considered the "threat of greenhouse gas pollution and global warming." The EIR attempts to present a non-sensational, balanced description based on the best information available. Section 4.13.2 describes the entire regulatory setting, including all applicable federal, State and City of Moreno Valley regulations and policies.

Response to Comment 107. The process of LEED certification is a demanding one that includes not only aspects of the building construction but also is greatly affected by tenant operations. As the EIR is only covering aspects under the control of the applicant and not the future tenant, achieving the LEED status can only be discussed in general terms. The feasibility of suggested GHG-related mitigation measures have been discussed in other responses, see the Responses to Comments 60, 108, 112 in this letter (D-3, Johnson & Sedlack) and Responses to Comments 1 and 27 in Letter D-2 (Sierra Club).

Response to Comment 108. Mitigation Measure 4.13.6.1A lists select features from Title 24 of the California Code of Regulations to emphasize these important features are included in the project construction. The measure states that the features are required by Title 24 of the California Code of Regulations. Since the measures are required by Code, they are feasible. Mitigation measures which require compliance with environmental regulations have been found by the California courts to be common and reasonable mitigation measures (*Sundstrom v. County of Mendocino* (11988) 202 Cal. App.3d)

Response to Comment 109. A clerical error was made in the Draft EIR regarding energy conservation and project mitigation. Section 4.3, *Air Quality*, contains two mitigation measures that refer to a 20 percent reduction in project energy use beyond or below Title 24. First, the "20 percent reduction" phrase refers to older California Building Code requirements – these older codes were much less stringent than the current California "Green" Building Code, which includes the latest Title 24 requirements. In addition, one measure just refers to "Title 24" while the other refers to "2008 California Title 24, Part 6 Energy Efficiency Standards". These references are inconsistent, and the

measures have been modified to reflect the most current regulatory requirements for energy conservation. The most current California Green Building Code was adopted in 2010, but incorporates the most current Title 24, Part 6 Energy Efficiency Standards which are from 2008, not 2010. Projects that would have been able to achieve a 20 percent reduction in building energy use from previous California Building Codes would most likely not be able to achieve a 20 percent reduction from the current code because it is much more stringent than previous versions.

It should be noted that the state has already approved new energy standards effective January 1, 2014 that would require industrial buildings to achieve 20 percent or more savings above the 2008 Title 24 standard. Until that time, the project is required to achieve a 10 percent reduction from the 2008 Title 24 standards.

Response to Comment 110. The implementation of any water conservation strategy insures that water use efficiency will be improved compared to the situation of no water conservation strategy. The Mitigation Monitoring Plan states that the various activities outlined in this measure will be implemented to the satisfaction of the Planning Division prior to issuance of an occupancy permit, so construction must include some or all of these measures or no permit can be issued.

Response to Comment 111. The EIR acknowledges that the expected project GHG emissions will exceed the interim, proposed SCAQMD Tier 1, 2 and 3 thresholds, none of which have been adopted as thresholds of significance. Also, as described in Section 4.13.2, page 4.13-6, no applicable agency, including the federal, California, and City of Moreno Valley governments, have adopted a greenhouse gas emissions threshold of significance. It is in this absence of regulatory guidance that this EIR is attempting to assess the significance of project emissions of greenhouse gases. The CEQA Guidelines do include two qualitative thresholds, which the DEIR used as the basis for significance, as discussed in Sections 4.13.5 and 4.13.6. The DEIR concludes that the project would have a less than significant impact for the first CEQA threshold: *Would the proposed project conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?* The DEIR concludes that the project would have a significant impact for the second CEQA threshold: *Would the proposed project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?* and includes Mitigation Measures 4.13.6.1A thru 4.16.6.1C to reduce this impact.

Response to Comment 112. See also Response to Comment D-3, No. 111 above. The EIR complies with OPR guidance related to GHG/Climate change analyses and all other guidance applicable to the region. With implementation of the strategies and programs described in the EIR, it was concluded that the project is consistent with the strategies to reduce California's emissions to the levels proposed in Executive Order S-3-05. Based on the threshold of the project's consistency with these measures, the project has a less than significant impact as it complies with these measures. Because the project's impacts alone would not cause or significantly contribute to global climate change, project-related CO₂e emissions and their contribution to global climate change impacts in the State of California would not make a significant contribution to cumulatively considerable GHG emission impacts.

Response to Comment 113. As discussed in Section 6.3.3 of the Draft EIR, Alternative 3 does reduce several of the significant impacts of the project, and it is feasible because the applicant controls the proposed project site. While Alternative 5 does reduce some significant impacts of the project (including land use since it would not require a GPA or ZC), the applicant does not own or control that or any other potential offsite location for this project. Therefore, Alternative 5 is not feasible compared to Alternative 3. In addition, Alternative 3 is the only one that eliminates significant impacts to agricultural resources, so it was selected as the Environmentally Superior Alternative. For additional discussion, see Response 7 earlier in this section.

Response to Comment 114. As explained in Response to Comment D-3, No. 113 above, Alternative 5 is not feasible compared to Alternative 3 as the applicant does not own or control any offsite properties that would accommodate the proposed project. In addition, almost all of the significant impacts of the project would also be present at an alternative site, based on the proposed land uses and air pollutant emissions. Alternative 3 does reduce some of the significant impacts of the proposed project, and it will be up to the discretion of the City Council whether to approve the proposed project, or adopt one of the project alternatives. If the City Council approves the proposed project, it would have to adopt a Statement of Overriding Considerations that demonstrates the benefits of the project (e.g., employment, revenues) outweigh the significant impacts of the project.

**RE: Comment on Draft Environmental Impact Report for ProLogis
Eucalyptus Industrial Park (State Clearinghouse No. 2008021002)**

Dear Mr. Bradshaw:

I am writing on behalf of Laborers International Union of North America, Local Union No. 1184 and its members living in Riverside County (collectively "LIUNA Local Union No. 1184" or "LIUNA" or "Commenters") regarding the Draft Environmental Impact Report ("DEIR") prepared for the ProLogis Eucalyptus Industrial Park, State Clearinghouse No. 2008021002 ("Project").

We have reviewed the DEIR with the assistance of:

1. Atmospheric Scientist, Dr. James Clark, Ph.D.
2. Hydrogeologist, Matthew Hagemann, C.Hg., MS.

These experts have prepared written comments that are attached hereto, and which are incorporated in their entirety. The City of Moreno Valley ("City") should respond to the expert comments separately. These experts and our own independent review demonstrate that the DEIR is woefully inadequate and that a new supplemental EIR is required to be prepared and recirculated for public comment. In particular, the EIR suffers from the following significant errors and omissions, among others:

- **SEGMENTATION OF PROJECT:** The DEIR improperly segments the Project by failing to include the infrastructure (e.g., roads, water, and sewer) as part of the Project.
- **LOSS OF FARMLAND:** The DEIR acknowledges that the Project's conversion of Prime Farmland is a significant impact, but the DEIR fails to adequately mitigate for the loss of farmland. The conclusion that mitigation measures are infeasible is unsupported.
- **HAZARDOUS MATERIALS:** The baseline of the physical environmental conditions in the vicinity of the Project is erroneous because the DEIR does not provide any details on the types of pesticides used on the Project site, relies on two outdated Phase I Environmental Site Assessments ("ESAs") that do not cover the entire Project site, and fails to disclose the status of an underground storage tank.
- **GREENHOUSE GAS:** The DEIR fails to provide support for the conclusion that greenhouse gas emissions after mitigation will be less than significant.
- **AIR QUALITY:** The DEIR fails to adequately analyze impacts to air quality because: (1) the DEIR underestimates the potential particulate emissions for the construction phase of the Project, (2) fails to accurately compare construction emissions to daily construction significance thresholds, (3) fails to consider health risks from contaminated dust, (4) fails to properly identify and address the Project's operational air quality impacts, (5) fails to disclose impacts to offsite receptors, and (6) fails to adequately analyze cumulative impacts.

Commenters urge the City to revise the EIR to adequately describe, analyze, and mitigate the Project and its impacts.¹ The revised EIR should be recirculated to allow public review and comment.

I. PROJECT DESCRIPTION

The Project site encompasses 122.8 acres of land located within the City of Moreno Valley, south of and adjacent to SR-60, east of Moreno Valley Auto Mall, and adjacent to and west of the Quincy Channel in Riverside County. (DEIR, p. 3-1). Single-family residential uses are located approximately 50 feet southeast of the southeastern corner of the Project site. (DEIR, p. 3-1). The Assessor's Parcel Numbers ("APNs") for this site are 488-330-011, 488-330-012, 488-330-013, 488-330-017, 488-330-018, 488-330-019, 488-330-022, 488-330-023, 488-330-024, and 488-330-025. (DEIR, p. 3-1).

¹ We reserve the right to supplement these comments at later hearings and proceedings for this Project. See, *Galante Vineyards v. Monterey Water Dist.* (1997) 60 Cal. App. 4th 1109.

The Project would include the construction of a warehouse facility comprising six buildings consisting of a total of approximately 2,244,638 square feet. (DEIR, p. 3-2). The Project site is divided into 2 areas: (1) the northern area (north of future Eucalyptus Avenue) would contain approximately 1,030,377 square feet of warehouse uses divided between two buildings and (2) the southern area (south of the future Eucalyptus Avenue) would consist of approximately 1,214,261 square feet of warehouse uses divided among four separate buildings. (DEIR, p. 3-2). The specific uses/users are not known at this time. (DEIR, p. 3-11).

The Project site currently consists of 57 acres used to grow grapefruit, 36 acres used for hay and alfalfa production, as well as portions that are vacant. (DEIR p. 4.2-1). Approximately 82.5 acres of the Project site is designated as Prime Farmland. (DEIR, p. 4.2-6).

The Project would require significant changes to the General Plan and local zoning ordinances including:

- General Plan Amendment. The proposed project includes an amendment to the Land Use Element to change the General Plan designations for a portion of the project site from Residential 15, Residential 5 and Residential 2 to Business Park. (DEIR, p. 1-2). The project also proposes an amendment to the Circulation Element by making changes to the alignment of Encilia Street and the removal of Quincy Street from within the project boundaries. (DEIR, p. 1-2).
- Change of Zone. The proposed project includes a change to the project site zoning from Business Park (BP), Business Park Mixed-use (BPX), Residential Agriculture 2 (RA2), Residential 5 (R5), and Residential 15 (R15) to Light Industrial (LI). (DEIR, p. 1-2).
- Municipal Code Amendment. The project includes a Municipal Code Amendment to establish a minimum clearance of 250 feet between adjacent residential zoning districts and any truck court or primary truck circulation driveway in lieu of the buffer established by the Business Park zone. (DEIR, p. 1-2).

II. Standing

Members of Local Union No. 1184 live, work, and recreate in the immediate vicinity of the Project site. These members will suffer the impacts of a poorly executed or inadequately mitigated Project, just as would the members of any nearby homeowners association, community group, or environmental group. Hundreds of LIUNA Local Union No. 1184 members live and work in areas that will be affected by traffic, air pollution, and water pollution generated by the Project.

In addition, construction workers will suffer many of the most significant impacts from the Project as currently proposed, such as from air pollution emissions from poorly maintained or controlled construction equipment, possible risks related to hazardous materials on the Project site, and other impacts. Therefore, LIUNA Local Union No. 1184 and its members have a direct interest in ensuring that the Project is adequately analyzed and that its environmental and public health impacts are mitigated to the fullest extent feasible.

3

III. LEGAL STANDARDS

A. EIR

CEQA requires that an agency analyze the potential environmental impacts of its proposed actions in an environmental impact report ("EIR") (except in certain limited circumstances). (See, e.g., Pub. Res. Code § 21100). The EIR is the very heart of CEQA. (*Dunn-Edwards v. BAAQMD* (1992) 9 Cal.App.4th 644, 652). "The 'foremost principle' in interpreting CEQA is that the Legislature intended the act to be read so as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language." (*Communities for a Better Environment v. Calif. Resources Agency* (2002) 103 Cal. App. 4th 98, 109).

CEQA has two primary purposes. First, CEQA is designed to inform decision makers and the public about the potential, significant environmental effects of a project. (14 Cal. Code Regs. ("CEQA Guidelines") § 15002(a)(1)). "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'" (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal. 3d 553, 564). The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return." (*Berkeley Keep Jets Over the Bay v. Bd. of Port Comm'rs.* (2001) 91 Cal. App. 4th 1344, 1354 ("*Berkeley Jets*"); *County of Inyo v. Yorty* (1973) 32 Cal.App.3d 795, 810).

4

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring "environmentally superior" alternatives and all feasible mitigation measures. (CEQA Guidelines § 15002(a)(2) and (3); See also, *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564). The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." (Guidelines §15002(a)(2)). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that

any unavoidable significant effects on the environment are "acceptable due to overriding concerns." (Pub.Res.Code § 21081; 14 Cal.Code Regs. § 15092(b)(2)(A) & (B)).

While the courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A 'clearly inadequate or unsupported study is entitled to no judicial deference.'" (*Berkeley Jets*, 91 Cal. App. 4th 1344, 1355 (emphasis added), quoting, *Laurel Heights Improvement Assn. v. Regents of University of California*, 47 Cal. 3d 376, 391 409, fn. 12 (1988)). As the court stated in *Berkeley Jets*, 91 Cal. App. 4th at 1355:

A prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process." (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal. App. 4th 713, 722; *Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997) 60 Cal. App. 4th 1109, 1117; *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal. App. 4th 931, 946).

B. Supplemental EIR

Recirculation of an EIR prior to certification is required "when the new information added to an EIR discloses: (1) a new substantial environmental impact resulting from the project or from a new mitigation measure proposed to be implemented (cf. Guidelines, § 15162, subd. (a)(1), (3)(B)(1)); (2) a substantial increase in the severity of an environmental impact unless mitigation measures are adopted that reduce the impact to a level of insignificance (cf. Guidelines, § 15162, subd. (a)(3)(B)(2)); (3) a feasible project alternative or mitigation measure that clearly would lessen the environmental impacts of the project, but which the project's proponents decline to adopt (cf. Guidelines, § 15162, subd. (a)(3)(B)(3), (4)); or (4) that the draft EIR was so fundamentally and basically inadequate and conclusory in nature that public comment on the draft was in effect meaningless." *Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal. 4th 1112, 1130, citing *Mountain Lion Coalition v. Fish & Game Comm'n* (1989) 214 Cal.App.3d 1043.

Significant new information requiring recirculation can include:

- (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

(14 Cal. Code Regs. § 15088.5(a)).

The DEIR fails to analyze significant environmental impacts pertaining to the Project and to fully consider available mitigation measures to address those impacts. A revised EIR is required to be prepared and recirculated to address these deficiencies.

IV. THE DEIR IMPROPERLY SEGMENTS THE PROJECT

A. Legal Standard

The courts have repeatedly held that "an accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient [CEQA document]." *County of Inyo v. City of Los Angeles*, 71 Cal.App.3d 185, 193 (1977). Thus, CEQA mandates "that environmental considerations do not become submerged by chopping a large project into many little ones -- each with a minimal potential impact on the environment -- which cumulatively may have disastrous consequences." *Bozung v. LAFCO*, 13 Cal.3d 263, 283-84 (1975); *City of Santee v. County of San Diego*, 214 Cal.App.3d 1438, 1452 (1989). Before undertaking a project, the lead agency must assess the environmental impacts of all reasonably foreseeable phases of a project and a public agency may not segment a large project into two or more smaller projects in order to mask serious environmental consequences. As the Court of Appeal stated:

The CEQA process is intended to be a careful examination, fully open to the public, of the environmental consequences of a given project, **covering the entire project, from start to finish**...the purpose of CEQA is not to generate paper, but to compel government at all levels to make decisions with environmental consequences in mind.

Natural Resources Defense Council v. City of Los Angeles, 103 Cal.App.4th 268 (2002) (emphasis added).

In *County of Amador v. City of Plymouth*, 149 Cal. App. 4th 1089, 1095 (2007) an Indian tribe intended to build a large gaming development comprised of a hotel, restaurants, and bars, on land located in or adjacent to the city. The Court held that the

5

6

construction of public works, including a city road to the casino hotel, constituted a project within the scope of CEQA. *Id.* at 1100. The Court cited to the CEQA Guideline § 15378(a)(1) which states that the following is included in the term “project”: “public works construction and related activities, clearing or grading of land [and] improvements to existing public structures...” *Id.* at 1100.

B. The DEIR Improperly Segments the Project By Failing to Include the Infrastructure as Part of the Project

The DEIR states:

If the proposed project is constructed prior to the West Ridge project, ProLogis will install the infrastructure necessary to serve its project (e.g., roads, water, and sewer) and will be reimbursed by the City from the West Ridge developer at the time that project is constructed. If the West Ridge project is constructed first, ProLogis will contribute an appropriate amount to the City for a reimbursement account to help off-site improvement costs installed by the West Ridge project that serve the ProLogis project. The timing of improvements shall be coordinated by the City in cooperation with ProLogis and the West Ridge.

(DEIR, p. 3-11). Instead of including the roads, water, and sewer lines required to serve the ProLogis Project as part of the Project, the DEIR treats these infrastructure improvements as a separate project included in the cumulative projects list provided in Table 3.C: Cumulative Projects. (DEIR, p. 3-16). The City is improperly chopping the ProLogis Project into different segments, which is prohibited by CEQA because proper analysis of the whole project is thwarted. Like the casino road in *County of Amador v. City of Plymouth*, the roads, water, and sewer lines that will serve the ProLogis Project must be included as part of the Project and properly analyzed as part of the whole Project.

V. THE DEIR FAILS TO ANALYZE AND MITIGATE ALL POTENTIALLY SIGNIFICANT IMPACTS

An EIR must disclose all potentially significant adverse environmental impacts of a project. (Pub. Res. Code § 21100(b)(1); 14 Cal.Code Regs. § 15126(a); *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354). CEQA requires that an EIR must not only identify the impacts, but must also provide “information about how adverse the impacts will be.” (*Santiago County Water Dist. v. County of Orange* (1981) 118 Cal.App.3d 818, 831). The lead agency may deem a particular impact to be insignificant only if it produces rigorous analysis and concrete substantial evidence justifying the finding. (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692).

CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring mitigation measures. (CEQA Guidelines § 15002(a)(2) and (3); See also, *Berkeley Jets*, 91 Cal. App. 4th 1344, 1354; *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564). The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced." (Guidelines §15002(a)(2)). If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has "eliminated or substantially lessened all significant effects on the environment where feasible" and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns." (Pub.Res.Code § 21081; 14 Cal.Code Regs. § 15092(b)(2)(A) & (B)).

In general, mitigation measures must be designed to minimize, reduce, or avoid an identified environmental impact or to rectify or compensate for that impact. (CEQA Guidelines § 15370). Where several mitigation measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified. (*Id.* at § 15126.4(a)(1)(B)). A lead agency may not make the required CEQA findings unless the administrative record clearly shows that all uncertainties regarding the mitigation of significant environmental impacts have been resolved.

CEQA requires the lead agency to adopt feasible mitigation measures that will substantially lessen or avoid the Project's potentially significant environmental impacts (Pub. Res. Code §§ 21002, 21081(a)), and describe those mitigation measures in the CEQA document. (Pub. Res. Code § 21100(b)(3); CEQA Guidelines § 15126.4). A public agency may not rely on mitigation measures of uncertain efficacy or feasibility. (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 727 (finding groundwater purchase agreement inadequate mitigation measure because no record evidence existed that replacement water was available)). "Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors. (CEQA Guidelines § 15364). To demonstrate economic infeasibility, "evidence must show that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project." (*Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167, 1181). The EIR must provide evidence and analysis to show project cannot be economically implemented. (*Kings County, supra*, 221 Cal.App.3d at 734-737). This requires not just cost data, but also data showing insufficient income and profitability. (*See Burger v. County of Mendocino* (1975) 45 Cal.App.3d 322, 327 (infeasibility claim unfounded absent data on income and expenditures showing project unprofitable); *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 694 (upholding infeasibility finding based on analysis of costs, projected revenues, and investment requirements)). Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments. (*Id.* at § 15126.4(a)(2)).

7

A lead agency may not conclude that an impact is significant and unavoidable without requiring the implementation of all feasible mitigation measures to reduce the impacts of a project to less than significant levels. (CEQA Guidelines §§ 15126.4, 15091).

↑
7

A. The DEIR Fails to Adequately Mitigate for the Loss of Farmland

1. Preservation Is an Appropriate Mitigation Measure for the Loss of Agricultural Resources

Preservation can be used as a tool to mitigate impacts of urbanizing land and it is encouraged and supported by legislative pronouncements and case law. For example,

[s]ee the following legislative pronouncements to the effect that conversion of agricultural land is of significant concern, and that the preservation of agricultural land is significant goal of the state. Gov. Code, § 51220 (Williamson Act findings that agricultural preservation is valuable and necessary); Civ. Code, § 815 (legislative declaration that preservation of agricultural lands "is among the most important environmental assets of California"); Pub. Resources Code, § 10200 *et seq.* (California Farmland Conservancy Program Act (formerly the Agricultural Land Stewardship Program of 1995), promoting the establishment of agricultural easements as a means to preserve agricultural land); Pub. Resources Code, §§ 21031.1, 21061.2, 21095 (CEQA provisions requiring the Resources Agency to take steps it to ensure that the environmental effects of agricultural land conversion are quantitatively and consistently considered in the environmental review process); Stats. 1993, ch. 812, § 1, subd. (d) (declaring a legislative intent that CEQA should play an important role in the preservation of agricultural lands).

8

In *Mira Mar* [*Mobile Community v. City of Oceanside* (4th Dist. 2004) 119 Cal. App. 4th 477 [14 Cal. Rptr. 3d 176]], the court heard a challenge to the City of Oceanside's approval of a condominium project on 7.5 acres of private property. The project would cause the loss of about .86 acres of coastal sage scrub, which was identified as a significant impact to a sensitive resource. The EIR required the applicant to mitigate for this loss at a ratio of 3 to 1 (or 2.58 acres of mitigation for .86 acres of last habitat). In implementing this mitigation measure, the city required the preservation of .65 acres of undisturbed coastal sage scrub, the restoration and preservation of 2.3 acres of disturbed coastal sage scrub, and the creation of .63 acres of new coastal sage scrub on site. Petitioners argued that this mitigation was inadequate because *preservation* of coastal sage scrub does not mitigate for lost habitat, making the measure "illusory and

↓

inadequate." 119 Cal. App. 4th 477, 495. The Court of Appeal disagreed, citing CEQA Guidelines section 15370, as well as the opinions of various resource agencies, for the proposition that preservation can be a feasible means of reducing or eliminating the impact of lost habitat.

While the *Mira Mar* case deals specifically with biological and habitat resources, the reasoning of this case seems to have more general applicability to mitigation for lost resources, including agricultural resources.

(Guide to CEQA, Michael H. Remy, et. al., eleventh edition, p. 549-550).

2. The DEIR Fails to Adopt Appropriate Mitigation Measures for the Loss of Farmland

Approximately 82.5 acres of the Project site is designated as Prime Farmland. (DEIR, p. 4.2-6). The DEIR states that "[b]ecause Prime Farmland is a finite resource, its conversion to a non-agricultural use is significant." (DEIR, p. 4.2-6). The DEIR identifies several mitigation measures including mitigation measures discussed in the City General Plan EIR:

- Enrolling productive agricultural land, not presently under contract, under a Williamson Act Contract;
- Providing protection to ongoing agricultural operations from complaints and nuisance complaints from adjacent new development;
- Protecting productive agricultural land subject to conversion through the purchase of or transfer of its development rights;
- Purchasing conservation easements on existing agricultural land to ensure that the land is never converted to urban uses; and
- Donating funds to a regional or statewide program that promotes and implements the use of agricultural land conservation easements.

(DEIR, p. 4.2-7 - 4.2-8). However, the DEIR states that

[t]he potential mitigation measures identified by the City's General Plan have been deemed infeasible by the property owner under current economic conditions. In addition, supplementary analysis of the project

8

site and local economic conditions indicates that continued citrus production and/or the raising of row crops would not be economically feasible on the project site (see Appendix L).

(DEIR, p. 4.2-8) (emphasis added).

The conclusion that the mitigation measures are infeasible is completely unsupported. The DEIR states the City General Plan EIR mitigation measure of enrolling productive land under Williamson Act contracts is infeasible because the "contracts are entered into voluntarily by property owners" and these contracts would "result only in temporary contracts at any time after the ten-year contract period ends." (DEIR, p. 4.2-8). Mitigation measures are designed to minimize significant environmental impacts, not necessarily to eliminate them. (Pub. Res. Code § 21100(b)(3); 14 Cal. Code Regs. § 15126.4(a)(1)). The minimum term for a Williamson Act contract is 10 years, however jurisdictions have the option of making them longer. (*Williamson Act Program - Basic Contract Provisions*, State of California Department of Conservation, available at http://www.conservation.ca.gov/dlrp/lca/basic_contract_provisions/Pages/index.aspx#w hat is a williamson act contract). Enrolling land into Williamson Act contracts would minimize the environmental impacts of converting Prime Farmland to warehouses.

In evaluating the feasibility of the mitigation measures: (1) purchasing conservation easements and (2) donating funds to a regional or statewide program, the DEIR states

The purchase or transfer of development rights, purchase of conservation easements, or donation of funds to assist in the conservation of agricultural land would need to be implemented to ensure the preservation of agricultural land. As stated previously, the City anticipates the conversion of agricultural land within the City and does not set aside land for permanent preservation. The City expects that the majority of the land within the City will be converted to urban uses, although some agriculture will continue as interim uses, as allowed by the City's Development Code for all zoning categories.

(DEIR, p. 4.2-8 - 4.2-9). These "reasons" are flawed because the identified mitigation measure was to donate funds to regional or statewide programs that promote and implement the use of agricultural land conservation easements. The "reasons" do not address why donating funds to regional or statewide programs is infeasible.

A supplemental EIR is required to analyze and require implementation of these feasible mitigation measures to reduce the Project's impacts on agricultural land. The fact that the measures are set forth in the City's own General Plan itself makes a prima facie case that the measures are feasible and should be implemented. If the City

8

concludes that the measures are infeasible, then it must provide substantial evidence to demonstrate infeasibility. The EIR must provide evidence and analysis to show project cannot be economically implemented. (*Kings County, supra*, 221 Cal.App.3d at 734-737). This requires not just cost data, but also data showing insufficient income and profitability. (*See Burger v. County of Mendocino* (1975) 45 Cal.App.3d 322, 327 (infeasibility claim unfounded absent data on income and expenditures showing project unprofitable); *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656, 694 (upholding infeasibility finding based on analysis of costs, projected revenues, and investment requirements)). The EIR is devoid of any such evidence and is therefore legally inadequate.

B. The DEIR Fails to Adequately Analyze Hazards and Hazardous Materials and Establishes an Erroneous Baseline

1. CEQA Baseline Standard

Every CEQA document must start from a "baseline" assumption. The CEQA "baseline" is the set of environmental conditions against which to compare a project's anticipated impacts. *Communities for a Better Environment v. So Coast Air Qual. Mgmt. Dist.* (2010) 48 Cal. 4th 310, 321. Section 15125(a) of the CEQA Guidelines (14 C.C.R., § 15125(a)) states in pertinent part that a lead agency's environmental review under CEQA:

...must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time [environmental analysis] is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant.

(*See, Save Our Peninsula Committee v. County of Monterey* (2001) 87 Cal.App.4th 99, 124-125 ("*Save Our Peninsula*"). As the court of appeal has explained, "the impacts of the project must be measured against the 'real conditions on the ground,'" and not against hypothetical permitted levels. (*Save Our Peninsula*, 87 Cal.App.4th 99, 121-123). As the court has explained, using such a skewed baseline "mislead(s) the public" and "draws a red herring across the path of public input." (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 656; *Woodward Park Homeowners v. City of Fresno* (2007) 150 Cal.App.4th 683, 708-711).

2. Residual Pesticides in the Soil May Pose Health Risks to Workers and Nearby Residents

According to the DEIR, 57 acres of the Project site are used to grow grapefruit and 36 acres of the Project site are used for hay and alfalfa production. (DEIR, p. 4.2-1).

The DEIR and supporting documents fail to provide any specific details on the types of pesticides that have been used on the Project site in association with these agricultural operations and therefore the DEIR fails to adequately describe the environmental setting for the Project. According to Mr. Hagemann,

[o]ur review has shown known and potential pesticide use at the Project site as follows:

- Data available online from the California Department of Pesticide Regulation show that 2,4-D, 2-Ethylhexyl Ester was used on the Project site.^{2,3} Occupational exposure to 2,4-D, 2-Ethylhexyl Ester can occur via inhalation or dermal contact and can result in skin irritation, respiratory failure, hyperventilation, and pulmonary enemas.⁴
- Organochlorine pesticides DDE and DDT were detected in soil samples collected at the Project site⁵, indicating past use. Use of organochlorine pesticides in the area is common: review of the Department of Toxic Substances Control's (DTSC) Envirostor database shows that the surrounding lands have been surveyed for organochlorine pesticides, DDE and DDT.⁶ These pesticides can persist in soil for hundreds of years despite being banned in the 1970s.⁷ Exposure to DDT can result in headaches, nausea, and convulsions.⁸ The U.S. EPA identifies DDT and DDE as probable human carcinogens.⁹
- The EPA states that soils at fruit orchards, such as the grapefruit orchard on the Project site, may contain high levels of arsenic from application as a pesticide.¹⁰ Another chemical used on fruit orchards is lead arsenate, a very persistent pesticide.¹¹ Arsenic is a known human carcinogen and even short-term inhalation of arsenic

¹¹ <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1551991/>

dust can cause gastrointestinal effects¹² while lead is known to cause neurotoxicological effects.¹³

Pesticide use at the Project site was not disclosed in the DEIR and the detection of pesticide residuals in soil were not described in the Hazards and Hazardous Materials section.

Failure to disclose the presence of pesticide residuals in Project site soils may pose significant health risks to construction workers. Construction of the Project requires grading and the disturbance of subsurface soils and removal of citrus groves (DEIR, p. 4.7-21). During earthmoving activities, construction workers will be exposed, via inhalation of dust and dermal contact, to Project site soils which may contain harmful levels of pesticide residuals associated with agricultural activities on the site. To protect worker safety, Project site soils must be sampled for pesticides. Sampling results should be compared to health-protective regulatory screening levels such as U.S. EPA Regional Screening Levels¹⁴ and California Human Health Screening Levels.¹⁵

Soil sampling results should also be evaluated for the protection of nearby residents, located 50 feet from the southern boundary and 200 feet from the northern boundary of the Project site (DEIR, p. 4.3-6). Inhalation of pesticides has been linked to asthma in recent research.^{16,17} A report prepared by the California Department of Health identifies pesticides as an asthma trigger.¹⁸ Offsite receptors, including any children living in the neighboring residences, may be exposed to pesticide residuals via dust generated during Project construction.

Construction activities, such as grading and excavation of soils, may generate dust that contains pesticides in concentrations that are harmful to the health of workers and nearby residents and which may act as an asthma trigger. Project site soils should be sampled and results should be compared to human health screening levels. A revised DEIR should be prepared to disclose the results of sampling and include any necessary mitigation to reduce impacts to the health of construction workers and nearby residents.

3. The Phase I Environmental Site Assessments Completed for the Project Site are Outdated and Inadequate

According to Mr. Hagemann,

The DEIR relies on the findings from two Phase I Environmental Site Assessments (ESAs) that were completed in October and November 2003, nearly nine years ago. The Phase I ESAs surveyed 121 acres of the 123-acre Project site. The Applicant purchased the Project site more than five years ago.¹⁹ A Phase I ESA, according to the U.S. EPA, must be conducted within one year of the acquisition of the property and on-site visual inspections must be completed within 180 days prior to acquiring ownership of the property.²⁰

Because the Phase I ESAs are dated and omit two acres of the Project site, they cannot be used to evaluate conditions that are potentially hazardous to construction workers and future site personnel. Therefore, the DEIR's analysis of the Project site based on these Phase I ESAs is inadequate.

Review of Google Earth images shows that the Project site has been used for ongoing agricultural operations since the Phase I ESAs were completed in 2003. Limited pesticide sampling was conducted during the Phase I ESAs (a total of 8 soil samples for a 123-acre Project site) but because the samples were collected nine years ago and because they do not reflect continued agricultural use, the results are reflective of current site conditions.

The Phase I ESAs cover 121 acres of the 123-acre Project site. We have created a map to show the areas of the Project site surveyed by the two 2003 Phase I ESAs and the boundaries for the current Project site (Attachment A). As the map shows, not all areas of the current Project site were included in the 2003 Phase I ESAs' site assessments.

The DEIR fails to establish an adequate environmental setting for the Project site because it relies on Phase I ESAs that are outdated and do not cover the entire Project site. A revised DEIR is required, including a new Phase I ESA, to evaluate the Project site's current environmental conditions.

¹⁹ <http://www.pe.com/local-news/riverside-county/moreno-valley/moreno-valley-headlines-index/20120726-moreno-valley-officials-seek-comments-on-prologis-project.ece>

²⁰ <http://www.epa.gov/brownfields/aai/aaicerclafs.pdf>

4. The DEIR Fails to Disclose the Status of an Underground Storage Tank

According to Mr. Hagemann,

A 13,400 gallon underground storage tank (UST), abandoned in the 1950s, was removed from the Project site in 2004 (Appendix F, p. 3/191). The Phase I ESA recommended an additional investigation to be conducted in the area of the former UST (Appendix F, p. 10/191). Accordingly, a permit for removal of the UST was submitted to the Riverside County's Department of Environmental Health in December 2003 and soil samples around the area of the UST were analyzed in 2004. However, the DEIR and supporting documents did not include any documentation that the UST was properly closed by the Riverside County Department of Environmental Health. If the UST removal was not approved, an Underground Storage Tank Closure Application and Permit²¹, per the Riverside County Department of Environmental Health Guidelines,²² must be submitted.

The DEIR fails to establish an adequate baseline because it does not provide the status of a 13,400 gallon UST. A revised DEIR is required to disclose this important information (i.e., whether closure was granted by the Riverside County Department of Environmental Health).

C. The DEIR Fails to Adequately Analyze Greenhouse Gas Emissions

The DEIR states that the Project's operational greenhouse gas (GHG) emissions, before mitigation, are estimated to be 79,000 metric tons of CO₂e/year (MT CO₂e/yr) which exceed the SCAQMD threshold of 10,000 MT CO₂e/yr and are therefore considered significant. (DEIR, p. 4.13-19). The Project's GHG emissions exceed the SCAQMD threshold by nearly eight times. After mitigation, the DEIR states that GHG emissions will be less than significant. (DEIR, p. 4.13-21). This conclusion is completely unsupported. The DEIR fails calculate what the Project's GHG emissions will be after the mitigation measures are implemented. In fact, the DEIR and supporting documents, including a GHG Study (Appendix B), fail to provide any evidence that the proposed mitigation measures will reduce GHG emissions by a factor of eight.

According to Mr. Hagemann,

²¹ http://www.rivcoeh.org/opencms/system/galleries/download/Environmental-Health/HMM/UST_Closure_App.pdf

²² http://www.rivcoeh.org/opencms/system/galleries/download/Environmental-Health/HMM/Closure_by_removal_UST.pdf

A revised DEIR should be prepared to show the efficiency of the Project's proposed mitigation measures in reducing greenhouse gases. If these measures do not account for an eight-fold reduction in the Project's estimated GHG levels, additional mitigation measures (listed below) that are routinely considered in other CEQA projects should be implemented:

- Require preparation of a traffic control plan;
- Demonstrate proper inspection and maintenance of construction equipment;
- Implement a carpool program for construction workers;
- Employ a construction site manager to verify that engines are properly maintained and keep a maintenance log;
- Configure construction parking to minimize traffic interference;
- Consolidate truck deliveries when possible;
- Provide dedicated turn lanes for movement of construction trucks and equipment on and off site;
- Suspend use of all construction equipment operations during second stage smog alerts;
- Establish a staging zone for trucks that are waiting to load or unload material at the work zone in a location where diesel emissions from the trucks will have minimum impact on abutters and the general public;
- Locate construction equipment away from sensitive receptors such as fresh air intakes to buildings, air conditioners and operable windows;
- Require all diesel trucks used by construction contractor(s) at the site, or for on-road hauling of construction material, to be post-1996 models; Diesel portable generators less than 50 hp shall not be allowed at the construction site;
- Use of hybrid and fuel efficient construction equipment and support vehicles (e.g., pick-up trucks);
- Use of grid electricity for smaller equipment such as saws, pumps, and welders;²³
- Reduction in vehicle miles travelled in construction crew commutes through trip carpooling, trip reduction, providing bus service for crews from work sites to carpool parking areas, and in providing incentives to carpool; and
- Use of a Heavy-Duty Off-Road Vehicle Plan to ensure compliances with construction mitigation measures (e.g., hourly meters on equipment, documenting the serial number, horsepower,

12

²³ <http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf>, p. 47

manufacture age, fuel, etc. of all onsite equipment and daily logging of the operating hours of the equipment).²⁴

A supplemental EIR should be prepared that calculates the Project's GHG emissions after implementation of all feasible mitigation measures. The supplemental EIR should analyze all mitigation measures set forth in the GHG Guidance Document published by the California Attorney General, Addressing Climate Change at the Project Level (see attached exhibit, also available at http://ag.ca.gov/globalwarming/pdf/GW_mitigation_measures.pdf). If GHG impacts remain significant after implementation of all feasible mitigation measures, then the EIR must acknowledge that the impacts are significant and unavoidable, and the City must adopt a statement of overriding considerations.

D. The DEIR Fails to Adequately Analyze Impacts to Air Quality

1. The DEIR Underestimates the Potential Particulate Emissions for the Construction Phase of the Project

Computer modeling (e.g., the California Air Resource Board's ("CARB's") Urban Emission ("URBEMIS") and the California Emissions Estimator Model ("CalEEMod")) is used to estimate emissions of criteria pollutants during construction and operational phases of projects. The South Coast Air Quality Management District ("SCAQMD") permits the use of the outputs from both the URBEMIS and CalEEMOD in air quality analyses. According to Dr. Clark, there are significant differences between these two models that "must be highlighted in the DEIR." In pertinent part, Dr. Clark states:

The changes in the method used to estimate construction impacts from the proposed project by using the CalEEMod model instead of the URBEMIS model include:

- Failure to account for wind-blown fugitive dust²⁵. According to the July, 2011 CalEEMod Technical Paper, wind-blown fugitive dust is not calculated in CalEEMod. For sites as large as the proposed project site, this can result in significant quantities of particulate matter being released.
- SCAQMD's surveys of construction sites were limited to sites of 35 acres or less. For projects larger than 35 acres the data was extrapolated by increasing the number of construction days but not increasing the number of construction equipment pieces used on a

²⁴ *Ibid.*, p. 431

²⁵ CalEEMod. Technical Paper: Methodology Reasoning and Policy Development of the California Emission Estimator Model. July, 2011. Pg 4.

- given day. The impact is to reduce the construction PM estimates for the site as compared to URBEMIS²⁶.
- The acreage to be based upon Walker's Building Estimator's Reference Book. Grading in URBEMIS is based upon 25% of total project acreage in one day. The impact of this change is to decrease PM emissions from grading in the CalEEMod²⁷.

A revised DEIR should be prepared to highlight the differences between the two models so that the potential impacts are adequately analyzed.

2. The DEIR Fails to Accurately Compare Construction Emissions to Daily Construction Significant Thresholds

According to Dr. Clark, the CalEEMod results were not presented properly. The model shows CEQA significance levels were exceeded as well as South Coast Air Quality Management District Localized Significance Thresholds were exceeded. In pertinent part, Dr. Clark states:

Unlike the operational emissions from most projects, which are typically more or less continuous, emissions from construction sites are highly variable depending on the type of construction that is being performed. For example, grading results in large quantities of fugitive dust and combustion emissions from diesel-powered equipment. Short-term emissions during the various construction phases can be considerable and may result in degradation of local and regional air quality and severe health effects.

To determine whether short-term emissions may result in degradation of local and regional air quality and severe health effects, it is common practice for lead agencies to compare project emissions to quantitative significance thresholds developed by local air districts as a screening tool for CEQA review. Thresholds of significance for construction emissions are typically expressed on a short-term basis, *i.e.* daily or hourly basis to adequately capture impacts due to the high variability of emissions during different construction stages.

Table 1 presents a summary of short-term emissions thresholds developed by SCAQMD and other air districts for assessing impacts on air quality from construction projects.

²⁶ CalEEMod. Technical Paper: Methodology Reasoning and Policy Development of the California Emission Estimator Model. July, 2011. Pg 5.

²⁷ CalEEMod. Technical Paper: Methodology Reasoning and Policy Development of the California Emission Estimator Model. July, 2011. Pg 5.

 FRAQMD = Feather River Air Quality Management District,
http://www.fraqmd.org/CEQA_Thresholds.htm;
 SMAQMD Sacramento Metropolitan Air Quality Management District, Guide to Air Quality Assessment, July 2004;
 YSAQMD, Yolo-Solano Air Quality Management District, Air Quality Handbook, Guidelines for Determining Air Quality Thresholds of Significance and Mitigation Measures for Proposed Development Projects that Generate Emissions from Motor Vehicles, revised 2002

A review of the CalEEMod analysis for the project shows that the mitigated construction emissions of ROG and PM_{2.5} exhaust (a surrogate for diesel particulate emissions) are in excess of the CEQA significance thresholds listed above. During Year 2013, ROG and PM_{2.5} exhaust emissions are estimated to be 368.03 lbs/day and 7.95 lbs/day, respectively.

In addition to the Significant Thresholds above, SCAQMD recommends the use of Localized Significance Thresholds (LSTs) to determine potential impacts to receptors near projects. According to the Air Quality Analysis prepared by the proponent, Table I of the Air Quality Analysis shows that the emissions of the pollutants on the peak day of construction are below the SCAQMD LST. In this table the proponent uses the emission estimates from the grading phase of the construction. The proponent inaccurately asserts that the emission levels will be below the LST values.

14

**Table 2:
 Construction LST Impacts from Air Quality Analysis**

Emission Sources	Pollutant Emissions, lbs/day			
	NOx	CO	PM ₁₀	PM _{2.5}
On-Site (grading) Emissions	104	55	8.4	6.3
LST Threshold	270	1,577	13	8
Significant Emissions?	No	No	No	No

A review of the CalEEMod analysis shows that the highest emission values are not associated with the grading phase. In Section 2.0 Emission Summary of the CalEEMod analysis presented in the Air Quality Analysis the construction impacts are listed as:

**Table 3:
 Construction LST Impacts from CalEEMod Output**

Emission Sources	Pollutant Emissions, lbs/day			
	NOx	CO	PM ₁₀	PM _{2.5}
Mitigated Construction Emissions	139.84	166.77	29.2	8.28
LST Threshold	270	1,577	13	8
Significant Emissions?	No	No	Yes	Yes

The Proponent's analysis of air quality impacts clearly fails to accurately describe the impacts of the emissions on the receptors closest to the project site. Based on my expert opinion, applicable significance thresholds, and the CalEEMod analysis performed by the proponent, I conclude that the Project will have significant adverse impacts from construction air emissions of fugitive dust, ROG, and diesel emissions. The lead agency must re-evaluate the construction emissions and incorporate a phased approach to estimate the true impacts of construction activities on air quality, and propose all feasible mitigation measures to reduce these significant emissions, in a RDEIR.

14

3. The DEIR Fails to Consider Health Risks From Contaminated Dust

According to Dr. Clark:

Residual contaminants in soils at the site may be entrained in dust generated during construction activities. The release of residual contamination is a potentially significant impact, given the past use of the site for agricultural production. According to the California Department of Toxic Substances Control August 2002 Interim Guidance for Sampling Agricultural Fields for School Sites (known sensitive receptors), "the most commonly detected pesticides have been DDT and its derivatives DDD and DDE, toxaphene, dieldrin, and aldrin. Of these pesticides, toxaphene has been the major pesticide driving unacceptable levels of risk requiring remediation by soil removal." Given the volume of soils to be graded at each of the sites it is imperative to understand whether particulate matter generated at the sites will pose a potential health risk to sensitive receptors in the vicinity of each site.

According to DTSC, "the guidance is applicable to agricultural land that is currently under cultivation with row, fiber or food crops, orchards, or pasture. It is also applicable to fallow and former agricultural land that is no longer in production and has not been disturbed beyond normal disking and plowing practices. Each field of the same crop is assumed to have been watered, fertilized, and treated with agricultural chemicals to the same degree across the field. Because of this homogeneous application, contaminant levels are expected to be similar at any given location within the field."

There is no indication of a sampling and analysis plan in the DEIR, or the Project documents provided by the lead agency, a serious deficiency in the documents. Prior to issuing a DEIR for the project, the Proponent should be required to complete a sampling and analysis plan to confirm or rule out the possibility of the presence of residual contaminants at the site. Identifying residual pesticides or other contaminants in soils at the site prior to construction activities will provide an opportunity for the Proponent to remove/mitigate the potential exposure of sensitive receptors within the vicinity of the sites. In the absence of any sampling or analysis, and given the past use of the Project site, I conclude that there is at least a fair argument that the Project may have significant impacts related to residual contaminants at the site.

15

4. The DEIR Fails to Properly Identify and Address the Project's Operational Air Quality Impacts

The DEIR states, without any evidentiary support, that the project's emissions of criteria pollutants will not result in a considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard. According to Dr. Clark,

During the operational phase of the project the project will have the potential to generate significant quantities of criteria pollutants (NO_x, SO_x, Ozone precursors, PM). According to Table 3-1 of the most recent BAAQMD CEQA guidance, a construction of a 259,000 square foot light industrial or warehouse operation will typically violate NO_x construction thresholds and GHG operational thresholds. The proposed Project's 2,000,000 square feet plus of warehouse and manufacturing buildings are nearly 8 times the size of the screening threshold, ensuring a violation of local air quality thresholds. I therefore conclude that the Project will have significant NO_x and GHG emissions during Project operations.

The air quality impacts from the traffic associated with a 2,000,000 square foot facility are significant. Typically the impacts are quantified by the number of vehicle trips per day. In the case of the proposed project, the primary concern will be the number of truck trips per day. A truck trip is one round trip (one trip segment to a site and one trip segment away from a site).

According to one source, Bluffstone and Ouderkirk²⁸, a 500,000 square feet facility on 50 acres, will on average have 350 truck trips per day (or 700 trip segments) associated with its development. This figure is proportionate to estimates for an AMB Property Corporation center in Redlands (1,000 truck trips for a 1.3 million square feet structure); Wal-Mart distribution centers in Pueblo, Colorado (700 truck trips per day for an 880,000 square feet facility), Connecticut, and Delaware (both 1,000 truck trips per day for 1.2 million square feet structures); and a grocery distribution center in New York (Boas, 2002; Gasiewski, 2004; Hernandez, 2005; Pueblo Chieftain, 2004; Sholl, 2004).

Estimates from other sources indicate approximately 1 truck per 1,000 square feet of the building, which means that the proposed project would require 1,000 trucks per day (or 1,000 trip segments per day) for the warehouse segment of the Project. The number of truck trips could be

²⁸Bluffstone and Ouderkirk. 2007. Warehouses, trucks, and [PM.sub.2.5]: human health and logistics industry growth in the eastern Inland Empire. Contemporary Economic Policy 25(1):

16

higher at a new, more efficient facility where more inventory is moved per day. Without proper modeling of the emissions from these additional vehicles the impacts on the environment and the citizens of Moreno Valley is unknown. It is clear that the size of the Project will have significant NOx and GHG emissions during Project operations.

A proper cumulative impact analysis is vital for an environmental analysis because the full environmental impact of a proposed project cannot be gauged in a vacuum. One of the most important environmental lessons that has been learned is that the environmental damage often occurs incrementally from a variety of small sources with which they interact. The increase in PM in the region, even for short periods of time, will only exacerbate the already serious air quality issues in the region.

5. The DEIR Fails to Disclose Impacts to Offsite Receptors

The Project is located in the South Coast Air Basin and Riverside County,²⁹ both of which are designated non-attainment for PM10 and ozone. (DEIR, p. 4.3-6). According to Mr. Hagemann,

[s]ignificant emissions of PM10 and ozone and contributing factors such as NOx and ROG will lead to a worsening of regional air quality. The Project's estimates of construction emissions need to be properly disclosed and mitigated to ensure that the Project has a less than significant impact on regional air quality.

Estimates and impacts of project's construction and operational emissions
Project construction and operation will result in significant emissions of ROG, NOx, and PM10 even after mitigation (DEIR, pp. 4.3-29, 4.3-34).

Construction emissions

The DEIR estimates that the Project's construction emissions of NOx and ROG will be significant as they exceed the SCAQMD thresholds of 100 lbs/day and 75 lbs/day, respectively (DEIR, p. 4.3-23) and identifies mitigation measures to reduce the Project's emissions (DEIR, pp. 4.3-23 – 4.3-29). Even with mitigation, the Project's emissions of NOx and ROG will still exceed SCAQMD thresholds and therefore are considered significant (DEIR, p. 4.3-29).

Operational emissions

The DEIR estimates that the Project's emissions of ROG, NOx, and PM10 from operational activities will be significant as they exceed the SCAQMD

²⁹ <http://www.epa.gov/oagqs001/greenbk/ancl.html>

thresholds of 55 lbs/day, 55 lbs/day, and 150 lbs/day, respectively (DEIR, p. 4.3-33). The DEIR proposes mitigation measures to reduce the Project's emissions (DEIR, pp. 4.3-33 – 4.3-34) but, even with mitigation, the Project's emissions will still exceed SCAQMD thresholds and therefore are considered significant (DEIR, p. 4.3-34).

Gaseous particles such as NOx can react in the atmosphere to form PM10.^{30,31} Because Riverside County and the South Coast Air Basin are both designated non-attainment for PM10, significant emissions of NOx can lead to a further degradation of regional air quality. NOx emissions can also react to produce ground-level ozone.³² Exposure to NOx emissions and its products (ozone and PM10) can lead to the airway inflammation and can cause or exacerbate conditions such as emphysema and bronchitis.³³

ROG can react to form ozone and contributes to smog formation.^{34,35} Exposure to ozone can result in coughing, throat irritation, and chest pain, burning, and discomfort.³⁶ Smog exposure can lead to sneezing, nausea, coughing, headaches, and chest constriction.³⁷ A study published in the New England Journal of Medicine concluded that the risk of dying from respiratory diseases is three times higher in areas of concentrated ozone.³⁸

Exposure to PM10 can cause bronchitis, increase the number and severity of asthma attacks, damage to lung tissue, and even premature death.³⁹ Research identifies that dust from construction is a major contributor to PM10 and that PM10 exposure is associated with asthma.⁴⁰ Inhalation of PM10 can exacerbate asthma especially in children who are susceptible to higher risks from PM10 exposure.⁴¹

17

The Project will have significant emissions of ROG, NO_x, and PM₁₀. Because Riverside County and the South Coast Air Basin are designated non-attainment areas for ozone and PM₁₀, Project construction and operation will further degrade regional air quality. Exposure to ROG, NO_x, and PM₁₀ has adverse health effects and can impact offsite receptors, especially children in the nearby residences – a significant and undisclosed public health impact that the DEIR does not consider.

A revised DEIR should be prepared to disclose impacts to offsite receptors from Project construction and operation. Additional mitigation measures must be implemented to ensure that Project emissions of ROG, NO_x, and PM₁₀ are reduced to the maximum extent feasible.

6. The DEIR Fails to Adequately Analyze Cumulative Impacts

1. Legal Standard

An EIR must discuss significant cumulative impacts. CEQA Guidelines section 15130(a). This requirement flows from CEQA section 21083, which requires a finding that a project may have a significant effect on the environment if “the possible effects of a project are individually limited but cumulatively considerable... ‘Cumulatively considerable’ means that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.” “Cumulative impacts” are defined as “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.” CEQA Guidelines section 15355(a). “[I]ndividual effects may be changes resulting from a single project or a number of separate projects.” (CEQA Guidelines section 15355(a)).

“The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.” (*Communities for a Better Environment v. Cal. Resources Agency* (“*CBE v. CRA*”), (2002) 103 Cal.App.4th 98, 117). A legally adequate cumulative impacts analysis views a particular project over time and in conjunction with other related past, present, and reasonably foreseeable probable future projects whose impacts might compound or interrelate with those of the project at hand. “Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.” (CEQA Guidelines § 15355(b)).

As the court stated in *CBE v. CRA*, 103 Cal. App. 4th at 114:

↑
17

↑
18
↓

Cumulative impact analysis is necessary because the full environmental impact of a proposed project cannot be gauged in a vacuum. One of the most important environmental lessons that has been learned is that environmental damage often occurs incrementally from a variety of small sources. These sources appear insignificant when considered individually, but assume threatening dimensions when considered collectively with other sources with which they interact.

(Citations omitted).

In *Kings County Farm Bureau v. City of Hanford*, 221 Cal.App.3d at 718, the court concluded that an EIR inadequately considered an air pollution (ozone) cumulative impact. The court said: "The EIR concludes the project's contributions to ozone levels in the area would be immeasurable and, therefore, insignificant because the [cogeneration] plant would emit relatively minor amounts of [ozone] precursors compared to the total volume of [ozone] precursors emitted in Kings County. The EIR's analysis uses the magnitude of the current ozone problem in the air basin in order to trivialize the project's impact." The court concluded: "[t]he relevant question to be addressed in the EIR is not the relative amount of precursors emitted by the project when compared with preexisting emissions, but whether any additional amount of precursor emissions should be considered significant in light of the serious nature of the ozone problems in this air basin."⁴² The *Kings County* case was reaffirmed in *CBE v. CRA*, 103 Cal.App.4th at 116, where the court rejected cases with a narrower construction of "cumulative impacts."

Similarly, in *Friends of Eel River v. Sonoma County Water Agency*, (2003) 108 Cal. App. 4th 859, the court held that the EIR for a project that would divert water from the Eel River had to consider the cumulative impacts of the project together with other past, present and reasonably foreseeable future projects that also divert water from the same river system. The court held that the EIR even had to disclose and analyze projects that were merely proposed, but not yet approved. The court stated, CEQA requires "the Agency to consider 'past, present, and probable future projects producing related or cumulative impacts . . .'" (Guidelines, § 15130, subd. (b)(1)(A)). The Agency must interpret this requirement in such a way as to 'afford the fullest possible protection of the environment.'" (*Id.*, at 867, 869). The court held that the failure of the EIR to

⁴² *Los Angeles Unified v. City of Los Angeles*, 58 Cal.App.4th at 1024-1026 found an EIR inadequate for concluding that a project's additional increase in noise level of another 2.8 to 3.3 dBA was insignificant given that the existing noise level of 72 dBA already exceeded the regulatory recommended maximum of 70 dBA. The court concluded that this "ratio theory" trivialized the project's noise impact by focusing on individual inputs rather than their collective significance. The relevant issue was not the relative amount of traffic noise resulting from the project when compared to existing traffic noise, but whether any additional amount of traffic noise should be considered significant given the nature of the existing traffic noise problem.

18

analyze the impacts of the project together with other proposed projects rendered the document invalid. "The absence of this analysis makes the EIR an inadequate informational document." (*Id.*, at 872).

The Court in *Citizens to Preserve the Ojai v. Bd. of Supervisors*, 176 Cal.App.3d 421 (1985), held that an EIR prepared to consider the expansion and modification of an oil refinery was inadequate because it failed to consider the cumulative air quality impacts of other oil refining and extraction activities combined with the project. The court held that the EIR's use of an Air District Air Emissions Inventory did not constitute an adequate cumulative impacts analysis. The court ordered the agency to prepare a new EIR analyzing the combined impacts of the proposed refinery expansion together with the other oil extraction projects.

2. The DEIR Fails to Adequately Analyze Cumulative Construction Impacts

As part of its cumulative impact analysis, the DEIR identifies 13 proposed projects encompassing approximately 7.3 million square feet of space within five miles of the Project site (DEIR, p. 3-16). However, the DEIR does not identify the construction schedule of these projects except to state that "a number of individual projects may be under construction simultaneously with the proposed project." (DEIR, p. 4.3-37). The WestRidge Commerce Center Project (which will be built adjacent to the proposed Project) is scheduled to be constructed in 2012, a schedule similar to the proposed Project. According to Mr. Hagemann,

[s]imultaneous construction of these projects, along with other potential projects, is likely to result in PM10, NOx, and ROG emissions that will have a cumulatively significant impact. The construction timetables of all projects within the vicinity of the Project site should be identified. Any cumulatively significant emissions should be disclosed and impacts to workers and nearby residents should be addressed in a revised DEIR.

VI. CONCLUSION

For the foregoing reasons, LIUNA Local Union No. 1184 urge the City to continue the matter for future consideration pending completion of a supplemental EIR addressing the Project's significant impacts and mitigation measures. Thank you for your attention to these comments. Please include this letter and all attachments hereto in the record of proceedings for this project.

Attorneys for LIUNA Local Union No. 1184

RESPONSES TO LETTER D-4A

Response to Comment 1: The following responses will address the specific comments made by the commenter regarding these topics.

Response to Comment 2: The project information summarized by the commenter is correct.

Response to Comment 3: The City understands comments made by the LIUNA Local Union No. 1184 regarding standing to make these comments. While it is not the City's responsibility to determine standing, the following responses will address all the comments raised in this letter consistent with CEQA.

Response to Comment 4: The information provided in the letter regarding several EIR and CEQA topics is factually correct, but it may or may not apply to this particular EIR for this specific project. Nonetheless, the following responses address specific comments made by the commenter on the Draft EIR for the ProLogis project.

Response to Comment 5: The information provided in the letter regarding recirculation of an EIR under is factually correct, but it may or may not apply to this particular EIR for this specific project. Nonetheless, the following responses address specific comments made by the commenter on the Draft EIR for the ProLogis project. The City contends that this information does not rise to the level of that requiring circulation, but several mitigation measures have been added to make certain there will be no significant impacts relative to the issues raised by the commenter.

Response to Comment 6: The commenter is correct that the project description of the EIR must describe the "whole of the action" as outlined in CEQA. However, the City believes the EIR does provide that information and does not segment the utility or infrastructure improvements outlined by the commenter. The discussion related to the Westridge project was only relative to the timing and funding of the various improvements for which both projects would either construct or provide a fair share contribution towards their construction, since both were being processed at approximately the same time. Section 3.5.4 of the ProLogis EIR clearly identifies the various utility improvements for which the project will be responsible, and Section 3.5.5 outlines the road and intersection improvements for which the ProLogis project is responsible. The following discussion in Section 3.5.1, Operations and Infrastructure Timing, was included to show the relationship of the two projects in terms of the timing of the various improvements.

3.5.1 Operations and Infrastructure Timing

The EIR evaluated "worst case" conditions of the project operating 24/7. If the proposed project is constructed prior to the West Ridge project, ProLogis will install the infrastructure necessary to serve its project (e.g., roads, water, and sewer) and will be reimbursed by the City from the West Ridge developer at the time that project is constructed. If the West Ridge project is constructed first, ProLogis will contribute an appropriate amount to the City for a reimbursement account to help off-site improvement costs installed by the West Ridge project that serve the ProLogis project. The timing of improvements shall be coordinated by the City in cooperation with ProLogis and the West Ridge developer.

Therefore, the project EIR does not segment these improvements from inclusion in the project description. The impacts of these improvements are also addressed in the appropriate sections of the environmental analysis (e.g., 4.3, *Air Quality*, 4.11, *Transportation and Traffic*, and 4.12, *Utilities*).

Response to Comment 7: The information provided in the letter regarding implementation of all feasible mitigation measures is factually correct, but it may or may not apply to this particular EIR for this specific project. Nonetheless, the following responses address specific comments made by the commenter on specific sections of the Draft EIR and mitigation for impacts on those sections.

Response to Comment 8: The commenter presents information that indicates preservation of habitat is appropriate mitigation for loss of habitat based on the results of the *Mira Mar* case in Oceanside. The commenter then concludes that concept can be applied to loss of prime agricultural land. The comparison may not be directly applicable, but an Appeals Court decision (*Building Industry Association of Central California v. County of Stanislaus*) certified in November 29, 2010 may be more applicable to this situation. That case concluded that it is appropriate to mitigate at a 1:1 ratio for the loss of prime agricultural land through the acquisition of an offsite agricultural easement if such a program is established by a county or regional governmental entity. However, as outlined in the DEIR section, there is no established County or regional program, and active agriculture in western Riverside County is no longer economically viable or feasible.

The commenter also quotes the “farmland mitigation measures” in the General Plan EIR (GPEIR) out of context. The commenter implies that these measures are recommended in the GPEIR, but actually the EIR section, after only describing the potential measures, concludes that they are all infeasible, does not adopt any mitigation measures for loss of farmland, and concludes impacts related to loss of farmland are significant and unavoidable. There are also numerous references in the GP that state the City’s support of interim farmland and agricultural use throughout the City in all land use designations as long as they are economically viable as outlined in Objective 4.1 shown below and included with other materials in Final EIR Appendix E:

Objective 4.1 “Retain agricultural open space as long as agricultural activities can be economically conducted, and are desired by agricultural interests, and provide for an orderly transition of agricultural lands to other urban and rural uses.”

It should also be noted that a statement of overriding considerations was adopted for the GPEIR to address this and other significant impacts of implementing the City GP. Therefore, no mitigation is required for the ProLogis project relative to loss of farmland, as outlined in the DEIR.

Response to Comment 9: The information provided in the letter regarding several EIR and CEQA topics is factually correct, but it may or may not apply to this particular EIR for this specific project. The City believes the EIR did use the proper baseline for hazardous materials. The commenter states that the Phase 1 ESA reports for the site were “out of date”, however, CEQA does not mandate when the data from certain types of studies, such as Phase 1 reports, are considered out of date. The only concept of “out of date” refers to the typical limitation for financial institutions upon which to base their decisions using Phase 1 ESA reports. For that purpose, Phase 1 reports are typically only considered “good” for 90 days. However, if it can be established that the conditions outlined in the Phase 1 have not changed since that report was prepared, a lead agency may rely on that information for the purposes of CEQA documentation. That is the case with the ProLogis EIR, in that the project applicant acquired the project site in 2008 and hired a local grower to manage the citrus trees until December of 2013 when the trees were removed to reduce irrigation and maintenance costs. Until the time the trees were removed, the developer indicates no agricultural chemicals were applied to the property, and the commenter’s own records show that various materials were applied back in 2010.

The commenter also questioned the number of samples taken on the site. The comment references the Department of Toxic Substance Control Interim Guidance for Sampling Agricultural Properties (Third Revision), dated August 7, 2008 as the standard that should have been used for pesticide sampling conducted during the several Phase I Environmental Site Assessment (ESA) reports for

various parcels that comprise the site. The referenced (California) Department of Toxic Substance Control (DTSC) document is:

“specific to agricultural properties where pesticides and/or fertilizers were presumably applied uniformly, for agricultural purposes consistent with normal application practices. It is applicable to agricultural properties that are currently under cultivation with row, fiber or food crops, orchards, or pasture. It is also applicable to fallow and former agricultural properties that are no longer in production and have not been disturbed beyond normal disking and plowing practices. Each field of the same crop is assumed to have been watered, fertilized and treated with agricultural chemicals to the same degree across the field. Because of this homogeneous application, contaminant levels are expected to be similar at any given location within the field. This is the underlying premise of the guidance...”

Properties not requiring agricultural sampling under the referenced guidance include property used exclusively as grazing lands or pasture. The guidance also states that dry-land farming, which is the practice of growing a crop without irrigation, are not treated with pesticides or infrequently treated, since the lack of water does not provide a desirable habitat for most agricultural pests. Properties that clearly qualify as dry-land farming do not need further investigation for pesticides or metals. *“For properties where there is uncertainty regarding dry-land farming, limited sampling may be conducted at a rate of four discrete samples per site, with one sample collected in each quadrant.”* It should be noted that five samples were taken on the ProLogis site, one each in the four quadrants and one near the northern portion of the site near the former UST location.

The DTSCs 2003 Interim Guidance for Sampling Agricultural Properties, which they referenced as to why additional samples for organo-chloro-phosphate (OCPs) were necessary, was taken out of context. The 2008 Interim Guidance for Sampling Agricultural Properties speaks to how an environmental assessor for the DTSC should conduct an evaluation of an agricultural property to be converted into another use. The guidance is envisioned as being most relevant to sites on which schools will be constructed or for residential use. However, it does apply to any project with DTSC oversight. Properties not subject to this guidance include former agricultural property that has been graded for construction or other purposes, land used exclusively for grazing or pasture, most dry-land farming fields, and sites that were agricultural properties prior to 1950. The subject site would be an exempted site as it was dry farmed land.

Based on standard spraying practices for such crops, the number of soil samples taken at the subject site during the Phase I ESA demonstrate that pesticide use was infrequent and limited over the site, and are at levels that are below regulatory requirements for residential property. These are the baseline conditions with respect to pesticide use at the site.

In terms of sample frequency, the sampling pattern should be sufficient to characterize the site. The guidance, done for school and residential properties, apparently interprets this as a range for properties from one acre to fifty acres (with the number of each of the following categories increasing every few acres), of between 4 and 60 borings, 4 and 15 composite organo-chloro-phosphate (OCP) samples. For acreages greater than 50, consultation with the DTSC is required. However, mitigation of frequency is available to sites based on documentation of consistent ownership, operator, and use. It should be noted that none of our samples were composites but all were discrete samples, so they are more representative of what is actually on the properties. The DTSC's document is a guidance document for school sites and residential properties not those that are to be commercial/industrial. The intent is to avoid having children (schools, residential) from coming in contact with soils with high levels of OCPs. Therefore, evidence supports the EIR's contention that there are no significant OCPs present on the site, and only trace amounts were detected in the onsite sampling in 2003.

The state records provided by the commenter indicate that approximately 200 pounds of 2,4-D, 2-Ethylhexyl Ester (DEHE) was applied to the site as a general herbicide (based on data in the

commenter's letter and appendix) in 2010. DEHE is a very common herbicide used in the United States and can be purchased at retailers like Home Depot. Assuming it was applied to the 70 acres of the site without citrus trees (i.e., available for dry farming), this equals less than 3 pounds per acre, or 0.00002 ounce per square foot, in other words a very small amount. In addition, this chemical has a relatively short half-life. Data from the National Library of Medicine, provided by the commenter, indicates that DEHE has a half-life of 1 to 51 days when applied as a spray, and 4-16 days when applied in granular form. In only 6 months there would be less than 0.5 percent of the original product in the soil, so this is not a significant soil contamination issue. It is expected this chemical would have become inert or diluted well past the point of concern or any established governmental action level in the 3 years or more from its most recent application in 2010.

NOTE: There is NO evidence that DDT, DDE, or arsenic were ever applied to the project site, they were not typical pesticides that were sprayed for dry farming and/or citrus production in this area.

The existing conditions at the time the NOP was issued (February 21, 2012), which is when the timeframe of baseline conditions is established, were there was no dry framing or citrus production being conducted on the site, although the trees were being maintained at a minimal level so they would not die and become a fire hazard.

Although both Phase 1 ESA reports were done in 2003, the onsite conditions have not changed appreciably since the Phase 1 reports were done. The commenter also stated the "entire" site had not been surveyed. While this may be technically correct, the commenter failed to note that 98.5 percent or 121 acres of the 122.8-acre site was surveyed, and the 1.8 acres not surveyed were on the far west boundary of the site and planted with citrus, so it is reasonable to conclude the conditions found on the rest of the site apply to this portion as well. It should also be noted that the underground storage tank that would on the site at one time was removed or remediated according to the "Report of Removal of the Abandoned Underground Storage Tank" dated January 28, 2004 in the DEIR Appendix F.

Section 2.3, *Interviews*, in the Phase 1 reports indicate the following:

On November 12, 2003, our environmental assessor interviewed Mr. Pat Kawamoto, owner of APN 477-120-015. Mr. Kawamoto reportedly has owned the land for over 25 years. According to Mr. Kawamoto, no petroleum storage tanks have ever been present on the project site. Mr. Kawamoto indicated that the project site had been regularly leased to Mr. David Bruno of Bruno Ranching for agricultural purposes. Mr. Kawamoto had no knowledge of any pesticides or PCBs stored or used on the site.

In addition, the following information from the EIR (Section 4.6, *Hazards and Hazardous Materials*, bears directly on this discussion:

...because the project site has been historically utilized for agricultural production and because of the close proximity to SR-60, soil samples were taken in various parts of the project site to further evaluate the potential contamination on the site. Soil samples were also collected from the area of a wind-machine remaining in the western portion of the site, the area adjacent to SR-60 in the northern portion of the site, and from selected areas of the citrus groves on the site. These soil samples are identified in Figure 4.6.1. [NOTE: 5 sampling locations spread out around the site]

Two soil samples were collected at the base of the wind-machine. One 200 to 300-gallon petroleum tank is located in the western portion of the site within the column of the wind machine structure. In interviews with Raymond Noriega, manager of the site, he indicated that the wind machine had not been used in the past 10 years that he had been employed there. Soil samples were taken at depths of 1.5 feet and 3 feet below the ground surface to assess the potential of

hydrocarbon compounds occurring in the soil. Laboratory results indicated no detectable concentrations of hydrocarbon compounds in the samples collected.

Two soil samples were collected at areas adjacent to SR-60 at depths of one to four inches below ground surface to assess the potential of lead contamination. Laboratory results indicated total lead concentrations of 0.601 to 4.41 milligrams per kilogram (mg/Kg), which were determined to be insignificant.¹ In addition, on September 3, 2003, five near-surface (upper 6 inches) soil samples were collected from selected areas (upper portion) of possible drainage accumulation and pesticide usage on the site. The detected concentrations of organochlorine pesticides and PCBs were within the allowable Preliminary Remedial Goals (PRGs) for the project. No additional assessment for organochlorine pesticides or PCBs is recommended for the site.² [NOTE: *emphasis added*]

On November 7, 2003, three near-surface (upper six inches) soil samples were collected from selected areas (lower portion) of possible drainage accumulation and pesticide usage on the site. The detected concentrations of organochlorine pesticides and PCBs were within the allowable PRGs for the project. No additional assessment for organochlorine pesticides or PCBs is recommended for the site.³ [NOTE: *emphasis added*]

At the request of the current owner of the site (northern portion), the area of the former abandoned 13,400-gallon UST was excavated during the site reconnaissance on September 20, 2003. No significant hydrocarbon odors or staining were observed. Between January 5 and 8, 2004, the UST was removed from the site. The UST had been abandoned in-place approximately 50 years ago. The abandonment reportedly consisted of removal of free-liquids; removal of the UST top; then backfilling the interior of the UST with on-site soils. Due to the installation of a 12-inch diameter, Eastern Municipal Water District (EMWD) waterline main in the north portion of the UST, the north portion of the UST was not removed. No indication of soil contamination was observed during the UST removal work. Additionally, soil sampling was conducted on January 7, 2004, at depths between 2 feet and 6 feet below the former bottom elevation of the UST, under the direction of a representative from the County of Riverside DEH Hazardous Materials Management Division. Laboratory results of the collected soil samples indicated a concentration of total petroleum hydrocarbons as oil (116 mg/Kg) in the soil sample collected at 2 feet below the bottom elevation of the UST. No other hydrocarbons, BTEX,⁴ or fuel oxygenates were detected; therefore, no additional environmental investigation is recommended for the former UST location.⁵ [NOTE: *emphasis added*]

Therefore, the project site was previously surveyed for pesticides and no significant impacts were found. It has also been documented that the former UST on the site was properly remediated, so it also would not pose a threat to any workers on the site during grading. This previous documentation supports the conclusion that there are no significant health risks on the project site for construction workers related to the proposed project. However, to determine the most current hazmat conditions of the site, the following measure will be added to the DEIR in response to this and other comments:

¹ Phase 1 Preliminary Environmental Site Assessment 84± Acres, Assessor Parcel Numbers (APNs) 477-120-001 and 477-120-006, Near Intersection of Pettit Street and Highway 60, Moreno Valley, California, R M Environmental, October 30, 2003, page 8.

² Phase 1 Preliminary Environmental Site Assessment 84± Acres, Assessor Parcel Numbers (APNs) 477-120-001 and 477-120-006, Near Intersection of Pettit Street and Highway 60, Moreno Valley, California, R M Environmental, October 30, 2003, page 9.

4.6.6.1A Prior to issuance of a grading permit for the project, a qualified contractor shall test onsite soils for contamination by agricultural chemicals. If present in concentrations above established actionable levels or thresholds, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. This measure shall be implemented to the satisfaction of the Building Division including written documentation of the disposal of any agricultural chemical residue in conformance with all applicable regulations.

The text of the EIR will be revised to reflect this additional information. Implementation of this measure will assure that any potential impacts related to pesticide residues on the project site, to either area residents or construction workers on the site, will be reduced to less than significant levels. The addition of this measure will address the commenter's comments in this regard.

Response to Comment 10: Most of this comment was addressed in the early portion of Response 9 above. The commenter's citation that the U.S. EPA requires Phase 1 ESA reports to be prepared within 180 days of property acquisition are related to federal remediation of sites and do not apply directly to the requirements of CEQA to provide accurate information on the project site. As previously stated, CEQA does NOT require a Phase 1 ESA report, but they are typically used to provide the baseline information for EIRs. Although the Phase 1 reports for this project are ten years old, there has been no evidence presented that would indicate baseline conditions are otherwise than presented in the EIR. The site has been dry farmed and supported citrus trees for many years, which were removed in December 2013 to reduce irrigation and maintenance costs and reduce fire hazards. The previous Response 9 addressed the coverage of the Phase 1 reports (121 out of 122.8 acres or 98.5 percent of the site surveyed) much more than an adequate statistical sampling of the site. Response 9 also outlines an additional mitigation measure that addresses these concerns.

Response to Comment 11: As outlined in the previous Response 9 in this letter, the DEIR did evaluate the removal or remediation of the former Underground Storage Tank (UST) which was fully documented in Appendix F of the EIR. There is no empirical evidence that there is any hazmat or health risk from a UST on the site since it has been effectively remediated.

Response to Comment 12: This comment states that the EIR did not show the GHG emissions with mitigation. The reductions with mitigation were not calculated because the GHG-related mitigation measures included in the EIR do not have quantified reduction amounts. The EIR supports the statement of less-than-significance qualitatively by stating: "...project-related GHG emissions and their contribution to global climate change impacts in the State are less than significant and less than cumulatively considerable because: (1) the project's impacts alone would not cause or significantly contribute to global climate change, and (2) the project has no substantial effect on consumption of fuels or other energy resources, especially fossil fuels that contribute to GHG emissions when consumed."

Response to Comment 13: This commenter asks for information about the URBEMIS modeling results. The URBEMIS model was not used in the EIR, except for a few parameters in the health risk assessment. None of the construction or operational emissions modeling were conducted using URBEMIS, only CalEEMod, which is currently the accepted computer emission modeling program recommended by the SCAQMD. Thus, there is no need for highlighting the differences in the models.

In addition, the commenter quotes information from the CalEEMod Technical Paper, but leaves out the following sentence: "This limitation could result in underestimated fugitive dust emissions if high wind and loose soil are substantial characteristics for a given land use/construction scenario." As this project will be constructed following the requirements for dust control specified in SCAQMD Rule 403, including watering the disturbed areas three times per day, there will be no "loose soil".

Response to Comment 14: First, the commenter states the DEIR fails to accurately compare construction emissions to daily construction significance thresholds. The comment correctly states that ROG emissions would be in exceedance of the CEQA thresholds, as is also stated in the EIR. However, the comment incorrectly states that PM_{2.5} emissions would be in exceedance of the CEQA thresholds. The comment correctly identifies the EIR emissions rate of PM_{2.5} as 7.95 lbs/day, and then correctly states that the threshold is 55 lbs/day. It is not clear why the commenter believes that 7.95 lbs/day of PM_{2.5} would be in exceedance of 55 lbs/day.

Further in Section D.2, on page 21: A review of the CalEEMod analysis shows that the highest emission values are not associated with the grading phase. By design and SCAQMD direction, LST analyses only include onsite emissions. The following table from the Air Quality technical report Appendix shows all the onsite emissions for all the construction phases. Note that the onsite emissions (i.e., not fugitive) for the grading phase are the greatest.

Construction Phase	Onsite Pollutant Emissions, lbs/day							
	ROG	NO _x	CO	SO ₂	Fugitive PM ₁₀	Exhaust PM ₁₀	Fugitive PM _{2.5}	Exhaust PM _{2.5}
Site Preparation	10.43	84.72	47.82	0.07	7.05	4.27	3.87	4.27
Grading	12.5	103.9	55.13	0.1	3.38	5.01	1.29	5.01
Building Construction	5.63	37.37	23.73	0.04	0	2.54	0	2.54
Architectural Coating	342.39	2.96	1.94	0	0	0.27	0	0.27
Paving	7.91	33.81	20.89	0.03	0	2.93	0	2.93

Response to Comment 15: As outlined in Responses 9 through 11 above, there is no empirical evidence that onsite soils are contaminated by pesticides or other agricultural chemicals. However, Response 9 outlines an additional mitigation measure that will assure there are no health risks from pesticides or contaminated soil on the site.

Response to Comment 16: It is not clear why the BAAQMD CEQA Guidance is pertinent to this project, as the Bay Area has substantially different climate and pollution conditions than the South Coast area. As a result of these differences, the BAAQMD has different NO_x construction and GHG operational standards than the SCAQMD does. The EIR adequately compares all construction and operational emissions to the appropriate SCAQMD thresholds.

Response to Comment 17: The commenter states the DEIR fails to disclose impacts to offsite receptors. The EIR includes a localized impacts analysis for both construction and operational emissions as well as a full health risk assessment of operational emissions. These analyses completely disclose project-related impacts to offsite receptors.

Response to Comment 18: The information provided in the letter regarding the legal standard for cumulative impacts is factually correct, but it may or may not apply to this particular EIR for this specific project. In fact, the information is not specific to the ProLogis project but is rather a restatement of court case citations and evaluations, so there is no specific response to this comment relative to the EIR.

Response to Comment 19: The EIR includes a complete cumulative air quality impacts analysis that satisfies all CEQA requirements and that includes the conclusion that the long-term cumulative air quality impacts would be significant and avoidable. A similar analysis is performed regarding water supplies and water-related impacts, and that analysis concludes the project will not make a significant contribution to any cumulatively considerable impacts outlined in the DEIR.

Response to Comment 20: The commenter will receive a copy of the revised FEIR document prior to action on the project, similar to that afforded public agencies for projects in the City of Moreno Valley (i.e., 10 days before the next Planning Commission hearing).

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

Lozeau | Drury LLP
410 12th Street, Suite 250
Oakland, CA 94607

Attn: Mr. Michael Lozeau

Subject: Comment Letter on the Draft Environmental Impact Report for the Prologis Eucalyptus Industrial Park, SCH No. 2008021002.

Dear Mr. Lozeau:

At the request of Lozeau | Drury LLP (Lozeau Drury), Clark and Associates (Clark) has reviewed materials related to the above referenced project, including the Draft Environmental Impact Report¹ (DEIR) for the Prologis Eucalyptus Industrial Park (hereafter called the Project), SCH No. 2008021002 and its appendices. The proposed project site is located in the eastern portion of the City of Moreno Valley, in Riverside County, California. The 122.8-acre project site is located south of State Route 60 (SR-60) east of the Moreno Valley Auto Mall, and adjacent to and west of the Quincy Channel. According to the DEIR the proposed project would result in the construction and operation of a warehouse facility, consisting of approximately 2,244,638 square feet (sq ft).

Currently the site is used undeveloped for commercial uses and has two citrus groves in the northeastern and northwestern portions of the site, while the central and southern portions are vacant and support mainly weedy vegetation. According to a March, 2012 Memo from LSA

¹ LSA. 2012. Draft Environmental Impact Report, State Clearinghouse No. 2008021002, Prologis Eucalyptus Industrial Park (formerly Prologis Park Moreno Valley Eucalyptus Project), City of Moreno Valley, Riverside County, California. LSA Associates, Inc. 1500 Iowa Ave, Suite 200, Riverside, CA LAS Project No. PLO1101. Prepared July 2012 pg. 1-2

Associates², the project site contains 57-acres of citrus (Grapefruit) trees with the rest of the site vacant. The surrounding area has been dry-farmed in the past, and the eastern end of the City has historically supported a variety of crops, including citrus, melon, potatoes, etc³. There are three small natural drainage features on site, two ephemeral channels in the southwestern portion of the site and the larger Quincy Channel along the eastern edge of the property. According to the DEIR⁴, there is some minor amount of refuse is present in the southwest and southeast corners of the site from unauthorized dumping.

Land adjacent to the project site includes vacant land east and south of the proposed project site, SR- 60 to the north, and the Moreno Valley Auto Mall and the City of Moreno Valley Fire Station No. 58 northwest of the project site. Existing single-family residential uses are located approximately 50 feet southeast of the southeastern corner of the project site⁵.

The proposed project has had and will have significant impacts on the community prior to the approval of the DEIR. The proposed project will require significant changes in the local zoning ordinances (General Plan for the City of Moreno Valley) including:

² LSA. 2012. Project Memorandum: Agricultural Use of ProLogis Industrial Property. Memorandum from Kent Norton, LSA Riverside Office to Jeff Bradshaw, City of Moreno Valley. Dated March 21, 2012.

³ LSA. 2012. Project Memorandum: Agricultural Use of ProLogis Industrial Property. Memorandum from Kent Norton, LSA Riverside Office to Jeff Bradshaw, City of Moreno Valley. Dated March 21, 2012.

⁴ LSA. 2012. Draft Environmental Impact Report, State Clearinghouse No. 2008021002, Prologis Eucalyptus Industrial Park (formerly Prologis Park Moreno Valley Eucalyptus Project), City of Moreno Valley, Riverside County, California. LSA Associates, Inc. 1500 Iowa Ave, Suite 200, Riverside, CA LAS Project No. PLO1101. Prepared July 2012 pg 3-1

⁵ LSA. 2012. Draft Environmental Impact Report, State Clearinghouse No. 2008021002, Prologis Eucalyptus Industrial Park (formerly Prologis Park Moreno Valley Eucalyptus Project), City of Moreno Valley, Riverside County, California. LSA Associates, Inc. 1500 Iowa Ave, Suite 200, Riverside, CA LAS Project No. PLO1101. Prepared July 2012 pg 3-1

- Approval of a General Plan Amendment to change the land use designation of 71.3 acres of the project site from Residential (R15, R5, and R2) to Business Park (BP) so the entire site would then be designated Business Park (BP).
- Approval of a Zone Change of the entire 122.8 acres from its current zoning designations of Business Park (BP), Business Park/Mixed Use (BPX), Residential 15 District (R15), Residential 5 District (R5), and Residential Agriculture 2 (RA-2) to all Light Industrial (LI).
- Zone Change will also be used to redraw the boundary of the Primary Animal Keeping Overlay (PAKO) district.
- Approval of an amendment to the City's Master Plan of Trails to relocate the Eucalyptus Avenue Trail to the north side of future Eucalyptus Avenue and eliminate the planned trail segment on Quincy Avenue from SR-60 to Fir Avenue (future Eucalyptus Avenue), based on discussion with the City Trails Commission.
- Approval of an amendment to the Circulation Element of the General Plan. These changes include the following:
 - Eliminate the undeveloped Quincy Street from Eucalyptus Avenue south to Encilia Avenue;
 - Realign Encilia Avenue from its current alignment such that its westerly terminus is located at Moreno Beach Drive instead of the current General Plan westerly terminus at Eucalyptus Avenue; and
 - The segment between Quincy Channel and Moreno Beach Drive would be classified as a Collector.

In addition, to the changes above, the proposal of the project has forced the Moreno Valley Unified School District (MVUSD) to abandon plans to locate an elementary school (MVUSD Elementary School #24), a middle school (MVUSD Middle School #7), and a high school (MVUSD

High School #5) in the vicinity of Redlands Boulevard and future Eucalyptus Avenue, in close proximity to the proposed. After the Notice of Preparation (NOP) for the proposed project was released, MVUSD decided to abandon plans for these school sites and relocate the future school facilities in a different area of the City⁶. Students who live in the area to be serviced by the proposed schools will now have to travel farther to attend schools.

The DEIR for the Project, determined that the proposed project's construction and operational phases would have impacts on air quality that would be less than significant with mitigation incorporated. These conclusions are premature and based upon a flawed analysis of the potential emissions at the site. The proponents should re-evaluate the impacts of the project and present them in a revised draft environmental impact report (RDEIR).

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

This DEIR was issued prematurely without considering the serious flaws in the Proponent's analysis of the project. The flaws include:

1. The proponent's use of the CalEEMod ensures an underestimation of the potential particulate emission for the construction phase of the proposed project.
2. Failure of the proponent to compare construction emissions to daily construction significance thresholds;
3. Failure to consider health risks from contaminated dust; and
4. Failure to properly identify and address the Project's operational air quality impacts.

⁶ LSA. 2012. Draft Environmental Impact Report, State Clearinghouse No. 2008021002, Prologis Eucalyptus Industrial Park (formerly Prologis Park Moreno Valley Eucalyptus Project), City of Moreno Valley, Riverside County, California. LSA Associates, Inc. 1500 Iowa Ave, Suite 200, Riverside, CA LAS Project No. PLO1101. Prepared July 2012 pg 4.3-6.

COMMENTS

1. The Proponent's Use Of The CalEEMod Ensures An Underestimation Of The Potential Particulate Emission For The Construction Phase Of The Proposed Project.

The California Air Resource Board's (CARB's) Urban Emission (URBEMIS) model and the California Emissions Estimator Model (CalEEMod) are computer models designed to estimate emissions of criteria pollutants during construction and operational phases of projects. Currently, South Coast Air Quality Management District (SCAQMD) accepts the outputs from both models in their air quality analyses. Significant differences in the models must be highlighted in the DEIR. The changes in the method used to estimate construction impacts from the proposed project by using the CalEEMod model instead of the URBEMIS model include:

- Failure to account for wind-blown fugitive dust⁷. According to the July, 2011 CalEEMod Technical Paper, wind-blown fugitive dust is not calculated in CalEEMod. For sites as large as the proposed project site, this can result in significant quantities of particulate matter being released.
- SCAQMD's surveys of construction sites were limited to sites of 35 acres or less. For projects larger than 35-acres the data was extrapolated by increasing the number of construction days but not increasing the number of construction equipment pieces used on a given day. The impact is to reduce the construction PM estimates for the site as compared to URBEMIS⁸.

⁷ CalEEMod. Technical Paper: Methodology Reasoning and Policy Development of the California Emission Estimator Model. July, 2011. Pg 4.

⁸ CalEEMod. Technical Paper: Methodology Reasoning and Policy Development of the California Emission Estimator Model. July, 2011. Pg 5.

- Grading in URBEMIS is based upon 25% of total project acreage in one day. Grading in CalEEMod is based upon Walker's Building Estimator's Reference Book. The impact of this change is to decrease PM emissions from grading in the CalEEMod⁹ by tying the emissions to the number of pieces of equipment present at the site.

3

The proponent's must include an analysis of these impacts in a revised DEIR (RDEIR) to ensure that an accurate analysis of the potential impacts from the proposed project are presented as required by CEQA.

2. Failure To Accurately Compare Construction Emissions To Daily Construction Significance Thresholds.

Unlike the operational emissions from most projects, which are typically more or less continuous, emissions from construction sites are highly variable depending on the type of construction that is being performed. For example, grading results in large quantities of fugitive dust and combustion emissions from diesel-powered equipment. Short-term emissions during the various construction phases can be considerable and may result in degradation of local and regional air quality and severe health effects.

4

To determine whether short-term emissions may result in degradation of local and regional air quality and severe health effects, it is common practice for lead agencies to compare project emissions to quantitative significance thresholds developed by local air districts as a screening tool for CEQA review. Thresholds of significance for construction emissions are typically expressed on a short-term basis, *i.e.* daily or hourly basis to adequately capture impacts due to the high variability of emissions during different construction stages.

⁹ CalEEMod. Technical Paper: Methodology Reasoning and Policy Development of the California Emission Estimator Model. July, 2011. Pg 5.

Table 1 presents a summary of short-term emissions thresholds developed by SCAQMD and other air districts for assessing impacts on air quality from construction projects.

Table 1:
CEQA significance thresholds for construction emissions from various air districts

Air district construction thresholds*	NO _x (lbs/day)	ROG (lbs/day)	PM ₁₀ (lbs/day)	DPM (lbs/day)	PM _{2.5} (lbs/day)	CO (lbs/day)
SCAQMD	100	75	150		55	550
BAAQMD	54	54	82		54	
EDCAPCD	82	82				
SLOCAPCD				7		
MBUAPCD			82			550
FRAQMD	25	25	80			
SMAQMD	85					
YSAQMD	82	82	150

 BAAQMD = Bay Area Air Quality Management District, CEQA Guidelines 2009;
 EDCAPCD = El Dorado County Air Pollution Control District, CEQA Guide, February 2002;
 SLOCAPCD = San Luis Obispo County Air Pollution Control District, CEQA Air Quality Handbook, December 2009.
 MBUAPCD = Monterey Bay Unified Air Pollution Control District, CEQA Air Quality Guidelines, June 2004,
 FRAQMD = Feather River Air Quality Management District,
http://www.fraqmd.org/CEQA_Thresholds.htm;
 SMAQMD Sacramento Metropolitan Air Quality Management District, Guide to Air Quality Assessment, July 2004;
 YSAQMD, Yolo-Solano Air Quality Management District, Air Quality Handbook, Guidelines for Determining Air Quality Thresholds of Significance and Mitigation Measures for Proposed Development Projects that Generate Emissions from Motor Vehicles, revised 2002

According to the DEIR¹⁰, “criteria pollutant emissions during project construction would exceed the SCAQMD emission thresholds for oxides of nitrogen (NO_x) and reactive organic gases (ROG). Compliance with SCAQMD Rules and Regulations during construction will minimize construction-related air quality impacts from fugitive dust emissions and construction equipment emissions. Mitigation is required. The proposed

¹⁰ LSA. 2012. Draft Environmental Impact Report, State Clearinghouse No. 2008021002, Prologis Eucalyptus Industrial Park (formerly Prologis Park Moreno Valley Eucalyptus Project), City of Moreno Valley, Riverside County, California. LSA Associates, Inc. 1500 Iowa Ave, Suite 200, Riverside, CA LAS Project No. PLO1101. Prepared July 2012 pg 1.

project would not exceed any of the localized significance thresholds (LSTs) during construction periods.” This statement is incorrect and misleading.

A review of the CalEEMod analysis for the project shows that the mitigated construction emissions of ROG and particulate matter less than 2.5 microns (PM_{2.5}) exhaust (a surrogate for diesel particulate emissions) are in excess of the CEQA significance thresholds listed above. During Year 2013, ROG and PM_{2.5} exhaust emissions are estimated to be 368.03 lbs/day and 7.95 lbs/day, respectively.

In addition to the Significant Thresholds above, SCAQMD recommends the use of LSTs to determine potential impacts to receptors near projects. According to the Air Quality Analysis prepared by the proponent, Table I of the Air Quality Analysis (Table 2 below) shows that the emissions of the pollutants on the peak day of construction are below the SCAQMD LST. In this table the proponent uses the emission estimates from the grading phase of the construction. The proponent inaccurately asserts that the emission levels will be below the LST values.

4

Table 2:

Construction LST Impacts from Air Quality Analysis

Emission Sources	Pollutant Emissions, lbs/day			
	NOx	CO	PM ₁₀	PM _{2.5}
On-Site (grading) Emissions	104	55	8.4	6.3
LST Threshold	270	1,577	13	8
Significant Emissions?	No	No	No	No

A review of the CalEEMod analysis shows that the highest emission values are not associated with the grading phase. In Section 2.0 Emission Summary of the CalEEMod analysis presented in the Air Quality Analysis the construction impacts are listed as:

**Table 3:
Construction LST Impacts from CalEEMod Output**

Emission Sources	Pollutant Emissions, lbs/day			
	NO _x	CO	PM ₁₀	PM _{2.5}
Mitigated Construction Emissions	139.84	166.77	29.2	8.28
LST Threshold	270	1,577	13	8
Significant Emissions?	No	No	Yes	Yes

The Proponent's analysis of air quality impacts clearly fails to accurately describe the impacts of the emissions on the receptors closest to the project site (homes within 50 feet of the site boundary and the fire station immediately adjacent to the site boundary). Emissions of PM_{2.5} (surrogate for diesel exhaust) and PM₁₀ from the construction site may have lasting impacts on the receptors nearby.

Diesel exhaust contains nearly 40 toxic substances including toxic air contaminants (TACs) and may pose a serious public health risk for residents in the vicinity of the facility. TACs are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances. The current California list of TACs¹¹ includes approximately 200 compounds, including particulate emissions from diesel-fueled engines.

DPM and TAC emissions may affect numerous sensitive receptors in the region including onsite construction workers, fire personnel at the station adjacent to the site and the single-family residences located near the site. Evidence exists that clouds of soot emitted by heavy-duty

¹¹ URS. 2012. Impacts to Air Quality from the Construction and Operation of the Brannon Solar, LLC Solar Energy Generation Project. Dated Febraury 7, 2012. Table A-7

construction equipment can travel downwind for miles, then drift into heavily populated areas. For example, health impact studies from the SCAQMD¹² have documented that diesel emissions travel miles from the sources impacting residents.

Diesel exhaust has been linked to a range of serious health problems including an increase in respiratory disease, lung damage, cancer, and premature death^{13,14,15}. Fine diesel particles are deposited deep in the lungs in the smallest airways and can result in increased respiratory symptoms and disease; decreased lung function, particularly in children and individuals with asthma; alterations in lung tissue and respiratory tract defense mechanisms; and premature death.¹⁶ Exposure to diesel exhaust increases the risk of lung cancer. It also causes non-cancer effects including chronic bronchitis, inflammation of lung tissue, thickening of the alveolar walls, immunological allergic reactions, and airway constriction.¹⁷

4

¹⁶ California Air Resources Board, Initial Statement of Reasons for Rulemaking, Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, Staff Report, June 1998.

¹⁷ Findings of the Scientific Review Panel on The Report on Diesel Exhaust as adopted at the Panel's April 22, 1998 Meeting.

A recent analysis found that air pollution from diesel construction equipment is already taking a heavy toll on the health and economic well-being of Californians^{18,19}.

PM₁₀ emissions from the construction phase of the proposed project may be extremely troublesome for receptors near the site (i.e., homes near the site boundary and the fire station next to the site) since they will act as carriers for residual pesticides/herbicides from the site (see comment below). The project site currently contains 57-acres of citrus (Grapefruit) trees and the surrounding area has been dry-farmed in the past, and the eastern end of the City of Moreno Valley historically supported a variety of other crops²⁰. Given the proximity of receptors to the site and the estimated emission rates of particulate matter from the site after mitigation, it is clear that construction activities at the project site will adversely impact the previously identified receptors.

Based on my expert opinion, applicable significance thresholds, and the CalEEMod analysis performed by the proponent, I conclude that the Project will have significant adverse impacts from construction air emissions of fugitive dust, ROG, and diesel emissions. The lead agency must re-evaluate the construction emissions and incorporate a phased approach to estimate the true impacts of construction activities on air quality, and propose all feasible mitigation measures to reduce these significant emissions, in a RDEIR.

¹⁸ These estimates are conservative because they do not include emissions from a large number of small construction projects (residential and commercial and projects smaller than 1 acre in size). Further, John Hakel, vice president of the Associated General Contractors, which represents construction equipment fleet owners and general contractors, indicated that the report appeared to underestimate the sheer volume of construction equipment.

²⁰ LSA. 2012. Project Memorandum: Agricultural Use of ProLogis Industrial Property. Memorandum from Kent Norton, LSA Riverside Office to Jeff Bradshaw, City of Moreno Valley. Dated March 21, 2012.

3. Failure To Consider Health Risks From Contaminated Dust.

Residual contaminants in soils at the site may be entrained in dust generated during construction activities. The release of residual contamination is a potentially significant impact, given the past use of the site for agricultural production. According to the California Department of Toxic Substances Control August 2002 Interim Guidance for Sampling Agricultural Fields for School Sites (known sensitive receptors), “the most commonly detected pesticides have been DDT and its derivatives DDD and DDE, toxaphene, dieldrin, and aldrin. Of these pesticides, toxaphene has been the major pesticide driving unacceptable levels of risk requiring remediation by soil removal.” Given the volume of soils to be graded at each of the sites it is imperative to understand whether particulate matter generated at the sites will pose a potential health risk to sensitive receptors in the vicinity of each site.

According to DTSC, “the guidance is applicable to agricultural land that is currently under cultivation with row, fiber or food crops, orchards, or pasture. It is also applicable to fallow and former agricultural land that is no longer in production and has not been disturbed beyond normal disking and plowing practices. Each field of the same crop is assumed to have been watered, fertilized, and treated with agricultural chemicals to the same degree across the field. Because of this homogeneous application, contaminant levels are expected to be similar at any given location within the field.”

There is no indication of a sampling and analysis plan in the DEIR, or the Project documents provided by the lead agency, which is a serious deficiency. Prior to issuing a DEIR for the project, the Proponent should be required to complete a sampling and analysis plan to confirm or rule out the possibility of the presence of residual contaminants at the site. Identifying residual pesticides or other contaminants in soils at the site

prior to construction activities will provide an opportunity for the Proponent to remove/mitigate the potential exposure of sensitive receptors within the vicinity of the sites. In the absence of any sampling or analysis, and given the past use of the Project site, I conclude that there is at least a fair argument that the Project may have significant impacts related to residual contaminants at the site.

5

4. Failure To Properly Identify and Address the Project's Operational Air Quality Impacts.

The DEIR asserts with no analysis whatsoever that the project's emissions of criteria pollutants will not result in a considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard.

During the operational phase of the project the project will have the potential to generate significant quantities of criteria pollutants (NO_x, SO_x, Ozone precursors, PM). According to Table 3-1 of the most recent BAAQMD CEQA guidance, a construction of a 259,000 square foot light industrial or warehouse operation will typically violate NO_x construction thresholds and GHG operational thresholds. The proposed Project's 2,000,000 square feet plus of warehouse and manufacturing buildings are nearly 8 times the size of the screening threshold, ensuring a violation of local air quality thresholds. I therefore conclude that the Project will have significant NO_x and GHG emissions during Project operations.

6

The air quality impacts from the traffic associated with a 2,000,000 square foot facility are significant. Typically the impacts are quantified by the number of vehicle trips per day. In the case of the proposed project, the primary concern will be the number of truck trips per day. A truck trip is one round trip (one trip segment to a site and one trip segment away from a site).

According to one source, Bluffstone and Ouderkirk²¹, a 500,000 square feet facility on 50 acres, will on average have 350 truck trips per day (or 700 trip segments) associated with its development. This figure is proportionate to estimates for an AMB Property Corporation center in Redlands (1,000 truck trips for a 1.3 million square feet structure); Wal-Mart distribution centers in Pueblo, Colorado (700 truck trips per day for an 880,000 square feet facility), Connecticut, and Delaware (both 1,000 truck trips per day for 1.2 million square feet structures); and a grocery distribution center in New York (Boas, 2002; Gasiewski, 2004; Hernandez, 2005; Pueblo Chieftain, 2004; Sholl, 2004).

Estimates from other sources indicate approximately 1 truck per 1,000 square feet of the building, which means that the proposed project would require 1,000 trucks per day (or 1,000 trip segments per day) for the warehouse segment of the Project. The number of truck trips could be higher at a new, more efficient facility where more inventory is moved per day. Without proper modeling of the emissions from these additional vehicles the impacts on the environment and the citizens of Moreno Valley is unknown. It is clear that the size of the Project will have significant NOx and GHG emissions during Project operations.

A proper operational impact analysis is vital for an environmental analysis because the full environmental impact of a proposed project cannot be gauged in a vacuum. One of the most important environmental lessons that has been learned is that the environmental damage often occurs incrementally from a variety of small sources with which they interact. The increase in PM in the region, even for short periods of time, will only exacerbate the already serious air quality issues in the region.

²¹Bluffstone and Ouderkirk. 2007. Warehouses, trucks, and [PM.sub.2.5]: human health and logistics industry growth in the eastern Inland Empire. Contemporary Economic Policy 25(1):

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project will result in significant adverse impacts that were not identified in the DEIR and that are not adequately mitigated. Many of the DEIR's conclusions that environmental impacts are not significant or less than significant with mitigation are unsupported or contradicted by the evidence. As a result, several analyses presented in the DEIR, including impacts on air quality fail to identify or disclose the magnitude of significant adverse impacts. To protect air quality and public health the Proponent must prepare a RDEIR for the Project.

7

Sincerely,

James Clark, Ph.D.

**RESPONSES TO LETTER D-4B
LOZEAU DRURY, MEMORANDUM FROM JAMES CLARK, PH.D.**

Response to Comment 1: Most of this comment repeats information from the EIR regarding characteristics of the project and requested approvals. The following responses address each of the specific comments made by the commenter on several topics, as outlined below.

Response to Comment 2: The air quality assessment for the project used the CalEEMod program because the SCAQMD requires projects doing CEQA-level analyses to use that particular program. See the Responses to Comments D-4A-13 and D-4A-14 in the previous Letter D-4A from Lozeau Drury.

Response to Comment 3: For a detailed response regarding the use of CalEEMod vs. URBEMIS, see the Responses to Comments D-4A-13 and D-4A-14 in the previous Letter D-4A from Lozeau Drury.

Response to Comment 4: For a detailed response on comparing construction emissions to daily construction thresholds, see the Responses to Comments D-4A-13 and D-4A-14 in the previous Letter D-4A from Lozeau Drury.

Response to Comment 5: This comment is similar to that addressed in Response D-4A-9 in the letter from Mr. Drury. There is no empirical evidence that onsite soils are contaminated by pesticides or other agricultural chemicals. However, Response D-4A-9 outlines an additional mitigation measure that will assure there are no health risks from pesticides or contaminated soil on the site.

Response to Comment 6: For a detailed response on operational impacts of the project, see the Response to Comment D-4A-16 in the previous Letter D-4A from Lozeau Drury.

Response to Comment 7: Contrary to the commenter's conclusion, there does not appear to be sufficient empirical evidence presented that would lead a reasonable person to conclude the EIR is flawed or lacking in its analysis of these potential impacts. A mitigation was added in response to comments by this commenter and the related comments by Mr. Drury (Letter D-4A), but there is no justification for recirculation based on this information, and there are no new or substantially different significant impacts of the project.

Brooke O'Hanley
Lozeau | Drury LLP
410 12th Street, Suite 250
Oakland, CA 94607

Subject: Comments on the Prologis Eucalyptus Industrial Park Project, Riverside County, California

Dear Ms. O'Hanley:

We have reviewed the July 2012 Draft Environmental Impact Report (DEIR) for Prologis Eucalyptus Industrial Park Project ("Project"). The Project would construct six buildings encompassing approximately 2.3 million square feet (or 53 acres) of warehouse space. The Project site would be located on a 123-acre lot in the eastern portion of the City of Moreno Valley in Riverside County, California.

1

We have reviewed the DEIR for issues associated with hazards and hazardous materials, greenhouse gases, air quality, and cumulative impacts. Project construction will result in potentially significant impacts to construction workers and nearby residents that are not adequately disclosed in the DEIR. A revised DEIR needs to be prepared to fully disclose, evaluate, and mitigate these impacts.

Hazards and Hazardous Materials:

Construction workers and nearby residents may be at risk during construction from failure to disclose baseline soil conditions at the Project site.

2

Residual pesticides in soil may pose health risks to workers and nearby residents

Currently, 57 acres of the Project site are used to grow grapefruit and 36 acres of the Project site are used for hay and alfalfa production (DEIR, p. 4.2-1). The DEIR and supporting documents do not provide any specific details on the types of pesticides that have been used on the Project site in association with

these agricultural operations. Our review has shown known and potential pesticide use at the Project site as follows:

- Data available online from the California Department of Pesticide Regulation show that 2,4-D, 2-Ethylhexyl Ester was used on the Project site.^{1,2} Occupational exposure to 2,4-D, 2-Ethylhexyl Ester can occur via inhalation or dermal contact and can result in skin irritation, respiratory failure, hyperventilation, and pulmonary enemas.³
- Organochlorine pesticides DDE and DDT were detected in soil samples collected at the Project site⁴, indicating past use. Use of organochlorine pesticides in the area is common: review of the Department of Toxic Substances Control's (DTSC) Envirostor database shows that the surrounding lands have been surveyed for organochlorine pesticides, DDE and DDT.⁵ These pesticides can persist in soil for hundreds of years despite being banned in the 1970s.⁶ Exposure to DDT can result in headaches, nausea, and convulsions.⁷ The U.S. EPA identifies DDT and DDE as probable human carcinogens.⁸
- The EPA states that soils at fruit orchards, such as the grapefruit orchard on the Project site, may contain high levels of arsenic from application as a pesticide.⁹ Another chemical used on fruit orchards is lead arsenate, a very persistent pesticide.¹⁰ Arsenic is a known human carcinogen and even short-term inhalation of arsenic dust can cause gastrointestinal effects¹¹ while lead is known to cause neurotoxicological effects.¹²

Pesticide use at the Project site was not disclosed in the DEIR and the detection of pesticide residuals in soil were not described in the Hazards and Hazardous Materials section.

Failure to disclose the presence of pesticide residuals in Project site soils may pose significant health risks to construction workers. Construction of the Project requires grading and the disturbance of subsurface soils and removal of citrus groves (DEIR, p. 4.7-21). During earthmoving activities, construction workers will be exposed, via inhalation of dust and dermal contact, to Project site soils which may contain harmful levels of pesticide residuals associated with agricultural activities on the site. To protect worker safety, Project site soils must be sampled for pesticides. Sampling results should be

¹² <http://www.epa.gov/lead/pubs/learn-about-lead.html#effects>

compared to health-protective regulatory screening levels such as U.S. EPA Regional Screening Levels¹³ and California Human Health Screening Levels.¹⁴

Soil sampling results should also be evaluated for the protection of nearby residents, located 50 feet from the southern boundary and 200 feet from the northern boundary of the Project site (DEIR, p. 4.3-6). Inhalation of pesticides has been linked to asthma in recent research.^{15,16} A report prepared by the California Department of Health identifies pesticides as an asthma trigger.¹⁷ Offsite receptors, including any children living in the neighboring residences, may be exposed to pesticide residuals via dust generated during Project construction.

Construction activities, such as grading and excavation of soils, may generate dust that contains pesticides in concentrations that are harmful to the health of workers and nearby residents and which may act as an asthma trigger. Project site soils should be sampled and results should be compared to human health screening levels. A revised DEIR should be prepared to disclose the results of sampling and include any necessary mitigation to reduce impacts to the health of construction workers and nearby residents.

Phase I ESAs completed for the Project site are outdated and inadequate

The DEIR relies on the findings from two Phase I Environmental Site Assessments (ESAs) that were completed in October and November 2003, nearly nine years ago. The Phase I ESAs surveyed 121 acres of the 123-acre Project site. The Applicant purchased the Project site more than five years ago.¹⁸ A Phase I ESA, according to the U.S. EPA, must be conducted within one year of the acquisition of the property and on-site visual inspections must be completed within 180 days prior to acquiring ownership of the property.¹⁹

Because the Phase I ESAs are dated and omit two acres of the Project site, they cannot be used to evaluate conditions that are potentially hazardous to construction workers and future site personnel. Therefore, the DEIR's analysis of the Project site based on these Phase I ESAs is inadequate.

Review of Google Earth images shows that the Project site has been used for ongoing agricultural operations since the Phase I ESAs were completed in 2003. Limited pesticide sampling was conducted during the Phase I ESAs (a total of 8 soil samples for a 123-acre Project site) but because the samples were collected nine years ago and because they do not reflect continued agricultural use, the results are reflective of current site conditions.

¹⁸ <http://www.pe.com/local-news/riverside-county/moreno-valley/moreno-valley-headlines-index/20120726-moreno-valley-officials-look-for-prologis-project.ece>

¹⁹ <http://www.epa.gov/brownfields/aai/aicerclafs.pdf>

The Phase I ESAs cover 121 acres of the 123-acre Project site. We have created a map to show the areas of the Project site surveyed by the two 2003 Phase I ESAs and the boundaries for the current Project site (Attachment A). As the map shows, not all areas of the current Project site were included in the 2003 Phase I ESAs' site assessments.

The Phase I ESAs are outdated and do not cover the entire Project site; therefore, they cannot be used to define baseline conditions for the DEIR's Hazards and Hazardous Materials section. A revised DEIR should be prepared to include a new Phase I ESA that evaluates current Project site conditions.

Status of an underground storage tank is uncertain

A 13,400 gallon underground storage tank (UST), abandoned in the 1950s, was removed from the Project site in 2004 (Appendix F, p. 3/191). The Phase I ESA recommended an additional investigation to be conducted in the area of the former UST (Appendix F, p. 10/191). Accordingly, a permit for removal of the UST was submitted to the Riverside County's Department of Environmental Health in December 2003 and soil samples around the area of the UST were analyzed in 2004. However, the DEIR and supporting documents did not include any documentation that that the UST was properly closed by the Riverside County Department of Environmental Health. If the UST removal was not approved, an Underground Storage Tank Closure Application and Permit²⁰, per the Riverside County Department of Environmental Health Guidelines,²¹ must be submitted. A revised DEIR should be prepared to disclose whether closure was granted by the Riverside County Department of Environmental Health.

Greenhouse Gas Emissions:

The Project's operational greenhouse gas (GHG) emissions, before mitigation, are estimated to be 79,000 metric tons of CO₂e/year (MT CO₂e/yr) which exceed the SCAQMD threshold of 10,000 MT CO₂e/yr and are therefore considered significant (DEIR, p. 4.13-19). After mitigation, the DEIR states that GHG emissions will be less than significant (DEIR, p. 4.13-21). However, the DEIR does not calculate what the Project's GHG emissions will be after the mitigation measures are implemented.

The Project's GHG emissions exceed the SCAQMD threshold by nearly eight times. The DEIR and its supporting documents, including a Greenhouse Gas Study attached as Appendix B, do not provide any evidence that the proposed mitigation measures will reduce GHG emissions by a factor of eight.

A revised DEIR should be prepared to show the efficiency of the Project's proposed mitigation measures in reducing greenhouse gases. If these measures do not account for an eight-fold reduction in the Project's estimated GHG levels, additional mitigation measures (listed below) that are routinely considered in other CEQA projects should be implemented:

- Require preparation of a traffic control plan;

²⁰ http://www.rivcoeh.org/opencms/system/galleries/download/Environmental-Health/HMM/UST_Closure_App.pdf

²¹ http://www.rivcoeh.org/opencms/system/galleries/download/Environmental-Health/HMM/Closure_by_removal_UST.pdf

- Demonstrate proper inspection and maintenance of construction equipment;
- Implement a carpool program for construction workers;
- Employ a construction site manager to verify that engines are properly maintained and keep a maintenance log;
- Configure construction parking to minimize traffic interference;
- Consolidate truck deliveries when possible;
- Provide dedicated turn lanes for movement of construction trucks and equipment on and off site;
- Suspend use of all construction equipment operations during second stage smog alerts;
- Establish a staging zone for trucks that are waiting to load or unload material at the work zone in a location where diesel emissions from the trucks will have minimum impact on abutters and the general public;
- Locate construction equipment away from sensitive receptors such as fresh air intakes to buildings, air conditioners and operable windows;
- Require all diesel trucks used by construction contractor(s) at the site, or for on-road hauling of construction material, to be post-1996 models; Diesel portable generators less than 50 hp shall not be allowed at the construction site;
- Use of hybrid and fuel efficient construction equipment and support vehicles (e.g., pick-up trucks);
- Use of grid electricity for smaller equipment such as saws, pumps, and welders;²²
- Reduction in vehicle miles travelled in construction crew commutes through trip carpooling, trip reduction, providing bus service for crews from work sites to carpool parking areas, and in providing incentives to carpool; and
- Use of a Heavy-Duty Off-Road Vehicle Plan to ensure compliances with construction mitigation measures (e.g., hourly meters on equipment, documenting the serial number, horsepower, manufacture age, fuel, etc. of all onsite equipment and daily logging of the operating hours of the equipment).²³

Air Quality:

The Project is located in the South Coast Air Basin and Riverside County²⁴, both of which are designated non-attainment for PM10 and ozone (DEIR, p. 4.3-6). Significant emissions of PM10 and ozone and contributing factors such as NOx and ROG will lead to a worsening of regional air quality. The Project's estimates of construction emissions need to be properly disclosed and mitigated to ensure that the Project has a less than significant impact on regional air quality.

Estimates and impacts of project's construction and operational emissions

²² <http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf>, p. 47

²³ *Ibid.*, p. 431

²⁴ <http://www.epa.gov/oagps001/greenbk/ancl.html>

Project construction and operation will result in significant emissions of ROG, NOx, and PM10 even after mitigation (DEIR, pp. 4.3-29, 4.3-34).

Construction emissions

The DEIR estimates that the Project's construction emissions of NOx and ROG will be significant as they exceed the SCAQMD thresholds of 100 lbs/day and 75 lbs/day, respectively (DEIR, p. 4.3-23) and identifies mitigation measures to reduce the Project's emissions (DEIR, pp. 4.3-23 – 4.3-29). Even with mitigation, the Project's emissions of NOx and ROG will still exceed SCAQMD thresholds and therefore are considered significant (DEIR, p. 4.3-29).

Operational emissions

The DEIR estimates that the Project's emissions of ROG, NOx, and PM10 from operational activities will be significant as they exceed the SCAQMD thresholds of 55 lbs/day, 55 lbs/day, and 150 lbs/day, respectively (DEIR, p. 4.3-33). The DEIR proposes mitigation measures to reduce the Project's emissions (DEIR, pp. 4.3-33 – 4.3-34) but, even with mitigation, the Project's emissions will still exceed SCAQMD thresholds and therefore are considered significant (DEIR, p. 4.3-34).

Gaseous particles such as NOx can react in the atmosphere to form PM10.^{25,26} Because Riverside County and the South Coast Air Basin are both designated non-attainment for PM10, significant emissions of NOx can lead to a further degradation of regional air quality. NOx emissions can also react to produce ground-level ozone.²⁷ Exposure to NOx emissions and its products (ozone and PM10) can lead to the airway inflammation and can cause or exacerbate conditions such as emphysema and bronchitis.²⁸

ROG can react to form ozone and contributes to smog formation.^{29,30} Exposure to ozone can result in coughing, throat irritation, and chest pain, burning, and discomfort.³¹ Smog exposure can lead to sneezing, nausea, coughing, headaches, and chest constriction.³² A study published in the New England Journal of Medicine concluded that the risk of dying from respiratory diseases is three times higher in areas of concentrated ozone.³³

Exposure to PM10 can cause bronchitis, increase the number and severity of asthma attacks, damage to lung tissue, and even premature death.³⁴ Research identifies that dust from construction is a major

²⁵ <http://www.fhwa.dot.gov/resourcecenter/teams/airquality/brochure/particulatebrochure.pdf>

²⁶ <http://www.epa.gov/captrade/documents/power.pdf>

²⁷ *Ibid.*

²⁸ <http://www.epa.gov/air/nitrogenoxides/health.html>

²⁹ <http://www.arb.ca.gov/research/health/fs/fs2/fs2.htm>

³⁰ <http://www.arb.ca.gov/html/gloss.htm#smog>

³¹ <http://www.epa.gov/o3healthtraining/population.html>

³² <http://are.berkeley.edu/courses/EEP101/spring03/AllThatSmog/extern.html>

³³ <http://www.nytimes.com/gwire/2009/03/12/12greenwire-study-links-smog-exposure-to-premature-death-10098.html>

³⁴ <http://www.epa.gov/airtrends/aqtrnd95/pm10.html> and <http://www.arb.ca.gov/html/brochure/pm10.htm>

contributor to PM10 and that PM10 exposure is associated with asthma.³⁵ Inhalation of PM10 can exacerbate asthma especially in children who are susceptible to higher risks from PM10 exposure.³⁶

The Project will have significant emissions of ROG, NOx, and PM10. Because Riverside County and the South Coast Air Basin are designated non-attainment areas for ozone and PM10, Project construction and operation will further degrade regional air quality. Exposure to ROG, NOx, and PM10 has adverse health effects and can impact offsite receptors, especially children in the nearby residences – a significant and undisclosed public health impact that the DEIR does not consider.

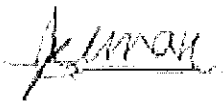

A revised DEIR should be prepared to disclose impacts to offsite receptors from Project construction and operation. Additional mitigation measures must be implemented to ensure that Project emissions of ROG, NOx, and PM10 are reduced to the maximum extent feasible.

Cumulative Impacts:

The DEIR identifies 13 proposed projects encompassing approximately 7.3 million square feet of space within five miles of the Project site (DEIR, p. 3-16). The DEIR does not identify the construction schedule of these projects except to state that “a number of individual projects may be under construction simultaneously with the proposed project” (DEIR, p. 4.3-37). The WestRidge Commerce Center Project (which will be built adjacent to the proposed Project) is scheduled to be constructed in 2012, a schedule similar to the proposed Project. Simultaneous construction of these projects, along with other potential projects, is likely to result in PM10, NOx, and ROG emissions that will have a cumulatively significant impact.

The construction timetables of all projects within the vicinity of the Project site should be identified. Any cumulatively significant emissions should be disclosed and impacts to workers and nearby residents should be addressed in a revised DEIR.

Sincerely,

Uma Bhandaram

**RESPONSES TO LETTER D-4C
LOZEAU DRURY, MEMORANDUM FROM MATTHEW HAGEMANN**

Response to Comment 1: It appears that Mr. Hagemann's comments were incorporated more or less directly into the letter from Mr. Drury (Letter D-4A). However, the following responses will address Mr. Hagemann's comments with reference to the responses to Mr. Drury's letter when appropriate.

Response to Comment 2: The commenter believes that residual soil contamination may contribute health risks to area residents and workers on the project site. However, the issues raised by Mr. Hagemann have already been addressed in Response to Comment D-4A-9 through D-4A-11.

Response to Comment 3: The commenter believes the Phase 1 ESA reports are out of date. These comments are addressed in the previous Response to Comment D-4A-9 and D-4A-10.

Response to Comment 4: For a detailed response on greenhouse gas emissions of the project, see the Response to Comment D-4A-12 in the previous Letter D-4A from Lozeau Drury.

Response to Comment 5: For a detailed response on comparing construction emissions to daily construction thresholds, see the Responses to Comments D-4A-13 and D-4A-14 in the previous Letter D-4A from Lozeau Drury. For a detailed response on operational impacts of the project, see the Response to Comment D-4A-16 in the previous Letter D-4A from Lozeau Drury. The DEIR presented evidence and supported its conclusions with empirical evidence that the project would not result in any significant health risks to local residents as a result of project air emissions, both in the short-term and over the long-term.

Response to Comment 6: The commenter makes the same comment as Mr. Drury in Response to Comment D-4A-19. The reader is referred to that response for more information.

RESPONSES TO LETTER D-4D: LOZEAU DRURY APPENDICES

Response to Appendix 1 – GHG Strategies Issued by the State Attorney General’s Office: Section 4.13 of the DEIR examined the potential impacts of the ProLogis project relative to greenhouse gases, and compared the project characteristics and impacts to the .

As outlined in DEIR Section 4.13.5.1, *Greenhouse Gas Plan, Policy, Regulation Consistency*, the CAT and the CARB have developed several reports to achieve the Governor’s GHG targets that rely on voluntary actions of California businesses, local government and community groups, and State incentive and regulatory programs. These include the CAT’s 2006 “Report to Governor Schwarzenegger and the Legislature,” the CARB’s 2007 “Expanded List of Early Action Measures to Reduce Greenhouse Gas Emissions in California,” and the CARB’s “Climate Change Proposed Scoping Plan: a Framework for Change. The reports identify strategies to reduce California’s emissions to the levels proposed in Executive Order S-3-05 and AB 32 (i.e., 29 percent below existing “business as usual” emissions) that are applicable to proposed project. Table 4.3.C presents the applicable Recommended Actions (qualitative measures) identified to date by CARB in its Climate Change Proposed Scoping Plan and whether or not the proposed project is consistent with the applicable Recommended Actions. Table 4.13.C, Proposed Scoping Plan Recommended Actions for Climate Change, in the DEIR examined the project’s consistency with these policies.

In addition, GHG emissions reduction strategies were also set forth in the 2006 CAT Report, and the strategies included in the CAT Report that apply to the project were evaluated in Table 4.13.E of the DEIR, which also summarized the extent to which the project would comply with the strategies to help California reach the emission reduction targets. The strategies listed in DEIR Table 4.13.E were addressed as either part of the project, required mitigation measures, or requirements under local or State ordinances.

The mitigation measures outlined in the Attorney General’s guidance have already been addressed in the two evaluation processes outlined above, since most or all of the AG’s recommendations are an outgrowth of the CAT report. Therefore, the project does not need an additional evaluation specifically against the AG’s criteria.

Response to Appendix 2 – Resumes for James Clark Ph.D. and Matt Hagemann: Resumes were provided for the two primary authors of the supplementary comment memos that were included in the Lozeau Drury Letter D-4A. No comments on their qualifications.

Response to Appendix 3 – CalEEMod Technical Paper (July 2011 SCAQMD et al): This report outlines the methodology, reasoning, and policy development issues related to the California Emission Estimator Model (CalEEMod). The commenter does not indicate why this reference was included, so no specific response is necessary. A discussion on two comments regarding differences between the project emissions using CalEEMod and the older URBEMIS model is provided in Responses D-4A-13 and D-4B-3.

Response to Appendix 4 – Initial Statement of Reasons for Rulemaking – Staff Report (CARB): The commenter does not indicate why this reference was included, so no specific response is necessary. However, the air quality study prepared for the project included a Health Risk Assessment (HRA) that assumed diesel exhaust as a toxic air contaminant and used the procedures established by the SCAQMD to conduct the HRA.

Response to Appendix 5 – Health Assessment Document for Diesel Engine Exhaust (U.S. EPA): The commenter does not indicate why this reference was included, so no specific response is necessary. However, the air quality study prepared for the project included a Health Risk Assessment

(HRA) that assumed diesel exhaust as a toxic air contaminant and used the procedures established by the SCAQMD to conduct the HRA, which are in turn consistent with the U.S. EPA guidance.

Response to Appendix 6 – Interim Guidance for Sampling Agricultural Fields for School Sites (Cal DTSC 8/02): The commenter refers to this document in relation to comments that the soil sampling conducted for the Phase 1 ESA reports on the project site were not consistent with the guidance in this report. A discussion on two comments regarding this topic is provided in Responses D-4A-9 through D-4A11 and D-4C-3.

Response to Appendix 7 – Various DTSC forms and chemical data materials related to pesticide applications or suspected applications on the project site (various dates around 2010): The commenter refers to this document in relation to comments that the onsite soils may be contaminated with pesticides, and the attached materials document that certain pesticides were applied to the site (or at least purchased by site maintenance staff) around 2010. A discussion on two comments regarding this topic is provided in Responses D-4A-9, and it should be noted a mitigation measure (4.6.6.1A) was added to do additional soil testing before grading (see Response D-4A-9).

Response to Appendix 8 – Various reports and data on pesticides and other agricultural chemicals (various): The commenter refers to this document in relation to comments that the onsite soils may be contaminated with pesticides such as DDT, DDE, and arsenic. A discussion on two comments regarding this topic is provided in Responses D-4A-9, and it should be noted a mitigation measure (4.6.6.1A) was added to do additional soil testing before grading (see Response D-4A-9).

Response to Appendix 9 – Use of California Human Health Screening Levels in Evaluation of Contaminated Properties (January 2002): The commenter refers to this document in relation to comments that the onsite soils may be contaminated with various kinds of pesticides applied over the years. A discussion on comments regarding this topic is provided in Responses D-4A-9, and it should be noted a mitigation measure (4.6.6.1A) was added to do additional soil testing before grading (see Response D-4A-9).

Response to Appendix 10 – Strategic Plan for Asthma in California, 2008 – 2012, and other reports related to health and air quality: This report was included apparently to support the commenter's contention that there will be health risks to local residents and construction workers from project air emissions, including diesel emissions. The air quality study prepared for the project was comprehensive and based on guidance from SCAQMD for such studies. It included a Health Risk Assessment (HRA) that assumed diesel exhaust as a toxic air contaminant and used the procedures established by the SCAQMD to conduct the HRA, which are in turn consistent with U.S. EPA guidance. The study determined impacts on local residents would be less than significant, although it would contribute to cumulatively significant air impacts due to the poor quality of air in the South Coast Air Basin.

In addition, the commenter is referred to Section 4 of this document for an evaluation of a less intensive modified plan, which is a subset of the Reduced Intensity Alternative evaluated in the DEIR (and which was determined to be environmentally superior to the Proposed Project). This less intensive plan proposes to develop 4 warehouse buildings, leaving the southeast portion of the site vacant for future development of residential uses consistent with existing zoning (R-5 and RA-2) adjacent to the existing residential neighborhood to the southeast.

3. EIR ERRATA AND ADDITIONS

Any corrections to the Draft Environmental Impact Report (EIR) text and figures generated either from responses to comments or independently by the City, are stated in this section of the Final EIR. The Draft EIR text and figures have not been modified to reflect these EIR modifications.

These EIR errata are provided to clarify, refine, and provide supplemental information for the Eucalyptus Industrial Park Draft EIR. Changes may be corrections or clarifications to the text and figures of the original Draft EIR. Other changes to the EIR clarify the analysis in the EIR based upon the information and concerns raised by commenters during the public review period. None of the information contained in these EIR modifications constitutes significant new information or changes to the analysis or conclusions of the Draft EIR.

The information included in this EIR erratum that resulted from the public comment process does not constitute substantial new information that requires recirculation of the Draft EIR. The California Environmental Quality Act (CEQA) Guidelines, Section 15088.5, states in part:

- (a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification. As used in this section, the term “information” can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not “significant” unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project’s proponents have declined to implement. “Significant new information” requiring recirculation includes, for example, a disclosure showing that:
 - (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
 - (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
 - (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project’s proponents decline to adopt it.
 - (4) The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.
- (b) Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR.

The changes to the Draft EIR included in these EIR modifications do not constitute “significant” new information because:

No new significant environmental impact would result from the project or from a new mitigation measure;

There is no substantial increase in the severity of an environmental impact that would result unless mitigation measures are adopted that reduce the identified significant impacts to a level of insignificance;

No feasible project alternative or mitigation measure considerably different from others previously analyzed has been proposed or identified that would clearly lessen the significant environmental impacts of the project; and

The Draft EIR is not fundamentally or basically inadequate or conclusory in nature such that meaningful public review and comment were precluded.

Therefore, recirculation of the Draft EIR is not required because the new information added to the EIR through these modifications clarifies or amplifies information already provided or makes insignificant modifications to the already adequate Draft EIR.

For simplicity, the EIR modifications contained in the following pages are in the same order as the information appears in the Draft EIR. Changes in text are signified by strikeouts (~~strikeouts~~) where text has been removed and by underlining (underline) where text has been added. The applicable page numbers from the Draft EIR are also provided where necessary for easy reference.

Draft EIR, Section 1.0 Executive Summary, Summary (pages 1-13 through 1-73)

Table 1.C: The Environmental Summary in the Draft EIR has been updated to be consistent with changes that have been made, as a result of the responses to comments. Changes have been made to mitigation measures for air quality, biological resources, cultural resources, and noise. These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR. The change to Impact 4.3.6.1 was an editorial one, the action section 4.3.5.1 concluded the impact related to “Conflict with an Existing Agricultural Zone” was less than significant with no mitigation required, but Table 1.C wrongly showed it as “significant with no mitigation available”. This has been corrected.

IMPORTANT NOTE: *The various changes to the mitigation measures will be presented following Table 1.C, but the actual wording changes will not be reflected in Table 1.C to avoid duplication and unnecessary length of the table. However, a note will be included in the table to reference mitigation measures that have changed. The revised mitigation measures will appear in their entirety in Section 4, Mitigation Monitoring and Reporting Program.*

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
4.1 AESTHETICS		
<p>Impact 4.1.6.1: <u>Existing Visual Character or Quality of Site and Its Surroundings:</u> Implementation of the proposed project would replace the undeveloped character of the project site with an urban setting containing warehouse uses. Therefore, the change in the character of the site would be recognizable and would constitute a permanent alteration of the existing visual character of the project site. Although the visual characteristic of the project site would change, the proposed project would replace the existing vacant parcel with an attractive, well designed development through the use of architectural elements, landscaping, and design of the project site. In addition, the proposed project would be designed and constructed per applicable City Municipal Code and General Plan standards. <u>Despite these requirements, a less than</u> significant impact related to this issue would occur.</p>	No feasible mitigation is available	Significant and unavoidable

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
4.2 AGRICULTURAL RESOURCES		
<p>Impact 4.2.6.1: Conflict with an Existing Agricultural Zone: The proposed project would not conflict with an existing agricultural zone. An approximately 12-acre portion of the project site is zoned Residential Agriculture (R-A-2) with a PAKO designation, and is located near the southern border. With the development of the project, this portion of the site would be rezoned to Light Industrial to allow for the proposed warehouse distribution uses. While this zone change would not conflict with the existing zone for this area of the project site. This type of change is expected, and planned for within the City, and is consistent with the City's overall vision. Impacts are less than significant.</p>	<p>No feasible mitigation is available</p> <p>No mitigation required.</p>	<p>Significant and unavoidable</p> <p>Less than Significant</p>
<p>Impact 4.2.6.2: Conversion of State Designated Farmland: The project site is designated as 67 percent Prime Farmland (82.5 acres) and 12 percent (39.8 acres) as Farmland of Local Importance (5.3 acres). While farmland conservation measures have been implemented in other areas of the State, neither the City of Moreno Valley nor Riverside County maintains a program that developers and property owners can participate in to offset agricultural resource impacts; therefore, the conversion of State designated Prime Farmland is a significant impact.</p>	<p>No feasible mitigation is available</p>	<p>Significant and unavoidable</p>
4.3 AIR QUALITY		
<p>Impact 4.3.6.2: Equipment Exhaust Emissions From Construction Activities Impacts: Grading and other construction activities would result in combustion emissions from heavy-duty construction vehicles, haul trucks, utility engines, and vehicles transporting the construction crew. Construction equipment/vehicle emissions during proposed on-site grading periods would exceed the SCAQMD daily thresholds for CO and NO_x. This remains a significant impact requiring mitigation.</p>	<p>4.3.6.2C Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.</p> <p><u>Project start to December 31, 2014:</u> <u>All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 3 off-road emission standards. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission</u></p>	<p>Implementation of identified mitigation measures would reduce construction-related emissions; however, it is not possible to quantify emission reductions for all pollutants, so impact remains significant and unavoidable.</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<p><u>reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.</u></p> <p><u>Post January 1, 2015: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.</u></p> <p><u>A copy of each unit's certified tier specifications, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.</u></p> <p>4.3.6.2D All clearing, grading, earthmoving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.</p> <p>4.3.6.2H The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and during smog season (May through October) by shall not allowing construction equipment to be left idling for more than five minutes (per California law).</p> <p>4.3.6.2J Grading plans, construction specifications and bid documents shall also include the following</p>	

FINAL EIR - RESPONSE TO COMMENTS

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
4.4 BIOLOGICAL RESOURCES		
<p>Impact 4.4.6.2: Riparian Habitat or Other Sensitive Natural Communities: The three on-site drainages, including the Quincy Channel, contain riparian/riverine area. While the proposed project would incorporate the design standards identified in the City's Municipal Code, the development of the proposed project may result in the elimination of habitat for special-status plant species (mule fat scrub) or reduce population size of sensitive plant species below self-sustaining levels. Therefore, a potentially significant impact would occur and mitigation is required.</p>	<p>4.4.6.2A As outlined in the project's Determination of a Biologically Equivalent or Superior Preservation (DBESP) report, the project applicant shall compensate for the <u>temporary and permanent impact on and loss of jurisdictional waters and streambeds by providing a minimum 2:1 off-site replacement of equivalent riverine/riparian habitat prior to project construction.</u> (0.36 acre impact = 0.72 acre replacement). This off-site replacement shall be accomplished through the contribution of in-lieu fees to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of riparian habitat adjacent to the tributaries of the San Jacinto River or within the Santa Ana River watershed. Documentation of acceptance of the SAWA contribution shall be provided to the City prior to issuance of a grading permit. <u>Offsite restoration, enhancement, and/or land purchase mitigation for the drainage impacts will occur at an offsite location through one or more of the following: an USACE approved mitigation bank, through an in lieu fee mitigation program, and/or land purchase and conservation. DFG and USFWS will need to provide concurrence that this mitigation is equivalent or superior to that proposed for impact through their review and acceptance of the DBESP.</u></p> <p>4.4.6.2B The project applicant shall retain qualified personnel to prepare and implement a Habitat Mitigation and Monitoring Plan (HMMP) to oversee restoration of temporarily affected areas (0.35 acre of riverine/riparian habitat) to their pre-construction contours and vegetation. The HMMP will be approved by USACE and CDFG prior to the City issuing any</p>	<p>Less than Significant with Mitigation</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	occupancy permits. <u>Riparian/riverine resources that are temporarily impacted by project construction shall be returned to their preconstruction contours and hydroseeded, as outlined in the DBESP.</u>	
<p>Impact 4.4.6.3: Jurisdictional Waters/Wetlands: Implementation of the proposed project would result in permanent impacts to 0.051 acre (354 linear feet) of non-wetland waters of the United States and waters of the State and 0.362 acre (440 linear feet) of State streambed associated with the eastern, southern, and western drainages. In addition to permanent impacts, the proposed project would result in temporary impacts to 0.054 acre (332 linear feet) of non-wetland waters of the United States and waters of the State and 0.33 acre (547 linear feet) of State streambed associated with construction activities. This is a significant impact requiring mitigation.</p>	<p>4.4.6.3A The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE and a Section 1602 Streambed Alteration Agreement from the CDFG. Direct temporary impacts to more than 0.1 acre of jurisdictional area that are regulated by the USACE, CDFG, and RWQCB shall be mitigated at a 2:1 ratio, including enhancement and/or creation of wetlands or the contribution of in-lieu fee to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of off-site riparian habitat, as outlined in Mitigation Measure 3.3.6.2A. <u>The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE, a Section 401/Porter-Cologne Water Quality Certification from the RWQCB, and a Section 1602 Streambed Alteration Agreement from the CDFG. Offsite restoration, enhancement, and/or land purchase mitigation of jurisdictional drainage impacts will occur at an off-site location through one or more of the following: an USACE approved mitigation bank, through an in-lieu fee mitigation program, and/or land purchase and conservation.</u></p>	Less than Significant with Mitigation
4.5 CULTURAL RESOURCES		
<p>Impact 4.5.6.1: Prehistoric Cultural Resources: The cultural resources survey indicates there are no recorded cultural sites or surface evidence that cultural resources are present on the project site. Correspondence from Native American groups represents appropriate consultation under SB 18. The site's location within the Moreno Hills Complex indicates a potential exists that excavation and construction activities may uncover</p>	<p>4.5.6.1A <u>Prior to the issuance of a grading permit, the Project Applicant shall provide evidence to the City of Moreno Valley that a Cultural Resources Monitoring Agreement has been secured for qualified Tribal representatives, and that a</u></p>	Less than Significant with Mitigation

City of Moreno Valley

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<p><u>4.5.6.1C</u> If a significant archaeological resource(s) is discovered on the property, ground disturbing activities shall be suspended 100 feet around the resource(s). The archaeological monitor and representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division shall confer regarding mitigation of the discovered resource(s). A treatment plan and/or preservation plan shall be prepared and by the archaeological monitor and reviewed by representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division and implemented by the archaeologist to protect the identified archaeological resource(s) from damage and destruction. The landowner shall relinquish ownership of all archaeological artifacts that are of Native American origin found on the Project site to the culturally affiliated Native American tribe(s) for proper treatment and disposition. A final report containing the significance and treatment findings shall be prepared by the archaeologist and submitted to the City Planning Division, the appropriate Native American tribe(s), and the Eastern Information Center at the University of California, Riverside. All cultural material, excluding sacred, ceremonial, grave goods and human remains, collected during the grading monitoring program and from any previous archaeological studies or excavations on the project site shall be curated, as determined by the treatment plan, according to the current professional repository standards and may include the Pechanga Bands curatorial facility.</p> <p><u>4.5.6.1D</u> Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:</p>	

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<p><u>"If any suspected archaeological resources are discovered during ground-disturbing activities and the archaeological monitor or Tribal representatives are not present, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call the project archaeologist and the Tribal representatives to the site to assess the significance of the find."</u></p> <p><u>4.5.6.1E If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made by the Coroner. If the Riverside County Coroner determines the remains to be Native American, the California Native American Heritage Commission must be contacted within 24 hours. The Native American Heritage Commission must then immediately notify the "most likely descendant(s)" of receiving notification of the discovery. The most likely descendant(s) shall then make recommendations within 48 hours, and engage in consultations concerning the treatment of the remains as provided in Public Resources Code §5097.98.</u></p>	
<p>Impact 4.5.6.2: Paleontological Resources: The project site is located in an area identified as having a "high sensitivity" for paleontological resources. Construction of the proposed project has the potential to result in significant impacts to nonrenewable paleontological resources, requiring mitigation.</p>	<p><u>4.5.6.2D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:</u></p> <p><u>"If any suspected paleontological resources are discovered during ground-disturbing activities, the</u></p>	<p>Less than Significant with Mitigation</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<p><u>construction supervisor is obligated to halt work in a 100-foot radius around the find and call a qualified paleontologist to the site to assess the significance of the find. A qualified paleontologist shall evaluate the suspected resource. If the paleontologist determines that the find is not unique, construction shall be permitted to proceed. However, if the paleontologist determines that further information is needed to evaluate significance, the City of Moreno Valley shall be notified and a treatment plan shall be prepared and implemented in consultation with the City to protect the identified paleontological resource(s) from damage and destruction."</u></p>	
4.6 HAZARDS AND HAZARDOUS MATERIALS		
<p>4.6.6 Although the EIR did not identify any significant impacts related to hazardous materials, the mitigation measure was added to assure there will be no impacts related to soil contamination.</p>	<p>4.6.6.1A <u>Prior to issuance of a grading permit for the project, a qualified contractor shall test onsite soils for contamination by agricultural chemicals. If present in concentrations above established actionable levels or thresholds, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. This measure shall be implemented to the satisfaction of the Building Division including written documentation of the disposal of any agricultural chemical residue in conformance with all applicable regulations.</u></p>	Less than Significant
4.9 NOISE		
<p>Impact 4.9.6.1: Short-Term Construction Noise Impacts: Construction activities would include grading, excavation, and installation activities generating noise levels up 91 dBA L_{max} at 50 feet from an active construction area. These noise levels would diminish rapidly with distance from the construction site at a rate of approximately 6 dBA per doubling of distance. The worst-case scenario during construction would be a noise level of 91 dBA L_{max} at a distance of 50 feet from the noise source to the nearest existing sensitive receptor. However, compliance with the construction hours specified in the City's</p>	<p>4.9.6.1D. During all project site construction activities at Building 6 (i.e., closest to existing residences), the construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and</p>	Less than Significant with Mitigation

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code, mitigation measures have been identified to reduce the noise levels that would expose nearby sensitive receptors to noise levels in excess of the City's noise standards.	holidays, unless written approval is obtained from the City Building Official or City Engineer <u>for specific construction activities that must be conducted outside of the permitted time periods.</u>	
4.11 TRANSPORTATION		
<p>Impact 4.11.6.1A: <u>Existing (2011) with project Conditions (Intersection) Traffic and Level of Service Impacts:</u> The addition of project traffic to this scenario would result in conditions exceeding the established LOS standard at the following intersections:</p> <p>Redlands Boulevard/SR-60 Westbound Ramps (a.m. and p.m. peak hours); and</p> <p>Redlands Boulevard/Eucalyptus Avenue-Fir Avenue (p.m. peak hour).</p> <p>The project would contribute toward the worsening of the already unsatisfactory LOS at the intersection of Redlands Boulevard/SR-60 Westbound Ramps and would create a significant impact at the intersection of Redlands Boulevard/Eucalyptus Avenue-Fir Avenue. Therefore, mitigation is required at both intersections.</p>	<p>4.11.6.4A Prior to issuance of a building permit <u>Certificate of Occupancy</u>, the project applicant shall construct <u>pay the fair share contribution toward</u> the following traffic improvements through fees paid to the City of Moreno Valley based on the City's DIF system and the County's TUMF program:</p> <ul style="list-style-type: none"> • Redlands Boulevard/SR-60 Westbound Ramps. Install a traffic signal. This improvement is currently approved, and permitted by Caltrans. If not otherwise completed prior to project opening, the required traffic signal shall be constructed by the Applicant prior to issuance of the first Certificate of Occupancy. • Redlands Boulevard/Fir Avenue/Eucalyptus Avenue. If not otherwise completed prior to project opening, prior to issuance of the first Certificate of Occupancy, the Applicant shall construct the following improvements: Install a traffic signal and This improvement is listed in the City's DIF program. A add a northbound left-turn lane and a southbound left-turn lane. These improvements are listed in the TUMF. <p>If the improvements are constructed by others prior to the Certificate of Occupancy, the applicant shall pay its fair share towards the improvements through the City's DIF program.</p>	<p>With the implementation of the recommended improvements, the minimum level of service standards would be maintained for the Existing (2011) with project condition and impacts would be reduced to a less than significant level for all identified intersections. However, improvements to freeway facilities are under the authority of Caltrans. Since the City has no control over when and how the improvements will be in place, impacts associated with SR-60 ramp intersections would remain significant and unavoidable until such improvement is constructed.</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
4.12 GLOBAL CLIMATE CHANGE		
<p><u>Greenhouse Gas Emissions and Climate Change:</u> Construction of the project would emit approximately 37.5 tons per day of CO₂ equivalent emissions, while occupancy of the project will emit 61,000 tons of CO₂ equivalent emissions per year. The carbon dioxide, methane, and nitrous oxide emissions that would be associated with the proposed project is approximately 0.0024 percent of California's 2004 total emissions for carbon dioxide, methane, and nitrous oxide (492 Tg CO₂ Eq).</p> <p>The proposed project would be consistent with all feasible and applicable strategies to reduce greenhouse gas emissions in California. Therefore, the impact of the proposed project, based on these specifications, would be less than significant. The SCAQMD currently recommends that potential GHG emissions be addressed through energy efficiency.</p>	<p>4.13.6.1B. Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been incorporated into the design and construction of the project:</p> <ul style="list-style-type: none"> • Use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project. • Use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project. • Limit unnecessary idling of construction equipment. A reduction in equipment idling would reduce fuel consumption, and therefore, GHG emissions. • Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants. • Design the project building to exceed the California Building Code's (CBC) Title 24 energy standard, including, but not limited to, any combination of the following: <ul style="list-style-type: none"> ○ Increase insulation such that heat transfer and thermal bridging is minimized. ○ Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. 	<p>Less than Significant with Mitigation</p> <p>Since the project is consistent with the strategies to reduce California's emissions to the levels proposed by Executive Order S-3-05, the project's incremental contribution to climate change at the project level is less than significant.</p>

Table 1.C: ProLogis Eucalyptus Industrial Park - Environmental Summary

Issues/Impacts	Mitigation Measures	Level of Significance after Mitigation
	<ul style="list-style-type: none"> ○ Incorporate ENERGY STAR or better rated windows, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment. • Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping. • Install efficient lighting and lighting control systems. Use daylight as an integral part of the lighting systems in buildings. • Install light-colored “cool” roof) and cool pavements. • Install energy-efficient heating and cooling systems, appliances and equipment, and control systems. • Install solar or light-emitting diodes (LEDs) for outdoor lighting <u>for auto parking areas.</u> 	

Draft EIR Section 4.1, AESTHETICS

4.1.1.1 Topographic/Vegetation Features (page 4.1-1)

Until recently, commercial citrus groves occupied the northwestern and northeastern portions of the project site, forming a dark-green canopy over approximately a third of the site area. The 2006 City General Plan EIR notes that the remaining citrus groves are “visually pleasing features” (MVGP FEIR, p. 5.11-2). However, in December 2013, the trees were removed due to ongoing maintenance and irrigation costs, and fire protection concerns (J. Jachetta, personal communication, December 2, 2013).

4.1.6 Significant Impacts

4.1.6.1 Scenic Vistas (page 4.1-9)

Views from SR-60 and Residences North of SR-60. ...As identified in Figure 4.1.3, existing views from this vantage point include SR-60 in the foreground, a concrete lane divider ~~and the tops of citrus groves~~ in the midground, and the Mount Russell Range in the background. As part of conditions of approval for the proposed project, two rows of ~~the existing~~ orange trees would be provided and

maintained on the northern portion of the project site adjacent to SR-60 and along the perimeter of the proposed project site adjacent to the public ROW or residential zoning. With development of the proposed project, buildings, associated parking lots, and ornamental landscaping would be built and placed on the project site. This would change existing views from the single-family residences north of SR-60 along Pettit Street. Foreground views would consist of SR-60, midground views would consist of a concrete divider and the tops of the ~~remaining~~ mature orange trees, and background views would consist of the upper half of the proposed warehouse buildings.

~~It is anticipated that the existing orange trees have an approximate height ranging from 12 feet to 16 feet.~~ Two rows of the former orange trees will be retained on the northern boundary adjacent to SR-60. Additionally, new orange trees would be planted along the northern length of Buildings No. 1 and 2. With the inclusion of the orange trees along this project boundary, the existing residences would see the upper 27 to 31 feet of the proposed buildings.

4.1.6.2 Scenic Resources and Scenic Highways (page 4.1-17)

... As illustrated in Figure 4.1.4, existing eastbound views on SR-60 would be altered with the development of the proposed project. Motorists would still view noise attenuation walls, urban development, landscaping, and ~~orange~~ scattered trees as they look to the south, although these views would be of short duration for motorists traveling at normal freeway speeds.

Level of Significance after Mitigation. Since there is no feasible mitigation is available to reduce impacts related to the substantial change in visual character from development of the proposed project, impacts associated with this issue would remain significant and unavoidable.

***NOTE:** This conclusion would be the same regardless with or without the existing citrus trees onsite, so the conclusions and mitigation outlined in the DEIR do not change (i.e., significant).*

Draft EIR Section 4.2, AGRICULTURAL RESOURCES

4.2.1 Existing Setting (page 4.2-1)

***NOTE:** The following paragraph was reworded to account for removal of the citrus trees.*

~~In addition to on-site farming of citrus, a~~Active agricultural operations take place on properties located to the north of SR-60, east and south of the proposed project site.

... The project site can be divided into ~~two three~~ categories of land cover: ~~citrus production,~~ hay/alfalfa production and fallow. ~~Currently, Until recently,~~ the majority of the northern portion of the site (approximately 57 acres) ~~was is~~ used for citrus production. ~~The remaining portions of the site are~~ Approximately 36 acres of the site, located in the southern portion of the site, supports hay/alfalfa and approximately 75 acres of fallow land is located in the northern portion of the site. Until December 2013, approximately 50 acres of the site contained citrus trees, but these were removed to eliminate ongoing maintenance and irrigation costs and potential fire safety issues. In any case, they are planned to be removed as part of project development. Currently, there are several abandoned wells and a non-functioning wind machine that were used in the past for on-site agricultural uses.

4.2.6.1 Conversion of State Designated Farmland (page 4.2-8)

Mitigation Measures. The potential mitigation measures identified by the City's General Plan have been deemed infeasible by the property owner under current economic conditions. In addition, supplementary analysis of the project site and local economic conditions indicates that continued citrus production and/or the raising of row crops would not be economically feasible on the project site (see Appendix ~~L~~ E).

4.2.6.2 Conversion of an Existing Agricultural Operation to a Non-Agricultural Use (page 4.2-9)

Threshold	Would the proposed project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use?
-----------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The proposed project would result in the development of industrial uses on land that ~~was~~ has historically ~~been~~ utilized for citrus production. Implementation of the proposed project would result in the ~~retention~~ or provision of rows of citrus trees along the northern portion of the project site adjacent to SR-60, along the western perimeter of Building No. 6, and along the southern perimeter of Buildings No. 5 and 6. Although these citrus trees would be ~~retained~~ or provided along the perimeter of the project site, the ~~retention~~ or provision of citrus trees on site is for ornamental and landscaping purposes and not for agricultural cultivation. The conversion of the project site's agriculture land to non-agricultural uses is a result of various economic and demographic factors. Increased cost for water and a continuing demand for housing and other development in the City and region are the primary reasons for this agricultural land conversion.

NOTE: *The removal of the citrus trees onsite in December 2013 does not change the conclusions of the DEIR regarding agricultural impacts or mitigation. Loss of agricultural soils and former citrus activity would still be significant.*

Draft EIR Section 4.3, AIR QUALITY

Section 4.3.6.2 Equipment Exhaust from Construction-Related Activities (pages 4.3-23 and 4.3-24)

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.2C in response to concerns expressed by the South Coast Air Quality Management District (Letter B-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2C Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.

Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 3 off-road emission standards. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3

diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

Post January 1, 2015: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.

A copy of each unit's certified tier specifications, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.2D in response to concerns expressed by the South Coast Air Quality Management District (Letter B-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2D All clearing, grading, earthmoving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.1H in response to concerns expressed by Johnson and Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2H The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and ~~during smog season (May through October)~~ by not allowing construction equipment to be left idling for more than five minutes (per California law).

NOTE: *The following requirement was added to Mitigation Measure 4.3.6.2J in response to concerns expressed by Johnson and Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.*

4.3.6.2J Grading plans, construction specifications and bid documents shall also include the following ~~requirements notations~~:

- Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty;
- Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads;
- Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect;
- The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;

- The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours;
- High-pressure injectors shall be provided on diesel construction equipment ~~where feasible~~ if available;
- Engine size of construction equipment shall be limited to the minimum practical size;
- Substitute gasoline-powered for diesel powered construction equipment where ~~feasible~~ gasoline powered equipment is available;
- Use electric construction equipment where ~~feasible~~ it is practical to use such equipment;
- Install catalytic converters on gasoline-powered equipment where ~~feasible~~ this type of equipment is available;
- Ride-sharing program for the construction crew ~~shall be encouraged and~~ shall be supported by contractor(s) via incentives or other inducement;
- Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;
- Lunch vendor services shall be ~~provided~~ allowed on site during construction to minimize the need for off-site vehicle trips; and
- All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered.

NOTE: The following requirement was added to Mitigation Measure 4.3.6.2K in response to concerns expressed by Johnson and Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.3.6.2K Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on site. In coordination and cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM₁₀ (fugitive dust) generation or other construction-related air quality issues within 24 hours.

Section 4.3.6.3 Localized Construction Equipment Exhaust Emissions Impacts (page 4.3-30)

4.3.6.3A Prior to the issuance of grading permits, the project applicant shall require by contract specifications that all trucks hauling dirt, sand, soil, or other loose materials are to be covered or ~~should~~ shall maintain at least 2 feet of freeboard in accordance with the requirements of California Vehicle Code (CVC) Section 23114 (freeboard means vertical space between the top of the load and top of the trailer).

Section 4.3.6.5 Long-Term Project-Related Emissions Impacts (page 4.3-33)

NOTE: A clerical error was made in the Draft EIR in Mitigation Measure 4.3.6.5B. These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.

Mitigation Measures

- 4.3.6.5B** Prior to issuance of building permits, the project applicant shall provide evidence to the City that energy-efficient and low-emission methods and features of building construction shall be incorporated into the project design. These methods and features may include (but are not limited to) the following:
- Construction of buildings that exceed statewide energy requirements beyond 20_10 percent of that identified in Title 24, Part 6 Energy Efficiency Standards:
 - Use of low-emissions water heaters;
 - Use of central water-heating systems;
 - Use of energy-efficient appliances;
 - Use of increase insulation;
 - Use of automated controls for air conditioners;
 - Use of energy-efficient parking lot lighting; and
 - Use of lighting controls and energy-efficient lighting.
 - Utilize low-VOC interior and exterior coatings during project repainting.
 - Provide on-site improvements such as sidewalks or pedestrian walkways to promote pedestrian activity and reduce the amount of vehicle trips.
 - Installation of skylights and energy-efficient lighting that exceeds California Title 24 standards where feasible, including electronic dimming ballasts and computer-controlled daylight sensors in the buildings.
 - Shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and building shall be planted at the proposed project site. These strategies will minimize the heat island effect and thereby reduce the amount of air conditioning required.
 - Strategies to be considered include fans to assist natural ventilation, centralized water and space conditioning systems, high efficiency individual heating and cooling units, and automatic setback thermostats.
 - Reduction of energy demand associated with potable water conveyance through the following methods:
 - Incorporating drought-tolerant plants into the landscaping palette; and
 - Use of water-efficient irrigation techniques.
 - Energy-efficient low-pressure sodium parking lot lights or lighting equivalent as determined by the City, shall be used;
 - Buildings shall be oriented north-south where feasible;
 - Implement an on-site circulation plan in parking lots to reduce vehicle queuing;
 - Develop a trip reduction plan to achieve 1.5 average vehicle ridership (AVR) for businesses with fewer than ~~400~~ 250 employees or multitenant worksites;
 - Include bicycle parking facilities such as bicycle lockers and racks;
 - Include showers for bicycling employees use; and

- Construct on-site pedestrian facility improvements such as building access that is physically separated from street and parking lot traffic and walk paths.

Section 4.3.6.6 Project-Related Localized Operational Emission Impacts (pages 4.3-35 through 4.3-37)

Mitigation Measure 4.3.6.6A has been modified to address concerns expressed by the South Coast Air Quality Management District (Letter B-3), Sierra Club (Letter D-2), and Johnson & Sedlack (Letter D-3). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.3.6.6A Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of ~~20~~ 10 percent until January 1, 2014. For building permits issued after that date, new state energy standards require a 20 percent reduction from 2008 Title 24, Part 6 Energy Efficiency Standards. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. ~~Any combination of~~ The following design features ~~including but not limited to the following list~~ shall be used to fulfill this requirement:

- Buildings shall exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.
- Increase in insulation such that heat transfer and thermal bridging is minimized.
- Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.
- Incorporate dual-paned or other energy efficient windows.
- Incorporate energy efficient space heating and cooling equipment.
- Interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards shall be installed, as deemed acceptable by the City. Automatic devices to turn off lights when they are not needed shall be implemented.
- To the extent that they are compatible with landscaping guidelines established by the City, shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings shall be planted at the project site.
- Paint and surface color palette for the project shall emphasize light and off-white colors which reflect heat away from the buildings.
- All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.
- To reduce energy demand associated with potable water conveyance, the project shall implement the following:
 - Landscaping palette emphasizing drought-tolerant plants;
 - Use of water-efficient irrigation techniques; and,
 - U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.
- The project shall provide secure, weather-protected, on-site bicycle storage/parking.

- The project shall provide on-site showers (one for males and one for females). Lockers for employees shall be provided.
- The project will establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce greenhouse gas (GHG) emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.
- The project shall provide preferential parking for carpools and vanpools. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, preferential parking for carpools and vanpools shall be delineated on the project site plan.
- The project shall provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, stub outs for charging stations shall be indicated on the project building plans.
- Lease/purchase documents shall identify that tenants are encouraged to promote the following:
 - Implementation of compressed workweek schedules.
 - SmartWay partnership;
 - Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long-haul trips carried by SmartWay 1.0 or greater carriers.
 - Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long-haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers.
 - Use of fleet vehicles conforming to 2010 air quality standards or better.
 - Installation of catalytic converters on gasoline-powered equipment.
 - Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.
 - Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles.
 - Provision of preferential parking for EV and CNG vehicles.
 - Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.
 - Use of electric (instead of diesel or gasoline-powered) yard trucks.
 - Use of SmartWay 1.25 rated trucks.
 - Each facility operator shall provide regular sweeping of onsite parking and drive areas using street sweepers that comply with applicable SCAQMD Rules.

- Each facility operator shall maintain a log of all trucks entering the facility to ensure that, on average, the daily truck fleet meets applicable air quality emission standards. This log shall be available for inspection by City staff at any time.
- Each facility operator shall prohibit all vehicles from idling in excess of five minutes in all onsite areas.
- Each facility operator shall ensure that onsite staff in charge of keeping the daily log and monitoring for excess idling will be trained and certified in diesel health effects and technologies, such as by requiring attendance at CARB-approved courses.
- Each facility operator which upon occupancy does not already operate 2007 and newer trucks shall in good faith be required to apply for funding to replace or retrofit their trucks such as Carl Moyer, VIP, Prop 1B or similar funds. Should funds be awarded, the tenant shall be required to accept and use them.

Draft EIR, Section 4.4, BIOLOGICAL RESOURCES

4.4.1 Existing Setting

4.4.1.2 Vegetation (page 4.4-4)

... Until December 2013, agriculture-citrus (citrus tree orchards) occurred on the northwestern, northeastern, and east-central portions of the project site and occupied approximately 57.2 acres. The trees were removed recently to avoid additional maintenance and irrigation costs, and to help reduce fire safety issues. Approximately 47.4 acres of ruderal vegetation occurs on the project site and is dominated by weedy vegetation that is typically associated with a past disturbance (agriculture).

Section 4.4.6.2, Riparian Habitat or Other Sensitive Natural Communities (page 4.4-29)

Impact 4.4.6.2: *The proposed project has the potential to permanently affect 0.36 acre of riparian/riverine habitat and to temporarily affect 0.35 acre of riparian/riverine habitat.*

Threshold	Would the proposed project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?
-----------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The project site consists of highly disturbed land from which most natural vegetation has been removed by regular disking for weed abatement and historical citrus cultivation.

NOTE: *The removal of the citrus trees in December 2013 does not affect the conclusions of the DEIR regarding biological impacts or mitigation.*

MITIGATION NOTE: *Based on a pre-application MSHCP project meeting with CDFG, USFWS, RCA, and RWQCB that occurred on October 10, 2012, the following minor changes and clarifications have been made to the indicated mitigation measures, mainly to incorporate temporary impacts into the compensation for permanent impacts but also to make the EIR mitigation measures consistent with the DBESP implementation measures:*

4.4.6.2A As outlined in the project's Determination of a Biologically Equivalent or Superior Preservation (DBESP) report, the project applicant shall compensate for the temporary and permanent impact on and loss of jurisdictional waters and streambeds by providing a minimum 2:1 off-site replacement of equivalent riverine/riparian habitat prior to project construction. (0.36 acre impact = 0.72 acre replacement). This off-site replacement shall be accomplished through the contribution of in-lieu fees to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of riparian habitat adjacent to the tributaries of the San Jacinto River or within the Santa Ana River watershed. Documentation of acceptance of the SAWA contribution shall be provided to the City prior to issuance of a grading permit. Offsite restoration, enhancement, and/or land purchase mitigation for the drainage impacts will occur at an offsite location through one or more of the following: an USACE approved mitigation bank, through an in lieu fee mitigation program, and/or land purchase and conservation. DFG and USFWS will need to provide concurrence that this mitigation is equivalent or superior to that proposed for impact through their review and acceptance of the DBESP.

4.4.6.2B ~~The project applicant shall retain qualified personnel to prepare and implement a Habitat Mitigation and Monitoring Plan (HMMP) to oversee restoration of temporarily affected areas (0.35 acre of riverine/riparian habitat) to their pre-construction contours and vegetation. The HMMP will be approved by USACE and CDFG prior to the City issuing any occupancy permits. Riparian/riverine resources that are temporarily impacted by project construction shall be returned to their preconstruction contours and hydroseeded, as outlined in the DBESP.~~

NOTE: *The DBESP replaces the need for a separate Habitat Mitigation and Monitoring Plan.*

Section 4.4.6.3, Jurisdictional Waters/Wetlands (page 4.4-31)

4.4.6.3A ~~The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE and a Section 1602 Streambed Alteration Agreement from the CDFG. Direct temporary impacts to more than 0.1 acre of jurisdictional area that are regulated by the USACE, CDFG, and RWQCB shall be mitigated at a 2:1 ratio, including enhancement and/or creation of wetlands or the contribution of in-lieu fee to the Santa Ana Watershed Association (SAWA) for its efforts in removal of invasive plants and restoration of off-site riparian habitat, as outlined in Mitigation Measure 3.3.6.2A. The project applicant shall obtain a Section 404 Nationwide or Individual Permit, as appropriate, from the USACE, a Section 401/Porter-Cologne Water Quality Certification from the RWQCB, and a Section 1602 Streambed Alteration Agreement from the CDFG. Offsite restoration, enhancement, and/or land purchase mitigation of jurisdictional drainage impacts will occur at an off-site location through one or more of the following: an USACE approved mitigation bank, through an in-lieu fee mitigation program, and/or land purchase and conservation.~~

Draft EIR, Section 4.5, CULTURAL AND PALEONTOLOGICAL RESOURCES

Section 4.5.6.1 Prehistoric Cultural Resources (page 4.5-6)

All of the mitigation measures were modified to better address concerns expressed by the Pechanga Band and Morongo Tribe (Letters A-4 and A-5, respectively). These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR, and are shown below:

- 4.5.6.1A** Prior to the issuance of a grading permit, the Project Applicant shall provide evidence to the City of Moreno Valley that a Cultural Resources Monitoring Agreement has been secured for qualified Tribal representatives, and that a professional archaeological monitor meeting Secretary of Interior standards has been retained by the Applicant to conduct monitoring of all mass grading and trenching activities and has the authority to temporarily halt and redirect earthmoving activities in the event that suspected archaeological resources are unearthed during Project construction. The Project Archaeologist and Tribal representatives shall attend the pre-grading meeting with the City and contractors to explain and coordinate the requirements of the monitoring program.
- 4.5.6.1B** Prior to the issuance of a grading permit, the Applicant shall provide evidence to the City of Moreno Valley that appropriate Native American representative(s), Project Archaeologist, and the Tribal representative(s) shall be allowed to monitor and have received a minimum of 30 days advance notice of all mass grading and trenching activities. During grading and trenching operations, the Tribal representatives and the project archaeological monitor shall observe all mass grading and trenching activities per the Cultural Resources Monitoring Agreement. If the Tribal representatives suspect that an archaeological resource may have been unearthed, the archaeologist, in consultation with the tribal representative, shall immediately halt and redirect grading operations in a 100-foot radius around the find to allow identification and evaluation of the suspected resource. In consultation with the appropriate Native American Tribe(s), the archaeological monitor shall evaluate the suspected resource and make a determination of significance pursuant to California Public Resources Code Section 21083.2.
- 4.5.6.1C** If a significant archaeological resource(s) is discovered on the property, ground disturbing activities shall be suspended 100 feet around the resource(s). The archaeological monitor and representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division shall confer regarding mitigation of the discovered resource(s). A treatment plan and/or preservation plan shall be prepared and by the archaeological monitor and reviewed by representatives of the appropriate Native American Tribe(s), the Project Applicant, and the City Planning Division and implemented by the archaeologist to protect the identified archaeological resource(s) from damage and destruction. The landowner shall relinquish ownership of all archaeological artifacts that are of Native American origin found on the Project site to the culturally affiliated Native American tribe(s) for proper treatment and disposition. A final report containing the significance and treatment findings shall be prepared by the archaeologist and submitted to the City Planning Division, the appropriate Native American tribe(s), and the Eastern Information Center at the University of California, Riverside. All cultural material, excluding sacred, ceremonial, grave goods and human remains, collected during the grading monitoring program and from any previous archaeological studies or excavations on the project site shall be curated, as determined by the treatment plan, according to the current professional repository standards and may include the Pechanga Bands curatorial facility.

4.5.6.1D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:

"If any suspected archaeological resources are discovered during ground-disturbing activities and the archaeological monitor or Tribal representatives are not present, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call the project archaeologist and the Tribal representatives to the site to assess the significance of the find."

Although DEIR Section 4.5.5.2, Human Remains, concludes potential impacts of the project will be less than significant with compliance with state law, Mitigation Measure 4.5.6.1E has been added at the request of the tribe to help assure there will be no significant impacts related to the potential discovery of human remains during grading:

4.5.6.1E If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. Further, pursuant to California Public Resources Code Section 5097.98(b), remains shall be left in place and free from disturbance until a final decision as to the treatment and disposition has been made by the Coroner. If the Riverside County Coroner determines the remains to be Native American, the California Native American Heritage Commission must be contacted within 24 hours. The Native American Heritage Commission must then immediately notify the "most likely descendant(s)" of receiving notification of the discovery. The most likely descendant(s) shall then make recommendations within 48 hours, and engage in consultations concerning the treatment of the remains as provided in Public Resources Code §5097.98.

Section 4.5.6.2, Paleontological Resources

The following mitigation measure was added to address general concerns expressed by the Pechanga Band and Morongo Tribe (Letters A-4 and A-5, respectively).

4.5.6.2D Prior to grading permit issuance, the City shall verify that the following note is included on the Grading Plan:

"If any suspected paleontological resources are discovered during ground-disturbing activities, the construction supervisor is obligated to halt work in a 100-foot radius around the find and call a qualified paleontologist to the site to assess the significance of the find. A qualified paleontologist shall evaluate the suspected resource. If the paleontologist determines that the find is not unique, construction shall be permitted to proceed. However, if the paleontologist determines that further information is needed to evaluate significance, the City of Moreno Valley shall be notified and a treatment plan shall be prepared and implemented in consultation with the City to protect the identified paleontological resource(s) from damage and destruction."

Draft EIR Section 4.6, HAZARDS AND HAZARDOUS MATERIALS

Section 4.6. Significant Impacts

This section did not identify any significant impacts related to hazardous materials, including past use of pesticides on the project site in the past. However, the following measure is proposed in response to comments in Letter D-4 in this regard:

4.6.6.1A Prior to issuance of a grading permit for the project, a qualified contractor shall test onsite soils for contamination by agricultural chemicals. If present in concentrations above established actionable levels or thresholds, these materials shall be removed and transported to an appropriate landfill by a licensed contractor. This measure shall be implemented to the satisfaction of the Building Division including written documentation of the disposal of any agricultural chemical residue in conformance with all applicable regulations.

Draft EIR Section 4.9, NOISE

Section 4.9.6.1 Short-Term Construction Noise Impacts (pages 4.9-26 and 4.9-27)

Mitigation Measure 4.9.6.1D was amended to be consistent with the City's Municipal Code for noise and to specify hourly limits for work nearest the existing residences. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.9.6.1D. During all project site construction activities at Building 6 (i.e., closest to existing residences), the construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and holidays, unless written approval is obtained from the City Building Official or City Engineer for specific construction activities that must be conducted outside of the permitted time periods.

Draft EIR Section 4.11 TRANSPORTATION

Section 4.11. (page 4.11-14)

Section 4.11.6.6 Mitigation Measures (page 4.11-31)

The following text has been amended to clarify the intension of the measure. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.11.6.4A Prior to issuance of a building permit Certificate of Occupancy, the project applicant shall construct pay the fair share contribution toward the following traffic improvements through fees paid to the City of Moreno Valley based on the City's DIF system and the County's TUMF program:

- **Redlands Boulevard/SR-60 Westbound Ramps.** Install a traffic signal. This improvement is currently approved, and permitted by Caltrans. If not otherwise completed prior to project opening, the required traffic signal shall be constructed by the Applicant prior to issuance of the first Certificate of Occupancy.
- **Redlands Boulevard/Fir Avenue/Eucalyptus Avenue.** If not otherwise completed prior to project opening, prior to issuance of the first Certificate of Occupancy, the Applicant shall construct the following improvements: Install a traffic signal and ~~This improvement is listed in the City's DIF program.~~ Add a northbound left-turn lane and a southbound left-turn lane. ~~These improvements are listed in the TUMF.~~

If the improvements are constructed by others prior to the Certificate of Occupancy, the applicant shall pay its fair share towards the improvements through the City's DIF program.

Draft EIR Section 4.12, UTILITIES AND SERVICE SYSTEMS

Section 4.12.1.7 Cumulative Impacts to Solid Waste Services (page 4.12-5)

The following text has been amended to clarify the Badlands Sanitary Landfill is scheduled to close in 2024 not 2016. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

AB 939 mandates the reduction of solid waste disposal in landfills. While the Badlands Sanitary Landfill has an estimated closure date of ~~2016~~ 2024, as previously identified, the City's waste hauler will also use other County landfills in the area (e.g., Lamb Canyon Landfill and El Sobrante Landfill). The estimated closure date of the Lamb Canyon Landfill is 2023 and the estimated closure date of the El Sobrante Landfill is 2030. With planned expansion activities of landfills in the project vicinity and projected growth rates contained within the City's General Plan EIR, sufficient landfill capacity would exist to accommodate future disposal needs through City build out in 2030. Therefore, build out of the City General Plan would not create demands for solid waste services that would exceed the capabilities of the County's waste management system. Consequently, cumulative impacts associated with solid waste within the City would be considered less than significant.

Draft EIR 4.13, GLOBAL CLIMATE CHANGE

Section 4.13.6.1 Greenhouse Gas Emissions (page 4.13-20)

The following text has been amended to clarify the intension of the measure. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

- 4.13.6.1B.** Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been incorporated into the design and construction of the project:
- Use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project.
 - Use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project.
 - Limit unnecessary idling of construction equipment. A reduction in equipment idling would reduce fuel consumption, and therefore, GHG emissions.
 - Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants.
 - Design the project building to exceed the California Building Code's (CBC) Title 24 energy standard, including, but not limited to, any combination of the following:
 - Increase insulation such that heat transfer and thermal bridging is minimized.
 - Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.

- Incorporate ENERGY STAR or better rated windows, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment.
- Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping.
- Install efficient lighting and lighting control systems. Use daylight as an integral part of the lighting systems in buildings.
- Install light-colored “cool” roof and cool pavements.
- Install energy-efficient heating and cooling systems, appliances and equipment, and control systems.
- Install solar or light-emitting diodes (LEDs) for outdoor lighting for auto parking areas.

Draft EIR 6.0, ALTERNATIVES

Section 6.5 Environmentally Superior Alternative (page 6-39)

There was a typographical error in Table 6.M under Alternative 5 for Air Quality that has been rectified below. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

Table 6.M: Summary of Significant Environmental Impacts of the Project Alternatives

Topic	Proposed Project Impact	Impacts of Alternatives ¹					
		PP	1	2	3	4	5
Aesthetics	Scenic Vistas	S			S		
Aesthetics	Scenic Resources and Scenic Highways	S			S

Alternative 3: Reduced Intensity
Alternative 4: Mixed Commercial/Office/Residential
Alternative 5: Off-Site Location
S = Significant

4. REDUCED INTENSITY ALTERNATIVE EVALUATION

Based on input received at the City's public hearings and after completion of the Final EIR on April 2, 2014, the applicant is proposing the City adopt the Reduced Intensity Alternative evaluated in the DEIR (pages 6-18 through 6-24 and 6-37 through 6-40). The Reduced Intensity Alternative evaluated developing 25% less warehousing on the site (1.7 million square feet) compared to the Proposed Project (2.2 million square feet). The applicant has now proposed to develop only 4 of the 6 warehouse buildings (1.5 million square feet) which is consistent with the Reduced Intensity Alternative evaluated in DEIR Section 6.0 (1.7 million square feet). The DEIR did not contain a specific site plan depicting the Reduced Intensity Alternative, so the applicant has prepared a conceptual site plan referred to in this analysis as the "less intensive modified plan".

The proposed less intensive modified plan is consistent with the Reduced Intensity Alternative and proposes that 84.8 acres of the site would be developed for warehousing while the remaining 38 acres would remain undeveloped at this time. The vacant land would retain its existing General Plan and zoning designations (R2 and R5). This less intensive modified plan represents a net decrease in square footage of approximately 32 percent compared to the original Proposed Project, and a 7 percent reduction in square feet compared to the Reduced Intensity Alternative evaluated in the DEIR (see Table 4.A). The less intensive modified plan removes the two industrial buildings (Buildings 5 and 6 in the original site plan) closest to the residential homes southeast of the project site.

Warehouse buildings under the less intensive modified plan are 1,515 feet from the nearest existing residential neighborhood (southwest), and 1,636 feet from the existing neighborhood at the southeast corner. The less intensive modified plan also provides a 250-foot buffer between the nearest warehouse truck court and future residential uses. In addition, the large detention basin that was proposed at the south end of Building 6 in the original plan would be moved to near the southeast corner of Building 4 in the less intensive modified plan. Approval of this modified plan would also establish a minimum 250-foot buffer from truck activity areas and future residential uses on the former location of warehouse buildings 5 and 6 under the original plan. Otherwise, the development characteristics of Buildings 1 through 4 would remain the same as those outlined and analyzed in the Draft EIR. For the purposes of this environmental analysis, the less intensive modified plan is considered equivalent to the Reduced Intensity Alternative except where noted that impacts are less than those of the Reduced Intensity Alternative. The conceptual land plan for the less intensive modified plan is shown in Figure 4.2 in this section. Table 4.A presents the land uses and ITE rates of the four scenarios evaluated in the following sections.

It is important to emphasize that the less intensive modified plan would allow development of future residential uses in the southeast portion of the project site, consistent with the existing R-5 and RA-2 zoning (Parcel 5), adjacent to the existing residential neighborhood to the southeast. The modified plan also has a 250-foot setback from the project warehouses to the future residential uses, consistent with the City's municipal code requirements (i.e., use of a 250-foot buffer and a non-building easement over a portion of Parcel 5).

Table 4.A: Land Use Characteristics Evaluation Scenarios

Land Use (ITE rate) Characteristics	Land Use Scenario			
	Proposed Project	Existing Zoning	Reduced Intensity Alternative (EIR)	Less Intensive Modified Plan ¹
Warehousing (152)				
Square Footage	2,244,600	0	1,683,000	1,529,500
Gross Acres	122.8	0	90.8	84.8
Vacant Acres	0	0	32.0	(38.0)
Business Park/Business Park Mixed Use (770)				
Square Footage	0	622,000	0	0
Gross Acres	0	48.3	0	0
Multi-Family (230) Residential (R-15)				
Units	0	548	0	0
Gross Acres	0	36.5	0	0
Single Family (210) Residential (R-5 & R-2)				(Future)
Units	0	133	0	126
Gross Acres	0	38.0	0	38.0
TOTAL				
Square Feet	2,244,600	622,000	1,683,000 (-25%)	1,529,000 (-32%)
Units	0	681	0	126
Gross Acres	122.8	122.8	122.8	122.8

Source: ProLogis data and trip generation table from LSA Traffic Group, September 2014 (See FEIR Appendix F)

¹ **NOTE:** Residential units under this plan would be built at some later by a different developer with separate CEQA review. This plan is a sub-set of the Reduced Intensity Alternative from the DEIR, it is **NOT** a new alternative.

Less Intensive Modified Site Plan

This Page Intentionally Left Blank

It should be noted that the 38 acres of residential uses shown in Table 4.A for the less intensive modified plan are only approximate, and the actual acreage will be based on appropriate development constraints, development impact fees, and conditions of approval imposed on the property during the City's development review process of the revised parcel map and revised tentative tract map.

The following analysis is based on Section 6.3.3 of the DEIR but goes into more detail based on development details of the less intensive modified plan. Table 4.D at the end of this section summarizes the impacts of the less intensive modified plan compared to both the Proposed Project and the Reduced Intensity Alternative evaluated in the DEIR. In addition, this analysis shows what the impacts of developing the site under its existing zoning designations (i.e., with Business Park/Business Park-Mixed Use, Residential 15, Residential 5, and Residential 2 uses).

4.1 Aesthetics

- (a) **Proposed Project** – Project would introduce 6 large warehouse buildings into the area, with existing residential uses adjacent to the southeast. Impacts from loss of views and new night lighting are significant even with mitigation.
- (b) **Existing Zoning** – Development of the site under existing zoning designations would result in the alteration of the existing visual character of the site but with new residential uses adjacent to the existing residences to the southeast, and development intensity increasing from R2 next to the existing residences to more dense R5 and R15 uses to the north along Eucalyptus Avenue. This pattern would be consistent with that outlined in the existing General Plan and zoning. New development would adhere to City design and development standards for each particular land use, but would still be a substantial change from existing vacant conditions.
- (c) **Reduced Intensity Alternative** – Impacts to views and lighting are substantially reduced by eliminating 25% of development in the southeast portion of the site compared to the Proposed Project. However, impacts are still significant, similar to the Proposed Project.

Under the less intensive modified plan impacts to views and lighting are substantially reduced by eliminating 32% of development proposed in the southeast portion of the site (Buildings 5 and 6) compared to the Proposed Project. However, impacts are still significant compared to the Proposed Project.

- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, but impacts of all three are significant due to the fundamental change in character for the area from existing conditions.

4.2 Agricultural Resources

- (a) **Proposed Project** – Project would introduce 6 large warehouse buildings onto an area designated as Prime Farmland and Farmland of Local Importance. Impacts from the loss of prime agricultural lands are significant and no mitigation is available.
- (b) **Existing Zoning** – Development of the project site with urban uses would result in the conversion of Prime Farmland. Impacts associated with development of this alternative would be significant and unavoidable.
- (c) **Reduced Intensity Alternative** – Impacts to farmland would be substantially reduced by eliminating 25% of development (i.e., in the southeast portion of the site) compared to the Proposed Project. Impacts are less than significant.

Under the less intensive modified plan, impacts to farmland would be substantially reduced by eliminating 32% of proposed development (i.e., Buildings 5 and 6 in the southeast portion

of the site) compared to that planned under the Proposed Project. Agricultural impacts associated with the development of the less intensive modified plan are less than significant as no development would occur (i.e., the land would remain at least temporarily vacant) in the southeast portion of the site. However, it is likely that the southeast corner of the project site would eventually be developed with residential uses. Subsequent CEQA analysis would need to be conducted at that time regarding all impacts of that proposed residential development on approximately 38 acres (see previous Table 4.A). The loss of this agricultural land would be temporarily delayed under this development scenario.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced to less than significant levels compared to the Proposed Project.

4.3 Air Quality

- (a) **Proposed Project** – Project would produce operational air pollutant emissions except for SO_x above CEQA threshold limits (see Table 4.B below). Impacts from increased air quality emissions would be significant even with mitigation.
- (b) **Existing Zoning** – A similar mix of equipment would operate during earthmoving and construction activities as the Proposed Project. Peak daily construction emissions would be below SCAQMD thresholds of significance for CO, ROC, and SO_x (See Table 4.B below). Although SCAQMD regulations and project-specific mitigation measures would reduce the amount of construction emissions, impacts associated with construction emissions for NO_x remain significant and unavoidable. Although the total number of trips is increased, the volume of each operational pollutant emitted during operation the Existing General Plan would be less since there would be no diesel trucks involved. Operational emissions would continue to exceed SCAQMD significance thresholds for NO_x, CO, and ROG, but would not exceed operational thresholds for PM₁₀ and PM_{2.5}. The impacts for the Existing General Plan development to air quality would be decreased, but the long-term air quality impacts resulting from this alternative would continue to be significant and unavoidable.
- (c) **Reduced Intensity Alternative** - Impacts due to operational air pollutant emissions would be reduced by eliminating 25% of development in the southeast portion of the site compared to the Proposed Project (see Table 4.B below). However, even with a 25% reduction in air quality emissions impacts are still significant even with mitigation.

Under the less intensive modified plan, impacts due to operational air pollutant emissions would be reduced by eliminating 32% of development proposed in the southeast portion of the site (Buildings 5 and 6) compared to the Proposed Project (see Table 4.B below). However, air quality emissions are still significant even with mitigation.

- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however impacts of all three are still significant.

Table 4.B: Comparison of Operational Emissions

Source	Pollutant Emissions (lbs/day)					
	CO	ROC	NO _x	SO _x	PM ₁₀	PM _{2.5}
Proposed Project	1,801	289	2,001	3.1	370	85
Existing Zoning	850	114	230	1.2	130	11
Reduced Intensity Alternative	1,351	217	1,501	2.3	278	64
less intensive modified plan	1,225	197	1,361	2.1	252	58
SCAQMD thresholds	550	55	55	150	150	55

Source: data from DEIR Section 6.0 and extrapolated from LSA Associates, Inc., September 2014

Note: During Public Comment and Hearings many people commented on the health impacts of truck related air pollution. While there are health effects associated with exposure to diesel particulate matter (DPM), the following graphs (Figures 4.3 and 4.4) indicated that compliance with state and federal regulations will substantially reduce diesel-related emissions in the coming years. In addition, the previous Table 4.B compares operational emissions of the proposed project to development under the existing zoning, the Reduced Intensity Alternative in the EIR, and the less intensive modified plan.

4.4 Biological Resources

- (a) **Proposed Project** – Project has the potential to impact migratory bird species, 15 listed special status species (including burrowing owl), riparian/riverine habitat, and jurisdictional waters/wetlands. However, these impacts can be reduced to levels of less than significant by implementation of the recommended mitigation measures.
- (b) **Existing Zoning** – This alternative would result in grading of the entire project site. No plant species listed by the State and/or Federal government as endangered or threatened were identified on site during the field reconnaissance. Similar to the proposed project, potential impacts of site development would be reduced to less than significant levels by implementing mitigation similar to that recommended for the proposed project.
- (c) **Reduced Intensity Alternative** – Impacts to migratory birds and riparian/riverine habitat would be reduced to less than significant in this alternative compared to the proposed project due to the elimination of 25% of development in the southeast portion of the site. This alternative would still have significant impacts related to jurisdictional water/wetlands and listed species (including burrowing owl), which would be reduced to less than significant levels by mitigation measures similar to the proposed project.

Under the less intensive modified plan, impacts to biological resources would be reduced compared to the Proposed Project due to the elimination of development in the southeast corner. Like the Reduced Intensity Alternative, the less intensive modified plan would have less than significant impacts to migratory birds and riparian/riverine habitat with mitigation. In addition, recommended project mitigation would reduce impacts to jurisdictional water/wetlands and listed species (including burrowing owl) to less than significant levels.

- (d) **Summary** – The Reduced Intensity Alternative, including the less intensive modified plan, have impacts to migratory birds, riparian/riverine habitat, jurisdictional water/wetlands, and listed species (including burrowing owl) that can be mitigated to less than significant levels with implementation of recommended mitigation.

4.5 Cultural Resources

- (a) **Proposed Project** – No cultural resources have previously been detected within the project limits. However, as undetected cultural or paleontological resources could be encountered so mitigation was recommended to reduce potential impacts to less than significant levels.
- (b) **Existing Zoning** – Development would result in ground-disturbing activities affecting the entire project site, and similar archaeological and paleontological impacts would be anticipated when compared to the Proposed Project. Adherence to the archaeological and paleontological mitigation measures identified for the proposed project would reduce impacts to less than significant, and no greater impacts would occur with this alternative.
- (c) **Reduced Intensity Alternative** – Similarly to the proposed project, this alternative would include ground-disturbing activities all but 34 acres in the southeast portion of the project site. Similar archaeological and paleontological impacts would be anticipated when compared to the Proposed Project. Therefore, adherence to the archaeological and paleontological mitigation measures identified for the proposed project would reduce impacts to less than significant levels. Compared with the proposed project, no greater impact would occur with this alternative.

The development area of the less intensive modified plan is smaller than the Proposed Project, so implementation of the recommended mitigation would reduce potential impacts to less than significant levels.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are similar compared to the Proposed Project, and all three would have the same mitigation which would reduce potential impacts to less than significant levels.

4.6 Forest Resources

- (a) **Proposed Project** – The City of Moreno Valley's General Plan does not identify any forest resources on the project site or surrounding area, and the project site is currently vacant, although it did support citrus trees in the past. Therefore, no significant impact would occur in relation to forest resources.
- (b) **Existing Zoning** – The City of Moreno Valley's General Plan does not identify any forest resources on the project site or surrounding area. Therefore, there are no significant impacts under the any development scenario for the project site.
- (c) **Reduced Intensity Alternative** – Although the Reduced Intensity Alternative project site is smaller than the Proposed Project site, the site is still in the same location. Therefore, like the Proposed Project, no significant impacts related to forest resources would occur.

Under the less intensive modified plan, development would be located on the same site as the Proposed Project. Therefore, no significant impacts to forest resources would occur.
- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are the same as the Proposed Project. No reduction in impact would occur.

4.7 Geology and Soils

- (a) **Proposed Project** – The Proposed Project, like all of southern California, would be subject to moderate to severe ground shaking. However, with adherence to UBC, the California Building Code, and City design and engineering standards. Impacts associated with this issue would be considered less than significant.
- (b) **Existing Zoning** – Development of the Existing General Plan would have geologic and soil-related impacts since the project site is located in a seismically active area and is subject to ground shaking resulting from activity on local and regional faults. Development of the proposed project site would be required to adhere to UBC, the California Building Code, and City design and engineering standards. Impacts associated with this issue would be considered less than significant.
- (c) **Reduced Intensity Alternative** – Although the Reduced Intensity Alternative project site is smaller than the proposed project site, the site is still in the same location. Therefore, like the Proposed Project adherence to UBC, the California Building Code, and City design and engineering standards will reduce significant impacts to less than significant levels.

The less intensive modified plan is the same site as the Proposed Project. Therefore, no significant impacts related to ground shaking would occur with adherence to UBC, the California Building Code, and City design and engineering standards.
- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are essentially the same as the Proposed Project. No reduction in impact would occur.

4.8 Global Climate Change

- (a) **Proposed Project** – Project would produce greenhouse gas emissions above CEQA threshold limits. Impacts from increased greenhouse gas emissions would be significant and require mitigation. The recommended measures would reduce potential climate change impacts to less than significant levels.
- (b) **Existing Zoning** – GHG emissions would increase as development under existing zoning designations would measurably increase the number of daily trips made to the site. Implementation of the mitigation recommended for the proposed project, or similar measures applicable to residential projects, could help keep these emissions at less than significant

levels, but this impact would need to be evaluated in a subsequent CEQA document when specific development was proposed.

- (c) **Reduced Intensity Alternative** – Impacts due to greenhouse gas emissions would be reduced by eliminating 25% of development in the southeast portion of the site compared to the Proposed Project. However, even with a 25% reduction in air quality emissions impacts are still significant and require mitigation measures similar to those recommended for the proposed project which would reduce impacts to less than significant levels.

Under the less intensive modified plan, impacts due to greenhouse gas emissions would be reduced by eliminating 32% of development planned in the southeast portion of the site (Buildings 5 and 6) compared to the Proposed Project. GHG emissions would require the recommended project mitigation to reduce levels to less than significant levels.

- (d) **Summary** - Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, but implementation of the required project mitigation would reduce GHG emission and climate change impacts to less than significant levels for all the other development scenarios.

4.9 Hazards and Hazardous Materials

- (a) **Proposed Project** – The Proposed Project would result in the on-site handling of hazardous substances, both during project construction and operation. However, adherence to existing regulations related to the handling and transport of potentially hazardous materials during construction and operation would reduce impacts to less than significant levels.
- (b) **Existing Zoning** – Development of the site according to existing zoning designations would result in the on-site handling of hazardous substances, both during project construction and operation. All development in the City is required to adhere to existing local, State, and Federal regulations pertaining to hazardous materials, therefore, impacts associated with hazards and hazardous materials under this alternative would be reduced in magnitude and would remain at less than significant levels.
- (c) **Reduced Intensity Alternative** – Because the Reduced Intensity Alternative would construct fewer warehouse uses, impacts associated with the transport or use of hazardous materials or potential upsets or accidents may be reduced in magnitude due to the reduced quantities of hazardous materials that would be present on the site. Similar to the Proposed Project, the Reduced Intensity Alternative would be required to adhere to applicable local, State, and Federal standards associated with hazards and hazardous materials. Impacts of the Reduced Intensity Alternative would remain at less than significant levels, similar to the Proposed Project.

Under the less intensive modified plan, impacts related to hazardous materials would be further reduced compared to the Reduced Intensity Alternative. In addition, like all projects in the City, the less intensive modified plan would be required to adhere to applicable local, State, and Federal standards associated with hazards and hazardous materials. The Reduced Intensity Alternative would remain less than significant, similar to the Proposed Project.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however impacts of all three are still less than significant with implementation of the recommended mitigation.

4.10 Hydrology and Water Quality

- (a) **Proposed Project** – The Project would modify existing on-site pattern of drainage and would require the installation of drainage improvements that may include detention/retention basins, connected to existing in-street drainage features, on-site storm drains, and other features.

- The project proposes three basins south of building 2 north of Eucalyptus Avenue and a basin south of buildings 5 and 6. With adherence to required local, State, and Federal policies pertaining to surface and groundwater resources, NPDES requirements, SWPPP, BMPs, and preparation of a WQMP impacts related to hydrology and water quality would be less than significant.
- (b) **Existing Zoning** – Development of the site under existing zoning designations would require the modification of the existing on-site pattern of drainage and would require the installation of drainage improvements that may include detention/retention basins, connection to existing in-street drainage features, on-site storm drains, and other features. The extent of the impermeable surfaces (parking area) would be similar to the project so it would have similar environmental impacts to the Proposed Project. All local, State, and Federal policies and regulations pertaining to surface water and groundwater resources would remain in effect under the existing zoning. Any development of the site has the potential to affect water quality due to sedimentation and erosion, runoff from paved surfaces, and contamination caused by a mixture of sediment, debris, and other contaminants. However, construction of any onsite land uses would be required to follow applicable NPDES requirements, including the preparation of and adherence to an SWPPP and BMPs. A standard condition with any such development would be the preparation and implementation of a WQMP, which would effectively mitigate post-construction water quality impacts from the developed area. Similar to the Proposed Project, potential impacts related to hydrology and water quality would be less than significant.
- (c) **Reduced Intensity Alternative** – Due to the smaller development area of the Reduced Intensity Alternative, this scenario would have a reduced impact on the project site compared to the Proposed Project. However, development of this alternative would still require the modification of the existing onsite pattern of drainage. Adherence with required local, State, and Federal policies pertaining to surface and groundwater resources, NPDES requirements, SWPPP, BMPs, and preparation of a WQMP would reduce impacts to less than significant levels.
- Similar to the Reduced Intensity Alternative, the less intensive modified plan would reduce impacts to the project site by not constructing buildings 5 and 6 proposed in the southeast corner. However, this project would still require the installation of drainage improvements that may include detention/retention basins, connection to existing in-street drainage features, on-site storm drains, and other features. The less intensive modified plan proposes three basins south of Building 2 above Eucalyptus Avenue, similar to the proposed project, a small additional basin south of Building 1, and a basin east of Building 4. Similar to the Proposed Project the less intensive modified plan would be required to adhere to local, State, and Federal policies pertaining to surface and groundwater resources, NPDES requirements, SWPPP, BMPs, and preparation of a WQMP. Impacts would be less than significant.
- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however impacts of all three are still less than significant.

4.11 Land Use and Planning

- (a) **Proposed Project** – The project would require a General Plan Amendment that would change the General Plan designations of the project site from Residential to Business Park and an amendment to the Circulation Element of the General Plan. A Zone Change from Business Park (BP), Multi-Family Residential (R-15), Suburban Residential (R-5), and Residential Agriculture (RA-2) to Light Industrial for the project site would also be required. In addition, the Proposed Project would be inconsistent with regional projections and the City's

Housing Element. Due to the lack of feasible mitigation this is a significant and unavoidable impact.

- (b) **Existing Zoning** – Development of this alternative would not require a General Plan Amendment for the residential uses or business park uses as these uses are allowed under the existing land use designations. However, the business park component of this alternative would require a change of zone to allow the construction of buildings greater than 50,000 square feet. This alternative would comply with applicable provisions of local and regional plans (e.g., Water Quality Control Plan and Air Quality Management Plan). Compliance with applicable City policies related to development within the project site would ensure that on-site alternative uses would be compatible with existing development in the project area. However, since the development envisioned under this Existing General Plan has already been tentatively approved by the City, this alternative would not require a General Plan Amendment. Therefore, land use impacts associated with this scenario would be reduced to less than significant levels. This alternative would also be fully consistent with the City's Housing Element regarding future sites for affordable housing (i.e., R-15 parcels).
- (c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative would require the same General Plan Amendment and Zone Changes excluding the 32 acres in the southeastern corner that would be used as a buffer for the existing residences to the southeast (see previous Table 4.A). This would reduce potential land use impacts associated with the GPA and Zone Change. However, the Reduced Intensity Alternative would still be inconsistent with regional projections and the City's Housing Element. Similar to the Proposed Project, due to the lack of feasible mitigation this is a significant and unavoidable impact.

The less intensive modified plan would be similar to the proposed project and Reduced Intensity Alternative in that it would require the same GPA and Zone Changes. Similar to the Reduced Intensity Alternative the southeast corner of the site would have a 250 foot buffer from any future residential uses, reducing potential land use impacts associated with the GPA and Zone Change. This alternative would leave 38 acres in the southeastern corner of the property temporarily vacant which would act as a buffer for the existing residences to the southeast (see previous Table 4.A). It is expected that this vacant land would eventually be developed with residential uses consistent with the existing General Plan and zoning. Similar to the Proposed Project and the Reduced Intensity Alternative, the less intensive modified plan is inconsistent with regional projections and the City's Housing Element. Therefore, impacts are significant and unavoidable.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however impacts of all three are still significant and unavoidable.

4.12 Mineral Resources

- (a) **Proposed Project** – The project site is not identified as a locally important mineral resource recovery site. Therefore, no impact related to mineral resources would occur.
- (b) **Existing Zoning** – Development of the project site with any build scenario would not result in the loss of or reduce the availability of mineral resources or the resource base from which they would be derived. No impact to mineral resources would occur.
- (c) **Reduced Intensity Alternative** – Although the Reduced Intensity Alternative project site is smaller than the Proposed Project site, the site is still in the same location. Therefore, like the proposed project no significant impacts related to mineral resources would occur.

The less intensive modified plan is also located on the same site as the Proposed Project. Therefore, no impact related to mineral resources would occur.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however all three are located on the same site and therefore have less than significant impacts on mineral resources.

4.13 Noise

- (a) **Proposed Project** – Project would produce construction noise levels that would require mitigation measures to reduce short-term noise impacts to levels of less than significant. However, project-related traffic noise would not be perceptible and therefore is considered a less than significant impact.
- (b) **Existing Zoning** – Development of the site under existing zoning designations would require the implementation of mitigation measures to reduce construction noise impacts to less than significant levels. The short-term noise impacts resulting from project construction and stationary noise impacts associated with the operation of the shopping center would be similar and remain less than significant with mitigation incorporated.

The increase in project-related traffic for this scenario would result in an incremental increase in traffic noise which increases the overall mobile source noise impact. Parking lot noise, mechanical ventilation noise, and noise from the loading docks would still occur under this alternative. In addition, the uses envisioned under the Existing General Plan would increase the number (i.e., more commercial buildings) and extent of noise sources but would still have noise approaching levels below significant levels. Therefore, project-related traffic noise would not be perceptible and therefore is considered a less than significant impact.

- (c) **Reduced Intensity Alternative** – Similar to the Proposed Project, the Reduced Intensity Alternative would have short-term construction noise impacts that would be mitigated to less than significant levels. Because the alternative is smaller than the Proposed Project it would generate less traffic and thereby less traffic-related noise. However, like the Proposed Project, noise impacts of this alternative would be less than significant.

Due to its reduced development footprint, noise impacts on sensitive receptors would be greatly reduced under the less intensive modified plan. If Buildings 5 and 6 are not constructed, the nearest sensitive receptors are 1,515 feet from the nearest warehouse. However, mitigation will still be required to further reduce construction noise impacts. Similar to the Proposed Project, operational noise impacts would be less than significant under this alternative and would still generate traffic onto surrounding streets, with a resulting increase in noise levels.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however construction noise impacts of all three are still less than significant with mitigation.

4.14 Population and Housing

- (a) **Proposed Project** – The proposed project would generate up to 1,532 job opportunities. The new employment opportunities resulting from development of the proposed warehouse uses would improve the City's current jobs-to-housing ratio by providing jobs to local residents. As the jobs would likely be filled by local residents the Proposed Project will not significantly increase the City's population. In addition, the Proposed Project will not displace housing or people.
- (b) **Existing Zoning** – Development under existing zoning designations would result in the development of business park uses making it difficult to conclude if or how many persons from outside of the area may be required to relocate to Moreno Valley to fill positions in the business park. Therefore, it is not possible to determine if this scenario would result in a

population increase in the City. However, the development of single-family and multi-family residential units would result in a direct increase to the existing population, consistent with the City's Housing Element. Potential impacts of this development scenario related to population and housing would be less than significant.

- (c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative would generate 25% fewer jobs compared to the Proposed Project. The Reduced Intensity Alternative would be located on the same site as the Proposed Project. Therefore, the alternative would not displace housing or people.

The less intensive modified plan would generate 32% fewer jobs compared to the Proposed Project (based on the square footage reduction). The less intensive modified plan would not displace housing or people. In addition, the southeast quarter of the site would maintain its General Plan Land Use Designations and Zoning (R2 and R5), which would allow the development of future residential housing. Based on this, it is expected this alternative would have less than significant impacts on population and housing.

- (d) **Summary** – Potential impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project; however, impacts of all three are still less than significant.

4.15 Public Services

- (a) **Proposed Project** – The Project would be required to pay development impact fees for schools, police services, and fire services. The payment of development impact fees would offset any impacts to these public services that may result from the development of the Proposed Project.
- (b) **Existing Zoning** – Demands on schools, parks, other public facilities, law enforcement, and fire protection services would be greater in magnitude than what was identified for the Proposed Project, however, payment of City and School DIFs would help offset the increased demands for service, so impacts would be reduced to less than significant levels.
- (c) **Reduced Intensity Alternative** – Compared to the Proposed Project, the Reduced Intensity Alternative would result in a reduction of approximately 25 percent of proposed warehouse uses. However, the magnitude of impacts on public services would be similar to the Proposed Project (i.e., no residential development). The Reduced Intensity Alternative would be required to pay development impacts to reduce potential impacts to less than significant levels.

Compared to the Proposed Project, the less intensive modified plan would generate approximately 32% less need for public services due to having fewer proposed warehouse uses. However, like the Proposed Project and Reduced Intensity Alternative, the less intensive modified plan would have a similar magnitude or overall of impact on public services (i.e., no residential uses). The project would be required to pay development impact fees and impacts would be less than significant.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however all three would have similar impacts to public services and would be required to pay development impact fees to reduce potential impacts to less than significant levels.

4.16 Recreation

- (a) **Proposed Project** – The Proposed Project does not contain any residential components. Therefore, there would be no significant increase in existing population and no increase in demand for park and recreation facilities. No impact would occur.

(b) **Existing Zoning** – The increase in population from new housing would increase the demand for park and recreation facilities, therefore future development would be required to dedicate or provide in-lieu fees for approximately 7.24 acres of land for park uses (based on anticipated project population). The dedication of land and/or the payment of parkland fees would reduce potential recreation impacts to less than significant levels.

(c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative would not result in any increase in the City’s population (i.e., no additional housing). Therefore, this alternative would have no impacts related to parks and recreation facilities, similar to the Proposed Project.

The less intensive modified plan would have little or no impact to parks or recreation similar to the Reduced Intensity Alternative and the Proposed Project because none of them propose any residential units which would generate additional population. Therefore, no significant impact to parks and recreation facilities would occur.

(d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are reduced compared to the Proposed Project, however, none of these scenarios propose residential uses, therefore, all three would have no impact on parks and recreation facilities.

4.17 Traffic

(a) **Proposed Project** – The Proposed Project would cause potentially significant traffic impacts on roadway segments and intersections through deficient LOS levels (4,408 daily trips and 7,527 PCE trips). The estimated trip generation for the Proposed Project, Existing General Plan Alternative, and the less intensive modified plan are compared in Table 4.C below. Even with mitigation some traffic impacts would be significant and unavoidable due to certain roadway improvements not being under the jurisdiction of the City and could not be guaranteed to be in place when development would be operational.

(b) **Existing Zoning** – Development under existing zoning designations would result in an almost three-fold increase in average daily traffic (ADT) and a 55% increase in passenger car equivalents (PCE) trips compared to the Proposed Project (see Table 4.C). This additional traffic would substantially increase traffic impacts on nearby roads and intersections, resulting in much worse levels of service (LOS) even with mitigation. Note that the use of PCE accounts for increased traffic impacts due to the larger size of trucks on roadways.

The addition of traffic volumes associated with this scenario could result in deficient LOS levels at one or more of the intersections in the project vicinity during the lifetime of the development. While significant traffic impacts may occur under this alternative, these impacts could be mitigated by payment of DIF and (County) TUMF fees as appropriate. Despite the implementation of appropriate mitigation measures, certain roadway improvements would not be under the jurisdiction of the City and cannot be guaranteed to be in place when development under existing zoning designations would occur. Therefore, traffic-related impacts would remain significant and unavoidable.

(c) **Reduced Intensity Alternative** – This alternative would reduce traffic trip generation and traffic impacts on local roadways by approximately 25% by eliminating a quarter of the total warehouse development in the southeast portion of the site compared to the Proposed Project. However, even with this reduction in traffic trip generation, impacts are still significant even with mitigation since some roadways that need improvements are not under the control of the City.

The less intensive modified plan would have slightly less traffic trip generation than the Reduced Intensity Alternative because it would have slightly less square footage. The estimated trip generation for the Proposed Project, Existing General Plan Alternative, and the less intensive modified plan are compared in the table below (see Table 4.C), which shows the less intensive modified plan would generate 30% less total traffic (PCE) compared to the

Proposed Project. It is important to note that, while this modified plan does not propose residential development at this time, it would leave approximately 38 acres in the southeastern portion of the project property vacant for now. At some point in the future, it is anticipated this 38 acres would be developed into 126 housing units under the R-5 and R-2 zones as outlined in the previous Table 4.A, based on 5 units per acre for the R-5 property and 2 units per acre for the R-2 land. Even with a substantial reduction in trip generation, traffic impacts of this modified plan are considered to be significant even with mitigation. In addition, like the Proposed Project, including the Reduced Intensity Alternative, certain roadway improvements are not under the jurisdiction of the City and could not be guaranteed to be in place when development would be operational.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project (i.e., almost 30% less), however impacts of all three are still significant and unavoidable.

It should be noted that when residential uses are eventually added to the vacant land of the less intensive modified plan (southeast corner of the property), overall traffic impacts of these land uses would be 13.8% less than those anticipated under the Proposed Project, as shown in Table 4.C.

Table 4.C: Comparison of Average Daily Vehicle Trips

Scenario	AM Peak	PM Peak	Daily Trips (ADT) ¹	Trip Total (PCE) ²	% PCE to Project
Proposed Project					
Truck Trips	133	157	1,989	5,107	
Car Trips	176	199	2,420	2,420	--
Total	309	356	4,409	7,527	
Existing Zoning³					
Truck Trips	205	185	1,129	2,845	
Car Trips	758	793	8,848	8,848	+
Total	1,894	1,860	12,188	11,693	55.3%
Reduced Intensity Alternative (from EIR)					
Truck Trips	100	118	1,491	3,830	-25.0%
Car Trips	132	149	1,815	1,815	
Total	232	267	3,306	5,645	
Less Intensive Modified Plan-Industrial Only⁴					
Truck Trips	91	107	1,337	3,428	-29.7%

Less Intensive Modified Plan-Industrial + (Future) Residential⁴					
Truck Trips	91	107	1,337	3,428	-13.8%
Car Trips	234	282	3,064	3,064	
Total	325	389	4,401	6,492	

Source: LSA Associates, September 2014 based on land uses and ITE rates shown in Table 4.A (see FEIR Appendix F).

¹ Average Daily Trips (ADT)

² Passenger Car Equivalents (PCE)

³ Assumes 30 percent floor area ratio or site coverage for business park uses (i.e., total building square footage divided by the total gross site area).

⁴ **IMPORTANT NOTE:** ProLogis is proposing development of only industrial uses at this time – the industrial plus residential scenario is provided for information purposes only to show traffic generation under ultimate buildout conditions at some point in the future if the residential uses are developed on the vacant portion of the project property

4.18 Utilities and Service Systems

- (a) **Proposed Project** – The project would connect to existing utility infrastructure, require installation of water supply infrastructure, and would generate solid waste. However, the project would be required to adhere to existing requirements identified by the City and EMWD, obtain verification from the water purveyor that water is available to serve the development, and adhere to provisions of the solid waste provider of the site. These requirements would result in the project having less than significant impacts related to Utilities and Services.
- (b) **Existing Zoning** – Development under the existing zoning designations would connect to existing utility infrastructure subject to the terms and conditions of the City and EMWD. This scenario would generate approximately 226,718 gallons of wastewater per day, which is a fivefold increase over what the proposed project would generate, and would increase the wastewater treatment demand. However, adherence to existing requirements identified by the City and EMWD would result in impacts remaining at a less than significant level.

The development of the business park and various residential uses would require the installation of water supply infrastructure to serve the project site and would consume approximately 277,660 gallons of water per day, which is over three times more than what would be consumed by the Proposed Project. However, development under this scenario would be required to obtain verification from the water purveyor (EMWD) that water is available to serve the development. In the event that the amount of water required for this alternative is available, impacts associated with this issue would be less than significant. However, in the event that water is not available for the Existing General Plan, a significant impact associated with this issue would occur.

This development scenario would generate 5,158 tons of solid waste per year, which is over twice what the Proposed Project would be expected to generate. Therefore, demands on solid waste services and landfill capacity would be increased in magnitude. However, development under this scenario would also be required to adhere to the provisions of the solid waste provider that would service the project site. Even with the increase, solid waste impacts under this alternative would be expected to remain at less than significant levels.

- (c) **Reduced Intensity Alternative** – The Reduced Intensity Alternative reduces total development compared to the Proposed Project by 25%, therefore it is reasonable to conclude that demands on utilities services would also be reduced by 25%. The Reduced Intensity Alternative, like the Proposed Project, would be required to adhere to existing requirements identified by the City and EMWD, obtain verification from the water purveyor that water is available to serve the development, and adhere to provisions of the solid waste provider of the site. Like the Proposed Project, the Reduced Intensity Alternative would have less than significant impacts related to utilities.

The less intensive modified plan reduces proposed development by 32%, compared to the Proposed Project (i.e., Buildings 5 and 6 would not be constructed). Therefore it is reasonable to conclude that demands on utilities services would also be reduced by approximately 32%. The less intensive modified plan, like the Proposed Project and Reduced Intensity Alternative, would be required to adhere to existing requirements identified by the City and EMWD, obtain verification from the water purveyor that water is available to serve the development, and adhere to provisions of the solid waste provider of the site. Like the Proposed Project and the Reduced Intensity Alternative, the less intensive modified plan is expected to have less than significant impacts related to utilities.

- (d) **Summary** – Impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however impacts of all three are less than significant.

4.19 Cumulative Impacts

- (a) **Proposed Project** – The Proposed Project would have significant cumulative impacts related to permanent conversion of farmland, long-term operational air pollutant emissions of CO, ROC, NOx, PM10, and PM2.5, and increased traffic operations on local roadways and at local intersections. There are no feasible mitigation measures to reduce impacts related to the conversion of Prime Farmland, reduce long-term air pollutant operational emissions and mitigate increased traffic; therefore cumulative impacts would remain significant and unavoidable for these topics.
- (b) **Existing Zoning** – Development under the existing zoning designations would contribute toward the permanent conversion of farmland, long-term operational air pollutant emissions, and increased traffic operations on local roadways and at local intersections. In addition, there are no mitigation measures that would reduce long-term air quality operational impacts to below the SCAQMD threshold standard and no mitigation measures that would reduce impacts associated with increased traffic in the area. Therefore, cumulative impacts associated with long-term air quality and long-term traffic would remain significant and unavoidable. This scenario would also require the development of the project site. Since there is no feasible mitigation that would reduce the cumulative impacts associated with the conversion of Prime Farmland, cumulative impacts associated with farmland conversion would remain significant and unavoidable.
- (c) **Reduced Intensity Alternative** – Similar to the Proposed Project, the Reduced Intensity Alternative would have significant cumulative impacts related to permanent conversion of farmland, long-term operational air pollutant emissions, and increased traffic operations on local roadways and at local intersections. Although cumulative impacts would have a 25% reduction, there are no feasible mitigation measures to reduce impacts related to the conversion of Prime Farmland, reduce long-term air pollutant operational emissions and mitigate increased traffic; therefore cumulative impacts would remain significant and unavoidable.

Similar to the Proposed Project and the Reduced Intensity Alternative, the less intensive modified plan would have significant cumulative impacts related to permanent conversion of farmland, long-term operational air pollutant emissions, and increased traffic operations on local roadways and at local intersections. Although cumulative impacts would have a 32% reduction in planned development compared to the Proposed Project, there are no feasible mitigation measures to reduce impacts related to the conversion of Prime Farmland, reduce long-term air pollutant operational emissions and mitigate increased traffic; therefore cumulative impacts would remain significant and unavoidable.

- (d) **Summary** – Cumulative impacts of the Reduced Intensity Alternative, including the less intensive modified plan, are substantially reduced compared to the Proposed Project, however, all three development scenarios contribute to some cumulative impacts.

SUMMARY

The Proposed Project has significant and unavoidable impacts related to aesthetics, agricultural resources, air quality, land use, and transportation.

The Existing Zoning would also have significant and unavoidable impacts related to agricultural resources, air quality, and transportation, but would reduce aesthetic and land use impacts to less than significant levels compared to the Proposed Project, as long as future development was consistent with the City's development standards. It is also possible the Existing Zoning would substantially increase impacts on climate change, public services, recreation, and utilities, but it is expected these impacts could be reduced to less than significant levels with mitigation.

The Reduced Intensity Alternative under the EIR, including the currently proposed less intensive modified plan, would still have significant impacts related to aesthetics, air quality, land use, and transportation. Due to the reduced size of the less intensive modified plan (32% reduction), these impacts would be substantially reduced in magnitude compared to the Proposed Project. In addition, the less intensive modified plan would reduce impacts to agricultural resources to less than significant levels compared to the Proposed Project, at least until the southeastern portion of the site was developed with residential uses which are expected to be consistent with existing General Plan and zoning designations.

The following Table 4.D compares environmental impacts associated with the Proposed Project, Existing General Plan Alternative, and the Less Intense Modified Plan.

Table 4.D: Comparison of Impacts of the Proposed Project, Existing Zoning, and Reduced Intensity Alternative (including the Less Intensive Modified Plan)

5. MITIGATION MONITORING AND REPORTING PROGRAM

5.1 INTRODUCTION

This Mitigation Monitoring and Reporting Program has been prepared for use in implementing mitigation for the:

ProLogis Eucalyptus Industrial Park

The program has been prepared in compliance with State law and the Environmental Impact Report (EIR) (State Clearinghouse No. 2008021002) prepared for the project by the City of Moreno Valley.

The California Environmental Quality Act (CEQA) requires adoption of a reporting or monitoring program for those measures placed on a project to mitigate or avoid adverse effects on the environment (Public Resource Code Section 21081.6). The law states that the reporting or monitoring program shall be designed to ensure compliance during project implementation.

The monitoring program contains the following elements:

- 1) The mitigation measures are recorded with the action and procedure necessary to ensure compliance. In some instances, one action may be used to verify implementation of several mitigation measures.
- 2) A procedure for compliance and verification has been outlined for each action necessary. This procedure designates who will take action, what action will be taken and when, and to whom and when compliance will be reported.
- 3) The program has been designed to be flexible. As monitoring progresses, changes to compliance procedures may be necessary based upon recommendations by those responsible for the program. As changes are made, new monitoring compliance procedures and records will be developed and incorporated into the program.

This Mitigation Monitoring and Reporting Program includes mitigation identified in the Final EIR.

5.2 MITIGATION MONITORING AND RESPONSIBILITIES

As the Lead Agency, the City of Moreno Valley is responsible for ensuring full compliance with the mitigation measures adopted for the proposed project. The City will monitor and report on all mitigation activities. Mitigation measures will be implemented at different stages of development throughout the project area. In this regard, the responsibilities for implementation have been assigned to the Applicant, Contractor, or a combination thereof. If during the course of project implementation, any of the mitigation measures identified herein cannot be successfully implemented, the City shall be immediately informed, and the City will then inform any affected responsible agencies. The City, in conjunction with any affected responsible agencies, will then determine if modification to the project is required and/or whether alternative mitigation is appropriate.

5.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: Eucalyptus Industrial Park

Applicant:

Prologis

Date:

September 26, 2014

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
4.3 AIR QUALITY						
4.3.6.2A. Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.	City of Moreno Valley Engineering and Building and Safety Planning Division	Once prior to Grading and once during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.3.6.2B Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators where feasible. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.	City of Moreno Valley Engineering and Building and Safety Planning Division	Once prior to Grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.3.6.2C Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier III Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the	City of Moreno Valley Engineering and Building and Safety Planning Division	Once prior to Grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit

Item No. E.3

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non- Compliance
<p>proposed project construction documents, which shall be reviewed by the City.</p> <p>Project start to December 31, 2014: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 3 off-road emission standards. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.</p> <p>Post January 1, 2015: All off-road diesel-powered construction equipment greater than 50 horsepower shall meet Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with Best Available Control Technology (BACT) devices certified by CARB. Any emission control devices used by the contractor shall achieve emission reductions that are no less than what would be achieved by a Level 3 diesel emission control strategy for a similarly sized engine as defined by CARB regulations.</p> <p>A copy of each unit's certified tier specifications, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.</p>						

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non- Compliance
4.3.6.2D All clearing, grading, earthmoving, or excavation activities shall cease when winds (as instantaneous gusts) exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions. On-site truck idling shall be prohibited in excess of five minutes.	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During grading	Review of construction documents and on- site inspection		Issuance of a Stop Work Order
4.3.6.2E The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2F The contractor shall ensure that traffic speeds on unpaved roads and project site areas are reduced to 15 miles per hour or less to reduce PM ₁₀ and PM _{2.5} fugitive dust haul road emissions. Speed limit signs (15 mph maximum) shall be posted at entry points to the project site, and along any unpaved roads providing access to or within the project site and/or any unpaved designated on-site travel routes.	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2G Groundcover shall be replaced, and/or non-toxic soil stabilizers shall be applied (according to manufacturers' specifications) to any inactive construction areas (previously graded areas inactive for ten days or more).	City of Moreno Valley Engineering and Building and Safety Planning Division	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order

-2369-

Item No. E.3

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
4.3.6.2H The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and by not allowing construction equipment to be left idling for more than five minutes (per California law).	City of Moreno Valley Engineering and Building and Safety	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2I The contractor shall ensure use of low-sulfur diesel fuel in construction equipment as required by the California Air Resources Board (CARB) (diesel fuel with sulfur content of 15 ppm by weight or less).	City of Moreno Valley Engineering and Building and Safety	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.3.6.2J. Grading plans, construction specifications and bid documents shall also include the following requirements: <ul style="list-style-type: none"> Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty; Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads; Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect; The contractor or builder shall 	City of Moreno Valley Engineering and Building and Safety Planning Division	Review plans, specifications, and bid documents prior to grading; conduct site inspections during construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order

-2371-

Item No. E.3

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non- Compliance
<p>designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;</p> <ul style="list-style-type: none"> • The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours; • High-pressure injectors shall be provided on diesel construction equipment if available; • Engine size of construction equipment shall be limited to the minimum practical size; • Substitute gasoline-powered for diesel powered construction equipment where gasoline powered equipment is available; • Use electric construction equipment where it is practical to use such equipment; • Install catalytic converters on gasoline-powered equipment where this type of equipment is available; • Ride-sharing program for the construction crew shall be supported by contractor(s) via incentives or other inducement; • Documentation shall be provided to the City of Moreno Valley indicating 						

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
<p>that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;</p> <ul style="list-style-type: none"> Lunch vendor services shall be allowed on site during construction to minimize the need for off-site vehicle trips; and All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered. 						
<p>4.3.6.2K. Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on site. In coordination and cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM₁₀ (fugitive dust) generation or other construction-related air quality issues within 24 hours.</p>	City of Moreno Valley Engineering and Building and Safety	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
<p>4.3.6.2L. All project entrances shall be posted with signs which state:</p> <ul style="list-style-type: none"> Truck drivers shall turn off engines when not in use; Diesel delivery trucks servicing the project shall not idle for more than three (3) minutes; and Telephone numbers of the building facilities manager and CARB, to 	City of Moreno Valley Engineering and Building and Safety	Ongoing throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order

exclusion buffer, to be determined by the appropriate agency (e.g. the City, County, and/or CDFG), shall be set in place around the nest where no vegetation disturbance will be permitted. For raptor species, such as hawks and owls, this buffer may be as large as 500 feet. A qualified biologist shall closely monitor nests until it is determined that they are no longer active, at which time construction activity in the vicinity of nests may continue.				Review of a report of the survey findings. Periodic site inspections during construction activities during the nesting season to ensure compliance.		
4.4.6.1B. Prior to site grading, a pre-construction survey shall be required for the burrowing owl to confirm the presence/absence of this species from the site. The survey shall be conducted by a qualified biologist within 30 days prior to ground disturbance, and in accordance with MSHCP survey requirements, to avoid direct take of burrowing owls. If burrowing owls are determined to occupy the project site or immediate vicinity, the City of Moreno Valley Planning Department shall be notified and avoidance measures as identified in Mitigation Measure 4.4.6.1C , shall be implemented. Implementation of avoidance measures shall be executed pursuant to the MSHCP, the California Fish and Game Code, and the MBTA, and according the Burrowing Owl Survey Protocol and Mitigation Guidelines (California Burrowing Owl Consortium 1993) and reviewed the City of Moreno Valley, the Riverside Conservation Authority, and/or	City of Moreno Valley Planning Division	Once prior to grading	Prior to Issuance of Grading Permit	Review of Evidence that a qualified biologist has been hired and the pre-construction survey has been completed. PROCEEDING:
PROPOSED STATEMENT OF DECISION

This is a consolidated matter in which Friends of Northern San Jacinto Valley, Sierra Club, Center for Biological Diversity, San Bernardino Valley Audubon Society, and the City of Riverside all challenge the approval of a project proposed by real party in interest Nuevo Development Company. The Project is the Villages of Lakeview extending over 2,800 acres consisting of 11,350 dwellings, a mixed use town center including some 500,000 square feet of retail, office and commercial uses, public facilities including four schools and a library, and nearly 1,000 acres of open space/conservation areas. Respondent County of Riverside approved the Project and certified the Environmental Impact Report on March 23, 2010. Petitioners filed a joint opening and reply brief. Respondents and real party also filed a joint opposition and will be referred to collectively as "Respondents."

DISCUSSION

I. The EIR failed to adequately evaluate GHG impacts and possible mitigation of these impacts.

Petitioners contend that the County failed to proceed in the manner required by CEQA in that the EIR improperly assessed the significance of the greenhouse gas (GHG) emissions by

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 1 of 16 Page(s)

comparing them to a potentially unrealistic, unreasonable hypothetical scenario rather than to existing conditions as required by *CBE vs. SCAQMD* (2010) 48 Cal. 4th 310, 322.

Respondents contend they first measured the Project's total GHG emissions against the baseline of existing conditions (zero emissions) to generate the Project's GHG inventory, quantified as 137,637 tons of CO₂e annually and that this satisfied CEQA's mandate that project impacts be disclosed and compared to the existing physical environment which serves as a baseline for CEQA purposes. Next, the County exercised its discretion by utilizing compliance with AB 32 as the threshold against which to evaluate the impact on GHG, and compared the Project's GHG inventory against a business-as-usual (BAU) scenario to make its impact significance determination. This approach, according to respondents, provided an opportunity to evaluate the Project's emissions reduction strategy. According to respondents, the BAU hypothetical used represents the Project as proposed absent its voluntary design features, GHG reduction commitments and mitigation measures not require by existing mandates. Respondents contend that the analysis was reasonable and supported by substantial evidence in the record.¹

It is true that agencies can exercise discretion in formulating and establishing thresholds of significance for each potentially adverse environmental effect (Guidelines §15064(b)), and may use performance standards or guidance documents adopted or issued by regulatory agencies as thresholds of significance (§15126.4(a)(1)(B)). It is also true that, at this time, no agency with particular expertise or jurisdiction over the Project's air quality and GHG emissions has established a quantitative or numeric threshold for determining when or to what extent emissions are significant for CEQA purposes in relation to GHG.

¹ In support of their contention that this BAU approach was proper, respondents ask the court to take judicial notice of a decision from a Kern County trial court proceeding and an appellant's opening brief. The request is denied.

Nevertheless, the hypothetical project proposed for the EIR does not accurately reflect business as usual because it uses an unrealistic scenario which ignores local planning and zoning laws, strips all vegetation from the project, and contemplates development on mountainous portions of the project site. In addition, the hypothetical scenario fails to account for the fact that project approval under CEQA contemplates a process whereby the adverse environmental effects of a project of this nature are identified and analyzed; alternatives are considered; and potential impacts are eliminated or mitigated. The hypothetical project, which ignores not only local planning and zoning laws as well as potential adverse impacts, is not one that could ever be expected to actually occur in the County let alone on the project site. It does not appear the EIR used a “business as usual” approach but instead adopted a “worst-case” scenario as it began its evaluation of the GHG emissions.

Respondents’ reliance on *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal.App.4th 327 is misplaced. While the *Chula Vista* case did conclude that compliance with AB 32 was a proper threshold of significance and implicitly approved use of a “business as usual analysis” in assessing the significance of the impact, that case is factually distinguishable. In that case, business as usual was based on the existing store – not some hypothetical scenario like here.

Chula Vista simply does not support respondents’ use of a hypothetical “BAU” that has no correlation to baseline conditions or to the project as proposed and is not even based on what could be realistically developed in this area in light of existing zoning and other land use regulations.

As the Supreme Court noted in *CBE v. SCAQMD*, *supra*, 48 Cal.4th 310 at p. 322: “An approach using hypothetical allowable conditions as the baseline results in ‘illusory’ comparisons that ‘can only mislead the public as to the reality of the impacts and subvert full consideration of

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 3 of 16 Page(s)

the actual environmental impacts,' a result at direct odds with CEQA's intent. [Internal Citation Omitted.] The District's use of the prior permits' maximum operating levels as a baseline appears to have had that effect here, providing an illusory basis for a finding of no significant adverse effect despite an acknowledged increase in NOx emissions exceeding the District's published significance threshold."

Notwithstanding that the Supreme Court was addressing the issue of baseline conditions whereas here we are discussing a proper BAU model, the concerns expressed in *CBE* are the same. The use of this hypothetical "BAU" here which is tied neither to existing conditions or reasonably likely conditions serves only to mislead the public and the decision-makers in their understanding of the actual significance of the GHG emissions, and their effect on the environment. Further, because the EIR improperly assessed the significance of GHG emissions, the EIR could not and did not properly analyze and evaluate feasible mitigation for GHG impacts.

II. The County was required to recirculate the EIR.

The Court finds that new information was added after the close of the public comment period that revealed a substantial increase in the severity of environmental impacts.

In response to comments to the DEIR, a transportation analysis was conducted which indicated an increase of 100 million additional vehicle-miles traveled (VMT) per year (50% increase), and PM_{2.5} concentrations 300% greater than previously disclosed and 95 times higher than Air District's threshold for determining the significance of impacts. Petitioners contend that an agency is required to recirculate an EIR when it adds significant new information after the public comment period has closed, citing §21092.1 and *American Canyon Community vs. City of American Canyon* (2006) 145 Cal.App.4th 1062, 1075-76).

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 4 of 16 Page(s)

Respondents argue that substantial evidence supports the County's determination that the new information merely clarified, amplified, or made insignificant modifications to the general assumptions that were presented in the draft EIR. According to respondents, the new information did not change the severity of the Project's impacts on global climate changes (GCC) or air quality. They contend that even with the new VMT estimates, the Project would still reduce emissions consistent with AB 32. They conclude that the County's decision not to recirculate was proper, citing *Silverado Modjeska Recreation and Parks vs. County of Orange* (2011) 197 Cal.App.4th 282.

The Court finds that the new information did constitute a substantial increase in the severity of GCC and air quality impacts which required recirculation. (Guidelines §15088.5; Pub. Res. §21092.1, §21166.) The new analysis which revealed the substantial increase in GHG and fine particulates was conducted after the comment period. This new information did not merely supply additional requested details or merely explain the DEIR's analysis. Instead, the methodology used in connection with the DEIR was discarded. A new, more accurate methodology disclosed air quality impacts more severe than previously disclosed.

In addition, the County's reliance on its BAU hypothetical and analysis fails. The County cannot rely on alleged consistency with AB 32 as discussed above.

Petitioners did not have an adequate opportunity to comment on the newly disclosed impacts. The determination that the increased impacts did not warrant recirculation is not supported by substantial evidence.

III. The EIR did not adequately analyze the project's impacts on air quality and the related health impacts.

The Court finds that there is inadequate analysis in the EIR as to the Project's impacts on air quality and related health effects. In discussing significant environmental impacts, direct and

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 5 of 16 Page(s)

indirect significant effects of the project should be clearly identified and described, giving due consideration to both the short-term and long-term effects on matters including health and safety problems caused by the physical changes. (*Guidelines §15126.2(a).*) Here, the EIR makes only general references to respiratory and pulmonary conditions and cancer health risks. However, it provides little information or analysis as to the specific impacts on the general population versus sensitive receptors, or as to the degree of impacts and the specific effects on the public's health. When the informational requirements of CEQA are not met, an agency has failed to proceed in a manner required by law. (*Bakersfield Citizens for Local Control vs. City of Bakersfield* (2004) 124 Cal. App. 4th 1184, 1220).

The County's reliance on the South Coast Air Basin region-wide Air Quality Management Plan does not relieve it of its obligation to provide a reasonable analysis of the Project's cumulative impacts. (*Guidelines §15130(b).*) Pursuant to *Berkeley Keep Jets Over the Bay Committee vs. Bd. of Port Commissioners of the City of Oakland* (2001) 91 Cal. App. 4th 1344, 1371, the County is required to use its best efforts to find out and disclose all that it reasonably can. Here, Petitioners provided the County with numerous studies addressing the health effects of particulate pollution, yet County's only response was to discredit one of the reports, and to continue to rely on the SCAQMD methodology. Absent any attempt to use its best efforts to find out and disclose all that it reasonably can, the County failed to meet its obligations.

IV. The EIR failed to conduct an adequate review of the project's impacts on regional traffic.

The Court finds that the EIR failed to conduct adequate environmental review of the Project's impacts on regional traffic. The record establishes that the Project will result in over 85,000 vehicle trips per day, and will add 17,000 new car trips to the I-215 each day. Many of the residents will be driving to Moreno Valley and Riverside via the I-215, and those commuting

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 6 of 16 Page(s)

to Orange and Los Angeles Counties will contribute to the existing problems at the I-15/SR91 interchange.

The EIR failed to analyze the impacts on any of these freeways, and instead restricted its analysis based upon the Riverside County Traffic Impact Analysis Preparation Guide (TIA) and a supplemental analysis. In accordance with the TIA, County studied the area within a five-mile radius of the Project site and conducted a supplemental analysis including 17 additional intersections and 10 additional street segments. An EIR must include a description of the environment in the vicinity of the Project from both a local and regional perspective. (*Bozung vs. Local Agency Formation Comm. (1975) 13 Cal. 3d 263, 283; Guidelines §15125.*) By failing to analyze the Project impacts on the surrounding freeways, County failed to proceed as required by CEQA.

County also argues that it specifically noted there would be a need for subsequent environmental review related to potential traffic impacts and that significant changes with respect to development of regional transportation systems are expected to occur. CEQA, however, requires that the impacts of a proposed project are to be compared to the actual environmental conditions existing at the time of the analysis. (*Sunnyvale West Neighborhood Assn. vs. City of Sunnyvale (2010) 190 Cal. App. 4th 1351, 1380-1384.*) The EIR fails to provide any specific analysis as to the impacts of the Project on the existing freeways.

V. The EIR project description was adequate.

The question concerning which acts constitute the “whole of an action” for purposes of Guidelines §15738 is a question of law. (*Tuolumne County Citizens for Responsible Growth, Inc. vs. City of Rancho Cordova (2007) 155 Cal. App. 4th 1214, 1224.*) As such, it is to be determined by the trial court’s independent judgment. In this case, the Court finds that the

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 7 of 16 Page(s)

construction of the electrical substation and transmission lines, as well as the training dike, are not part of the Project.

The EIR does acknowledge that the new electric substation is necessary to the Project: the existing Nuevo substation only has the capacity to meet projected demands through 2012, after which additional substation capacity (and the extension of transmission lines) will be necessary to provide power to support the current and future growth. The construction of the off-site training dike is necessary to significantly reduce flooding within the Project. However, neither the substation nor the dike, are component parts of the Project and there has been no improper segmentation.

There are general principles used to determine whether a particular act is part of the activity that constitutes a CEQA project. One way is to evaluate how closely the related acts are to the overall objective of the project (the relationship being sufficiently close when the proposed act is among the "various steps which taken together obtain an objective"). (*Tuolumne, supra, p. 1226.*) Another is to consider how closely the act and project are related in time and physical location, and the entity undertaking the action. (*Id.*, at p. 1227.)

In this case, both the substation and dike were planned independently of the Project, and will serve development in addition to the Project. The substation will be built by a separate entity, Southern California Edison to accommodate regional development growth beyond 2012. The dike is part of a previously approved County infrastructure plan to serve regional needs. As such, neither the substation and transmission lines nor the dike are component parts of the Project. (See *Anderson First Coalition vs. City of Anderson* (2005) 130 Cal. App. 4th 1173.)

VI. The EIR adequately addressed the project's noise impacts.

Petitioners contend that the EIR does not properly account for the already existing noise environment attributable to some of the roadways which will serve the Project. They argue that

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 8 of 16 Page(s)

the EIR improperly uses thresholds of significance to avoid having to confront the possibility that any additional amount of noise might well be significant given the already existing problems. Petitioners contend that the EIR also fails to consider that the Project's incremental noise impacts might be cumulatively considerable. Petitioners conclude that the EIR avoids having to adopt feasible measures to mitigate the Project's contributions to noise.

On the contrary, the EIR acknowledges that because the cumulative noise without the Project is significant, any additional noise contributed by the Project would be significant. The EIR admits that the effect of the Project together with other cumulative impacts will result in significant area-wide cumulative noise impacts. Instead of refusing to examine mitigation for the noise impacts, the EIR considered the use of sound walls to mitigate the significant noise impacts. This mitigation was found not to be feasible, and the EIR concluded that the noise impacts were therefore significant and unavoidable. Petitioners do not dispute the finding that sound walls were not feasible. Nor do they suggest that there were other mitigation measures that could have been considered.

Petitioners also contend that the EIR fails to analyze specific noise impacts resulting from construction of the Project. However, the County was not required to speculate regarding construction activity for project buildup expected to take place over a 20-year period. (See *Tracy First v. City of Tracy* (2009) 177 Cal.App.4th 912, 932-933.) Instead, given the conceptual level of the Project, the County properly considered construction impacts to the extent possible and identified mitigation measures.

VII. EIR did not adequately address concerns raised with respect to the Habitat Conservation Plan.

CEQA requires the lead agency to respond to each significant environmental issue that is raised by commenters. (Pub. Res. C. §21091(d)(2).) Major environmental issues raised when

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 9 of 16 Page(s)

the lead agency's position is at variance with recommendations and objections should be addressed in detail with reasons why specific comments and suggestions were not accepted. (Guidelines §15088(c).) Responses to comments should at least demonstrate a good faith reasoned analysis. (*Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 378.)

Commenters pointed out that the Project's plan to construct "JJ Street" interferes with so-called "Constrained Linkage 20," a habitat block identified in the MSHCP. The Constrained Linkage allows space for migration, plant propagation, and increased mating opportunities between other habitat blocks. JJ Street will be constructed across the Constrained Linkage and will create another barrier to wildlife attempting to travel between the Wildlife Area and the Lakeview Mountains.

The County's responses to comments first maintained that JJ Street does not actually cross the wildlife corridor. But JJ Street is in fact perpendicular to the linkage and will be constructed directly across it.

The County also took the position that JJ Street should be considered part of the planned Mid-County Parkway, which includes the existing Ramona Expressway. This roadway also crosses the linkage and was already anticipated and contemplated by the MSHCP. Comment responses contend that the culvert/wildlife corridor under the Mid-County Parkway will be extended and will run under JJ Street. Petitioners point out that the MSHCP indicates that small mammals are not known to use culverts longer than 64 meters. With the addition of JJ Street, even if parallel to the Mid-County Parkway, the culvert will be at least 87 meters in length. The MSCHP anticipated a 67-meter wildlife crossing, and extending it an additional 20 meters for JJ Street may make the undercrossing unusable for the species and may compromise the integrity

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 10 of 16 Page(s)

of the Constrained Linkage. The County's analysis failed to address the additional length of the culvert which will be required in order to extend the undercrossing under JJ Street.

VIII. The EIR failed to adequately address the project's growth-inducing impacts.

Petitioners argue that EIR's brief analysis of growth-inducing impacts fails to meet the requirements of Guidelines §15126.2(d). The Project includes improvements to roads, the extension of energy services, and the extension of water lines and sewer services to serve future projects and urbanization. Petitioners further argue that pursuant to *Napa Citizens for Honest Government vs. Bd. of Supervisors* (2001) 91 Cal. App. 4th 342, 370, the EIR should have disclosed information about the housing units the infrastructure will accommodate, and the effect of the additional growth on public services.

The Court agrees that additional information about the Project's growth-inducing impacts should have been provided and analyzed. Although the County submits that such would be speculative, the record indicates that existing information is available which makes such discussion viable. The County references the expansion of the Ramona Expressway and incremental roadway improvements; the construction of new roads; and water and sewer improvements and infrastructure sized to serve future urbanization within the area. It also references "developing communities," and states how the infrastructure improvements and expansions could eliminate potential constraints for future development in the area. Given the extent of vacant and unimproved land surrounding the Project, the County should have been able to provide additional information and analysis about growth-inducing impacts.

IX. The EIR's Discussion of Project Alternatives was adequate.

Petitioners first argue that the Project's objectives are so narrow that they preclude consideration of a reasonable range of alternatives, citing *National Parks & Conservation Assn. vs. Bureau of Land Management* (9th Cir. 2010) 606 F.3d 1058, 1072. The Court finds that

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 11 of 16 Page(s)

argument unavailing. While certain Project objectives may be possible due to the existing circumstances (e.g., single ownership and location), the objectives overall reflect the County's goals as evidenced in Chapter 2 of the County's General Plan. This is distinguishable from *National Parks*, where only one of the four project objectives served the needs of the BLM. (*National Parks*, supra, at pp.1071-72.)

Petitioners then argue that the EIR improperly failed to analyze an off-site alternative, which is necessary given the significant amendments and zoning changes and the inconsistencies with the General Plan. (*Citizens of Goleta Valley vs. Bd. of Supervisors* ("Goleta I") (1988) 197 Cal. App. 3d 1167, 1179-80; Guidelines §15126.6.) Again, the Court disagrees and finds that the EIR properly considered and then rejected an alternate site. Guidelines §15126.6 requires the EIR identify alternatives that were considered and rejected as infeasible during the scoping process, and briefly explain the reasons underlying the determination. The factors that may be used to eliminate alternatives from detailed consideration in an EIR are failure to meet most of the project objectives, infeasibility, or inability to avoid significant environmental impacts. (§15126.6(c).) Here, the County included such discussion at AR 3403-04. The Court finds that discussion sufficient and distinguishable from that in *Goleta I*, supra.

X. The Project is inconsistent with the General Plan Circulation Element.

Petitioners argue that the Project is inconsistent with various General Plan policies: Land Use (L.U.) Policy 2.1(e) (to concentrate growth near or within existing urban and suburban areas to maintain the rural and open space character to the greatest extent possible); L.U. Policy 17.3 (to ensure development does not adversely impact the open space & rural character of the surrounding area); L.U. Policy 10.1 (to provide sufficient opportunities to increase local employment levels and minimize long-distance commuting); L.U. Policy 7.12 (to improve the

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 12 of 16 Page(s)

relationship and ratio between jobs and housing); L.U. Policy 2.1(a) (to provide a land use mix at the countywide and area plan levels based on projected need); and Air Quality Policy 8.2 (to emphasize job creation and reductions in VMTs in job poor areas to improve air quality. Petitioners also contend the project is inconsistent with General Plan Circulation Element 2.1 which requires the County to maintain target Levels of Service: LOS "C" along all County-maintained roads and conventional state highways.

The question is whether the Project is compatible with and will not frustrate the General Plan's goals and policies. (*Napa Citizens for Honest Government vs. Napa County Board of Supervisors* (2001) 91 Cal. App. 4th 342, 379.) If the Project will frustrate the General Plan's goals and policies, it is inconsistent with the General Plan unless it also includes definite affirmative commitments to mitigate the adverse effect or effects. (*Id.*)

Here, the record establishes that the Project will frustrate the General Plan's policy of maintaining the County's Level of Service standards as described in the General Plan Circulation Element. The EIR admits that at full build-out of both the current General Plan roadway system and the Project, some roadway segments and intersections will not meet the required standards. The General Plan Circulation Element establishes definite standards regarding traffic congestion, not mere guidelines or flexible goals. The County cannot establish specific traffic requirements and at the same time approve a project that will cause unacceptable congestion without taking affirmative steps to handle that increased congestion. (*Napa Citizens, supra*, 91 Cal.App.4th, at p. 380; *Endangered Habitats League v. County of Orange* (2005) 131 Cal.App.4th 777, 782-783.) No such affirmative steps or mitigation measures have been developed. This is particularly unacceptable given the improper/inadequate analysis concerning traffic impacts from the Project discussed previously.

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 13 of 16 Page(s)

Otherwise, the Court accepts the Board's findings of consistency as being supported by substantial evidence despite some inconsistency with a handful of land use policies articulated in the General Plan. A given project need not be in conformity with each and every land use policy. It need only be compatible with the objectives, general land uses and programs set forth in the General Plan. (*Families Unafraid To Uphold Rural El Dorado County v. Board of Supervisors* (1988) 62 Cal.App.4th 1332, 1336.) The County's determination of consistency with its own General Plan is entitled to great deference. It has the unique competence to balance the plan's policies when applying them and has the broad discretion to construe its policies in light of the plan's purposes. (See *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 373-374.)

XI. One of the County's findings in support of the extraordinary amendment to the general plan is inadequate.

The County's General Plan discourages amendments to the foundational elements of the Plan outside of the County's regular five-year amendment cycle. Foundational elements may not be amended outside of the five-year cycle unless specific findings are made that the amendment is justified as a result of extraordinary events. This "Extraordinary Amendment" procedure requires three particular findings to justify an Extraordinary Amendment. (General Plan, Ch. 10 at A-12; Riv. Co. Code §17.08.060(F)). These findings were necessary here because the Project included General Plan Amendment 720 which raised development densities in connections with existing foundational elements. As discussed below, the Court finds the second and third required findings were sufficient and are supported by substantial evidence.

The second required finding to support an extraordinary amendment is that a condition exists or an event has occurred that is "unusually compelling." The County's finding regarding the unusually compelling event cites "an opportunity that is presented by having 2,786 acres

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 14 of 16 Page(s)

under the control of one entity...to pursue a comprehensive master plan.” This finding is sufficient and is supported by substantial evidence.

The third required finding is that a component change is necessary to facilitate implementation of open space or transportation corridor designations arising from MSHCP and CETAP programs that could not be accomplished by a lesser change in the General Plan. The County supports this finding with the real party’s commitment to widen the Ramona Expressway, the fact that real party has much of the land necessary for the expansion without the County having to condemn it, and the fact that the Project’s circulation system is designed to align with planned access points for the Expressway obviating the need for a frontage road. This third finding is sufficient and is supported by substantial evidence.

The first required finding is that new conditions or circumstances justify modifying the General plan, that the modifications do not conflict with the overall County Vision, and that the modifications would not create an internal inconsistency among the elements of the General plan. Unlike the second and third findings discussed above, when the board made this required finding it did so merely by quoting the language in the extraordinary amendment procedure. The “new conditions or circumstances” are not defined and there is no indication as to what evidence the board relied on to support this finding.

To be adequate, a finding must apprise the reviewing court of the basis for the board’s actions. In other words, the finding must “bridge the analytic gap between the raw evidence and the ultimate decision or order.” (*Topanga Assn. for a Scenic Community vs. County of Los Angeles* (1974) 11 Cal. 3d 506, 514.) It is not the responsibility of the reviewing court to comb the record to find some evidence that might have supported the board’s finding. (*Id.*, at p. 516.)

Here, because the board merely quoted the language of the required finding, this Court does

Sharon Waters, Judge
L. Hall (cmg), Clerk
Page 15 of 16 Page(s)

not know and cannot determine the basis for the county's decision. This first finding is not sufficient.

CONCLUSION

Pursuant to California Rules of Court rule 3.1590(c), this tentative decision is the Court's proposed statement of decision with respect to the petitions for writ of mandate filed in RIC10007572, RIC10007574 and RIC10007586 subject to any party's objection under rule 3.1590(g). If timely objections are not filed and served within 15 days of service of this statement of decision, petitioners in RIC10007572 and RIC10007574 are hereby ordered to prepare, serve and submit proposed judgments and peremptory writs of mandate. In RIC10007586, this proposed statement of decision addressed only the first and second causes of action. Unless the City wishes to dismiss its third and fourth causes of action for declaratory relief and injunctive relief, respectively, a final judgment cannot be entered in that case at this time.

A hearing for receipt of proposed judgment in RIC10007572 and RIC10007574 and for status conference on the City's remaining causes of action in RIC10007586 is hereby set for April 30, 2012, at 8:30 a.m., in Dept. 10.

Petitioners and Plaintiffs, Friends of the Northern San Jacinto Valley and Sierra Club, challenged the March 23, 2010, decision of Respondents and Defendants, the County of Riverside and its Board of Supervisions (collectively, "County") to adopt Resolution Nos. 2010-88 and 2010-89 and Ordinance No. 348.4679, approving the Villages of Lakeview Project ("Project") and certifying an environmental impact report for the Project. This case was consolidated with Riverside Superior Court case Nos. RIC10007574 and RIC10007586 for purposes of administrative record, briefing schedule and hearing; however the Court ordered that separate judgments be entered in each case.

The hearing on the merits of the consolidated cases was held on March 2, 2012, before the Honorable Sharon J. Waters in Department 10 of the Riverside Superior Court. Daniel P. Selmi, Rachel B. Hooper, Erin Chambers and Sara A. Clark appeared as counsel for Petitioners Friends of the Northern San Jacinto Valley and Sierra Club; Matthew D. Vespa appeared on behalf of Petitioners Center for Biological Diversity and San Bernardino Valley Audubon Society; Anthony L. Beaumon appeared for Petitioner City of Riverside; Jack S. Yeh and Keli N. Osaki appeared on behalf of Real Party in Interest Nuevo Development Company, LLC and the County and Tiffany N. North appeared on behalf of the County.

The Court having reviewed the record of the proceedings in this matter, the briefs and papers submitted, and the argument of counsel and having issued its final statement of decision,

IT IS ORDERED AND ADJUDGED that:

1. For the reasons set forth in this Court's April 11, 2012, Statement of Decision, attached hereto as Exhibit A, judgment granting the petition for writ of mandate shall be entered in favor of Petitioners.
2. A peremptory writ of mandate directed to the County shall issue under seal of this Court, ordering the County to set aside all approvals related to Resolution Nos. 2010-88 and 2010-89 and Ordinance No. 348.4679 and to refrain from approving these same or new approvals relating to or implementing the Project until such time as the County fully complies with CEQA and State Planning and Zoning Law.
3. The County shall make its initial return to the writ no later than 60 days after service of the writ setting forth what it has done to comply with the writ.

CASE NO.: RIC10007572

~~PROPOSED~~ PEREMPTORY
WRIT OF MANDATE

TO: Defendants and Respondents, County of Riverside and Board of Supervisors
of Riverside County (collectively, "County").

The Court having entered a judgment in this proceeding directing that a peremptory
writ of mandate issue from this Court,

YOU ARE HEREBY COMMANDED to comply with the following:

1. Within forty five (45) days of the service of this Writ, the County shall set aside
all approvals relating to Resolution Nos. 2010-88 and 2010-89 and Ordinance No. 348.4679,
and shall refrain from approving these same or new approvals relating to or implementing

1 the Villages of Lakeview Project ("Project") until such time as the County fully complies with
2 CEQA and State Planning and Zoning Law.

3 2. Under Public Resources Code §21168.9(c), this Court does not direct the
4 County to exercise its lawful discretion in any particular way.

5 3. Under Public Resources Code §21168.9(b) and Code of Civil Procedure
6 §1097, this Court will retain jurisdiction over the County's proceedings related to this Project
7 by way of a return to this Writ until the Court has determined that the County has complied
8 with the provisions of CEQA, State Planning and Zoning Law.
9

10 You are further commanded to make and file a return to this writ within 60 days from
11 the date a copy of this writ is served on you, showing what you have done to comply with
12 this writ.

13 Witness the Honorable Barbara Walters, Judge of the Superior Court. Attest
14 my hand and the seal of this Court this 11 day of July, 2012.

Zero Sum Game: The Debate Over Off-Site Agricultural Mitigation Measures

VOLUME 9 **Joshua Safran**

VOLUME 8 I. Introduction

VOLUME 7 Current national development trends are expanding existing urban areas outward rather than upward. Across the country, low-density communities are spreading into open space areas historically devoted to agricultural uses. It is estimated that every year about 1.2 million acres of American farmland are converted into developed uses.[1] This translates into a loss of approximately two acres of agricultural land per minute.[2] Whatever the precise rate of loss, the pace of farmland conversion is quantitatively significant. The negative consequences of such loss and the corresponding importance of maintaining agricultural uses is an important issue to different people for different reasons.

VOLUME 3 Some emphasize the great practical benefits of agricultural operations, both as a source of food and fiber and as an integral part of the American economy.[3] Others champion the more intangible benefits of agriculture such as the important cultural role it plays in the American way of life.[4] Others stress the utility of farmland not necessarily for the agricultural uses it allows, but for its function as a sanctuary of undeveloped open space. Open space is said to provide both tangible benefits, such as serving as a buffer against urban sprawl and the pollution associated with it, as well as more intangible spiritual values associated with the aesthetic beauty of open views.[5]

Current
Volume

VOLUME 9 To stem the tide of agricultural land conversion, state and local governments are employing a number of strategies which range from outright mandatory prohibitions on development, such as traditional zoning restrictions, to incentive based programs that encourage the continuation of traditional agricultural practices, such as voluntary agricultural district programs.[6] Some jurisdictions use a variety of other methods, including comprehensive land planning, conservation easements, and the purchase or transfer of development rights.[7] As discussed below, Vermont and California address the loss of agricultural land through state-wide comprehensive land planning procedures. These procedures allow for the development of certain agricultural lands in exchange for off-site mitigation. Such mitigation usually involves the permanent preservation of existing farmland, which is in some proximity to the land being developed, through conservation easements or deeds of development rights.

VOLUME 5 Off-site mitigation programs provide benefits to both developers and agricultural preservation advocates. Such mitigation ideally allows farmland under the greatest development pressure, where long-term agricultural uses are least viable, to be developed as part of a comprehensive pattern of contiguous development. Simultaneously, this mitigation strategy provides for the permanent protection of viable agricultural lands that would otherwise be in the path of development in the future, creating a permanent buffer between developed areas and large areas of farmland. However, this trade-off of current development for future preservation is the subject of ongoing controversy in both Vermont and California, where the debate over the wisdom and effectiveness of such mitigation measures will likely continue long into the future. At the heart of the debate is whether the loss of a finite and unique resource such as agricultural land can be mitigated.

As discussed below, Vermont's off-site agricultural mitigation program is not expressly authorized by statute, but was established in a 1991 administrative decision recognizing the need to provide flexibility to the development process.

PDF
Version

Under the mitigation program, developers and landowners are generally permitted to develop agricultural lands in exchange for paying an amount deemed sufficient to preserve two acres of primary agricultural soils, in roughly the same area for each acre developed. While such arrangements are largely negotiated on an *ad hoc* basis, lands to be developed are generally those deemed unlikely to be used for agricultural production in the future and physically isolated from other farm units.

Opposition to Vermont's program led to another administrative decision a decade later. This decision altered the face of off-site agricultural mitigation in the state by tightening requirements for onsite mitigation and the satisfaction of other findings. While off-site mitigation is still an available option to developers and landowners in Vermont, it is now much more difficult to develop agricultural lands because off-site agricultural mitigation may only be used as a "last resort."

Unlike Vermont, California has not yet made up its mind about the fundamental question of whether the permanent preservation of off-site agricultural lands actually mitigates the loss of farmland. Litigants, the courts, State agencies, and the Office of the Attorney General are split on the mitigation issue. Because the three key legal decisions on the issue in California are unpublished or depublished and may not be cited as legal precedent or relied on by a court or party in any action or proceeding, the status of off-site agricultural mitigation measures in California is far from clear. Until the California Legislature or the California courts take affirmative action in this arena, the threshold question of whether the loss of agricultural land can be mitigated will remain unanswered.

California's unsettled approach to off-site agricultural mitigation is due, at least in part, to the nature of land use planning in the State. The legal basis for all land use regulation in both Vermont and California is the State's police power to protect the public health, safety, and welfare of its residents.[8] In Vermont, the State Legislature and State governmental bodies exercise the police power and generally dictate, implement, and oversee the land use policies and procedures for the State.[9] In contrast, land use regulations in California are not an exercise of authority delegated by the State Legislature, but are a manifestation of the police powers conferred on cities and counties by the California Constitution.[10] For example, in California, state zoning, planning, and environmental review requirements are not intended as specific grants of authority by the Legislature, but are minimum standards to be observed within the local planning practice and process.[11] As a consequence, although the California Legislature has passed legislation allowing for the preservation of off-site agricultural lands in the development process, the real power to require such a practice rests largely in the broad local police power of each jurisdiction. Hence, without a specific mandate from the State or a ruling by the courts, the off-site mitigation question in California will be decided jurisdiction by jurisdiction.

II. Off-Site Agricultural Mitigation in Vermont

A. Overview of Title 10, Sections 6001-8221 of the Vermont Statutes Annotated, Commonly Known as Act 250

Vermont's primary agricultural land protection laws are contained in the Land Use and Development Law, title 10, sections §§ 6001-8221 of the Vermont Statutes Annotated, commonly known as Act 250. In 1970, Act 250 was passed in response to a rapid and largely unregulated development boom.[12] In passing Act 250, the Vermont Legislature declared that it was necessary "to regulate and control the utilization and usages of lands and the environment" and to ensure that "the only usages which will be permitted are not unduly detrimental to the environment, will promote the general welfare through orderly growth and development and are suitable to the demands and needs of the people of this state." [13]

Act 250 establishes a comprehensive state-wide land use permitting system that requires developers and landowners to obtain public agency approvals prior to developing or subdividing certain real property.[14] To obtain a permit, developers and landowners must apply to a local District Environmental Commission and undergo a public hearing process. During the public hearing process, the probable environmental impacts of the proposed project are evaluated by the Commission.[15] This public review and evaluation process is designed to "protect the environment; balance development with local, regional and state issues; and to provide a forum for neighbors, municipalities and other interest groups to voice their concerns." [16]

The Commission has discretion to approve, conditionally approve, or deny a permit application based on a review of the significant environmental, aesthetic, and/or community impacts associated with the proposed project.[17] Specifically, the Commission must base its review and decision on a set of ten criteria established by Act 250. The criteria focus on the project's projected impacts on air and water quality, water supplies, traffic, educational and municipal services, and historic and natural resources, including scenic beauty and necessary wildlife habitat.[18]

Any party with standing may appeal Commission decisions to the State Environmental Court.[19] Prior to January 31, 2005, appeals of Commission decisions were heard by an administrative State Environmental Board.[20] The main body of current Act 250 jurisprudence results from formal, precedential decisions issued by the Environmental Board.[21] The Environmental Court considers issues on appeal *de novo* and its decisions may be appealed directly to the Vermont Supreme Court for judicial review, but only by certain limited statutory parties.[22]

While there are nominally only ten criteria for the Commission to consider, some criteria have discrete subparts that

stand alone in terms of their substantive requirements and treatment within Act 250 jurisprudence. Criteria 9(B) and 9(C) focus specifically on the proposed project's likely impacts to agricultural lands.[23] Criterion 9(B) focuses on "primary agricultural soils," requiring that the project applicant demonstrate that the project will not "significantly reduce the agricultural potential" of such soils.[24] Where agricultural potential of the subject land will likely be subject to significant reduction, the applicant must demonstrate that four additional subcriteria are satisfied, namely that:

- (i). The applicant can only realize a "reasonable return" on the fair market value of his or her land through uses which will significantly reduce agricultural potential;[25]
- (ii). The applicant does not own or control other lands which are "reasonably suited" for the proposed project;[26]
- (iii). The project has been planned to minimize impacts on agricultural soils;[27] and
- (iv). The project will not "significantly interfere with or jeopardize" the continuation of adjoining agricultural uses or reduce the potential of adjoining agricultural lands.[28]

Criterion 9(C) focuses on "secondary agricultural soils," requiring the project applicant to demonstrate that the project will not "significantly reduce the agricultural potential" of such soils or of adjacent primary agricultural soils for commercial agriculture.[29] As under Criterion 9(B), where the agricultural potential of the soils involved will likely be significantly reduced, the applicant must satisfy additional subcriteria, demonstrating that:

- (i). The applicant can only realize a "reasonable return" on the fair market value of his or her land through uses which will significantly reduce agricultural potential;
- (ii). The applicant does not own or control other lands which are "reasonably suited" for the proposed project; and
- (iii). The project has been planned to minimize impacts on agricultural soils.[30]

Despite their nominal designation as separate criteria, 9(B) and 9(C) are usually reviewed concurrently at Commission hearings and the method of analysis employed by the Board has been generally the same for both criteria.[31] The central issue of preservation of agricultural land expressed in both criteria is one of great importance under Vermont law. For example, the State Legislature has declared that:

[p]roducts of the land . . . as well as the beauty of our landscape are principal natural resources of the state. Preservation of the agricultural and forest productivity of the land, and the economic viability of agricultural units . . . and protection of the beauty of the landscape are matters of public good. Uses which threaten or significantly inhibit these resources should be permitted only when the public interest is clearly benefited thereby.[32]

In light of this declaration by the Legislature, it is no surprise that the requirements of Criteria 9(B) and 9(C) are lengthier and more involved than almost any of the other criteria.[33]

B. Establishment of Off-Site Agricultural Mitigation Under Act 250

On its face, Act 250 makes no provision for off-site agricultural mitigation, nor does it allow a project likely to significantly reduce agricultural potential to move forward without satisfying all of the subcriteria. However, in *Re: J. Philip Gerbode, #6F0357-EB*, Findings of Fact, Conclusions of Law, and Order (Mar. 26, 1991), the Environmental Board found that a project applicant had satisfied the requirements of 9(B) despite significant reductions in the agricultural potential of the land and a failure to demonstrate compliance with the subcriteria where he had entered into a Mitigation Agreement with the State of Vermont Department of Agriculture, Food and Markets ("DAG") which required the applicant to pay a fee to the Vermont Housing Conservation Board ("VHCB") for the permanent preservation of off-site soils elsewhere in the same town.[34] The proposed project involved the subdivision of a 150-acre tract of land currently used for crop production into a technology park composed of sixteen commercial and industrial lots with internal roadways and municipal water and wastewater services in the Town of St. Albans, Vermont. [35] The District Commission concluded that the project application did not comply with Criteria 9(B), and the applicant filed an appeal with the Board and sought a mitigation agreement with the Department.[36] Under the terms of the mitigation agreement subsequently presented to the Board, the applicant was to pay the VHCB an amount deemed sufficient to preserve two acres of primary agricultural soils in St. Albans for each of the 150 acres developed. [37] The Selectmen of the Town endorsed the mitigation agreement.[38]

The Board stated that in previous Criteria 9(B) cases, the Board's analysis regarding reduction in agricultural soils was limited to the project site, i.e., the land actually proposed for development.[39] The Board took the novel approach in the *Gerbode* case, however, of directing its inquiry into the net loss of agricultural soils on separate, non-contiguous lands, concluding that the proposed technology park would not significantly reduce the agricultural potential of the soils because, in the aggregate of the project site and land identified in the mitigation agreement, only one-third of the total amount of combined agricultural soils would be developed, while two-thirds of the agricultural potential would be permanently preserved.[40] Although the 150-acre project site was then under cultivation and had been historically used as a dairy farm, the Board based its decision, at least in part, on the conclusion that the subject land was not likely to be used for agricultural production "in the future." [41] The project site was in an area designated as commercial/industrial by the Town; was close to the railroad, an Interstate interchange, and commercial and industrial development; and was physically isolated from other farm units.[42] The Board's inquiry did not proceed to assess compliance with the subcriteria, presumably because it found, in the first instance, that no significant reductions in the agricultural potential of the aggregated lands as a whole would occur.

C. Off-Site Agricultural Mitigation Under Gerbode

Recognizing that there is no statute, regulation, or other express legislative authority which allows for mitigation agreements within the context of Criterion 9(B), subsequent cases characterized the *Gerbode* decision as "establishing," or giving birth to, primary agricultural soils mitigation agreements in Vermont.[43] Subsequent cases have described the Board's holding in *Gerbode* as based on recognition that "there would be instances where satisfaction of the strict requirements of Criterion 9(B) was not feasible." [44] Practically, an alternative to the four subcriteria was created in *Gerbode*, whereby applicants could "side-step" the requirements of the subcriteria.[45] Mitigation agreements became a third means by which applicants could pass Criterion 9(B) muster, instead of complying with the subcriteria, or demonstrating that no significant reduction in agricultural potential was likely.[46] Beginning with the *Gerbode* decision and until a subsequent change in the law, the "Board and . . . District Commissions . . . allowed applicants in particular cases to use mitigation agreements to fully compensate for the negative effects under Criterion 9(B) of their projects and thereby satisfy the criterion." [47] By entering into an agricultural mitigation agreement with DAG and agreeing to pay for the preservation of other, off-site primary agricultural soils, an applicant could, in effect "mitigate a project's way into compliance with the criterion." [48]

Following the *Gerbode* decision, "once a mitigation agreement had been signed by [the applicant and DAG], the Board generally accepted the agreement without further inquiry" into compliance with Criterion 9(B).[49] The Board's deference to DAG's discretion in setting the terms of mitigation agreements became controversial as did DAG's informal approach to mitigating the conversion of agricultural lands.[50] DAG's management of the mitigation process and the administration and spending of mitigation funds were undertaken on a relatively *ad hoc* basis after the *Gerbode* decision.[51] No formal process, rules, or procedures were established by DAG for the terms, implementation, or enforcement of mitigation agreements.[52]

While DAG's policy was to use funds collected under mitigation agreements to fund agricultural projects in the same Act 250 District as the lands to be developed, it did not necessarily dedicate funds to permanently preserve agricultural soils in the same municipality or county.[53] Similarly, no assurance was provided that the funds would serve to "protect soils of comparable quality or quantity to those [being] developed." [54]

As a matter of policy, DAG would generally only enter into a mitigation agreement (a)(i) if the agricultural land proposed for development was within an area designated for development under an approved municipal plan; or (a)(ii) if project designs minimizing the reduction in the agricultural potential of the soils had been considered and an onsite cluster development would not have resulted in the conservation of agricultural land with the ability to contribute to commercial agricultural enterprise; and (b)(i) if the development of the project site would not jeopardize the continuance of farming on nearby land (i.e. subcriterion iv); or (b)(ii) if the lands to be developed were in an area under conversion or likely to be converted to uses incompatible with farming or which would not support farming.[55] However, DAG did not always apply these policy considerations when determining whether off-site mitigation was appropriate for a project.[56]

In addition, while DAG required that developers contribute a calculated "price per acre" sufficient to permanently preserve two acres of land for each acre developed, its price per acre did not reflect the actual cost of purchasing or protecting any particular acre or group of acres of farmland in the same county.[57] The price per acre for primary agricultural soils was based on a county-average of the value of agricultural lands, "many of which [were] not under development pressure and [were] therefore less expensive" than lands in the path of development.[58] Consequently,

the price per acre for primary agricultural soils was actually less than the fair market value for lands under development pressure.[59]

D. Vermont's Current Approach to Off-Site Agricultural Mitigation

Criticism of the *Gerbode* decision and controversy surrounding DAG's subsequent administration of the mitigation fee program came to a head in *Re: Southwestern Vermont Health Care Corporation ("SVHC")*, #8B0537-EB, Findings of Fact, Conclusions of Law, and Order (Feb. 22, 2001), which altered the face of off-site agricultural mitigation in Vermont. In *SVHC*, the applicant filed a land use permit application with the Commission seeking authorization to construct a non-profit retirement facility with sixty-six assisted living units and fifteen duplex cottages for independent living on 51.5 acres.[60] The District Commission denied the project application and SVHC filed an appeal with the Board alleging, in part, that the Commission erred in its conclusions concerning Criterion 9(B) and its mitigation agreement with DAG.[61] In addition to the statutory parties, SVHC and DAG, the Board granted party status to several project opponents, including neighboring landowners and a countywide conservation district which filed a cross-appeal with the Board challenging the Board's authority to order off-site mitigation under Criterion 9(B).[62]

The project opponents attacked the validity of DAG's mitigation program in general and its application to the subject mitigation agreement, arguing that where the requirements of Criterion 9(B) and its subcriteria are not met, Act 250 requires denial of the land use permit.[63] The opponents argued that because there is no express language within Criterion 9(B) allowing protection of lands outside of the development site as a means by which to satisfy the criterion, mitigation agreements are unauthorized under the law.[64] The opponents also argued that while "the Environmental Board has broad authority to tailor conditions within an Act 250 permit," it does not have the inherent authority to impose conditions, such as the use of a mitigation agreement, that are contrary to the express criteria of Act 250.[65] In addition, the opponents contended that if off-site mitigation was to be employed, it should be effectuated through concrete guidelines, and that without such established standards, the use of mitigation agreements should be found invalid.[66] In this vein, the opponents asserted that the State's process for determining what agricultural land would be protected through a mitigation agreement took place "in a vacuum," with no information about the types of land to be protected, the quantity of land involved, the monetary value associated therewith, or whether lands with comparable soil types were located close enough to a proposed project's location such that off-site mitigation would really work.[67] Because of the informal nature of the process, the opponents argued, DAG's mitigation program allowed lands subject to development pressure to be developed while protecting lands which, because of their location, might never be developed anyway.[68]

The Board rejected the opponents' arguments regarding the validity of mitigation agreements and the Board's power to authorize their use, but conceded that the existing mitigation program was flawed. The Board held that authorizing off-site mitigation agreements was within the Board's police power and that "Act 250 provides the Board with broad authority to tailor permit conditions in order to ensure that proposed projects will comply with [Act 250's] ten criteria." [69] The Vermont Legislature expressly provided the Board with discretion to apply the requirements of Act 250 to unforeseen circumstances.[70] Citing subcriterion (iii)'s language encouraging onsite agricultural mitigation techniques, the Board stated that "the use of off-site mitigation to protect specifically targeted agricultural lands can be equally consistent with the legislative intent to protect 'economically viable agricultural units.'" [71] The Board held that "[a] narrow reading of criterion 9(B), resulting in the onsite preservation of a portion of agricultural soils on a project site, may not sufficiently preserve the economic viability of the agricultural soils involved;" and may, in the long run, fail to carry out the Legislature's goals "by attempting to preserve farmland which will ultimately be overwhelmed and fragmented by development at the expense of protecting large[r] parcels of land which are more amenable to preservation." [72] "Instead, the public's interest may be better served by a decision which approves the development of a project site in exchange for other economically viable agricultural lands of comparable quality." [73] Regarding its authority to implement mitigation agreements, the Board concluded that an off-site mitigation program "provides both DAG and the Board a reasonable means of achieving the Legislature's goal to preserve viable agricultural lands through an informed planning process." [74]

However, upon further consideration of the issues raised by the opponents, the Board stated that closer evaluation of the validity of mitigation agreements on an individual basis was warranted as part of the planning process.[75] The Legislature's consideration of the protection of primary agricultural soils in Vermont as a matter of great importance constituted a "clear signal" to the Board that it should "tread very carefully" when approving any procedure including mitigation agreements which could have the effect of reducing the potential of Vermont's primary soils.[76] To this end, the Board emphasized that going forward, mitigation agreements should be used only as a last resort: only after an applicant has "seriously attempted, but failed," to meet the subcriteria.[77] The Board cautioned that if efforts to reduce the impacts of a project are not even attempted, then "mitigation agreements will be seen as no more than a cost of

doing business."^[78]

The Board held that before a mitigation agreement would be accepted by the Board in the future, "an applicant must also design its project to meet subcriteria (ii) and (iii)" to the extent reasonably feasible.^[79] Thus, for example, if an applicant owns or controls other lands which would be suitable for the project but chooses not to use those lands or if the project could be planned to minimize the reduction of the potential of the primary agricultural soils, but the applicant chooses not to implement such a plan "the Board [could] not accept a mitigation agreement in lieu of meeting the subcriteria."^[80]

In addition, the Board reinforced the practice of DAG not to enter into mitigation agreements unless the project meets subcriterion (iv); thus, the Board formally required that all projects avoid significantly interfering with or jeopardizing adjoining agricultural uses.^[81] Finally, the Board required "assurances that funds donated under a mitigation agreement will be of an amount sufficient to ensure that at least two acres of farmland will be purchased or otherwise protected for every acre of primary agricultural soils that will be lost to development."^[82]

Applying its holding to the mitigation agreement at issue, the Board held that the agreement was too vague and uncertain to be accepted. Significantly, the project site was the largest parcel of primary agricultural land to ever participate in the off-site mitigation program, and the Board held that the mitigation agreement was flawed when reviewed under the heightened scrutiny deserved.^[83] The agreement was deficient because the mitigation fee amount was derived by using countywide average costs for farmland and did not provide assurances that soils of a comparable quality to those lost by the project would actually be protected.^[84] Upon application of the individual subcriteria to the project, the Board concluded that although it complied with subcriteria (ii) and (iv), it did not satisfy subcriteria (i) and (iii), and therefore the agreement did not conform with Criterion 9(B).^[85]

Subsequent Board decisions have recognized that the *SVHC* decision established a "new test" considerably limiting the acceptability of mitigation agreements in Vermont.^[86] Under the new standards for mitigation agreements, the Board has consistently treated them as a "last resort" and has made it more difficult to satisfy Criterion 9(B) by entering into them.^[87]

In response to the *SVHC* decision, DAG has promulgated detailed criteria and adopted formal procedures for the implementation and administration of mitigation agreements.^[88] As of November 30, 2002, mitigation agreements have led to the purchase of conservation easements on 22 farms containing a total of 5,183 acres of land.^[89]

III. Off-Site Agricultural Mitigation in California

A. Overview of Title 14 of the California Public Resources Code, Sections 21000 California Environmental Quality Act ("CEQA")

Like Vermont, California requires most major development projects to undergo a public environmental review process in order to assess the potentially significant impacts associated with the proposed project. The California Environmental Quality Act, California Public Resources Code §§ 21000-21006 is one of California's most important environmental laws.^[90] CEQA was passed in 1970 in response "to a general and growing awareness and acceptance of the importance of the natural environment in the lives of [California] citizens, and the vital necessity of its protection and preservation."^[91] The fundamental purpose of CEQA is to "develop and maintain a high-quality environment now and in the future, and take all action necessary to protect, rehabilitate, and enhance the environmental quality of the state" by regulating development so that "major consideration is given to preventing environmental damage, while providing a decent home and satisfying living environment for every Californian."^[92]

CEQA requires formal environmental review prior to public agency decisions to carry out, authorize, or approve projects that could have adverse effects on the environment.^[93] CEQA is primarily a procedural requirement in that it does not regulate project implementation through substantive regulatory standards, or prohibitions.^[94] Instead of prohibiting public agencies from approving projects with adverse environmental impacts, CEQA requires only that the agencies inform themselves about the environmental effects of their proposed actions, carefully consider all relevant information before they act, give the public an opportunity to comment on the environmental issues, and avoid or reduce potential harm to the environment when that is feasible.^[95]

To this end, after performing an initial study to identify any potential environmental impacts of a project, the public agency approving the project, the lead agency, must generally prepare an Environmental Impact Report ("EIR") if it

finds that any of the identified impacts may be "significant."^[96] The general purpose of the EIR is to provide state and local agencies and the general public with detailed information on the potentially significant environmental effects which the proposed project is likely to have, to list ways which the significant environmental effects may be minimized through mitigation, and to indicate alternatives to the project.^[97] CEQA's implementing regulations, 14 C.C.R. §§ 15000-15387 (the "Guidelines"), set forth a set of sixteen broad environmental factors that may be potentially affected by a project.^[98]

Potential impacts to "agricultural resources" must be studied as part of the environmental review process under CEQA.^[99] The term "agricultural resources" generally refers to agricultural land or agricultural uses.^[100] Impacts to agricultural resources include the conversion of agricultural land to non-agricultural uses and conflicts with existing zoning for agricultural use or a Williamson Act contract.^[101] Where impacts to agricultural resources are found to be significant, any feasible mitigation measures that would avoid or substantially lessen such environmental effects must be adopted.^[102] Specifically, mitigation under CEQA includes:

- (a) Avoiding the impact altogether by not taking a certain action or parts of an action;
- (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation;
- (c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment;
- (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and
- (e) Compensating for the impact by replacing or providing substitute resources or environments.^[103]

Mitigation measures need not be adopted, however, where specific economic, social, technological, or other considerations make infeasible the mitigation measures identified in the EIR process.^[104] In addition, where implementation of the mitigation measures proposed are within the responsibility and jurisdiction of another public agency and not the lead agency, the project may be approved if the lead agency simply makes findings that the proposed mitigation measures have been or "can and should be" adopted by the other agency.^[105]

B. The Debate Over Off-Site Agricultural Mitigation Under CEQA

CEQA does not provide for the specific type of mitigation measures that can or should be adopted to mitigate significant impacts on agricultural resources, leaving the determination of how best to mitigate such impacts to the discretion of local agencies. Unlike Vermont, where Act 250 jurisprudence has established off-site agricultural mitigation measures as common practice, California has not yet made up its mind. CEQA litigants and the courts are still engaged in a debate over the fundamental question of whether significant impacts to agricultural resources can be or are mitigated through the permanent preservation of off-site agricultural lands. Ironically, because CEQA does not require mitigation where mitigation is deemed infeasible, project proponents in California often argue that agricultural lands are a finite resource which, once lost, are irreplaceable. Under this logic, any loss of agricultural lands is unmitigable through the long-term preservation of off-site agricultural land because development still results in a net loss of agricultural lands in the State. Conversely, project opponents in California often argue that agricultural lands are not a finite resource and that the conversion of agricultural lands may be mitigated to a level less than significant or even that conversion of non-agricultural lands to agricultural uses is a feasible way of offsetting any net decrease.

Unfortunately for all stakeholders involved, the three key CEQA decisions addressing this debate are unpublished or depublished and may not be cited as legal precedent or relied on by a court or party in any action or proceeding.^[106] This has left the state of the law in this area in considerable disarray, particularly because the decisions represent a split in California's appellate districts, entail conflicting approaches by different state agencies, and were litigated under contradictory theories raised by the Office of the Attorney General.

1. County of Santa Cruz

The issue of off-site mitigation for impacts to agricultural resources was first addressed by the California Court of Appeal in *County of Santa Cruz v. City of San Jose*, where Santa Cruz County and environmental groups challenged the sufficiency of an EIR for a large-scale campus industrial development in the City of San Jose.^[107] The project entailed the conversion of 688 acres of farmland and open space into an industrial research park in which 269 acres would be devoted to open space and flood control improvements including a flood detention basin.^[108] The use proposed by the

project conformed with the City's adopted general plan.[109] The EIR provided that the loss of farmland and other open space due to the construction of the project could not be mitigated.[110]

The project opponents argued that the EIR's treatment of impacts to agricultural lands and open space was inadequate and that the City should have required the project applicant to purchase conservation easements or other off-site agricultural land to offset the loss, and thus, mitigate the impact.[111] The City responded by arguing that the loss of farmland and open space could not be "feasibly mitigated" because the land converted by the project to industrial use could not be replaced and was, in any event, designated by the general plan for industrial use.[112] The opponents responded that because the City did not even consider the purchase of other agricultural lands or easements, it was unknown whether this would have been a feasible mitigation measure. In the view of the project opponents, it was "environmentally unconscionable" for the City to adopt a policy that allowed for destruction of prime agricultural land without any attempt to mitigate this effect.[113]

The EIR for the project concluded that the loss of agricultural lands could not be mitigated by adopting the measures suggested by the opponents. The EIR explained its conclusion as follows:

There is a finite amount of land that is suitable for agricultural use. The purchase of fee title or of agricultural conservation easements over other agricultural parcels off-site would not avoid, reduce or compensate for the impact of converting land on the site to campus industrial use because it would not offset the loss of agricultural land caused by the Project -- i.e., there would still be a net reduction in the total amount of land suitable for agricultural use that is available for such use. At most, the suggested measures would prevent the conversion of other agricultural lands as a result of other hypothetical future projects on any parcels that were purchased or had a conservation easement placed on them.[114]

The EIR noted that because 269 acres of the 688-acre site would be preserved as open space, the loss of land was smaller than what was envisioned in the general plan. The City recognized that the impacts on agricultural lands could not be mitigated but concluded that they were acceptable in light of the significant benefits related to the development of the site in accordance with the goals of the general plan.[115] In ruling for the City, the court held that while CEQA authorizes the type of off-site mitigation proposed by the opponents and that other jurisdictions may have policies requiring purchases of easements or open space to offset the loss of agricultural land to development, CEQA does not require the adoption of such measures in every case.[116] The court stated that the City did not have any policies providing for offsetting purchases but did have a policy that land designated for development in its general plan should be developed in accordance with that plan. The plan included consideration of land use, housing, conservation, and open space issues. This was reflected in the long-term goals, objectives, and policies relating to the appropriate balance between development of housing, industrial, commercial and other uses on the one hand, and the preservation of agricultural land and open space on the other. The court concluded by holding that the EIR's explanation was sufficient and adequately supported the City's findings regarding the feasibility of mitigating the loss of open space and agricultural lands.[117]

2. Kangaroo Rat

The next case to rule on the off-site agricultural mitigation issue was *Friends of the Kangaroo Rat v. California Department of Corrections*, [118] where project opponents challenged the legal sufficiency of a subsequent EIR ("SEIR") [119] certified by the California Department of Corrections ("CDC") for a prison construction project in Kern County. [120] The SEIR stated that "the project would convert 480 acres of farmland to an institutional use," representing a significant impact to agricultural resources that could not be mitigated because no mitigation was available to reduce the impact. [121] During environmental review of the project, the project opponents commented that this conclusion was not supported by any evidence in the record and was not based on any analysis or discussion. The opponents stated that the SEIR should have examined "the possibility that the impact of this conversion could be reduced by creating agricultural easements over important farmlands [off-site] in the vicinity of the project site." [122] CDC responded to the opponents' comments as follows:

The [SEIR] does not discuss mitigation for the conversion of Important Farmland to non-agricultural uses because there is no known mitigation for this impact. The State CEQA Guidelines require that an EIR discuss feasible measures that would avoid or substantially reduce a project's significant environmental effects. They also require that if mitigation exists that is considered infeasible, the infeasibility be discussed. The State CEQA Guidelines, however, do not require that a lead agency present evidence of the non-existence of mitigation The same commenter proffered previously . . . that this impact was not mitigated, but provided no suggested mitigation As we can only infer the suggestion here, CDC would pay the owner of existing agricultural land to continue to farm the land. This would not mitigate the loss of farmland; it would not create new farmland or compensate for the loss of farmland that has already

occurred. The only other options would be to acquire for conversion to agricultural use (1) land that is presently undeveloped and not in agricultural use but that could be suitable for cultivation as Important Farmland (i.e., fallow land) or (2) land that is already developed. Based on field visits and a review of [the area Habitat Conservation Plan], it can be concluded that fallow agricultural land or natural open space land is likely to contain natural habitat that may potentially be used by special-status wildlife species . . . ; converting such land to agricultural use to mitigate a land use impact could therefore entail introducing disturbance (agricultural operations) into potential habitat, which would result in impacts on these species. This is not environmentally beneficial. Converting land developed with residential, commercial, or industrial uses to Important Farmland is infeasible for obvious reasons.[123]

In ruling for the CDC, the court held that the creation of an off-site agricultural easement would not constitute "mitigation" under CEQA.[124] The court stated that the suggested agricultural easement would presumably not create any new farmland where no farmland presently exists. "Thus, an agricultural easement would not compensate for a loss of farmland 'by replacing or providing substitute resources or environments.'"[125] At best, the court reasoned, such an easement might prevent the future conversion of some as yet unidentified parcel of farmland to a nonagricultural use. The court concluded that although the opponents might deem this future preservation function to be a desirable result, the desire for such a result did not turn the proposed action into mitigation of the project's impacts on agricultural resources.[126]

3. South County Citizens

In *South County Citizens for Responsible Growth v. City of Elk Grove*, the California Office of the Attorney General on behalf of the California Department of Conservation, took a totally contrary position to its stance in *Kangaroo Rat*, arguing that CEQA does require consideration of off-site mitigation for the loss of agricultural land.[127] At issue in this case was the development of approximately 295 acres of open space and farmland in the City of Elk Grove.[128] The City's general plan designated the project site for potential urban development by 2010 and the City approved the construction of extensive commercial uses, including a regional shopping mall, and some 280 residential units.[129] The "EIR identified the conversion of farmland as a significant environmental effect" of the project but "concluded that there [was] no feasible mitigation measure available to offset the loss of farmland." [130] It reasoned that "while preservation of other existing farmland or the payment of fees for the purchase of conservation easements would help to limit future losses, such measures would not reduce the specific loss of farmland converted to urban use through the project," and that it was impossible to create or manufacture more viable farmland.[131]

During the public comment period on the EIR, a number of commentators suggested that the loss of farmland could be mitigated by adopting a Sacramento County policy that for every acre developed, "the applicant would preserve .63 acres of agricultural land within the area or would contribute 950 dollars into a fund for the purchase of conservation easements or similar instruments." [132] Although it contacted a number of State and local agencies for information on agricultural conservation programs, City staff continued to recommend against the imposition of a conservation mitigation requirement for the project.[133] Staff "asserted that conversion of the land to urban use would result in permanent loss of [an agricultural] resource that could not be avoided, minimized, or rectified." [134] Staff also "noted that to impose a mitigation measure under CEQA, there must be an essential nexus between the mitigation measure and a legitimate governmental interest, and the measure must be roughly proportional to the impacts of the proposed project." [135] Staff concluded that because there had been no nexus study or ordinance in place requiring such mitigation, the imposition of such a requirement would not meet this test.[136]

During the environmental review process, the applicants informed the City that they would be willing to pay a mitigation fee and the City adopted a development agreement which required the payment of such a mitigation fee. However, "the City found that [the] payment of the fee would not mitigate the impact of the project [on agricultural resources] below a level of significance." [137] In ruling against the City, the court found that nothing in CEQA would support the view that a public agency was relieved of the duty to adopt a feasible mitigation measure which would substantially lessen the significant environmental effects of a project simply because those measures would not reduce the impact below a level of significance.[138] The Court also found that the applicants, "by agreeing to pay, and the City by agreeing to accept, mitigation fees tacitly agreed the loss of farmlands can be mitigated through the payment." [139]

With regard to the underlying issue of whether the loss of farmland can be mitigated under CEQA, the project applicants pointed to the *Kangaroo Rat* case and asserted that because a conservation easement would not create new farmland, it would not constitute mitigation for the conversion of existing farmland.[140] In reaching the opposite conclusion, the court, in a 2-1 decision, expressly disagreed with the Fifth Appellate District's holding in *Kangaroo Rat*. [141] The court reviewed a number of legislative pronouncements including provisions of the Williamson Act,

California's conservation easement law, the Agricultural Land Stewardship Program Act, and CEQA itself, and concluded that these legislative acts reflect that conversion of agricultural land to other uses has been a matter of significant concern to the Legislature for nearly four decades.[142] The court concluded that the California Legislature recognizes that conversion of farmland to other uses, particularly urban use, "inevitably creates development pressures that have a profound impact on the ability of the public and private sectors to conserve other land for agricultural use" and regards conservation easements as an important and necessary means of combating the development pressures created by the conversion of farmland.[143]

The court held that while it is obvious that off-site agricultural mitigation measures will not replace the converted land, they can diminish the development pressures created by the conversion of farmland and "can provide important assistance to the public and private sectors in preserving other farmland against the danger of the domino effect created by the project." [144] In this respect, the court held that off-site "conservation easements [fell] well within the concept of mitigation under CEQA" and that the EIR was deficient because it did not discuss the issue of conservation fees as a mitigation measure for the project.[145]

In a dissenting opinion, one Justice stated that the reasoning of the *Kangaroo Rat* case was persuasive and that a conservation easement does not lessen the loss of agricultural land caused by this or other past and probable future projects.[146] Rather, agricultural land is "unique, and once it is developed with urban uses, it is lost permanently." [147] Emphasizing that off-site conservation easements do not constitute mitigation under CEQA, the Justice wrote that the only means of mitigating or lessening the impacts on agricultural resources is by not approving the project and called for the Legislature to address the conflict between its desire to preserve agricultural land under the CEQA process and the fact the loss of such land cannot be substantially lessened or mitigated when approving a project under CEQA.[148]

Until the Legislature does act to clarify the law in this regard, or until the California Courts of Appeal publish some decisions in this arena, the status of off-site agricultural mitigation measures under CEQA is unclear.[149]

IV. Conclusion

Unlike agricultural district programs and other voluntary farmland preservation systems, off-site agricultural mitigation requirements can have teeth. If developers or landowners want to convert agricultural lands to developed uses, onsite concessions to project design generally have to be made and funds and resources have to be expended to arrange for the permanent preservation of nearby agricultural lands off-site, whether through conservation easement, deeds of development rights, or some other mechanism. Unlike agricultural zoning ordinances which "lock-up" existing farmland, and which are often viewed as unfair or too subject to political caprice, off-site mitigation programs allow for some development to occur, depending on site-specific conditions and the developer or landowner's willingness to compromise.

Ideally, off-site agricultural mitigation enables farmland subject to the greatest development pressure, where long-term agricultural uses are least viable, to be developed as part of a comprehensive pattern of contiguous development while simultaneously providing permanent protection for other viable farmland that might otherwise be in the path of future development. In practice, however, this balance between current development and future preservation is very difficult to maintain. After a decade of employing fairly loose mitigation standards, Vermont recently tightened its requirements and now permits off-site mitigation only as a "last resort." California is still wrestling with the fundamental question of whether the loss of farmland can even be mitigated. Because farmland is a finite resource and because there is no bright line delineating too much development from too little, states like Vermont and California are likely to host heated debates over where to draw the line for years to come.

* Joshua Safran is a senior associate attorney specializing in land use, real estate, and local government law in the Walnut Creek, California office of Bingham McCutchen LLP. This work is dedicated to the memory of Aviel Atash - for his loss there is no mitigation.

[22] See Act 250 §§ 8504(h), 8505. The Supreme Court did not review Environmental Board decisions de novo and the facts established by the Board were deemed to be conclusive where supported by substantial evidence. See, e.g., *In re Wal-Mart Stores, Inc.*, 702 A.2d. 397, 400-401 (1997) (noting that the Supreme Court gave "deference to the Environmental Board's interpretation of Act 250."). It is expected that the Supreme Court will afford similar deference to Environmental Court decisions.

[23] See Act 250 §§ 6086(a)(9)(B) & (C).

[24] See *Argentine*, supra note 14, at 189-190. Agricultural soils are "primary" when they have a potential for growing food and forage crops, are sufficiently well drained to allow sowing and harvesting with mechanized equipment, are well supplied with plant nutrients or highly responsive to the use of fertilizer, and have few limitations for cultivation or limitations which may be easily overcome. In order to qualify as primary agricultural soils, the average slope of the land containing such soils may not exceed 15 percent, and such land must be of a size capable of supporting or contributing to an economic agricultural operation. See Act 250 § 6001(15). The reduction in the potential of such soils is "significant" when the soils are paved, built upon, or divided into parcels too small to contribute to an economic agricultural operation.

[25] See Act 250 §§ 6086(a)(9)(B)(i); *Re: Thomas W. Bryant and John P. Skinner*, No. 4C0795-EB, Findings of Fact, Conclusions of Law, and Order at 26, 28-29 (Vt. Env'tl. Bd. Jun. 26, 1991). Applicants must demonstrate that there is no land use through which they can secure a reasonable rate of return on their investment which does not significantly reduce agricultural potential. See *Re: Marvin T. Gurman*, No. 3W0424-EB, Findings of Fact, Conclusions of Law, and Order at 19 (Vt. Env'tl. Bd. Jun. 10, 1985); *Re: Richard and Napoleon LaBrecque*, No. 6G0217-EB, Findings of Fact, Conclusions of Law, and Order at 6 (Vt. Env'tl. Bd. Nov. 17, 1980).

[26] See Act 250 §§ 6086(a)(9)(B)(ii).

[27] See Act 250 §§ 6086(a)(9)(B)(iii). Projects designed to minimize impacts generally utilize "clustered" housing plans. See, e.g., *Re: Nile and Julie Dupstadt and John and Deborah Alden*, # 4C1013 (Corrected)-EB, Findings of Fact, Conclusions of Law, and Order at 39-40 (Apr. 30, 1999); *Steven L. Reynolds and Harold and Eleanor Cadreact*, No. 4C1117-EB, Findings of Fact, Conclusions of Law, and Order 11-19 (Vt. Env'tl. Bd. May 27, 2004).

[28] See Act 250 §§ 6086(a)(9)(B)(iv). This subcriterion also examines impacts on adjoining forestry uses.

[29] Criterion 9(C) also examines impacts to forestry. See Act 250 § 6086(a)(9)(C).

[30] See Act 250 §§ 6086(a)(9)(C)(i), (ii) & (iii).

[31] See, e.g., *Re: Thomas W. Bryant and John P. Skinner*, No. 4C0795-EB, Findings of Fact, Conclusions of Law, and Order at 23-29 (Vt. Env'tl. Bd. June 26, 1991). It is anticipated that the Environmental Court will employ the same method of analysis for both criteria.

Russell Corporation*, 2004 WL 226387 (denying a mitigation agreement approved by DAG); *Ingleside Equity Group*, 2001 WL 933661; *Re: The Van Sicklen Limited Partnership*, 2002 WL 31856147 at 33.

[88] See Vermont Department of Agriculture, Food and Markets Act 250 Off-Site Mitigation Procedure for Criteria 9 (B) (Jan. 1, 2002).

[89] See Act 250 Off-Site Mitigation: Criterion 9(B) and Mitigation Agreements -- How Mitigation Funds are Used to Protect Vermont Farmland Forever, Vermont Department of Agriculture, Food and Markets & Vermont Housing and Conservation Board at 2 (Jan. 31, 2003).

[90] See Cal. Code Reg. tit. 14, §§ 15000-15387 (CEQA Guidelines), Appendix G § II. While CEQA is not California's main agricultural protection law, it is the arena in which impacts of the conversion of agricultural lands are debated and litigated. California's primary farmland preservation law is the California Land Conservation Act of 1965, Cal. Gov't Code §§ 51200 *et seq.*, commonly known as the Williamson Act, is a voluntary program. The Williamson Act sets forth a framework for placing restrictions on agricultural lands in exchange for tax breaks and other incentives and is based on traditional contract law whereby landowners *voluntarily* place their lands within locally designated agricultural preserves. See *County of Marin v. Assessment Appeals Board*, 64 Cal.App.3d 319, 325-326 (1976) (holding that Williamson Act contracts are to be interpreted like any other form of contract to achieve its objectives and to give each party the benefit of its bargain). Impacts on lands subject to Williamson Act contracts are analyzed as part of the CEQA process.

[91] See *County of Inyo v. Yorty*, 32 Cal.App. 3d 795, 802 (1973).

[92] California Public Resources Code (CEQA) §§ 21000(g), 21001(a), (West 2005). See *Friends of Mammoth v. Board of Supervisors*, 8 Cal.3d 247, 252 (1972) (CEQA described by the California Supreme Court as a "milestone" in the campaign for "maintenance of a quality environment for the people of this state"); see also *Napa Valley Wine Train, Inc. v. Public Utilities Commission*, 50 Cal.3d 370, 376 (1990) (acknowledging the importance of CEQA's purpose).

[93] See CEQA § 21002.1; CEQA Guidelines §§ 15002-15003.

[94] See Stephen L. Kostka & Michael H. Zischke, *Practice Under the California Environmental Quality Act* (CEB 2004), at § 1.1, and generally for an excellent guide to the CEQA process.

[95] See, e.g., CEQA § 21002.1; *Laurel Heights Improvement Assn. v. Regents of University of California*, 47 Cal.3d 376, 393 (1988) (holding that CEQA does not require agencies to select the alternative course most protective of the environmental status quo; CEQA does not and cannot guarantee that the agency's decisions will always be those that favor environmental considerations); *Citizens of Goleta Valley v. Board of Supervisors*, 52 Cal.3d 553, 564 (1990) (holding that courts may not pass upon the correctness of an EIR's conclusions but merely on its sufficiency as an informative document).

[96] See CEQA § 21068 (1996, Supp. 2005). Guidelines, §15382, expands on the statute and defines "significant effect on the environment" as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, mineral, flora, fauna, ambient noise, and objects of historic and aesthetic significance." An effect on the environment need not be "momentous" or "important" to meet the CEQA test for significance. The term "significant" covers a broad spectrum ranging from "not trivial" through "appreciable" to "important" and even "momentous." See, e.g., *No Oil, Inc. v. City of Los Angeles*, 13 Cal.3d 68, 83 (1974).

[97] See CEQA §§ 21002.1, 21061; CEQA Guidelines §15003.

[98] See CEQA Guidelines, Appendix G. The 16 factors are Aesthetics, Agriculture Resources, Air Quality, Biological Resources, Cultural Resources, Geology/Soils, Hazards & Hazardous Materials, Hydrology/Water Quality, Land Use/Planning, Mineral Resources, Noise, Population/Housing, Public Services, Recreation, Transportation/Traffic and

Utilities/Service Systems.

[99] See CEQA Guidelines, Appendix G § II.

[100] See CEQA §§ 21095, 21060.1; CEQA Guidelines, Appendix G § II.

[101]. See CEQA Guidelines, Appendix G; CEQA Guidelines, Appendix G § II *supra* note 96, *supra* re Williamson Act contracts. While impacts to "farmland," generally must be assessed, environmental review must also look specifically at the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency.

[102] See CEQA §§ 21002, 21002.1; CEQA Guidelines § 15091. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies *may* refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. See also CEQA § 21095.

[103]. See CEQA Guidelines § 15370. This definition of the term "mitigation" adopts the definition contained in the federal National Environmental Policy Act ("NEPA") regulations. The federal definition is used so that this term will have identical meanings under NEPA and CEQA for projects which are subject to both Acts.

[104] See CEQA Guidelines §§ 15091, 15093.

[105] CEQA, §§ 21002, 21002.1; .See CEQA Guidelines §§ 15091, 15093; CEQA, §§ 21002, 21002.1.

[106] Under California Rule of Court 976, opinions of a Court of Appeal are not published unless a majority of the three-Justice panel rendering the decision affirmatively certifies the case for publication. Cases for which no certification is obtained are referred to as "unpublished." Under Rule 979, the California Supreme Court may order a published Court of Appeal decision "depublished" without reason and without expressing an opinion of the Supreme Court "of the correctness of the result reached by the decision." The Court of Appeal may also depublish its own published decision on its own motion. Under Rule 977, unpublished and depublished cases may not be cited or relied on by a court or a party in any other action or proceeding.

[107] *County of Santa Cruz v. City of San Jose*, No. H023956, WL 1596613, at 2. This case was unpublished under Rule 976 and under Rule 977 may not be cited or relied on by a court or a party in any other action or proceeding.

A. Introduction

Commercial heavy-duty diesel trucks and buses (defined as commercial diesel buses and trucks exceeding 14,000 lbs gross vehicle weight rating (GVWR)) are currently the single largest source of nitrogen oxide (NO_x) emissions in California, accounting for 30% of statewide NO_x emissions (ARB, 2008). These same trucks buses are also the largest source of diesel particulate matter (diesel PM) in California, representing about 40% of statewide diesel PM emissions.

On-road mobile source emissions in California are currently calculated using the ARB's EMFAC2007 model that was released in December of 2006 (ARB, 2006). Since the last EMFAC release, Staff members have conducted a comprehensive re-evaluation of the heavy duty diesel truck emissions inventory. In developing this new analysis, we have integrated new data and assumptions into an expanded methodology that builds upon current modeling in EMFAC2007. With this methodology, we incorporate detail for different types of trucking operations and truck configurations that are referred to as "inventory categories". Emission factors differ from those in EMFAC2007 and reflect our enhanced knowledge of trucking operations in California that has been developed through this effort. With this document we describe our approach and the results from its application. With this document we also provide emissions estimates for each category of vehicles that would be regulated under the proposed Statewide Truck and Bus Regulation.

B. Methodology

Fundamentally the EMFAC model uses a simple, vehicle population-based technique for estimating emissions for any type of on-road vehicle. We calculate emissions as the product of a population of vehicles, the number of miles traveled per vehicle, and emission rates for each vehicle per mile. Beneath this simple equation lies a series of data and assumptions about the population, miles traveled, and emission rates per vehicle model year in a given calendar year, growth and attrition estimates, deterioration rates, and other factors that affect emissions estimates.

Our revised approach for estimating commercial heavy-duty diesel truck emissions builds upon this concept by applying it separately for each category of trucks. These categories were selected by evaluating different groups of trucks that have similar travel, service, size, age or other characteristics within the category but differing between categories.

The methodology used to develop the proposed rule inventory is based on the following equation:

$$EMS_{CY} = \sum_{MY, C} (POP_{MY, C} \times AC_{MY, C} \times ER_{MY, C})$$

where: EMS_{CY} is the emissions calculated in tons per day for a given calendar year CY.

$POP_{MY, C}$ is the population of trucks for model year MY within each inventory category C for a given calendar year;

$AC_{MY, C}$ is the accrual rate (miles traveled per year) per truck by model year MY and inventory category C in a given calendar year;

$ER_{MY, C}$ is the calculated emission rate, in grams pollutant per mile driven, assuming statewide speed travel distributions in EMFAC2007 and category-specific cumulative mileage accrual over the life of the truck, by model year MY and inventory category C;

With this new analysis, we developed a population and model year distribution for each vehicle category. We also estimated accrual by model year for the category and cumulative mileage accrual (odometer) by model year. Because trucks can move between categories as they age, we assessed the movement of used trucks between categories in order to develop cumulative mileage accrual estimates that reflect this movement. As a result, cumulative odometer readings by model year will not necessarily be consistent with accrual schedules for each inventory category. We developed emission rates using EMFAC2007 and statewide speed distributions, and we adjusted emission rates for modeled odometer readings by category. A more complete discussion of the data sources used is provided in the following section.

C. Data Sources

We have used many different data sources to develop input data to the methodology described above. In this section we provide a general description of each data source as well as links for further information.

1. Motor Vehicle Registration Data

The California Department of Motor Vehicles (DMV) is responsible for the process of vehicle registration in California (DMV, 2001). As part of this program, commercial trucks and buses are required to pay registration annually; however, vehicle owners have the option of registering their vehicles on a seasonal basis. Staff have an agreement with the DMV to get registration data downloads in April and October of each year. Staff process the data in order to compile a list of vehicles by vehicle class, body type, rated weight, and other parameters.

Using each vehicle's license plate configuration, which separates International Registration Plan (IRP) vehicles from non-IRP vehicles, each vehicle's rated weight, and each vehicle's body type data, we separated vehicles into different inventory categories. As such DMV registration was the primary source for vehicle population

and model year by category. We also used the DMV registration data to group trucks by fleet and thus fleet size. With these data we could assess the fraction of owner-operators in each category. We did this by sorting data by owner/operator name and address before grouping trucks into trucking categories. Overall, owner-operator trucks tend to be older than other trucks within the same inventory category. These results will be discussed in detail in subsequent sections of this report describing each inventory category.

2. International Registration Plan (IRP)

The International Registration Plan is a program administered by the American Association of Motor Vehicle Administrators to transfer registration fees assessed to commercial and other vehicles that cross state boundaries, in accordance with the number of miles affected vehicles travel in each participating U.S. State or Canadian Province (IRP Inc., 2008). IRP-registered vehicles most often include commercial heavy-duty trucks and buses but can also include government vehicles and smaller vehicles. Under this program a fleet of vehicles has the option of registering their vehicles in any state where a portion of their fleet is domiciled.

IRP recordkeeping varies by state with some states maintaining electronic databases and others paper files. To facilitate data analysis, Staff obtained IRP data from states in electronic format whenever possible. Staff received in electronic format comprehensive reports representing mileage driven by California-registered IRP trucks in calendar years 2000-2006, and obtained hardcopy samples of IRP data from a number of other jurisdictions for miles driven by their IRP trucks in California.

IRP data representing California trucks were used to directly assess the population and model year distribution of these trucks, as well as the fraction of IRP-registered vehicles' mileage accrual that occurs within California. To evaluate out-of-state IRP data, we copied and analyzed one month's worth of IRP updates by fleet. This represents about 9% of all fleets operating in a given state because a similar number of fleets are required to report each month. Data were collected from four neighboring states (Arizona, Idaho, Nevada, Oregon) as well as eight non-neighboring states (Alabama, Indiana, Nebraska, New Jersey, Oklahoma, Tennessee, Texas, and Wisconsin). Of these states, Alabama, Nebraska, New Jersey, and Oklahoma each provided a model year or Vehicle Identification Number (VIN) for each truck in each fleet, allowing detailed age distributions for each of these states to be developed. Staff relied on roadside survey data to develop age distributions for other states.

All IRP data are provided at the level of a fleet rather than the level of an individual vehicle. Each fleet registered with the IRP reports the total number of power units or trucks in the fleet, the total miles traveled by that fleet, and the total miles traveled in California by that fleet. Reporting is completed annually. Many fleets reporting to IRP are large; as a result, the population of trucks reflected in that fleet's report will reflect a large number of trucks that do not enter California even though they may be authorized to do so. In addition, each state's data format is different; some states provide information such as VIN or model year for each truck in the fleet, while other states

don't. Where model year data were available, staff used the information directly. Where model year data were not available but VIN data were, staff decoded the VIN to derive model year. Staff also received a summary report from DMV that provided the total population of trucks in the IRP program from each state. This report provided an estimate of the number of trucks in fleets cleared to come into California from other states.

3. Motor Carrier Permit Program (MCP)

The California Department of Motor Vehicles and California Highway Patrol (CHP) jointly administer the Motor Carrier Permit Program (MCP), which applies to any operator of a commercial vehicle in California exceeding 10,000 lbs GVWR or truck and trailer combinations exceeding 40 feet in length. The program generally applies to all commercial vehicle operators with an office in California. MCP data provide information on the number of vehicles per fleet and the number of fleets operating in California; the data are separated between for-hire and private carriers. The database does not provide license plate, VIN or GVWR of trucks in each fleet.

We obtained the DMV/CHP 2005 database and used it to estimate the fraction of truck owner-operators in California. These data were compared to similar estimates derived from DMV registration data. Because the MCP database does not provide information on individual truck size, activity, or model year, we ultimately chose to use DMV registration data to assess the fraction of total owners that are owner-operators.

4. International Fuel Tax Agreement (IFTA)

The International Fuel Tax Agreement (IFTA) is an agreement among U.S. states and Canadian provinces to simplify the reporting of fuel use taxes by interstate motor carriers. In California, IFTA is administered by the Motor Carrier Section of the Board of Equalization (BOE) (BOE, 2008). The program operates similarly to IRP in that motor carriers may choose a state for filing fuel tax returns and then each state distributes fuel taxes among other states depending on the fraction of fuel burned and miles traveled by each fleet in each jurisdiction.

Staff obtained 2005 aggregated IFTA data as well as 2006 and 2007 IFTA data summarized for each state by the California BOE. For each state, BOE provided information on the number of miles traveled and the amount of fuel burned within California by trucks from each reported state. However, data for 2006 and 2007 were incomplete with about 10% of the data in each of those years not summarized. For states with incomplete data, we extrapolated estimates using overall population data from IRP. Staff used the 2005 IFTA aggregated out-of-state records to estimate the miles traveled in California by out-of-state heavy-duty trucks; Staff used the 2006 and 2007 data to develop the ratio between trucks from neighboring and non-neighboring states.

5. Vehicle Inventory and Use Survey (VIUS)

The main intent of the Vehicle Inventory and Use Survey (VIUS) is to provide data on the physical and operational characteristics of the nation's private and commercial truck population (US Census Bureau, 2002), including national and state-level estimates of the total number of trucks. Up until 2002, this survey was conducted every 5 years by the U.S. Census Bureau as part of the national census but VIUS is no longer being updated due to lack of funding. Nevertheless, VIUS provides a wealth of information on truck body types, mileage accrual, odometer, and many other factors.

We used VIUS data reported by trucks operating in California to develop mileage accrual rates and cumulative odometer by model year for interstate trucks and by model year and body type for California-based trucks.

6. ARB Vehicle Surveys

As part of this rule development, staff developed an on-line survey for truck and bus fleets in general (ARB, 2008), as well as industry-specific surveys of individual truck categories including agricultural trucks, dump trucks, and others. These surveys provided information such as truck age, miles traveled, body type, and other factors useful for inventory development.

7. Estimated Emission Rates

The EMFAC2007 model (ARB, 2006a and 2006b) was used as the starting point for developing emission rates used in this inventory. EMFAC2007 emission rates are based on analysis of chassis dynamometer testing conducted by the Coordinating Research Council (CRC) under the E55/59 testing program (CRC, 2007). Although both heavy-heavy and medium-heavy duty trucks were tested in the E55/59 study, only heavy-heavy duty truck emission rates were updated for EMFAC2007.

As part of this rule development, staff made three revisions to EMFAC emission rates. Medium-heavy duty truck emission rates were updated with new data made available through the CRC E55/59 program. Staff re-evaluated assumed penetration rates of new technologies into truck sales between 2006 and 2011, and assessed the emissions impact of these revised assumptions. Carbon dioxide emission rates were updated based upon new analysis of several different data sources. Each of these revisions is discussed further in this document. We anticipate incorporating these revised emission rates into the next EMFAC update scheduled for 2010.

8. UC Davis Out-of-State Truck Travel Surveys

In 2006 the ARB contracted with researchers at the University of California at Davis (UC-Davis) to develop and administer truck surveys at major border crossings into California from Oregon, Nevada, Arizona, and Mexico (Lutsey, 2008). For these surveys, interstate trucks were assumed to be those trucks that were registered, domiciled, and/or refueled outside California. Researchers administered 433 surveys of truck drivers at seven weigh stations near state borders with high commercial truck

traffic (Lutsey, 2008). These surveys provided estimates of annual travel activity in California for each of the respondents, allowing staff to estimate the number of out-of-state trucks, their mileage, fuel usage, and fueling locations. Based on results of this study, staff examined whether estimates of interstate truck age, mileage, and fuel usage assumed in EMFAC2007 were reasonable.

Staff also used raw data from this analysis to validate estimates of model year distribution for out-of-state trucks that were developed using IRP data. In an accompanying report, UC Davis estimated the fraction of total VMT in California represented by out-of-state trucks relative to EMFAC2007. ARB did not use these estimates because, subsequent to the Lutsey (2008) report being finalized, staff received IFTA data from the BOE that provided direct mileage reports by state of registration. These issues will be described in greater detail later in this document.

D. Base Year Population and Activity by Age

In Table 1 below, we provide a list of the data sources underlying each of the truck inventory categories to be discussed in the next section including how each data source was used to help develop truck population and activity estimates.

Table 1. Data Sources Used to Develop Population and Activity Estimates

Type / Category	Population	Activity
Heavy-Heavy / Out-of-State	CA Dept. of Motor Vehicles (DMV) International Registration Plan (IRP) reports; adjusted to account only for trucks that enter California. Model-year distribution from IRP data and surveys. Category split between neighboring states (WA, OR, NV, AZ, ID) vs non-neighboring states.	Vehicle Inventory and Use Survey (2002) - Fraction of mileage accrued in California estimated using IRP data samples and International Fuel Tax Agreement Data (IFTA)
Heavy-Heavy / California-Interstate	DMV CA-IRP reports provide population by model year	VIUS for nationally registered trucks in IRP as above. CA-IRP reports fraction of mileage accrued in CA, and IFTA reports for total mileage.
Heavy-Heavy / In-State Tractor	DMV Registration data, adjusted to subtract vehicles from specific categories such as Utility, Drayage, and others.	VIUS 2002 data
Heavy-Heavy / In-State Single	DMV Registration data, adjusted to subtract specific vehicles from specific categories such as Utility, Drayage, and others.	VIUS 2002 data
Heavy-Heavy / Drayage Tractors	License plate and gate count surveys conducted at the Ports of Los Angeles, Long Beach, and Oakland.	Trip-based model developed for ARB Drayage Truck Regulation; mileage accrual assumed flat at total mileage divided by total number of trucks.
Heavy-Heavy / Agricultural Trucks	Age distribution from survey; population extrapolated from survey results; specialty trucks estimated from survey and registration data.	Accrual from survey
Heavy-Heavy / Utility Trucks	Population and age of trucks registered to public utilities in DMV database.	Surveys conducted for ARB Public Fleet Rule.

Type / Category	Population	Activity
Medium-Heavy / In-State Trucks	DMV registration data	VIUS 2002 data
Medium-Heavy / Interstate Trucks	IRP reports	VIUS 2002 data
Medium-Heavy / Agricultural Trucks	Age distribution from survey; population extrapolated from survey results; specialty trucks estimated from survey and registration data.	Accrual from survey
Medium-Heavy / Utility Trucks	DMV registration data.	Surveys conducted for ARB Public Fleet Rule.
Buses / School	California Highway Patrol Data	ARB Surveys
Buses / Other	EMFAC2007	EMFAC2007
Other / Power Take-Off	No population estimated. Total fuel usage provided by California State Board of Equalization; age distribution assumed same as in-state single-unit trucks	Fuel usage converted to equivalent mileage assuming EMFAC speed distributions and fuel economy.

One of the key assumptions in the development of this inventory is that trucks and buses that are grouped by vocation or body type have a common age distribution and accrual schedule. This assumption has been verified through analysis of the data sources described above.

Another assumption that applies to many truck inventory categories is that trucks typically move between categories as they age and accrue mileage. Staff recognized this through analysis of DMV data. For example, heavy-heavy duty diesel trucks (HHDDTs) that are used for interstate travel (e.g. by CA IRPs) are often retired from interstate travel after a few years due to increasing maintenance costs and bought for intrastate travel where reliability is less of a concern. Vehicles are driven many more miles during interstate travel than during intrastate travel. As a result, a ten year old truck that was used during its first five years for interstate travel and its last five for intrastate travel would, on average, have a higher odometer reading than a vehicle used strictly for intrastate travel during those ten years. Staff used estimated as to when vehicles would most typically be transferred between inventory categories and adjusted the odometer readings from those assumed in EMFAC2007 appropriately.

This section describes each vehicle category including the key assumptions and data analysis results that underlie the development of the inventory. For each category we show the age distribution in calendar year 2008 as well as the anticipated mileage accrual of vehicles of different age. We developed age distributions for trucks ranging between ages -1 and 44. Trucks of age -1 represent vehicles sold and operated in the calendar year prior to the model year (e.g. MY2009 trucks sold in CY2008). Model years beyond age 44 were included in the 44 age bin since the EMFAC model handles only 45 model years. We also show the distribution of trucks in each category between

different fleet sizes where appropriate and the difference in the average age of vehicles between different-size fleets.

1. Utility Fleets

In October 2006, the ARB adopted a regulation designed to reduce emissions from diesel trucks that are owned or operated by private utilities that operate in California (ARB, 2006). The utility truck category as defined by the regulation includes both medium-heavy (14,000 – 33,000 lbs gross vehicle weight rating or GVWR - MHDDT) and heavy-heavy (>33,000 lbs GVWR - HHDDT) trucks but does not include refuse haulers or fire trucks and other emergency vehicles operated by public agencies. The regulation required fleet operators to reduce diesel PM emissions on a defined schedule by purchasing newer regulation-compliant engines or installing diesel particulate filters. The following methodology was used to develop a Utility Fleet emissions inventory.

a) Base Year Population and Age Distribution by Fleet Size

Staff used an identical methodology for assessing the utility truck population and model year distribution as was used in development of the utility fleet regulation (ARB, 2005). Staff developed a list of utility names and used those names to extract vehicles from DMV registration data. Those vehicles were then separated by model year and weight category (MHDDT vs HHDDT). The population-weighted average age of a vehicle in the utility fleet category was estimated at 8.2 years for HHDDT, 7.2 years for MHDDT. Figure 1 provides the distribution of the California utility truck population by age for calendar year 2008.

Figure 1: Utility Truck Population and Model Year Distribution (2008)

b) Base Year Accrual, Lifetime Accrual, and Mileage Thresholds

Staff used accrual rates and cumulative odometer readings that were published in the utility fleet rule staff report (ARB, 2005). These were developed by TIAX (2003); results showed that utility trucks accrue between 6,000 and 8,000 miles per year, with slightly more miles accrued per year by HHDDT. The estimated annual average mileage accrual was 7,800 miles per year for HHDDT and 6,200 miles per year for MHDDT, all of which is assumed to occur in California. The estimated average odometer reading was 122,000 miles for HHDDT and 78,000 miles for MHDDT. In Figure 2 we plot annual accrual and cumulative modeled odometer readings for utility category trucks.

Figure 2: Utility Truck Category Accrual and Modeled Odometer Readings (2008)

c) Base Year Vehicle Miles Traveled by Fleet Size and Mileage Thresholds

Utility fleet vehicles were not separated into different categories by fleet size or mileage threshold. This vehicle and emissions inventory evaluates only the fleets of privately owned utilities. The utility fleets of larger municipal agencies are not included in this assessment.

2. Drayage Trucks Serving California’s Ports and Railyards

In 2007 the ARB passed a regulation requiring NO_x and diesel PM emissions reductions from drayage trucks serving California’s ports and railyards (ARB, 2007a). Drayage trucks are typically older than other trucks in California and primarily serve the Ports of Los Angeles, Long Beach and Oakland along with railyards near those ports. Drayage

truck travel is predominantly regional; in general, these trucks make multiple trips to and from the facilities each week. Drayage trucks are all heavy-heavy duty vehicles, exceeding 33,000 lbs GVWR. According to the regulation, by calendar year 2010 all drayage trucks must meet at a minimum model year 1994 or later emissions standards with a diesel particulate filter and by 2014 all trucks must meet 2007 truck emission standards. The following methodology was used to develop the drayage truck emissions inventory:

a) Base Year Population and Age Distribution by Fleet Size

Drayage trucks are defined by their operation rather than body type. Since DMV registration records provide information on body type but not vehicle operator, DMV registration cannot be used alone to estimate the statewide drayage truck population. The population of trucks serving the Ports of Los Angeles and Long Beach and associated railyards was derived from an analysis of one year of gate count and license plate information from approximately half of the terminals at the two Ports; these data were provided by officials from the ports. Staff compared observed license plates to DMV data to assess model year distribution; we then extrapolated results to all terminals at both Ports. A similar approach was used for the Port of Oakland and associated railyards. Regulatory documentation (ARB, 2007b) describes in more detail the methodology used to assess the population of drayage trucks. We estimated the age of drayage trucks serving other ports and railyards in California by assuming that these trucks were similar to those in the HHDDT (instate) tractor category (ARB, 2007b). The population-weighted average age of a vehicle in the drayage category was estimated at 12.4 years for trucks serving the Ports of Los Angeles and Long Beach and regional intermodal railyards and 9.7 years for drayage trucks serving Oakland and associated railyards and for trucks serving the remainder of California ports. In Figure 3 we provide drayage truck population by model year for calendar year 2008. As shown, trucks serving the Ports of Los Angeles and Long Beach are typically several years older than drayage trucks serving other California ports.

Figure 3. Drayage Truck Population and Model Year Distribution (2008)

b) Base Year Accrual, Lifetime Accrual, and Mileage Thresholds

Staff used accrual rates and cumulative odometer readings published in the drayage truck rule staff report (ARB, 2007b) to estimate the vehicle miles traveled (VMT) associated with drayage trucks in each region. Staff then assumed that accrual rates were independent of age for drayage trucks and that the vehicle population increased in proportion to the overall VMT for the inventory category.

Drayage trucks serving the Ports of Los Angeles and Long Beach were estimated to drive around 41,000 miles per year. Drayage trucks serving the Port of Oakland drive, on average, around 40,000 miles per year. Drayage trucks serving other ports in California are assumed to have travel characteristics similar to in-state HHDDT tractors and therefore drive, on average, 49,000 miles per year. All drayage-related VMT are assumed to accrue in California. Odometer readings are modeled assuming that drayage trucks were purchased used from larger national fleets that drive hundreds of thousands of miles in their first several years of operation. This assumption is described in detail in the in-state tractor category. The resulting average odometer reading as estimated was 860,000 miles for LA/LB trucks and 770,000 miles for trucks serving Oakland and other ports/railyards; the apparent difference from the mileage if projected from the accrual rate and the age results from the trucks likely having been used for other purposes before being converted to drayage trucks. In Figure 4 we plot annual accrual and cumulative modeled odometer readings for drayage trucks.

Figure 4. Drayage Truck Category Accrual and Modeled Odometer Readings (2008)

c) Base Year Vehicle Miles Traveled by Fleet Size and Mileage Thresholds

Drayage trucks were categorized by fleet size as single truck fleets, two truck fleets, three truck fleets, and fleets of more than three trucks. No differentiation was made for drayage trucks with regard to mileage threshold, on the assumption that nearly all drayage fleets are operated in a similar manner. In Table 2, Table 3, and Table 4 we show the distribution of VMT among drayage fleets of various fleet sizes and VMT-weighted ages for trucks near the Ports of Los Angeles/Long Beach, Oakland, and all other California ports/railyards, respectively. The age distribution of drayage trucks was also assumed not to differ with regard to fleet size. With regard to the VMT-weighted average age within each category, drayage trucks near LA/LB were estimated to be older, on average, than drayage trucks near other facilities. In Table 5 we provide a summary of the VMT driven by different size drayage trucks fleets serving all California facilities.

Table 2. Distribution of VMT among POLA/LB Drayage Trucks by Fleet Size (2008)

Fleet Size	Daily VMT	Share	VMT-weighted Average Age
1 truck	1,219,969	53.7%	12.4
2 trucks	135,552	6.0%	12.4
3 trucks	152,496	6.7%	12.4
> 3 trucks	762,481	33.6%	12.4
Total	2,270,498	100.0%	

Table 3. Distribution of VMT among Port of Oakland Drayage Trucks by Fleet Size (2008)

Fleet Size	Daily VMT	Share	VMT-weighted Average Age
1 truck	210,556	53.7%	9.7
2 trucks	23,395	6.0%	9.7
3 trucks	26,319	6.7%	9.7
> 3 trucks	131,597	33.6%	9.7
Total	391,868	100.0%	

Table 4. Distribution of VMT among Drayage Trucks at Other Ports/Railyards by Fleet Size (2008)

Fleet Size	Daily VMT	Share	VMT-weighted Average Age
1 truck	127,097	53.7%	9.1
2 trucks	14,122	6.0%	9.1
3 trucks	15,887	6.7%	9.1
> 3 trucks	79,436	33.6%	9.1
Total	236,542	100.0%	

Table 5. Distribution of VMT among Drayage Trucks at all California Ports/Railyards by Fleet Size (2008)

Fleet Size	Daily VMT	Share	VMT-weighted Average Age
1 truck	1,557,622	53.7%	11.8
2 trucks	173,069	6.0%	11.8
3 trucks	194,703	6.7%	11.8
> 3 trucks	973,513	33.6%	11.8
Total	2,898,907	100.0%	

3. Trucks Serving the Agricultural Economic Sector

Agricultural trade associations, in conjunction with staff, administered a survey to farmers, ranchers, and other agricultural businesses designed to identify and characterize trucks associated with agricultural businesses. The stakeholder survey was designed primarily to capture trucks owned and operated by farms, ranches, and first processing facilities, and was similar in format to the on-line survey used to collect information on the broader truck fleet as part of this rule development (ARB, 2008). Results from the survey were used to assess the population of MHDDT and HHDDT that operate in California for agricultural purposes, either seasonally or annually. The survey was also used to assess the model year distribution and mileage accrual of these trucks, as well as the fraction that would be captured by proposed rule exemptions.

a) Base Year Population and Age Distribution by Fleet Size

To assess the model year distribution of agricultural trucks, we compiled survey results for MHDDT and HHDDT separately, and modeled the data in order to smooth trends in model year variability. Based on analysis of the survey data, the population-weighted average ages of HHDD and MHHD agricultural trucks were found to be very similar (17.3 years for HHDDTs and 17.2 years for MHDDTs).

To assess population, we compiled the survey results and extrapolated the survey sample to a statewide population using the numbers of acres farmed and other metrics collected in the survey as scaling factors. Using this methodology, Staff estimated a statewide agricultural truck population of between 40,000 and 60,000 vehicles. However, when staff compared the model year specific truck populations estimated using the extrapolated data to model year specific DMV registration data, they found that the extrapolated agricultural truck populations for certain model years exceeded the total number of trucks of that model year in the DMV database. This suggested that the directly extrapolated survey results were overestimating the agricultural truck population, at least for those model years.

In reviewing the surveys, staff found that very few were administered to farms or organizations that do not own agricultural trucks. In effect, these businesses were excluded from the survey; thus, extrapolating the population using the metrics described above would overestimate the agricultural truck population.

To correct for this overestimation, we used the DMV registration data as an upper bound of the possible number of agricultural trucks of a given model year.

Using the statewide truck population, we back-calculated an agricultural truck population assuming that the agricultural truck population, in any model year, could not exceed 80% of the total trucks registered in that model year. With this technique, we assessed a likely population of 22,150 agricultural trucks in California, of which 45% are MHDDT and 55% are HHDDT. In Figure 5 we show the California agricultural truck population and model year distribution estimated for the 2008 calendar year.

Figure 5. Agricultural Truck Population and Model Year Distribution (2008)

b) Base Year Accrual, Lifetime Accrual, and Mileage Thresholds

We analyzed survey results in order to estimate mileage accrual for agricultural trucks. Because agricultural HHDDT are assumed to be purchased used, their modeled odometer follows a composite that accounts for the mix of single-unit and combination trucks entering the category as well as the likelihood that most tractors currently in the agricultural category were previously in other categories. Because in-state tractors and single-unit trucks are driven more, on average, than agricultural trucks, the composite odometer reading is projected to be higher than the odometer reading of a truck that had been used exclusively for agriculture. These trucks then follow the agricultural truck accrual rate upon transition. Agricultural MHDDT also followed a composite rate, since in-state MHDDT were also assumed to migrate toward the agricultural category. The average odometer reading for agricultural was estimated to be approximately

601,000 miles for HHDDT and 293,000 miles for MHDDT. The average annual mileage accrual was estimated to be 23,000 miles for HHDDT agricultural trucks and 11,000 miles for MHDDT agricultural trucks. All miles are assumed to accrue in California. We present the results in Figure 6.

Figure 6. Agricultural Truck Category Mileage Accrual and Modeled Odometer (2008)

c) Base Year Vehicle Miles Traveled by Size and Mileage Thresholds

Staff did not categorize agricultural trucks by fleet size. With regard to application, both medium-heavy and heavy-heavy trucks were categorized into specialty and non-specialty vehicles. Specialty vehicles are specifically defined under the proposed regulation as water trucks used on the farm, nurse rigs, cotton module movers, or feed or mixer feed trucks owned by a cattle or calf feedlot. Using this definition, by analyzing the DMV registration data, we found that 10% of agricultural trucks or approximately 2200 agricultural trucks statewide were specialty vehicles.

Non-specialty agricultural trucks were categorized according to mileage thresholds, since the regulation is to be applied differently to vehicles driven different mileage thresholds each year. The regulation sets the low use mileage threshold for trucks in general at 10,000 miles per year. Vehicles that exceed 10,000 miles per year but do not exceed an upper mileage threshold need to turnover or retrofit their trucks prior to 2017. Agricultural trucks are below the upper mileage threshold if they fall into one of the following three categories:

- MY 1995 or earlier, and driven less than 15,000 miles/year
- MY 1996-2005, and driven less than 20,000 miles/year, or
- MY 2006 or newer, and driven less than 25,000 miles/year

These categories of agricultural truck are subject to regulatory requirements at the beginning of calendar year 2017 and are categorized as “between mileage thresholds”. The third category consists of trucks that exceed the upper VMT threshold; these trucks are subject to the ARB regulation according to the standard turnover and retrofit timeline.

In Table 6 we show the distribution of daily VMT among medium-heavy agricultural trucks in California in calendar year 2008. In Table 7 we show the distribution of daily VMT among heavy-heavy agricultural trucks in California in 2008. In each table we also show the average VMT-weighted age by mileage threshold. For both heavy-heavy and medium-heavy agriculture truck weight classes, the trucks driven the fewest miles tended to be older than other vehicles.

Table 6. Distribution of VMT among Medium-Heavy Agricultural Trucks by Fleet Size (2008)

Vehicle Type	Daily VMT	Share	VMT-weighted Average Age
Non specialty, below lower threshold	46,021	13.4%	16.0
Non specialty, between thresholds	78,768	23.0%	10.3
Non specialty, above upper threshold	183,598	53.6%	9.2
Ag specialty vehicle	34,265	10.0%	10.5
Total	342,652	100.0%	

Table 7. Distribution of VMT among Heavy-Heavy Agricultural Trucks by Fleet Size (2008)

Vehicle Type	Daily VMT	Share	VMT-weighted Average Age
Non specialty, below lower threshold	82,489	9.4%	17.1
Non specialty, between thresholds	62,773	7.1%	12.5
Non specialty, above upper threshold	645,375	73.5%	10.5
Ag specialty vehicle	87,849	10.0%	11.4
Total	878,486	100.0%	

4. *Medium Heavy Duty Diesel Trucks*

Staff estimate that more than 200,000 MHDDT are registered in and operate in California. These trucks are primarily lighter weight delivery trucks with a GVWR between 14,000 and 33,000 lbs that travel during the work day within the area where they are registered. Most of these trucks are registered in and never leave California, although a few are California-registered and in the IRP program, and a few enter California from other states. Most MHDDTs are found in fleets of two or more although some are single-truck-fleet.

a) Base Year Population and Age Distribution by Fleet Size

Staff identified MHDDT in the DMV registration database by selecting all diesel powered vehicles with a GVWR between 14,000 and 33,000 lbs. The data were then analyzed in two ways. First, staff sorted the registration data by owner name and address to identify the number of vehicle records associated with a unique owner. This list was then used to develop the fleet size distribution, including the number of owner-operators and small fleets. Staff then used a combination of license plate and IRP registration data to estimate how many of the MHDDT are registered in California compared to other states, as well as what fraction of their travel is solely within California. Staff found that the vast majority of MHDDT that are registered in California never leave California. Also, using IRP data, staff estimated that very few out-of-state trucks fall into the MHDDT category. Since both the public and agricultural truck categories include MHDDT, we subtracted these by model year from the in-state MHDDT category to avoid double counting. We estimated the population-weighted average age of an out-of-state or IRP MHDDT at 5.4 years as compared to 8.0 years for an in-state MHDDT. In Figure 9 we show the population and age distribution estimated for MHDDTs operating in California.

Figure 7. MHDDT Population and Model Year Distribution (2008)

b) Base Year Accrual, Lifetime Accrual, and Mileage Thresholds

Staff used the most recent VIUS database (calendar year 2002) to estimate annual mileage accrual and modeled odometer readings for MHDDT. We did not differentiate between in-state and interstate MHDDT with modeled odometer readings. Staff used CA IRP data to calculate the fraction of total mileage accrual that occurs in California on average. Staff estimated that CA IRP MHDDT drive 63% and out-of-state registered

MHDDT 8% of their total annual miles in California. We estimated the average odometer reading as 161,000 miles for out-of-state MHDDT and CA IRP MHDDT and 207,000 miles for instate MHDDT. We estimated the average annual mileage accrual to be 22,000 miles for out-of-state and CA IRP MHDDT and 20,000 miles for instate MHDDT. Of the 22,000 miles driven annually by out-of-state and CA IRP MHDDTs, it was assumed that out-of-state vehicles drive only 8% (1,800 miles) of their annual miles in California as compared to 64% (14,000 miles) for CA IRP vehicles. The difference in average annual accrual resulted from the different age distribution representing the population within each category. In Figure 8 we plot the annual accrual in California and cumulative modeled odometer readings for MHDDT by age and category.

Figure 8. MHDDT Accrual and Modeled Odometer (2008)

Figure 8 shows the annual mileage accrual rates to be similar for medium-heavy duty diesel CA Instate, CA Out-of-State, and CA IRP-registered trucks. However, these accrual rates are simply the total accrual rates for the vehicles in each inventory category; they do not represent the accrual rate for vehicles in each category within California. Because the share of annual travel within California varies between categories (8% for Out-of-State; 63% for CA-IRP; 100% for MHDDT Instate), the accrual rate for vehicles within California also varies for each category. We show these accrual rates in Figure 9; because California-registered MHDDT are assumed to spend 100% of their time in California, they have the highest CA accrual rate.

Figure 9. MHDDT Accrual in California and Modeled Odometer (2008)

c) Base Year Vehicle Miles Traveled by Fleet Size and Mileage Thresholds

We categorized medium-heavy duty diesel trucks by fleet size as single-truck fleets, two-truck fleets, three-truck fleets, and fleets of more than three trucks. We also categorized MHDDT based on their annual miles driven since the regulation is to be applied differently to vehicles used at differing mileage levels. The mileage threshold of significance for MHDDT from a regulatory perspective is 5,000 miles per year. In Table 8, Table 9, and Table 10 we show the distribution of daily VMT driven in California in calendar year 2008 by different size fleets of in-state, CA-IRP, and out-of-state MHDDTs, respectively. Each table also shows the VMT-weighted average age of the trucks as a function of fleet size. For all categories of MHDDT, regardless of miles driven or state of registration, the smaller the fleet, the older the truck. Also, very little

(less than 2%) of the total statewide MHDDT VMT is driven by vehicles in fleets driving less than 5,000 miles a year. In addition, MHDDTs driving less than 5,000 miles a year are significantly older (4 to 6 years older) than those in comparable size fleets that drive more than 5,000 miles a year.

Table 8. Distribution of VMT among Medium-Heavy Instate Vehicles by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age
Below 5000 miles	1 truck	80,942	0.6%	13.4
	2 trucks	25,478	0.2%	13.1
	3 trucks	15,111	0.1%	13.0
	> 3 trucks	107,142	0.8%	11.6
Above 5000 miles	1 truck	3,786,410	29.7%	7.0
	2 trucks	1,244,223	9.8%	6.8
	3 trucks	740,914	5.8%	6.9
	> 3 trucks	6,731,027	52.9%	5.7
	Total	12,731,247	100.0%	

Table 9. Distribution of VMT among Medium-Heavy CAIRP Vehicles by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age
Below 5000 miles	1 truck	95	0.1%	8.2
	2 trucks	61	0.1%	8.4
	3 trucks	68	0.1%	9.2
	> 3 trucks	616	0.8%	9.4
Above 5000 miles	1 truck	9,684	13.0%	4.3
	2 trucks	6,018	8.0%	4.3
	3 trucks	5,943	7.9%	4.5
	> 3 trucks	52,292	69.9%	4.7
	Total	74,777	100.0%	

Table 10. Distribution of VMT among Medium-Heavy Out-of-state Vehicles by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age

	2 trucks	35	0.1%	8.4
	3 trucks	39	0.1%	9.2
	> 3 trucks	353	0.8%	9.4
Above 5000 miles	1 truck	5,552	13.0%	4.3
	2 trucks	3,450	8.0%	4.3
	3 trucks	3,407	7.9%	4.5
	> 3 trucks	29,980	69.9%	4.7
	Total	42,871	100.0%	

5. California Registered Heavy Heavy Duty Diesel Trucks

California is somewhat unique in the United States in that it has a comparatively large population of older heavy-heavy duty diesel trucks. These trucks, with an average age of 10 to 12 years, generally do not travel outside California, operating practically as a captive fleet. These California registered trucks drive fewer miles per truck than IRP trucks registered in California, both because they are older and less mechanically reliable and because they are engaged in more localized trucking services than their out-of-state registered counterparts. Consequently, California registered HHDDT are much more likely to drive in the air basin in which they are primarily based.

When evaluating VIUS data we realized there is a significant difference in the mileage a truck travels depending upon whether it is a single-unit truck or a combination tractor. On average, combination tractors drive more miles per year than single-unit trucks. We also found that while single-unit trucks tend to be purchased new in California and then operate in California for the life of the truck, in-state tractors tend to begin their life as interstate trucks and then transition into in-state usage as they age and accrue miles. Analysis of the VIUS data indicates interstate trucks are generally sold into the in-state fleets between 2 and 6 years of age, having accrued approximately 500,000 miles in interstate service.

a) Base Year Population and Age Distribution by Fleet Size

To develop population estimates for in-state HHDDT, staff used DMV registration data (license plate number and GVWR) to identify those HHDDT that operate solely within California (in-state). Staff then analyzed DMV and IRP data to identify only California registered IRP trucks. Next, staff used the DMV data to assess the body type of each in-state truck. We then used the DMV data to estimate the population and model year distribution of in-state single-unit trucks, in-state tractors, and California IRP trucks. We subtracted the populations of utility trucks, drayage trucks, and agricultural trucks estimated elsewhere from the in-state HHDDT category, by body type and registration, to estimate the number of in-state tractors and avoid double counting.

In Figure 10 we provide the estimated population and age distribution for in-state HHDDT categories in California in calendar year 2008. In general, vehicles traveling only in California are older than those traveling out-of-state and single unit trucks are slightly older than comparable model year tractors. As shown in Figure 10, CA IRP trucks have a population-weighted average age of 6.2 years, while in-state tractors average age 9.9 years, and single-unit trucks average 10.2 years old.

Figure 10. California-Registered In-State HHDDT Population and Model Year Distribution (2008)

b) Base Year Accrual, Lifetime Accrual, and Mileage Thresholds

Staff used VIUS to assess annual mileage accrual rates by body type for in-state HHDDT and CA-IRP trucks. This analysis indicated that California IRP trucks drive about 55% of their total miles in California. Because used trucks are sold into the in-state tractor category from interstate categories, and interstate category tractors drive more miles than in-state tractors during their early years, we developed a composite modeled odometer to represent in-state tractors. The composite odometer estimate assumes a high annual mileage in early model years when a tractor is in long-haul service and lower annual mileage once a tractor begins shorter haul service in the in-state category. For comparative purposes, a vehicle of a given model year that had been used exclusively for interstate purposes would have a higher odometer reading than a vehicle of the same age that had been used exclusively for instate purposes; a vehicle that had been used earlier in its life for interstate purposes and later for instate purposes would likely have an odometer reading between the two. The average odometer reading estimated using this approach was 723,000 miles for instate HHDDT, 338,000 miles for single-unit HHDDT, and 668,000 miles for CAIRP HHDDT. The

average annual mileage accrual was estimated to be 51,000 miles for in-state HHDDT, 25,000 miles for single-unit HHDDT, and 75,000 miles for CAIRP HHDDT (of which 43,000 miles are driven in California). Figure 11 provides in-state HHDDT mileage accrual and modeled odometer by model year; these data reflect the assumption of composite use. For comparative purposes, in Figure 12 we provide the composite odometer reading for in-state trucks of various model years in calendar year 2008 compared with the modeled odometer reading for similar trucks used purely for in-state or interstate long-haul traffic.

Figure 11. HHDDT In-state and Interstate Fleet Accrual and Modeled Odometer (2008)

Figure 12. HHDDT In-State Tractor Modeled Odometer (2008)

c) Base Year Vehicle Miles Traveled by Fleet Size and Mileage Thresholds

We categorized heavy-heavy duty diesel trucks by fleet size as single-truck fleets, two-truck fleets, three-truck fleets, and fleets of more than three trucks. We also categorized the fleets by their annual VMT since the regulation is to be applied differently to trucks driven at different mileages each year. The mileage threshold of significance for HHHDT from a regulatory perspective is 7,500 miles per year. In Table 11 we show the distribution of daily VMT and the VMT-weighted average age as a function of fleet size and annual miles driven for heavy-heavy instate trucks in California in 2008. Heavy-heavy duty diesel instate trucks driving less than 7,500 miles a year are significantly older (5 years) than their counterparts driving more than 7,500 miles a year and contribute less than 2% of the total VMT driven each year by in-state HHDDTs. Regardless of miles driven, HHDDT in smaller fleets are on average older than those in larger fleets.

Table 11. Distribution of Daily VMT among California Instate Tractors Heavy-Heavy Duty Vehicles by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age
Below 7500 miles	1 truck	44,925	0.4%	15.2
	2 trucks	12,992	0.1%	15.4
	3 trucks	7,370	0.1%	15.3
	> 3 trucks	48,792	0.5%	13.6
Above 7500 miles	1 truck	3,031,868	29.1%	10.1
	2 trucks	902,069	8.7%	9.7
	3 trucks	529,836	5.1%	9.5
	> 3 trucks	5,835,899	56.0%	6.4
	Total	10,413,751	100.0%	

In Table 12 we show the distribution of daily VMT as a function of fleet size and mileage driven for heavy-heavy single-unit trucks operating in California in calendar year 2008. In Table 13 we show the distribution of daily VMT as a function of fleet size and mileage driven in California for heavy-heavy trucks licensed in California under the International Registration Program in California in 2008. Each table also shows the average VMT-weighted age of vehicles within the fleets of different sizes; in each case, the trucks driven fewer miles tended to be older than trucks driven more miles, and the average age of vehicles within a fleet was also estimated to decrease with the size of the fleet.

Table 12. Distribution of Daily VMT among Single-Unit Heavy-Heavy Duty Vehicles by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age
Below 7500 miles	1 truck	37,585	1.1%	15.6
	2 trucks	13,153	0.4%	15.5
	3 trucks	7,951	0.2%	14.8
	> 3 trucks	63,491	1.9%	13.5
Above 7500 miles	1 truck	766,081	22.5%	10.3
	2 trucks	279,769	8.2%	9.9
	3 trucks	185,491	5.4%	9.2
	> 3 trucks	2,057,340	60.3%	7.1
Total		3,410,860	100.0%	

Table 13. Distribution of Daily VMT among California International Registration Program Vehicles in California by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age
Below 7500 miles	1 truck	5,804	0.1%	10.8
	2 trucks	2,096	0.0%	10.9
	3 trucks	1,223	0.0%	11.4
	> 3 trucks	9,801	0.1%	11.3
Above 7500 miles	1 truck	2,198,998	26.5%	6.0
	2 trucks	812,823	9.8%	5.8
	3 trucks	460,037	5.6%	5.7
	> 3 trucks	4,791,942	57.9%	4.6
Total		8,282,725	100.0%	

6. Out-of-State Heavy Heavy Duty Diesel Trucks

According to the California Department of Finance, California's economy is the eighth largest in the world (DOF, 2008). Foreign trade, construction, and transportation are all major contributors to California's economy, and these economic sectors attract the services of national trucking fleets including large numbers of out-of-state heavy-heavy duty diesel trucks.

a) Base Year Population and Age Distribution by Fleet Size

No single source of information describes out-of-state truck activity in California. To develop an inventory, staff conducted detailed research into the IRP and IFTA programs. The California DMV provided staff with a report providing the total number of out-of-state trucks, by state, that are enrolled in the IRP program and in fleets that reported any travel in California. These data suggested that more than one million trucks are in fleets that report mileage in California. However, this is likely to be an upper estimate as not all of the trucks in these fleets actually enter California. To better constrain the number of out-of-state trucks entering California, staff analyzed IRP data in greater detail, as described below.

In analyzing the age distribution of out-of-state trucks, staff divided heavy-heavy duty trucks into two groups based on their proximity to California under the assumption that trucks traveling longer distances are younger. Neighboring states were considered to include British Columbia, Washington, Oregon, Idaho, Nevada, and Arizona while non-neighboring states included all other states and Canadian provinces. Staff sampled IRP data from 12 states to obtain a statistically representative sample of data. IRP data suggested neighboring state trucks are on average 6.1 years old and have a model year distribution similar to that of California interstate trucks while non-neighboring state trucks are on average around 3.3 years old, much younger than other interstate trucks. Recent field studies supported by the ARB have confirmed this trend (Lutsey, 2008).

To better understand the population of out-of-state trucks that actually operate in California, staff developed a methodology to assess the number of trucks in a fleet likely to enter California. We evaluated all of the collected non-California registered IRP data by fleet. For each fleet we calculated the number of miles traveled in California per truck as reported in the IRP data. We then assumed an average trip length depending on the registered location of each fleet and where those trucks would most likely travel in California. In many cases the assumed trip length was longer than the calculated number of miles traveled per truck in the IRP data. In those cases, we calculated the population operating in California as the total miles traveled in California divided by the assumed trip length. For all other fleets we assumed all of the reported trucks in that fleet actually enter California. Staff then recompiled the population for trucks from neighboring states and non-neighboring states. The results suggested for fleets in states neighboring California, approximately 60% of trucks in those fleets authorized to enter California actually do so. Of fleets in states not neighboring California, approximately 40% of the trucks authorized to enter California are estimated to actually do so.

The fraction of owner-operators in the out-of-state category was based on the IRP samples collected. The population-weighted average age of HHDDT from neighboring states was estimated to be 6.2 years while HHDDT from non-neighboring states were estimated to be on average 3.6 years old. These estimates were each close to the IRP estimates. In Figure 13 we provide estimates of the out-of-state population and model year distribution of heavy-heavy duty diesel trucks operating in California in calendar year 2008.

Figure 13. Out-of-State HHDDT Population and Model Year Distribution (2008)

b) Base Year Accrual, Lifetime Accrual, and Mileage Thresholds

Staff used VIUS to assess accrual rates for the nationwide IRP truck category traveling in California. Staff then evaluated IRP sample data to estimate the fraction of miles accrued in California and 2005 IFTA records to quantify the total miles traveled in California by out-of-state HHDDT. Results suggested that trucks from neighboring states travel on average 40% of their total mileage in California, while trucks from non-neighboring states travel around 10% of their total mileage in California. The average odometer reading was estimated to be 668,000 miles for neighboring out-of-state HHDDT and 473,000 miles for non-neighboring out-of-state HHDDT. The average annual mileage accrual was estimated as 75,000 miles per year (30,000 miles per year in CA) for neighboring out-of-state HHDDT and 85,000 miles per year (8,400 miles per year in CA) for non-neighboring out-of-state HHDDT. In Figure 14 we provide estimates of the average annual mileage accrual and modeled odometer by model year for out-of-state heavy-heavy duty diesel trucks operating in California in calendar year 2008.

Figure 14. Out-of-State Truck Accrual and Modeled Odometer (2008)

In Figure 14, the accrual rates for HHDDT NOOS and NNOOS trucks are shown to be equal, but these rates represent the overall accrual for the trucks. Because trucks from states neighboring California drive a larger fraction of their annual miles in California than trucks from non-neighboring states, the model used for this analysis reflects different accrual rates for vehicles in each category in California. We show these in Figure 15.

Figure 15. Out-of-State Truck Accrual within California and Modeled Odometer (2008)

c) Base Year Vehicle Miles Traveled by Fleet Size and Mileage Thresholds

Staff also categorized heavy-heavy duty diesel trucks from outside California by fleet size as single truck fleets, two truck fleets, three truck fleets, and fleets of more than three trucks. We also categorized fleets based on the annual VMT of trucks, since the regulation is to be applied differently to fleets used at differing mileage levels. The mileage threshold of significance for HHDDT from a regulatory perspective is 7,500 miles per year. In Table 14 we show the distribution of daily VMT driven in California in calendar year 2008 by heavy-heavy diesel trucks of different fleet sizes registered in states neighboring California. In Table 15 we show the distribution of daily VMT driven in California in calendar year 2008 by heavy-heavy diesel trucks registered in non-neighboring states in 2008. Each table also shows the average VMT-weighted age of vehicles within each fleet size; we estimated the average age to be higher for vehicles

driven fewer miles. We estimated the average age to be independent of the fleet size for vehicles registered outside California.

Table 14. Distribution of Daily California VMT among Heavy-Heavy Duty Diesel Trucks Registered in Neighboring States by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age
Below 7500 miles	1 truck	1,149	0.0%	11.1
	2 trucks	357	0.0%	11.1
	3 trucks	261	0.0%	11.1
	> 3 trucks	7,253	0.2%	11.1
Above 7500 miles	1 truck	501,599	12.7%	5.1
	2 trucks	155,808	3.9%	5.1
	3 trucks	113,815	2.9%	5.1
	> 3 trucks	3,167,429	80.2%	5.1
	Total	3,947,672	100.0%	

Table 15. Distribution of Daily VMT among Heavy-Heavy Duty Diesel Trucks Registered in States not Neighboring California by Fleet Size (2008)

	Fleet Size	Daily VMT	Share	VMT-weighted Average Age
Below 7500 miles	1 truck	188	0.0%	8.3
	2 trucks	58	0.0%	8.3
	3 trucks	41	0.0%	8.3
	> 3 trucks	11,610	0.1%	8.3
Above 7500 miles	1 truck	192,875	1.6%	3.1
	2 trucks	58,926	0.5%	3.1
	3 trucks	41,740	0.3%	3.1
	> 3 trucks	11,889,217	97.5%	3.1
	Total	12,194,654	100.0%	

7. Buses

The proposed regulation achieves emissions reductions for two classes of buses: school buses and other buses. School buses may be either privately- or publicly-owned, but must be used exclusively for transporting students in accordance with the definition of school buses in the California Vehicle Code. Other buses are defined as all buses identified in the DMV database that cannot be categorized as school buses and are not owned by public transit agencies. This category includes intercity buses, charter buses, and church buses. This section describes the assumptions used to develop a baseline emissions inventory for school buses and other buses.

a) Base Year Population and Age Distribution by Fleet Size

Staff used a calendar year 2005 database of school buses compiled by the CHP to estimate the population and age distribution of school buses in California in 2005 (California Highway Patrol, 2006). The age distribution of school buses in 2005 was

assumed to be consistent with the age distribution of school buses between 2000 and 2004.

Staff used the survival rate of school buses in EMFAC2007 and the existing Lower Emissions School Bus Program (LESBP) to estimate the age distribution of school buses in future years. Specifically, the impact of the LESBP was modeled as though: i) all pre-1985 model year school buses will be replaced by buses that meet 2007 emission standards as of December 31, 2009, and ii) 50% of 1985 and 1986 model year school buses will be replaced with school buses that meet 2007 emission standards by December 31, 2010. In addition, the maximum age for a school bus was set at thirty years; any school bus older than thirty years was assumed to be replaced with a new bus. Any school bus that was retired due to age or attrition was assumed to be replaced in the population with a new school bus. The aggregate population of diesel school buses was assumed to remain unchanged; any increases to the total school bus population were assumed to represent new vehicles using natural gas or some other alternative fuel entering the fleet.

Other buses were assumed to follow the age distribution of such vehicles as modeled in EMFAC2007. The population-weighted average age was estimated to be 12.2 years for school buses and 9.6 years for other buses. We compare the age distribution of school buses and other buses operating in California as modeled for calendar year 2008 in Figure 16.

Figure 16. Bus Population and Model Year Distribution (2008)

b) Base Year Accrual, Lifetime Accrual, and Mileage Thresholds

In the absence of new information, staff used the average annual mileage accrual and odometer estimates assumed for buses in EMFAC2007 to estimate the benefits of the proposed rule. The average odometer reading was estimated to be 173,000 miles for school buses and 222,000 miles for other buses. The average annual mileage accrual was estimated to be approximately 13,000 miles for school buses and 22,000 miles for other buses. All such miles are assumed accrue in California. We show in Figure 17 the average annual mileage accrual and odometer estimates for school buses and other buses in California in calendar year 2008..

Figure 17. Bus Accrual and Modeled Odometer (2008)

c) Base Year Vehicle Miles Traveled by Fleet Size and Mileage Thresholds

Buses were not differentiated by fleet size or mileage threshold in this inventory as buses are not treated differently in the proposed regulation based on these criteria.

8. Power Take Off Operations in California

Power Take Off (PTO) operations are those that result in emissions related to activities other than travel, such as a crane lifting objects or a cement mixer processing raw materials. Emissions associated with these operations are more accurately quantified using fuel consumption than vehicle miles traveled, the usual activity metric for on-road vehicles.

a) Estimating Fuel Usage

Staff did not estimate the actual population or distribution of PTO activity. Instead we used fuel consumption data for PTO operations in California in calendar year 2005 as reported by the California Board of Equalization.

b) Converting Fuel Usage to Activity by Age

The age distribution PTO equipment was assumed to follow the same age distribution as HHDDT single-unit trucks. This distribution was given earlier in Figure 10.

Mileage accrual was not directly estimated for PTO operations since, as mentioned previously, emissions generally occur while the equipment is stationary. Staff used the fuel consumption rate in EMFAC2007 for HHDDT single-unit trucks at twenty miles-per-hour with the fuel consumption estimated by the CA Board of Equalization to back-calculate the VMT-equivalent for PTO activity in California, assuming the speed profile embedded in EMFAC2007.

E. Emission Rates

For most categories, staff have used EMFAC2007 and modeled cumulative mileage to develop category-specific emission rates. We have also updated several estimates of emission rates based upon recent data analysis. In this section we describe the methods used to estimate emission rates. In each case, a reference is provided for more detailed information as to the basis for the emission rates. The specific emission rates assumed for vehicles of each fleet will be provided in a database scheduled to be released in conjunction with the staff report..

1. Updated MHDDT Emissions

In EMFAC2007, staff did not update the emission factors for medium heavy heavy-duty trucks (MHDDT). Subsequent to the release of EMFAC2007, the CRC made emissions test data available for MHDDT available to staff through its E55/59 project final report. This proposed regulation incorporates updated MHDDT emission factors developed by staff using the latest E55/59 study results.

To revise the MHDDT emission factors for this analysis, staff merged the E55/59 data into the data set that was used to develop MHDDT emission factors for EMFAC2002. From this combined data set, staff then recalculated revised zero-mile rates (ZMR) and deterioration rates (DR) for MHDDT.

The method for deriving MHDDT ZMR and DR is the same as that used for calculating emission factors for heavy heavy-duty trucks (HHDDT); the methodology has been described in detail in an EMFAC2007 technical memo (ARB, 2006f).

In Table 16 we provide the zero-mile emission and deterioration rates for medium-heavy duty diesel trucks assumed in EMFAC2007. The deterioration rates are used to model the increase in emissions relative to the zero-mile (or new-vehicle) emission rate due to

a vehicle aging and accruing miles. In Table 17 we give the updated emission rates reflecting incorporation of the latest E55/59 data, as discussed previously.

Table 16. EMFAC2007 MHDDT Zero-Mile Emission Rate (ZMR, g/mi) and Deterioration Rate (DR, g/mi/10,000 mi)

2. Revised engine market information

Staff also updated the emission factors for heavy heavy-duty diesel trucks (HHDDT) and medium heavy-duty diesel trucks (MHDDT) to reflect manufacturers' compliance with the 2007 engine standard and the anticipated compliance with the 2010 engine standard between 2006 and 2011. Staff estimated that the adjustment to 2006-2011 model year emission factors would result in lower NO_x emission rates for 2006 and 2009 model years but higher NO_x emission rates for 2007, 2008, 2010, and 2011 model years than the rates currently assumed in EMFAC2007.

The latest information available to staff indicates that at least one engine manufacturer does not plan to use selective catalyst reduction technology in their 2010-2011 model year heavy-duty diesel engines. In addition, review of the certification data shows that some engine manufacturers introduced 1.2 g/bhp-hr NO_x heavy duty engines one year earlier than required. As a result, staff decided to update the emission factors in EMFAC2007 to reflect the latest information from manufacturers and certification data.

For the earlier introduction of engines meeting 1.2 g/bhp-hr NO_x and 0.01 g/bhp-hr PM standards, the current zero-mile rates (ZMR) and deterioration rates (DR) for 2003-06 and 2007-09 model year groups were weighted by the sales fractions of 2007 standard compliant engines in 2006 model year.

For the introduction of 0.5 g/bhp-hr NO_x engines in 2009 model year, staff estimated the ZMR by adjusting the current ZMR for 2006-2009 model year group (1.2 g/bhp-hr NO_x engines) but assumed that the deterioration rate for 2006-09 model year would still apply to the 0.5 g/bhp-hr NO_x engines. The assumption of unchanged DR is largely based on the fact that the engine manufacturers will achieve a 0.5 g/bhp-hr NO_x level with an integrated technology solution based on their 2006-09 model year technologies (advanced fuel system, air management, combustion and electronic controls, and enhanced cooled exhaust gas recirculation).

Staff estimated the 2005-2008 model year sales fractions of heavy and medium heavy-duty diesel engines based on the sales fraction data reported by the manufacturers and projected the 2009-2012 model year sales fractions from the information currently available. We show the ARB-estimated penetration rates for 2005 to 2012 model years in Table 18.

Table 18. ARB Estimated Penetration Rates of 2005-2012 Model Year Engines

Model Year	Certified NO _x (g/bhp-hr)				Certified PM ₁₀ (g/bhp-hr)	
	2.2	1.2	0.5	0.25/0.2*	0.1	0.01
Heavy Heavy-Duty Diesel						
2005	100%					
2006	99%	1%			98%	2%
2007	14%	86%			1%	99%
2008	7%	93%				100%
2009		90%	10%			100%
2010			10%	90%		100%
2011			10%	95%		100%
2012				100%		100%
Medium Heavy-Duty Diesel						
2005	100%					
2006	100%				98%	2%
2007	23%	77%				100%
2008	12%	88%				100%
2009		90%	10%			100%
2010			10%	90%		100%
2011			10%	90%		100%
2012				100%		100%

* 0.25 g/bhp-hour applies to 2010 model year only.

Using the sales fractions in Table 18, staff calculated the NO_x ZMRs and DRs of both HHDDT and MHDDT for 2006-2011 model years by weighting the ZMRs and DRs of the corresponding model year groups. Staff did not revise the PM emission factors for HHDDT and MHDDT. As can be seen in Table 18, the sales of PM filter-equipped engines in 2006 account for only about 2% for both HHDDT and MHDDT categories; thus the impact of DPF engines on the PM emission rates for the 2006 model year is negligible.

In Table 19 we show the current and revised NO_x ZMR and DR of both HHDDT and MHDDT for 2006 to 2011 model years.

Table 19. NO_x Emission Factors for 2006-2011 MY Heavy-Duty Diesel Trucks (ZMR in g/mi, DR in g/mi/10,000 mi)

Model Year	HHDDT				MHDDT			
	Current		Revised		Current		Revised

2011			1.46	0.0413			0.859	0.0540

3. Carbon Dioxide (CO₂) Emission Rates

Reducing carbon dioxide (CO₂) emissions is a primary goal of the State of California. CO₂ emissions are generated through the combustion of fuels and in particular by combustion of fuels in trucks and buses that operate in California. CO₂ emissions are a function of engine size, load, speed, miles traveled, and many other factors. This section describes how the staff derived CO₂ emission rates to develop emissions inventories in support of the proposed regulation.

Although EMFAC2007 provides CO₂ emission rates for heavy duty diesel trucks, it assumes them to be constant regardless of model year, technology group, activity and other factors. To develop more finely resolved CO₂ emission rates for trucks, staff used fuel economy data as a surrogate for CO₂ since there is a larger database of fuel economy data available for trucks than CO₂ data. Fuel economy estimates were converted to CO₂ emission rates based on the carbon content of diesel fuel, as discussed in more detail later in this section.

In this analysis we have evaluated available data to determine how improvements in engine technology and increasingly stringent criteria pollutant emission control requirements have affected the fuel economy of HHDDT and, consequently, CO₂ emission rates. Staff has recently reviewed the following data sources to develop model year-specific fuel economy values for HHDDTs operating in California:

- Department of Energy: Calendar Year Fleet Average from 1970-2006 (United States Department of Transportation, 2007)
- CRC E55/59 study by West Virginia University: Model Year 1988-2003
- International Fuel Tax Agreement (IFTA) for trucks operating in California
- Consent Decree, in-use study by West Virginia University: Model Year 1994-2003

We chose to not use the Department of Energy (DOE) fuel economy data directly since those are national data and therefore not representative of the truck fleet or driving conditions found in California. Also, the DOE data do not provide information on how fuel economy and CO₂ emission rates vary as a result of technology. DOE data were used instead as an independent check on our technical analysis.

Our technical analysis shows differences in fuel economy between different technology groups (represented as model year groups), as shown in Table 20. This table provides the estimated HHDDT fuel economy by model year group, as well as the assumptions that are embedded in those estimates.

Table 20. Proposed Fuel Economy Values for HHDDT Operating in California

MY	MPG	Note
Pre-1988	5.20	100% Mechanically controlled engines (100% @ 5.2 mpg)
1988-1990	5.39	25% Phase-in of electronic control (75% @ 5.2 mpg and 25% @ 5.95 mpg)
1991-1993	5.58	50% Phase-in of electronic control (50% @ 5.2 mpg and 50% @ 5.95 mpg)
1994-1995	5.76	75% Phase-in of electronic control (25% @ 5.2 mpg and 75% @ 5.95 mpg)
1996	5.95	100% Phase-in of electronic control (100% @ 5.95 mpg)
1997-1998	5.95	Same Fuel Economy as MY 1996 engines
1999-2002	5.48	Post consent Decree Engines with 8% loss in Fuel Economy (Timing Retarding)
2003-2006	5.75	5% gain in Fuel Economy (Better Combustion Strategies)
2007	5.61	3% loss in Fuel Economy due to EGR + DPF (86% @ 5.58 mpg; 14% @ 5.75 mpg)
2008	5.59	3% loss in Fuel Economy due to EGR + DPF (93% @ 5.58 mpg; 7% @ 5.75 mpg)
2009	5.58	3% loss in Fuel Economy due to EGR + DPF (100% @ 5.58 mpg)
2010	5.78	4% gain in Fuel Economy due to SCR (90% @ 5.80 mpg and 10% @ 5.58 mpg)
2011	5.78	4% gain in Fuel Economy due to SCR (90% @ 5.80 mpg and 10% @ 5.58 mpg)
2012	5.80	4% gain in Fuel Economy due to SCR (100% @ 5.80 mpg)

The assumptions described in Table 20 are estimated based on the following assumptions that were derived from analysis of available data:

- Mechanical vs. Electronically Controlled Engines (ECE)
 - 5.95 mpg fuel economy for electronic engines from CRC E55/59 data
 - 0.75 mpg difference in fuel economy between mechanical control and electronic control from CRC E55/59 data
 - Assume all model year mechanical control engines have same fuel economy (5.20 mpg)
 - Phase-in of Electronically Controlled Engines
 - MY 1988 to 1990: 25%
 - MY 1991 to 1993: 50%
 - MY 1994 to 1995: 75%
 - MY 1996: 100%

- Off-Cycle operation in Electronic Controlled Engines
 - MY 1993-1998
 - Higher fuel economy and higher NO_x than mechanical control engines.
 - Model year fuel economy of 5.95 mpg does not reflect chip reflash
 - Adjusted for chip reflash beginning calendar year 2002
- MY 1999-2002:
 - 8% fuel penalty
 - Post-Consent Decree engines with injection timing retarding for NO_x control
- MY 2003-2006:
 - 5% gain in fuel economy
 - Introduction of advanced combustion technologies including exhaust gas recirculation (EGR)
- MY 2007-2009:
 - Introduction of diesel particulate filter (DPF) used for PM control
 - 3% fuel penalty for meeting 2007 emissions standards
 - 86% of engines would meet 2007 emissions standards in CY 2007 (ARB, 2008a)
 - 93% of engines would meet 2007 emissions standards in CY 2008
 - 100% of engines would meet 2007 emissions standards in CY 2009
- MY 2010-2012:
 - Introduction of selective catalytic reduction (SCR) for NO_x control
 - 4% gain in fuel economy for engines equipped with (SCR)
 - 90% of engines would meet 0.2 g/bhp-hr NO_x standards in 2010 and 2011
 - 10% of engines would meet 0.5 g/bhp-hr NO_x standards with fuel economy of 5.58 mpg in 2010 and 2011
 - 100% of engines would meet 0.2 g/bhp-hr NO_x standards in 2012 (ARB, 2008c)

We applied the fuel economy estimates for each model year across each inventory category to develop a composite fuel economy by calendar year. Figure 18 compares fuel economy estimates by calendar year against values derived from DOE, IFTA, and EMFAC2007. This figure shows that HHDDT fuel economy is estimated to improve over time due initially to the introduction of electronically controlled engines and later due to the introduction of SCR-equipped engines. These results compare remarkably well with EMFAC, DOE, and IFTA data. For example, the composite fuel economy reported by all trucks operating in California in the IFTA program is 5.7 miles per gallon, which is equivalent to our estimates for interstate trucks. DOE data appear more variable across calendar years, probably due to varying sample size and representativeness in each year of reported data. Even so, DOE data are within 10% of ARB estimates, and EMFAC2007 is lower than current estimates by only 4 to 7%. In Figure 18 we show HHDDT fuel economy for interstate trucks only. In-state trucks, which are older on average than their interstate counterparts, are estimated to have slightly lower fuel economy (3% to 5%) than interstate trucks.

Figure 18. Fleet Average Fuel Economy for Trucks Operating in California

To convert fuel economy data to CO₂ emission rates, staff used the following methodology:

- estimate the fuel consumption, in gallons, for each truck category based upon the model year fuel economies and model year distribution
- multiply the estimated fuel consumption by the carbon content of diesel fuel (2,778 g carbon/gallon diesel (USEPA (2008))) to estimate the carbon emitted by each truck category
- multiply the estimate of carbon emitted by each category by the ratio between the molecular weight of CO₂ and the molecular weight of carbon (44/12) to estimate the CO₂ emissions from each category if 100% efficient
- assume 99% efficiency, multiplying the CO₂ emitted at 100% efficiency by 0.99, to estimate the final CO₂ emissions estimate for each category.

The application of this process is equivalent to applying an estimate of 22.2 lbs CO₂/gallon diesel fuel (10.08 kg CO₂/gallon diesel fuel) to the estimate of fuel consumed by vehicles in each category.

Fuel economy in MHDDT was assumed to be 33% higher than for HHDDT in the same model year, based on analysis of data described above. CO₂ emission rates for buses were taken directly from EMFAC2007.

4. Final emissions rates

Staff estimated the emission rates for each truck inventory category for two types of activity – vehicles in motion and vehicles idling. We estimated emission rates for vehicles in motion in terms of tons/day for the average vehicle; these are shown in the database provided in conjunction with this appendix. We estimated the emission rates for vehicles while idling in terms of tons/hour; these, too, are shown in the database provided with this appendix.

F. Forecasting the Baseline Inventory

In this section we describe the methods used to estimate the growth of future truck populations and truck VMT in the emissions inventory.

1. Growth

In modeling the emissions for future years, staff needed to estimate the amount of vehicular travel in future years. The emissions are in general proportional to the vehicle miles traveled. The growth rate for VMT is likely to vary between inventory categories; thus we estimated the VMT growth on a category-specific basis.

For utility trucks in this inventory, staff assumed the same growth rate (2.0%) as was assumed in the regulation adopted by the ARB for public and utility fleets (ARB, 2005).

Staff projected the population of drayage trucks to increase at 2.5% per year near the Ports of Los Angeles, Long Beach, and Oakland. We estimated the VMT associated with the drayage trucks at each of these ports/railyards to grow at a slightly faster rate. We estimated the population of drayage trucks at other California ports/railyards to increase at a rate between 1.5% and 1.6% per year, with the VMT also increasing at a slightly faster rate. We estimated future VMT using factors such as projected container traffic and projected vessel traffic that resulted from past data and survey data.

For agricultural trucks, staff assumed a negative growth rate of 0.31% statewide to reflect anticipated ongoing loss of farmland. This growth rate, which actually varies regionally, was developed in 2005 based on analysis of historical farmland acreage trends and with the assistance of agricultural stakeholders. The average annual mileage accrual of each agricultural truck was assumed to remain constant; thus the total annual VMT for agricultural trucks is assumed to decrease proportional to the truck population.

For all other truck types, we projected the VMT to grow at a rate equivalent to the overall VMT growth rate for trucks reported in EMFAC2007 which is 2.66% for heavy-heavy duty trucks and 1.62% for medium-heavy duty trucks. The annual VMT accrual of vehicles in these categories was assumed to remain constant; thus the population of the vehicles, in each category, was assumed to grow in proportion to the VMT. In Table 21 we summarize the annual growth rate estimated for VMT within each truck category.

Table 21. Annual VMT Growth Rates Projected by Category, 2008-2023

Inventory Category	VMT Growth Rate
MH Utility	2.00%
HH Utility	2.00%
HH Drayage near Oakland	5.38%
HH Drayage near LA/LB	4.93%
HH Drayage elsewhere	1.58%
MH Agriculture	-0.31%
HH Agriculture	-0.31%
MH Instate	1.62%
MH CAIRP	1.62%
MH Out of State	1.62%
HH Instate	2.66%
HH Single-unit	2.66%
HH CAIRP	2.66%
HH Non-neighboring Out-of-State	2.66%
HH Neighboring Out-of-State	2.66%
School Bus	-0.50%
Other Bus	3.65%
Power Take Off	2.64%
VMT-weighted Average	2.48%

Staff revisited VMT growth to examine the extent to which more current economic data could result in a revised VMT growth rate, different from that currently assumed in EMFAC2007. Staff regressed national VMT data from the Bureau of Transportation Statistics (BTS) against the US Gross Domestic Product (GDP) for the trucking industry nationwide, which was also released by the BTS. This relationship was then projected with a prediction of the future trucking GDP to estimate the future VMT, again on a federal level. The future nationwide trucking GDP was predicted by extending the relationship regressed earlier between the nationwide trucking GDP and the employment in the transportation sector predicted in the State of California Economic Forecast for the Sacramento Forecast Project. We show the results of this model in Figure 19.

Figure 19. The Historic and Projected Relationship between VMT and GDP on a Nationwide Level

The scale factor between nationwide VMT projected for future years and the nationwide VMT in 2007 was used with the VMT in California in 2007 to project future growth in California VMT. The resulting projections did not differ significantly from those that were estimated in the EMFAC2007 model; thus, staff decided to maintain the growth rates in EMFAC2007 as those for the overall California heavy duty truck fleet.

2. Attrition

For each vehicle category, staff assumed that, outside of regulatory impacts, the age distribution of vehicles within each inventory category would remain constant. Thus, the fraction of a vehicle class represented by vehicles of a certain age would remain

constant; for example, the fraction of MY 2000 vehicles in the category in calendar year 2008 was assumed to be equivalent to the fraction of MY 2001 vehicles in the category in calendar year 2009.

3. *Pre-buy*

When regulations are approved, past experience has indicated that the impact of these regulations can shift the purchase pattern of truck operators. A technology that is required in one year but not in another year may cause trucks from one year to be more expensive than, and thus preferred to, trucks of another year. A trucking firm might wish to not buy a truck with unproven technology; thus, they may delay their purchase for several years until the technology is more proven or purchase trucks with known technology in the year(s) preceding the regulation. Although our analysis has indicated that the shift in purchasing behavior related to “pre-buy” is less than that from general economic trends, we have attempted to incorporate this behavioral pattern in our assessment of model year distribution for each inventory category.

To approximate the sales of trucks in future years, and thus the impact to the age distribution of trucks, staff first estimated the historic annual nationwide truck sales as a function of the historic nationwide GDP associated with transportation activities. Staff used data regarding nationwide truck sales, as estimated by the website WardsAuto.com for 1985-2007, and GDP, as estimated for transportation services nationwide by the US Department of Commerce’s Bureau of Economic Analysis to establish the historical model of truck sales as a function of time and the nationwide transportation GDP. The approximation of this model indicated that GDP had a stronger positive correlation with truck sales than did time itself; while truck sales had a positive correlation with time itself, the correlation that also existed between GDP and time lessened the positive impact of time when truck sales were regressed against both. The strongest relationship was also found to exist between truck sales in Year y and the GDP from Year $y+1$, the time lag indicating that the trucking industry could foresee the decline in economic activity and deferred the purchase of new trucks before the decline was experienced.

Staff then approximated the historic relationship between the historic nationwide transportation GDP and the historic California transportation employment, as estimated by a UCLA business forecast released in July 2007 (UCLA, 2007). We assumed that the growth rate for transportation employment in California was approximated by the growth rate for nationwide transportation GDP. We used this relationship with the projections to 2020 for California transportation employment from the UCLA forecast to project the nationwide transportation GDP until 2020 as shown in Figure 20.

Figure 20. Nationwide Transportation GDP Trends: Historic and as Projected from Forecast Transportation Employment

As a first step toward projecting truck sales, staff developed a regression model between nationwide transportation-related GDP and historic truck sales. We then used the estimates of the future transportation-related GDP to estimate future truck sales. In Figure 21 we compare the actual truck sales between 1985 and 2006 with the sales that would have been predicted by the model as well as the truck sales initially predicted from this model beyond 2006.

Figure 21. The Modeled Relationship between Nationwide Transportation GDP and Nationwide Truck Sales

The modeled relationship did not account for what appeared to be extremes. During periods of slow sales, the model underpredicted the decrease in sales; during periods of higher sales, the model underpredicted the increase in sales. To account for this, staff estimated a correction factor by which the 2008 truck sales were lowered. This correction factor, the adjustment made to the estimate resulting from the model, was equivalent in proportion to the difference between earlier estimates and corresponding actual results. Staff then adjusted truck sales between 2008 and 2015 by an amount appropriate to ensure that the aggregate number of trucks sold within this period remained constant. We show the resulting estimate of truck sales, the “adjusted truck sales”, in Figure 22.

Figure 22. The Modeled Relationship between Nationwide Transportation GDP and Nationwide Truck Sales, Adjusted

Transportation employment within California was already projected to grow at a slightly slower rate after 2015; hence sales for this time period were projected to grow at a slower rate.

Finally, staff received additional data regarding truck sales to date in 2008. These sales were even lower than those projected by the adjusted model. To account for this difference, staff adjusted the model even further, decreasing the sales projected for 2008 and adjusting those in future years to account for the difference – sales in between 2008 and 2011 were adjusted downward, sales after 2011 were unchanged. We show the results of these adjustments in Figure 23.

Figure 23. (Estimated) Truck Sales for Future Years

Because no data were available at the time for prediction of GDP past 2020 with the model used in this analysis, we assumed that trucks were sold in the years beyond 2020 at the same ratio as has happened historically.

Finally, to incorporate these estimates in the populations, staff calculated the ratio between sales of trucks in one model year and the expected number of sales if no factor (e.g. GDP) had caused variation. We show the actual sales and the sales predicted from the pre-buy model in Figure 24.

Figure 24. Actual and Predicted Truck Sales

The ratio between the actual/predicted truck sales and the best-fit value (the ratio assumed to be 1.0 for future years beyond 2019) was used to adjust the representation of each model year within future calendar years. (Adjusting the sales upward/downward for new trucks in a calendar year would have the same impact on the representation of trucks of that model year in later calendar years.) The representation of each model year was then scaled as appropriate to allow the cumulative representation of model years to be 100%. This adjustment was not made for the age distribution of drayage trucks, since the age distribution from the ARB drayage regulation was used.

G. Statewide Baseline Activity and Emissions

We discussed the population of each vehicle type earlier in the Base Year Population and Activity section, but we provide a summary table (Table 22) here to describe the emission sources included in this inventory.

Table 22. Population and VMT by Inventory Category

CY	Category	Population	Share of CA Population	CA Share of VMT	Share of VMT in CA
2008	HH Out-of-State	492,340	52.3%	12.1%	28.5%
2008	HH CA-IRP	60,263	6.4%	57.0%	14.6%
2008	HH Tractor	63,684	6.8%	100.0%	18.4%
2008	HH Single Unit	43,275	4.6%	100.0%	6.0%
2008	HH Drayage	21,650	2.3%	100.0%	5.1%
2008	HH Agriculture	11,998	1.3%	100.0%	1.6%
2008	HH Utility	1,357	0.1%	100.0%	0.1%
2008	MH In-State	198,525	21.1%	100.0%	22.5%
2008	MH Interstate	8,896	0.9%	18.7%	0.2%
2008	MH Agriculture	9,438	1.0%	100.0%	0.6%
2008	MH Utility	2,798	0.3%	100.0%	0.1%
2008	Buses	26,443	2.8%	100.0%	2.3%
2008	PTO				

For this table and later analyses, some categories have been combined to allow for simpler evaluation. Specifically, HH Out-of-State trucks include those trucks from neighboring states as well as non-neighboring states. HH Drayage trucks includes all drayage trucks in service in California, including those serving areas around the Ports of Los Angeles, Long Beach, Oakland, and other California ports. MH Interstate trucks include the medium-heavy trucks registered in other states as well as those registered in the CA-IRP program. Buses include those in the “school bus” and “other bus” inventory categories.

The population shown in Table 22 represents the estimated number of trucks and buses operating in California that fall under this proposed rule in calendar year 2008, including vehicles registered in-state and out-of-state. The share of California population represents the percentage of the total truck and bus population represented by each category. The California share of VMT represents the percentage of total annual VMT driven by vehicles in each category that occurs in California; this is assumed to be 100% for the majority of inventory categories but can be small for interstate categories. The share of VMT in California represents the contribution made by each inventory category to the total truck and bus VMT estimated for California.

As shown in Table 22, heavy-heavy duty diesel trucks registered outside California account for the majority of trucks traveling in California. Because these trucks do not travel exclusively in California, however, their portion of VMT in California, at 28.5%, is not as large as their representation among the population (52.3%). In addition, because trucks in this inventory category tend to be newer than trucks in other categories, their

emission rates are lower and their contribution relatively less than from their in-state counterparts.

1. Base Year Age Distributions across Inventory Category

In an earlier section, we provided the age distribution of trucks within each inventory category. In Figure 25 we compare the age distributions for the different categories. (Note that trucks from non-neighboring states, because they outnumber trucks from other categories by such a large share, are plotted against the secondary axis.) From this figure one can see from the relative peaks of each age distribution that trucks from non-neighboring states tend to be newer than CA-IRP registered trucks and trucks from neighboring states, which in turn are newer than tractors registered in-state. This is logical, in that the trucks traveling the farthest distances to California need to be the most reliable and therefore on average younger. In addition, the trucks representing the CA in-state tractor category are frequently those transferred from the out-of-state and IRP categories in their later years. The oldest trucks represent the agriculture category and the drayage category; these trucks tend to travel, on average, the shortest distances. Staff used this age distribution when estimating emissions.

Figure 25. Comparison of Vehicle Age Distributions between Combination Tractors (2008)

Figure 26 gives a similar representation of the trucking categories more representative of single unit trucks. (In this figure, the MHDDT Instate Trucks are plotted on the secondary axis to allow for better comparison.) As this figure shows, the age

distribution for single-unit trucks does not vary so much between categories as the age distribution does for combination trucks. With regard to single-unit categories in particular, medium-heavy instate trucks are relatively newer and medium-heavy agriculture trucks relatively older.

Figure 26. Comparison of Vehicle Age Distributions between Single-Unit Trucks and Buses (2008)

2. Base Year and Forecasted Population by Inventory Category

In Figure 27 we show the distribution of trucks assumed to visit California in 2008 and 2020. In both years the majority of individual trucks represent one of four categories: heavy-heavy trucks registered outside California, California-registered heavy-heavy trucks in the International Registration Program, heavy-heavy tractors registered in California, and medium-heavy trucks registered in California. In a later section we show the distribution of California VMT between the categories; for two primary reasons, the distribution of VMT differs slightly from the distribution of the unique trucks themselves. First, trucks registered outside California do not travel entirely within California. Second, trucks within differing categories typically do not exhibit the same travel patterns with regard to distance.

Figure 27. A Comparison of Truck Population by Category (2008 and 2020)

3. Comparing Accrual Rates by Inventory Category

In Figure 28 we show the variation in VMT accrual rates between inventory categories in California. Note that this figure shows only the VMT estimated to be accrued within California's borders and does not include the VMT estimated to be accrued elsewhere. This is particularly relevant in the context of trucks registered in states that do not border California, of which more than 90% of the annual VMT are assumed to be accrued outside California. In the context of virtually all heavy vehicles except drayage trucks, the annual VMT for a vehicle is estimated to decrease with the age of the vehicle; drayage trucks are assumed to maintain a steady amount of usage throughout their lives.

Figure 28. Accrual Rates for Combination Trucks in California (2008)

In Figure 29 we show a similar distribution in accrual rates for single unit trucks. As shown, the average accrual rate is estimated to be highest for single unit trucks. The accrual rate is estimated to decrease with age for single unit trucks as well as medium-heavy instate trucks, buses, and medium-heavy trucks used for agriculture. The accrual rates estimated for heavy-heavy trucks from the utility category, however, start at a lower level and remain more stable throughout their lifetimes.

Figure 29. Accrual Rates for Single Unit Trucks in California (2008)

4. Base Year and Forecasted Vehicle Miles Traveled by Inventory Category

In Figure 30 and Table 23 we show the distribution of VMT driven by trucks in different categories in California between calendar years 2005 and 2025. Figure 30 shows the aggregate VMT for each year; the table lists the daily VMT for each truck category in select years. The five most significant contributors to VMT driven in California in calendar year 2008 are:

- MHDDT CA-registered instate trucks (22.5%)
- HHDDT Non-neighboring out-of-state trucks (21.5%)
- HHDDT CA-registered instate tractor (18.4%)
- HHDDT International Registration Plan, CA-IRP (14.6%)
- HHDDT Neighboring out-of-state trucks (7.0%)

Staff estimated these five categories together represent over 81% of all VMT associated with bus and truck travel in California in 2008. Though not necessarily in the same order, we project these five categories to remain the largest heavy duty truck VMT contributors in 2025, collectively accounting for over 83% of all heavy duty truck VMT driven within California's borders. (The HHDDT from states not neighboring California are projected to represent the single largest share in 2025 at 22.1%.)

Figure 30. California Vehicle Miles Traveled by Truck Category

Table 23. Distribution of Estimated Daily VMT in Select Calendar Years

Inventory Category	2000	2005	2010	2015	2020	2025
HH Out-of-State	11,763,164	14,094,931	16,694,413	19,776,058	22,554,003	24,722,681
HH CA-IRP	6,035,750	7,232,194	8,566,004	10,147,215	11,572,595	12,685,357

HH Single	2,485,547	2,978,247	3,527,515	4,178,664	4,765,642	5,223,882
HH Drayage	1,992,437	2,501,164	3,177,789	4,017,716	5,063,470	6,407,181
HH Agriculture	900,850	886,807	872,982	859,373	845,976	832,788
HH Utility	28,849	31,852	35,167	38,827	42,868	47,330
MH In-State	10,188,740	11,871,644	13,287,487	14,478,516	15,531,621	16,717,215
MH Interstate	94,153	109,705	122,789	133,795	143,526	154,482
MH Agriculture	351,375	345,897	340,505	335,197	329,972	324,828
MH Utility	47,746	52,716	58,203	64,260	70,949	78,333
Buses	890,204	1,125,836	1,259,711	1,371,993	1,500,120	1,617,738
PTO	358,622	429,614	509,088	601,588	685,075	751,094
Total	42,726,100	50,753,540	59,221,565	68,761,149	77,655,874	85,512,024

In Figure 31 we show the percentage of VMT associated with each category between 2005 and 2025. As the figure shows, the share of VMT represented by drayage traffic is expected to grow at the expense of other categories (e.g. MHDDT instate) due to the relatively higher growth in goods movement related truck categories.

Figure 31. Share of California Vehicle Miles Traveled by Truck Category

Table 24 provides the estimated population, average age, average odometer reading, and total VMT for each category of heavy duty truck in calendar year 2008.

Table 24. Assumptions made regarding truck categories in calculations.

CY	Inventory Category	Population	Average Age	Average Odometer	Total Accrual
2008	HH Out-of-State	492,340	3.8	489,526	41,666,633,775
2008	HH CA-IRP	60,263	6.2	668,314	4,535,889,834
2008	HH Tractor	63,684	9.9	722,999	3,249,093,053
2008	HH Single unit	43,275	10.3	338,253	1,064,186,055
2008	HH Drayage	21,650	11.8	839,789	904,462,366
2008	HH Agriculture	11,998	17.0	601,454	273,775,114
2008	HH Utility	1,357	8.2	74,611	10,545,996
2008	MH In-State	198,525	8.0	206,852	3,972,137,620
2008	MH Interstate	8,896	5.4	161,306	196,581,895
2008	MH Agriculture	9,438	17.3	293,027	106,907,874
2008	MH Utility	2,798	7.2	56,377	17,455,166
2008	Buses	26,443	11.2	191,829	406,667,394
2008	PTO				

In Figure 32 we show the distribution of annual truck VMT graphically. Four categories again represent the majority of truck VMT: heavy-heavy tractors registered outside California, heavy-heavy tractors registered in the International Registration Program, heavy-heavy tractors registered in California, and medium-heavy trucks registered in California.

Figure 32. A Comparison of Annual Truck VMT by Category (2008 and 2020)

5. Statewide Baseline Emissions Estimates

a) Baseline Emissions

Prior to implementation of the proposed regulation, approximately 941,000 trucks and buses were operating in California in calendar year 2008 and are estimated to contribute 859.3 tons per day NO_x, 33.1 tons per day PM_{2.5}, and 108,429 tons per day CO₂. We show these data in Table 25.

Table 25. Statewide Emissions (2008)

CY	Category	Truck Population	Truck CA VMT/day	NO _x (tons/day)	PM _{2.5} (tons/day)	CO ₂ (tons/day)
2008	All	940,667	57,009,437	859.3	33.1	108,429

b) Baseline Emissions by Inventory Category

We provide in Table 26 the baseline heavy duty truck and bus emissions inventory for the entire state of California in 2008, broken down by inventory category.

Table 26. Statewide Emissions by Inventory Category (2008)

CY	Inventory Category	Truck Population	Truck CA VMT/day	NO _x (tons/day)	PM _{2.5} (tons/day)	CO ₂ (tons/day)
2008	HH Out-of-State	492,340	16,142,326	221.9	8.0	32,766
2008	HH CA-IRP	60,263	8,282,725	139.6	5.2	16,783
2008	HH Tractor	63,684	10,413,751	194.1	7.9	20,897
2008	HH Single-unit	43,275	3,410,860	57.8	1.9	6,876
2008	HH Drayage	21,650	2,898,907	70.0	3.2	6,006
2008	HH Agriculture	11,998	878,486	17.3	0.7	1,788
2008	HH Utility	1,357	33,801	1	0	79
2008	MH In-State	198,525	12,731,247	125.0	4.6	19,067
2008	MH Interstate	8,896	117,648	1.0	0.0	176
2008	MH Agriculture	9,438	342,652	4.0	0.2	521
2008	MH Utility	2,798	55,942	1	0	85
2008	Buses	26,443	1,208,769	15.0	0.4	2,036
2008	PTO	0	492,322	12.2	0.8	1,349
2008	All	940,667	57,009,437	859.3	33.1	108,429

c) Baseline Emissions by Fleet Size

The baseline heavy duty truck emissions inventory for the entire state of California, broken down by inventory category, fleet size, and mileage threshold, is shown in Table 27.

Table 27. Baseline Emissions by Inventory Category and Fleet Size (2008)

Inventory Category	Fleet Size	Truck Population	Truck CA VMT/day	NO _x (tons/day)	PM _{2.5} (tons/day)	CO ₂ (tons/day)
HH Out of State	1 truck/above 7500 miles	12,011	694,474	10.92	0.40	1,411.3
	1 truck/below 7500 miles	432	1,337	0.04	0.00	4.2

We show the emissions as estimated with the baseline scenario for each category of pollutant in the following figures: NO_x in Figure 33, PM_{2.5} in Figure 34, and CO₂ in Figure 35. As shown, the statewide emissions for NO_x and PM_{2.5} are expected to decrease in the absence of regulation, due to the natural replacement of older trucks with newer, cleaner trucks. Baseline CO₂ emissions, however, are projected to increase since improvements in fuel economy are not expected to keep pace with increased heavy duty truck VMT. ARB is proposing to improve fuel economy and reduce CO₂ emissions from heavy duty trucks in future years through other programs and technologies, including increased usage of aerodynamic fairings and tires of lower rolling resistance.

Figure 33. California Statewide NO_x emissions from Trucks, Baseline 2008 - 2023

Figure 34. California Statewide PM_{2.5} Emissions from Trucks, 2008-2023

Figure 35. California Statewide CO₂ Emissions from Trucks, Baseline 2008-2023

H. Statewide Truck and Bus Regulation Benefits

The proposed Statewide Truck and Bus Regulation would initially require older vehicles to install diesel particulate filters. Several years later, the regulation would require operators to either purchase a newer compliant vehicle to replace an older non-compliant vehicle or retrofit the older non-compliant vehicle with emissions controls that would enable each vehicle to comply with regulatory emission standards. Under the proposed regulation, a fleet operator may choose among multiple compliance options on a per-pollutant and per-calendar year basis. Options include: (1) best available control technology (BACT) schedule; (2) fleet average requirements; (3) percent limit requirements; (4) low mileage thresholds with alternative compliance schedules; (5) small fleet compliance options; (6) regional compliance options; and (7) other special provisions.

To estimate the emissions benefits generated by the proposed regulation, one must understand how individual fleet operators may choose to comply with the regulation. Each operator's response may ultimately depend on the age, body type, and other characteristics of vehicles in each fleet and the relationship between vehicles in each fleet to the inventory categories. One of the ways we assess potential compliance patterns is by evaluating previous vehicle buying patterns by fleets based on survey data collected by staff. We input this information to the cost-model developed to assess capital costs under the baseline scenario and the scenario with regulation. We based the cost and economic model, described in greater detail in the *Appendix on Cost and Economic Analysis Methodology* upon survey data representing 6,700 vehicles from 688 individual company fleets.

Another way we can assess potential compliance patterns is by evaluating the base year age distribution in the inventory by category. As discussed above, the age distribution of non-neighboring out-of-state trucks suggests that trucks engaged in the longest hauls tend to be purchased new. After several years in long-haul operation, trucks tend to be sold to regional fleets, and a few years after that to local fleets. This type of purchase behavior may not be entirely true of all fleets or trucks within an inventory category, but it likely is representative of the majority. In addition to evaluating the age distribution for each inventory category, we also evaluated age distributions for each fleet size and mileage threshold group within each inventory category.

Our benefit calculations are also fundamentally based on the idea that newer vehicles drive more than older vehicles, but that the regulation will not affect the number of vehicle miles traveled within California. As a result, as new vehicles are purchased due to regulatory requirements, we redistribute VMT across age distributions by inventory category to ensure VMT is conserved, and to ensure that newer vehicles continue to be driven more than older vehicles.

1. Methodology to Assess Statewide Benefits

To calculate emission benefits, we used a methodology that separated vehicles into five groups: (a) high mileage large fleets, (b) high mileage small fleets, (c) low mileage

vehicles in large or small fleets, (d) agricultural trucks, and (e) buses. For each group we developed a compliance schedule based upon our best estimate of anticipated purchase decisions. Our compliance schedules developed for each inventory category and compliance group assumed that larger, newer fleets will comply with the regulation by purchasing new or near-new vehicles and that where possible fleets will choose to avoid installing retrofits (especially on mechanically controlled engines that are more costly to control) – instead opting to purchase 2007 standard compliant trucks.

a) High Mileage Trucks in Fleets of Four or Greater

Large, high-mileage truck fleets are well-represented in the cost model. The cost model uses previous purchase behavior to predict future purchases for regulatory compliance by fleet, based on the compliance schedules available to these fleets. We assigned an inventory category to each truck in each fleet so that model results could be summarized into four general categories: in-state heavy-heavy tractors, in-state heavy-heavy single-unit trucks, medium heavy duty trucks, and heavy-heavy interstate trucks. We then compiled and analyzed model results to develop a compliance schedule for the four categories.

We show those compliance schedules in Table 29. As shown in the table, we assume large fleets will choose to replace, rather than retrofit, pre-2003 model year vehicles to meet PM BACT requirements. We do assume fleets will choose to retrofit 2003-2006 model year trucks in order to gain maximum use out of recently purchased vehicles. We also assume that, as in-state fleets purchase compliant replacement vehicles, they will purchase a vehicle that is four or five year old. This assumption is a schematic representation that some fleets will choose to purchase older compliant vehicles relatively cheaply, while other fleets will choose to purchase new or near-new vehicles. Table 29 shows that interstate fleets will replace trucks with newer trucks more frequently than in-state fleets.

b) High Mileage Trucks in Fleets of Three or Fewer

Under the proposed regulation, small fleets are exempt from performance requirements through 2011. In 2012 a small fleet must upgrade its first truck to a maximum emission rate equivalent to a 2004 engine with a retrofit DPF. Other vehicles in small fleets must be upgraded between 2013 and 2022. Using this information, we developed the compliance schedule identified in Table 30.

c) Low Mileage Trucks in Any Fleet Size

Under the proposed regulation, low mileage trucks (defined as heavy-heavy duty diesel trucks driving less than 7,500 miles/yr and medium-heavy duty diesel trucks driving less

than 5,000 miles/yr) are allowed to delay compliance with turnover requirements until 2020. Using this information we applied the compliance schedule shown in Table 31.

2022	2008	2010	
2023	2009	2010	

d) Agricultural Trucks

Under the proposed regulation, agricultural fleets are allowed the choice of opting into an alternative compliance scenario. In this scenario, high mileage non-specialty trucks in agricultural fleets, defined as pre-1996 model year trucks driven more than 15,000 miles per year, 1996-2005 model year trucks driven more than 20,000 miles per year, and 2006 and newer model year trucks driven more than 25,000 miles per year, must comply with regulatory provisions. Non-specialty trucks driving fewer miles are not required to install retrofit DPFs and are not required to meet turnover requirements until 2016 or 2022 depending on the number of miles traveled per year. In 2016, the mileage threshold is reduced to 10,000 miles per year. Trucks above that threshold which had not previously been complying with regulatory provisions are required to upgrade to a 2010 model year truck. Trucks below that threshold, and all specialty agricultural vehicles, are required to upgrade to meet 2010 model year equivalent emissions standards by the beginning of 2023. In Table 32 we provide our compliance assumptions for agricultural trucks.

e) Buses

Under the proposed regulation, non-school buses that are privately owned are assumed to follow BACT provisions in the proposed regulation. Due to the cost of replacing these vehicles we assume bus operators will achieve compliance with the least-cost option; this typically involves the oldest compliant vehicle available. Under the proposed regulation, school buses are required to install DPFs but are not required to meet NO_x emission standards. These requirements apply in addition to previous regulatory requirements developed under the Lower Emissions School Bus program. We provide bus compliance schedules in Table 33.

2. Statewide Benefits

In this section we present the statewide emissions reductions anticipated from the proposed regulation.

a) Statewide Emissions Benefits

In Figure 36 we show the NO_x emissions reduction estimated to result from the proposed regulation. We estimate the greatest absolute NO_x emissions benefit to be achieved in calendar year 2014, with a reduction of 123.7 tons NO_x/day relative to baseline emissions. In Figure 37 we show the emissions reduction estimated to result from the regulation, in terms of PM_{2.5}. We anticipate the greatest emissions reduction to be achieved for PM_{2.5} in 2013, with a reduction of 13.6 tons PM_{2.5}/day relative to baseline emissions. We estimate the CO₂ emissions benefit resulting from the regulation to be negligible, with the greatest reduction of 570.8 tons CO₂/day occurring in 2023. In some years the CO₂ emissions are estimated to slightly increase due to the decreased fuel efficiency resulting from the technologies used to reduce NO_x and PM_{2.5}. We show the emissions reduction estimate for CO₂ in Figure 38.

Figure 36. Statewide NO_x Emissions Estimates with Regulation

Figure 37. Statewide PM_{2.5} Emissions Estimates with Regulation

Figure 38. Statewide CO₂ Emissions Estimates with Regulation

b) Statewide Emissions Benefits by Inventory Category

In Table 34 we provide statewide NO_x reductions achieved by the proposed regulation in calendar years 2014 and 2020 for each inventory category. As the table shows, we estimate that single-unit trucks will provide the greatest percent NO_x reduction relative to their baseline, achieving 45% reductions in 2014 and 2020. (The reduction achieved by the proposed regulation with regard to drayage trucks is negligible for NO_x and other pollutants in 2014 and 2020 as a result of the ARB drayage truck regulation adopted in 2007, which will already require significant emissions reductions prior to 2014 (ARB, 2007a; ARB, 2007b); the regulation proposed herein requires further reductions after 2020). When considering all truck categories in aggregate, the largest share of the overall NO_x reduction to be achieved by the proposed rule will be provided by in-state heavy-heavy duty tractors (42% of total reductions in 2014, 45% in 2020) and medium-heavy duty diesel trucks (20%; 17%).

³ The percent reduction estimated from each category with the proposed regulation

⁴ The share of total emissions reductions (e.g. 123.7 tons/day, for all, in 2014) represented by the category

In Table 35 we provide statewide PM_{2.5} reductions achieved by the proposed regulation in calendar years 2014 and 2020 for each inventory category. We predict that trucks in many categories will achieve large PM_{2.5} reductions but we predict the largest reductions to come from the single-unit category as well as the in-state medium- and heavy-heavy duty tractors, in terms of reductions relative to individual category baseline emissions. When considering all truck categories in aggregate, the largest share of the overall PM_{2.5} reduction to be achieved by proposed rule should be provided by in-state

heavy-heavy duty tractors (38% of total reductions in 2014; 47% of total reductions in 2020) and medium-heavy duty diesel trucks (16%; 17%).

³ The percent reduction estimated from each category with the proposed regulation

⁴ The share of total emissions reductions (e.g. 12.9 tons/day, for all, in 2014) represented by the category

In Table 36 we provide statewide CO₂ reductions achieved by the proposed regulation in calendar years 2014 and 2020 for each inventory category. The overall CO₂ reduction for each category is negligible, with none exceeding 1% and some actually increasing CO₂ emissions. When considering all the categories in aggregate, the largest share of the overall CO₂ reduction in 2014 is again represented by the tractors, the heavy-heavy tractors from out-of-state as well as California, and the medium-heavy trucks from in-state. In aggregate, we anticipate a slight increase in emissions for 2014 and a slight reduction for 2020.

¹ The emissions estimated from each category, under the baseline scenario in the absence of regulation

² The emissions estimated from each category, under the scenario with the proposed regulation

³ The percent reduction estimated from each category with the proposed regulation

⁴ The share of total emissions reductions (e.g. -258 tons/day, for all, in 2014) represented by the category

In Table 37 we show the distribution of all emissions reductions anticipated to result from the proposed regulation. We expect the largest reductions in NO_x and PM_{2.5} will come from trucks registered in California, with heavy-heavy instate trucks providing the greatest reductions followed by medium-heavy in-state trucks and single-unit trucks. These three categories alone represent over 74% of the overall NO_x and 67% of the overall PM_{2.5} emissions reductions anticipated between 2008 and 2023.

Table 37. Distribution of Total Future Emissions Reductions across Inventory Category , 2008-2023

Total	100.0%	100.0%

c) Statewide Emissions Benefits by Fleet Size

In Table 38 we subdivide the statewide benefits for NO_x reductions for 2014 and 2020 by truck fleet size. As shown in the table, we expect the reductions in both 2014 and 2020 to come primarily from trucks that are driven above the respective mileage thresholds that are included for application of the regulation. When pooling the fleets together, we expect that the largest share of the overall emission reduction will come from fleets operating more than three trucks, with the second largest share coming from single-truck fleets. We expect the reduction rates, however, to be largest for fleets of 3 or fewer vehicles. In addition, we expect that nearly 45% of the NO_x emissions reductions anticipated in 2014, and more than 47% of the reductions anticipated in 2020, will come from fleets with three or fewer vehicles. These projections result largely from the fact that smaller fleets tend to have on average older trucks than do larger fleets. In Table 39 we show the future NO_x baseline emissions and reductions as a function of inventory category and fleet size.

Table 38. California Statewide NO_x Future Emissions Reductions by Fleet Size, 2014 and 2020 (tons/day)

In Table 40 we provide statewide PM_{2.5} reductions in 2014 and 2020 by truck fleet size and mileage threshold. We expect the reductions in both 2014 and 2020 to come from trucks of all different fleet sizes, regardless of whether the trucks are driven above the

respective thresholds included for application of the regulation. The only trucks not affected are agricultural trucks that are less-utilized. When considering all fleets in aggregate, the largest share of the overall reduction is again represented first by fleets operating more than three trucks, with the second largest share represented by single-truck fleets. The reduction rates, again, are greatest for fleets of 3 or fewer vehicles. We again expect that nearly 45% of the PM_{2.5} emissions reductions anticipated in 2014, and more than 47% of the reductions anticipated in 2020, will come from fleets with three or fewer vehicles. These projections again result largely from the fact that smaller fleets tend to have older vehicles than do larger fleets. In Table 41 we break down the future PM_{2.5} baseline emissions and reductions further as a function of inventory category and fleet size.

In Table 42 we subdivide the statewide benefits for CO₂ reductions for 2014 and 2020 by truck fleet size. We anticipate a slight increase for CO₂ emissions in 2014 and a slight decrease for emissions in 2020. As noted earlier, these proposed regulations are not directed toward the reduction of CO₂ emissions. When pooling the fleets together, the largest share of the overall reduction is represented by larger fleets and single-truck fleets in both 2014 and 2020.

What Can Be Done to Reduce the Effects of Air Pollution on Children's Health? 15	

Introduction

Air pollution has many effects on the health of both adults and children. The purpose of this article will be to examine what is known about how air pollution affects health, especially children's.

Over the past several years the incidence of a number of diseases has increased greatly. Asthma is perhaps the most important disease with an increasing incidence, but other diseases, such as allergic reactions, bronchitis and respiratory infections also have been increasing. The cause of these increases may be due at least in part to the effects of air pollution. This review will address the following questions:

1. Why are children more susceptible to the effects of air pollution than adults?
2. Which air pollutants have the greatest impact on the health of children and adults?
3. What can be done to reduce the effects of air pollution on children's health?

Why are Children More Susceptible to Air Pollution Than Adults?

In many health effects research studies, children are considered as if they were small adults. This is not really true. There are many differences between children and adults in the ways that they respond to air pollution. For example, children take in more air per unit body weight at a given level of exertion than do adults. When a child is exercising at maximum levels, such as during a soccer game or other sports event, they may take in 20 percent to 50 percent more air -- and more air pollution -- than would an adult in comparable activity.

Another important difference is that children do not necessarily respond to air pollution in the same way as adults. Adults exposed to low levels of the pollutant ozone will experience symptoms such as coughing, soreness in their chests, sore throats, and sometimes headaches. Children, on the other hand, may not feel the same symptoms, or at least they do not acknowledge them when asked by researchers. It is currently not known if children actually do not feel the symptoms or if they ignore them while preoccupied with play activities.

This probably does not mean that children are less sensitive to air pollution than adults. There are several good studies that show children to have losses in lung functions even when they don't cough or feel discomfort. This is important because symptoms are often warning signals and can be used to trigger protective behavior. Children may not perceive these warning signals and might not reduce their activities on smoggy days.

Children also spend more time outside than adults. The average adult, except for those who work mostly outdoors, spends most of their time indoors -- at home, work, or even at the gym. Children spend more time outside, and are often outdoors during periods when air pollution is at its highest.

The typical adult spends 85 percent to 95 percent of their time indoors, while children may spend less than 80 percent of their time indoors. Children may also exert themselves harder than adults when playing outside.

Perhaps the most important difference between adults and children is that children are growing and developing. Along with their increased body size, children's lungs are growing and changing, too.

The Lung's Important Role in Health

The lung is an extremely complex organ. While most organs in your body are made up of a few different types of cells, the lung contains more than 40 different kinds of cells. Each of these cells is important to health and maintaining the body's fitness.

Air pollution can change the cells in the lung by damaging those that are most susceptible. If the cells that are damaged are important in the development of new functional parts of the lung, then the lung may not achieve its full growth and function as a child matures to adulthood. Although very little research has been conducted to address this extremely important issue, this review will discuss the information that is available.

USC Children's Health Study

Recent results from the Children's Health Study, conducted by investigators at the University of Southern California, suggest that children with asthma are at much greater risk of increased asthma symptoms when they live in communities with higher levels of ozone and particles and participate in three or more competitive sports. Having said all this, the purpose of this review is not to discourage children or adults from normal daily activities and outdoor exercise. Exercise has very important, beneficial outcomes. Appropriate exercise and prudent exposures of children and adults should be encouraged even in an environment that may always contain some amount of air pollution.

Which Air Pollutants Have the Greatest Impact on the Health of Children and Adults?

Ozone

Ozone is one of the most important air pollutants affecting human health in regions like Southern California.

Ozone (O₃) is a molecule built of three atoms of oxygen linked together in a very energetic combination. When ozone comes into contact with a surface it rapidly releases this extra force in the form of chemical energy. When this happens in biological systems, such as the respiratory tract, this energy can cause damage to sensitive tissues in the upper and lower airways.

Ozone formation

Because ozone forms as a product of solar energy and photochemical reactions of pollutants, it is not surprising that the highest concentrations of ozone in the atmosphere occur when sunlight is most intense. Thus, ozone generally reaches peak levels during the middle of the day in the summer months. These types of air pollution patterns are called diurnal and seasonal variations. The following graph shows that ozone levels in the San Bernardino Mountains are highest in the summer and fall, and peak in the late afternoon.

Ozone Air Quality Standards

Federal and state agencies have set air quality standards for ozone. An ozone level greater than 0.08 parts per million (ppm) averaged over eight hours is considered unhealthy. This level has been set because both laboratory and community studies have demonstrated measurable effects of ozone at or above that threshold.

The effects of ozone on people include:

- irritation of the nose and throat;
- increased mucus production and tendency to cough;
- eye irritation and headaches for some; and
- during severe episodes, chest pain and difficulty taking a deep breath without coughing.

How Ozone Damages Lungs

What happens when you breathe air that is contaminated with ozone? Like oxygen, ozone is soluble in the fluids that line the respiratory tract. Therefore some ozone can penetrate into the gas-exchange, or alveolar, region of the deep lung.

The following photos show how ozone affects the sensitive tissue in the deep lung. The pictures are from the lungs of rats exposed to ozone in a laboratory under carefully controlled conditions. The human lung is similar --although not identical -- to the rat's lung in terms of the types of cells and the overall structure of the alveolar region.

Figure 1

Figure 1 shows a magnified view of the structure of the normal gas-exchange region of the lung. It is called the gas-exchange region because oxygen inhaled from the air is transferred to the hemoglobin in blood in small blood vessels located inside the thin walls separating the alveolar air spaces.

At the same time, carbon dioxide, produced by normal metabolism and dissolved in the blood, is excreted into the air and expired when you breathe out.

The walls of a normal alveolus are very thin. There are only two layers of cells and a thin interstitial matrix separating the air in the alveolar space, or lumen, from the fluid inside the blood vessels. The cells that line the healthy alveoli are mostly very broad and very thin, and are called Type I lung cells or Type I pneumocytes. This provides a very large surface area across which gases can be efficiently transported.

Figure 2 shows the effects of breathing 0.2 ppm ozone for 4 hours. In Southern California air pollution levels can approach 0.2 ppm -- a Stage 1 ozone alert -- during the smoggiest summer days. The photo shows evidence of additional cells, called macrophages, and some material that may be fragments of ozone-injured alveolar wall cells inside the alveolar space.

Macrophages are immune system cells that respond to the injury of the delicate cells that line the alveolar lumen. These macrophages play important roles in protecting the lungs from inhaled bacteria,

Figure 2

fungi and viruses, and are also important in helping to repair lung tissue injury caused by inhaled pollutants.

Figure 3

Figure 3 shows more extensive damage following exposure a higher concentration of ozone, 0.6 ppm. The alveolar walls are thicker and there is evidence of cells infiltrating within the walls. There are more macrophages in the alveolar spaces and the thin, Type I cells have been damaged and replaced with thicker Type II, almost cube-shaped cells that are more resistant to the toxic effects of ozone. All of these changes occurred within 48 hours after exposure. If exposure continues for more than three days, the evidence of cell injury seems to be reduced, except for the continuing presence of the Type II cells.

Is Ozone-Related Lung Damage Permanent?

People actually report that the symptoms they feel when first exposed to ozone seem to go away, even though their exposure continues.

Following ozone injury, if the lung is not exposed to ozone for approximately five to seven days, it can for the most part repair itself provided the injury is not too extensive. However, long-term studies with laboratory animals have shown that there may be residual and in some cases permanent damage. This damage might be thought of as accelerated aging of the lung. Thus, frequent exposures to ozone can cause transient damage. The lung's defenses can repair most but probably not all of that damage within a relatively short time in most healthy individuals.

Research and Air Quality Standards

Health scientists probably know more about the effects of ozone on human health than about any other pollutants. This is because ozone is pervasive in the environment. Also there are excellent methods of measuring ozone so the pollutant can be studied using epidemiological methods. The findings of these epidemiological studies can be verified using well-controlled laboratory studies with human volunteers and laboratory animals. Thousands of scientific papers on the health effects of ozone have been published and these have been critically reviewed in documents that provide the scientific basis for National and State Ambient Air Quality Standards. (Ambient refers to outdoor air.)

These so-called Criteria Documents are important because they are extensively reviewed by scientists, public agencies, industry representatives, environmental groups such as the American Lung Association and the Natural Resources Defense Council,

and the public. National and state ambient air quality standards set the goals for healthy air quality in Southern California and across the country.

Based upon the most recent studies, it is now apparent that ozone plays an important role in causing acute health effects, such as heightening asthma symptoms and developing bronchitis symptoms.

The role of ozone in producing long-term or chronic effects is less clear, at least from the available epidemiological studies. However, laboratory animal studies suggest that there can be long-term consequences.

How to Reduce Ozone Exposure

The U.S. Environmental Protection Agency (EPA) has recommended that ozone should not exceed 0.08 ppm averaged over an 8-hr period. When ozone exceeds this level, active children and adults, those with respiratory disease such as asthma, and other people with unusual susceptibility to ozone should limit prolonged outdoor exposure.

Incidentally, personal tobacco smoking during periods of high ozone exposure doubled the risk of asthmatic individuals needing to go to the emergency room for treatment of asthma symptoms.

Carbon Monoxide

Carbon monoxide (CO), a colorless, odorless gas, is a byproduct of combustion.

When inhaled, carbon monoxide reacts very rapidly with hemoglobin in the blood, preventing uptake and transport of oxygen. Because carbon monoxide readily and firmly attaches to hemoglobin, it stays in the blood for a relatively long time. Thus, during an exposure carbon monoxide concentrations in blood can rise in a matter of minutes, then stay high for hours.

Who is Most Sensitive to the Health Effects of Carbon Monoxide?

Most of the health effects directly associated with carbon monoxide are most likely due to decreases in oxygen delivery to vital organs such as the heart and the brain.

People with heart disease may be especially sensitive to the effects of carbon monoxide. In addition, people with lung diseases that limit efficient use of inhaled oxygen, such as asthma and emphysema, may also be susceptible. Even in people without heart or lung diseases, reduced delivery of oxygen to skeletal muscles, especially during exercise, can reduce the ability to perform strenuous work.

At high levels of carbon monoxide exposure, impaired delivery of oxygen to the central nervous system can reduce the ability to respond quickly to external stimuli. After exposures that convert 5 percent to 10 percent of the circulating hemoglobin to carboxyhemoglobin (COHb), people's ability to recognize and react to flashes of light in a test system are reduced. At 10 percent to 30 percent carboxyhemoglobin, nausea,

headaches, unconsciousness, and sometimes death can result. The severity of symptoms increases with the concentration of carboxyhemoglobin.

Air Quality Standards for Carbon Monoxide

Both the EPA and the State of California have set air quality standards for carbon monoxide based on the results of epidemiological and laboratory findings. Ambient levels of carbon monoxide should not exceed 9 ppm, when averaged over an 8-hour interval, and should not exceed 20 ppm in any one-hour period. (The USEPA has a slightly higher 1-hour standard of 35 ppm).

Sources of Carbon Monoxide

The major sources of carbon monoxide pollution are automotive exhaust and emissions from large industrial combustion sources such as electrical power plants. Because these sources produce many contaminants in addition to carbon monoxide -- such as fine particles and nitrogen oxides -- it is often difficult to isolate the health effects of ambient carbon monoxide from those of other pollutants.

In addition to carbon monoxide generated outside, there are also important indoor sources of the pollutant. The most important of these are combustion sources such as gas ovens, gas burners, water heaters, and heating systems. However, in most cases emissions from well-maintained and vented gas appliances are small.

Tobacco smoking is a more significant source of carbon monoxide. Tobacco smoke can contain very high concentrations of carbon monoxide (1,000 ppm to 50,000 ppm). Carbon monoxide levels in the homes of children whose relatives smoke tobacco products can be higher than the carbon monoxide levels outdoors.

Health Effects of Carbon Monoxide

There are hundreds of cases per year of deaths or severe illness due to carbon monoxide poisoning from faulty appliances, indoor emissions of automobile exhaust and industrial exposures. These cases show that carbon monoxide poisoning causes symptoms very similar to those of the flu. In fact, the true number of cases is not really known because many people may have been poisoned slightly and thought that they were just fighting off a cold or the flu. Thus it is very important to make sure that home appliances are well-maintained and that all combustion sources are properly vented to the outdoors.

Epidemiological studies have shown significant association between several health effects and carbon monoxide, although as mentioned earlier it is difficult to completely isolate carbon monoxide's effects from those of other air pollutants.

For example, asthmatic children in Taiwan who were exposed to high levels of traffic-related air pollution -- using carbon monoxide and nitrogen dioxide as marker compounds-- reported more respiratory symptoms than children with lower exposures.

A study of physician office visits in London showed associations between air pollution and doctor visits for asthma and other lower respiratory disease. For children, levels of nitrogen dioxide, carbon monoxide, and sulfur dioxide were associated with increased numbers of medical consultations. However, in adults, the only consistent association was with levels of airborne particles. This suggests that children and adults might respond differently to pollution exposures.

Prenatal Effects of Carbon Monoxide

Carbon monoxide may also have prenatal effects. Pregnant women who were exposed to high levels of ambient carbon monoxide (5 ppm to 6 ppm) were at increased risk of having low birth-weight babies. It has long been known that women who smoke cigarettes during pregnancy have low birth-weight babies, but this is the first study of similar findings in women exposed to environmental carbon monoxide.

Babies exposed to carbon monoxide during the maturation of their organs may suffer permanent changes to those organs. Studies using newborn rats showed that carbon monoxide exposure could cause changes in the heart muscle tissue. This in turn could increase the severity of effects of artery constrictions when they became adults. Other animal studies have shown that long-term carbon monoxide exposure can contribute to a disease called ventricular hypertrophy, in which the cells of the heart's ventricle chambers are enlarged and possibly weakened.

Airborne Particles

Particles, including nitrates, sulfates, carbon¹ and acid aerosols² are a complex group of pollutants.

Unlike ozone, which has a specific chemical composition, airborne particles vary in size and composition depending on time and location. Although the components of particles may have common sources, the types and amounts of particles collected at any one time and location may be unique.

To add to the problem, gaseous pollutants including ozone, sulfur dioxide, nitrogen dioxide and carbon monoxide often are present in the atmosphere at the same time as are particles. It is not always possible to clearly differentiate between the health effects of the gases, the particles, and possibly the combination of particles and gases. This complexity presents a tremendous challenge to the scientific community and to public in trying to understand how inhaled particles affect human health.

The Challenge of Measuring Particle Pollution

Precisely measuring particulate pollution is more difficult and labor intensive than measuring gaseous pollutants such as ozone. For this reason, particle concentrations are not measured on a daily basis in most communities. Frequently, they are measured once every six days.

¹ Both elemental and organic. Elemental carbon is pure carbon from combustion sources, including diesel particulate. Organic carbon is a semi-volatile hydrocarbon from combustion and some evaporative sources.

² Aerosol is the scientific term used to describe particles suspended in a fluid, such as air.

Particle samples are collected on filters that are then weighed. Particle concentrations are reported in terms of micrograms of particles per cubic meter ($\mu\text{g}/\text{m}^3$) of collected air.

Originally, the particle samples were relatively indiscriminate with respect to particle size and often contained very large particles. These large particles contributed a great deal to the weighed particle mass, but might not have been very important with respect to lung health. This is because most of the particles were too large to penetrate through the nasal and head airways to reach the lung. A more health-related sample was needed.

After a great deal of scientific consideration it was decided that particulate matter with aerodynamic diameters³ less than or equal to 10 microns (μm) should be collected. Ambient air quality standards were developed for this material, which is called PM_{10} .

Sources of Particle Pollution

Researchers noted that the sources of relatively large-size particles (greater than 3 microns in aerodynamic diameter) were quite distinct from the sources of particles less than 1 micron in diameter.

The larger, so-called "coarse" particles are mostly produced by mechanical processes, such as automobile tire wear on the road, industrial cutting, grinding and pulverizing processes and re-suspension of particles from the ground or other surfaces by wind and human activities. The chemical composition of coarse particles may be somewhat similar to the chemical composition of soil in that area, along with industrial compounds from activities such as mining or smelting operations. The coarse fraction of urban aerosols also contains bits of plants, molds, spores and some bacteria. Thus the characteristics of the coarse particles may vary greatly in different communities.

In contrast, the smaller or so-called "fine" particles in the urban aerosol come from combustion sources, such as power plants, automobile, truck, bus and other vehicle exhaust or from the reactions that transform some of the pollutant gases into solid or liquid particles. These distinctions may be important because the current air pollution health effects literature suggests, although not with certainty, that for some key health effects the fine particles are more important than the coarse particles. These findings have led EPA to propose a new nationwide $\text{PM}_{2.5}$ standard that would reduce exposure to particles that are 2.5 microns or less in diameter.

Historic Air Pollution Disasters

Epidemiological studies have consistently associated adverse health effects with exposures to particulate air pollution. Early studies implicated particulate and sulfur dioxide pollution in the acute illnesses and premature deaths associated with extremely

³ Aerodynamic diameter is used to define particles' size. Particle deposition on a surface, or in the lung, depends on the particle's aerodynamic and diffusion characteristics. A particle's aerodynamic characteristics depend on its density, shape, actual size, and velocity while its diffusion characteristics are functions of its size and the density of the air in which it is suspended.

severe pollution episodes in Donora, Penn., London, and New York in the 1940s, 1950s, and 1960s. The particle levels in a four-week pollution disaster in London in 1955 were more than 50 times higher than the California standard.⁴ Twenty percent of that aerosol was composed of acid sulfates -- probably sulfuric acid. The number of people hospitalized for lung or heart-related diseases was extraordinarily high, but more importantly there were more than 4,000 premature, or "excess," deaths in the London population.

Fortunately, major efforts by government agencies, the public, and industries have made it very unlikely there will ever be a similar episode in modern urban communities. However, the lessons learned from these disasters are still relevant. Despite the fact that our levels of airborne particles are much lower than those that occurred during the disasters, EPA estimates that there are still more than 6,000 excess deaths in the United States that could be associated with inhaled particles.

Health Effects of Particulate Pollution

Current ambient levels of PM₁₀ -- 30 to 150 micrograms per cubic meter -- are associated with increases in the numbers of people that die daily from heart or lung failure. Most of these deaths are among the elderly. However there is a strong body of evidence that some children are also adversely affected by particulate matter.

The American Thoracic Society's Environmental and Occupational Health Assembly reviewed current health effects literature. They report that daily fluctuations in PM₁₀ levels have been related to:

- acute respiratory hospital admissions in children;
- school and kindergarten absences;
- decreases in peak lung air flow rates in normal children; and
- increased medication use in children and adults with asthma.

The USC Children's Health Study suggests that children with asthma living in a community with high particle concentrations may have suppressed lung growth. After children moved into cleaner cities their lung growth returned to the normal rate, but they did not recover the lost potential growth, according to John Peters, the study's principle investigator.

It is difficult to positively assign a quantitative risk associated with particulate matter because nearly all studies of its health effects find other pollutants present that may account for some of the effects.

Part of the problem is due to the nature of the data being collected. The levels of particulate matter vary during the course of the day and peak values can be quite high. Few studies have evaluated the effect of these short-term "spikes." However, at least one epidemiological study of children with asthma suggested that changes in symptoms

⁴ The California standard for particulate matter (PM₁₀) is 50 micrograms per cubic meter averaged over 24 hours

and lung function correlate more strongly with 1-hour peaks than with 24-hour average concentrations.

Other studies, primarily with laboratory animals, suggest that the chemical composition⁵ and surface areas of the particles may be more important than particle mass. Scientists are continuing to study the health effects of particles and are developing better methods for measuring the important constituents. It may be possible in the near future to more accurately assess the effects of inhaled particles on human health.

Nitrogen Oxides

Nitrogen oxides are produced during most combustion processes. Mobile sources and power plants are the major contributors in Southern California.

About 80 percent of the immediately released nitrogen oxide is in the form nitric oxide (NO). Small amounts of nitrous oxide (N₂O) are also produced. Nitrous oxide is a "greenhouse" gas that is suspected of playing an important role in global warming.

Nitric oxide reacts with oxygen in the air to produce nitrogen dioxide (NO₂). Further oxidation during the day causes the nitrogen dioxide to form nitric acid and nitrate particles. In the dark, nitrogen dioxide can react with ozone and form a very reactive free radical. The free radical then can react with organic compounds in the air to form nitrogenated organic compounds, some of which have been shown to be mutagenic and carcinogenic.

Health Effects of Nitrogen Dioxide

Nitrogen dioxide is the most important nitrogen oxide compound with respect to acute adverse health effects. Under most chemical conditions it is an oxidant, as is ozone. However, it takes about 10 times more nitrogen dioxide than ozone to cause significant lung irritation and inflammation.

Nitrogen dioxide differs from ozone in that it suppresses the immune system to a much greater degree. As discussed below, some epidemiological studies have shown that children exposed to high levels of ambient nitrogen dioxide may be at increased risk of respiratory infections. Studies with laboratory animals have indeed shown that if mice are exposed first to nitrogen dioxide and later to bacteria at a level that would not infect a healthy control animal, their normal lung defense mechanisms are suppressed and the bacteria are able to infect the host.

⁵ The idea that all particles are equally toxic is not scientifically justified. There are many good examples that can be taken from studies of particles in the workplace. For example, certain types of particles that contain quartz -- a natural mineral composed of silicon dioxide but with a specific crystal structure -- are very potent lung irritants. Repeated exposures to this material can lead to a serious, permanent lung disease called lung fibrosis. Other mineral particles that are fibrous, such as specific forms of asbestos, can cause lung cancer. Other particles such as titanium dioxide do not seem to cause occupational diseases.

Average levels of nitrogen dioxide in the United States range from 0.02 to 0.04 ppm. Levels in major urban areas in Southern California may be higher, but the region has not exceeded the federal standard⁶ for nitrogen dioxide since 1991.

During the 1970s, one of the first studies relating respiratory illnesses and changes in lung function to ambient nitrogen dioxide concentrations reported that children living in areas with high nitrogen dioxide concentrations had greater incidences of lung-related illness than children living in areas with lower concentrations. Since then, other epidemiological studies have suggested that children with asthma are more likely than children without asthma to have reduced lung function and symptoms of respiratory irritation, such as cough and sore throat, when outdoor average nitrogen dioxide concentrations exceed about 0.02 ppm.

Some studies also have suggested that children younger than five years old may be more severely affected by nitrogen dioxide than older children. Several epidemiological studies have suggested that for children, the most important effect of ambient exposure to nitrogen dioxide might be increased susceptibility to respiratory infections and increased severity of responses to inhaled allergens.

Although many epidemiological studies show significant associations between outdoor nitrogen dioxide concentrations and adverse health outcomes, some studies do not corroborate these effects. In part, this is because it is often difficult to fully account for the influences of indoor sources of nitrogen dioxide.

Improvements in Nitrogen Dioxide Measurements

More recent studies have used special devices, called passive dosimeters, that can be worn by children to collect nitrogen dioxide for later analysis. These measurements give epidemiologists the ability to better assess a child's total nitrogen dioxide exposure over the course of the day. These studies show that there can be a great deal of individual variation in exposures, even for children living in the same communities. Thus, it is not surprising that epidemiological studies that do not estimate a nitrogen dioxide dose may reach different conclusions.

However, laboratory studies involving controlled exposures of human volunteers and laboratory animals have demonstrated plausible effects of nitrogen dioxide on human health. For example, if one exposes rats or other animals to nitrogen dioxide, and then examines their respiratory tract tissues, it is very evident that the pollutant can cause short-term injury similar to that seen after ozone exposure.

Long-term exposures to high concentrations of nitrogen dioxide can produce chronic damage to respiratory tract tissue that resembles the lung disease emphysema.

The pollutant's suppression of immune system functions reduces the ability of the host to fight off bacterial and viral infections. Human volunteers who inhaled weakened

⁶ 0.053 ppm as an annual average

influenza virus after being exposed to nitrogen dioxide in laboratories were more susceptible to the infection than a control group that did not inhale nitrogen dioxide.

Other studies show that nitrogen dioxide decreases the body's ability to generate antibodies when challenged by pathogens, and may reduce the ability of the respiratory system to remove foreign particles such as bacteria and viruses from the lung.

Lead

People can be exposed to lead (Pb) through air, food and water. Lead is a toxic heavy metal that causes nerve damage and impairs the body's ability to make hemoglobin, leading to a form of anemia.

Sources of Lead Pollution

Large amounts of lead were emitted to the atmosphere when it was used as a gasoline additive.⁷ The emitted lead could be inhaled. In addition, lead fallout from the air caused widespread contamination of soil, plants, food products, and water.

Lead is often measured in children's blood as an index of environmental exposure. Even low levels⁸ of lead in the blood of children aged 6 to 7 are linked to measurable changes in intelligence quotient and certain perceptual-motor skills. Higher levels of lead exposure can also result in kidney damage and may be related to high blood pressure in adults.

Sulfur Oxides

Most manmade emissions of the gas sulfur dioxide (SO₂) come primarily from the combustion of fossil fuels such as coal, oil, and diesel fuel.

Most of the sulfur in fossil fuel is converted sulfur dioxide, but a small amount is also converted to sulfuric acid. In the atmosphere, gaseous sulfur dioxide can also be converted to sulfuric acid and sulfate-containing particles. Thus, atmospheric concentrations of sulfur dioxide are often highly associated with acidic particles, sulfuric acid particles and sulfate particle concentrations.

The current National Ambient Air Quality Standards for sulfur dioxide are 18 micrograms per cubic meter averaged annually, and 365 micrograms per cubic meter averaged over 24 hours. Southern California does not exceed the national air quality standard because its industries primarily burn low-sulfur fuels such as natural gas. Much of the sulfur oxide air pollution in Southern California is likely to be associated with diesel emissions.

⁷ Lead in the form of tetraethyl lead was added to gasoline in the United States in large amounts from the 1950s until it was banned in the mid-1970s.

⁸ 10 to 30 micrograms per 100 milliliters

Sulfur dioxide is a very water-soluble gas and therefore most of the sulfur dioxide that is inhaled is absorbed in the upper respiratory tract and does not reach the lung's airways. However, the small amount of sulfur dioxide that does penetrate into the airways can provoke important health effects, primarily in individuals with asthma.

For those with asthma, even relatively short-term, low-level exposures to sulfur dioxide can result in airway constriction leading to difficulty in breathing and possibly contribute to the severity of an asthmatic attack.

A number of epidemiological studies have shown associations between ambient sulfur dioxide and rates of mortality (death) and morbidity (illness). However, because sulfur dioxide is often strongly correlated with fine particles and especially sulfate-containing particles, it is difficult to separate the effects of sulfur dioxide from those of the particle compounds.

A study in France found an increase of 2.9 visits to the emergency room for every 20 micrograms per cubic meter increase in atmospheric sulfur dioxide. The results pertained to days when the average sulfur dioxide levels were above 68 micrograms per cubic meter but below the U.S. health standard.

In London, asthma and other lower respiratory diseases in children were most significantly associated with exposures to nitrogen dioxide, carbon monoxide, and sulfur dioxide. In adults the only consistent association was with particulate matter.

Hospital admissions for children with asthma may increase by 20 percent following acute exposure to ozone peaks and possibly with sulfur dioxide. Chronic exposure to increased levels of fine particles, sulfur dioxide, and nitrogen dioxide may be associated with up to threefold increase in nonspecific respiratory symptoms. Thus, recent literature suggests that sulfur dioxide affects adults and children differently and that chronic and acute effects may also be different.

Diesel Emissions

Diesel fuel is burned to power buses, trucks, road-building equipment, trains, boats and ships and electricity-generating equipment. When diesel fuel is burned, the exhaust includes both particles and gases. Diesel emissions are important constituents of ambient air pollution.

What's in Diesel?

Diesel particles consist mainly of elemental carbon and other carbon-containing compounds. Hundreds of compounds have been identified as constituents of diesel particles. These include polycyclic aromatic hydrocarbons (PAHs) and other compounds that have been associated with tumor formation and cancer. In 1998, the California Air Resources Board designated diesel particulate a cancer-causing toxic air contaminant.

Diesel particles are microscopic. More than 90 percent of them are less than 1 micron in diameter. Due to their minute size, diesel particles can penetrate deeply into the lung. There is evidence that once in the lung, diesel particles may stay there for a long time.

In addition to particles, diesel exhaust contains several gaseous compounds including carbon monoxide, nitrogen oxides, sulfur dioxide and organic vapors, for example formaldehyde and 1,3-butadiene. Formaldehyde and 1,3-butadiene have been classified as toxic and hazardous air pollutants. Both have been shown to cause tumors in animal studies and there is evidence that exposure to high levels of 1,3-butadiene can cause cancer in humans.

AQMD's recent landmark research project, the Multiple Air Toxics Exposure Study II, found that diesel particulate is responsible for about 70 percent of the total cancer risk from all toxic air pollution in the greater Los Angeles metropolitan area.

Diesel emissions may also be a problem for asthmatics. Some studies suggest that children with asthma who live near roadways with high amounts of diesel truck traffic have more asthma attacks and use more asthma medication.

Some human volunteers, exposed to diesel exhaust in carefully controlled laboratory studies, reported symptoms such as eye and throat irritation, coughing, phlegm production, difficulty breathing, headache, lightheadedness, nausea and perception of unpleasant odors. Another laboratory study, in which volunteers were exposed to relatively high levels of diesel particles for about an hour, showed that such exposures could cause lung inflammation.

Thus current epidemiological and laboratory evidence suggests that at typical urban concentrations, diesel exhaust may contribute significantly to the health effects of air pollution.

What Can Be Done to Reduce the Effects of Air Pollution on Children's Health?

After reviewing the literature on how children's exposures differ from those of adults, it is evident that:

- children are outdoors more hours per day than most adults;
- they exert themselves to a greater degree while they are outside than most adults; and
- they participate in more organized activities than adults.

There are definite health benefits to having children participate in outdoor activities. However, scientific evidence also suggests that air pollution exposures can injure children's lungs and other organs.

Air quality information in the form of health reports and air quality advisories are now a regular part of life in California. One logical step is to reduce strenuous activities during pollution episodes and try to take advantage of those hours when airborne pollutant levels are lower.

At the public level there is a long-standing commitment to improve air quality. When you look at the air pollution levels in California today you can see that a great deal of progress has been made. There has been a cost for this progress. For instance, some products are more expensive. In return, the lower levels of pollutant exposure compared to 20 years ago should decrease the adverse effect of air pollution on the long-term health of our developing children.

February 2005

Foreword

Scientists have been examining relationships between air pollution and death and disease for decades but only now are we beginning to understand the impacts of one of the most toxic sources of emissions today – the diesel engine. Diesels churn out a hazardous mix of gaseous and particle pollutants. What's more, diesel exhaust is emitted at ground level – where we breathe it – by trucks and buses around us in traffic, at school and transit bus stops, and by heavy construction or agricultural equipment. Diesel exhaust contains numerous dangerous compounds, ranging from respiratory irritants to carcinogens including a host of air toxics, particulate matter, carbon monoxide and nitrogen oxides.

While scientists have concluded that combustion-related particulate matter from all combustion sources is associated with premature death from heart attacks and cancer, we also are finding that carbon particles from mobile sources may be particularly unhealthy. These particles adsorb other metals and toxic gases produced by diesel engines – such as cancer causing-PAH (polycyclic aromatic hydrocarbons) – onto their surfaces making them even more dangerous. Furthermore, research on personal exposures demonstrates that these small particles easily penetrate our indoor environment where they may be trapped for days when ventilation is poor.

This report presents for the first time estimates of the health toll from diesel vehicle pollution. Using methodology approved by the U.S. Environmental Protection Agency's Science Advisory Board (SAB), the analysis finds that approximately 21,000 people die prematurely each year due to particulate matter pollution from diesels. Other serious adverse health impacts include tens of thousands of heart attacks, asthma attacks, and other respiratory ailments that can lead to days missed at work and at school.

Using more highly time-resolved studies we are increasingly able to understand the inflammation mechanism by which particles can lead to atherosclerosis, heart attacks, strokes and ultimately, untimely deaths. From all we know today, we can confidently say that reducing diesel exhaust in our environment will mean improving public health, and as this report demonstrates, reducing preventable premature deaths. We do not need to wait. Technology is available today that can reduce particulate matter emissions by up to 90 percent. Now is the time to clean up our old trucks, buses, heavy equipment and locomotives to provide a cleaner future for us and our children.

Executive Summary

Everyone has experienced it: getting hit right in the face by a cloud of acrid diesel smoke. Perhaps you were standing on a street corner when a bus or truck whizzed by. Or maybe you were standing at a bus stop or stuck behind a dump truck grinding up a hill. But breathing diesel exhaust isn't just unpleasant. It is hazardous to your health. In fact, health research indicates that the portion of the exhaust you can't see may be the most dangerous of all. Asthma attacks, respiratory disease, heart attacks, and even premature death – all of these are among the most serious public health problems linked to emissions from the nation's fleet of diesel vehicles. The good news is that the technology exists right now to clean up emissions from these engines, so that most of the adverse health impacts can be prevented.

Today in the U.S. more than 13 million diesel vehicles help to build our cities and towns, transport our food and goods, and take us to and from work. More than three quarters of all Americans live near intersections, bus stops, highways, bus and truck depots, or construction sites with heavy equipment – all of which are concentrated sources of diesel exhaust. In rural areas, those who live near heavy diesel agricultural equipment suffer their share of exposure to diesel as well.

The U.S. Environmental Protection Agency has issued important regulations that will require dramatic reductions in emissions from new diesel vehicles starting in 2007 – but only the new ones. These regulations, to be phased in over the next quarter century, apply only to *new* engines. What about the diesels on the road today? The lifespan of the

average diesel vehicle is nearly 30 years. Many diesels are driven over a million miles. Because of this longevity, we will be left with the legacy of pollution from dirty diesel vehicles for decades to come. That is, *unless* we take action to reduce emissions from vehicles currently on the road. We don't have to wait. Control technologies exist right now that can significantly reduce deadly fine particle emissions from diesel vehicles, in some cases by upwards of 90 percent.

American know-how, witnessed by the success of the manufacturers of engines, control devices, and fuel refiners in developing innovative solutions for reducing diesel exhaust, provides a lifesaving opportunity we can seize today. Pollution from dirty diesels on the road now can be dramatically reduced using a combination of cleaner fuels, retrofit emission controls, rebuilt engines, engine repowerings, and accelerated purchase of new, cleaner

vehicles. Unlike so many other vexing environmental issues, these affordable solutions present a highly unusual opportunity to actually address a major risk to public health and the environment. In fact, we could virtually eliminate this problem if diesel manufacturers, fleet owners, environmentalists, concerned citizens, and government regulators make the commitment to work together.

An Aggressive Program to Reduce Diesel Emissions Could Save About 100,000 Lives between Now and the Year 2030.

What are the health impacts of these dirty diesel vehicles? What benefits will we realize if we act now to clean them up? The Clean Air Task Force commissioned Abt Associates, an highly-respected consulting firm that U.S. EPA and other agencies rely upon to assess the benefits of national air quality policies, to quantify for the first time the health impacts of fine particle air pollution from America's diesel fleet. Using this information, we were able to estimate the expected benefits – in lives saved – from an aggressive but feasible program to clean up dirty diesel buses, trucks, and heavy equipment across the U.S.

This report summarizes the findings of the Abt Associates study. It then reviews the degree to which diesel vehicles increase the level of fine particle pollution in the air we breathe, and recommends reduction measures that will save thousands of lives each year.

Key findings include:

- Reducing diesel fine particle emissions 50 percent by 2010, 75 percent by 2015, and 85 percent by 2020 would save nearly 100,000 lives between now and 2030. These are additional lives saved above and beyond the projected impact of EPA's new engine regulations.
- Fine particle pollution from diesels shortens the lives of nearly 21,000 people each year. This includes almost 3,000 early deaths from lung cancer.
- Tens of thousands of Americans suffer each year from asthma attacks (over 400,000), heart attacks (27,000), and respiratory problems associated with fine particles from diesel vehicles. These illnesses result in thousands of emergency room visits, hospitalizations, and

lost work days. Together with the toll of premature deaths, the health damages from diesel fine particles will total \$139 billion in 2010.

- Nationally, diesel exhaust poses a cancer risk that is 7.5 times higher than the **combined** total cancer risk from all other air toxics.
- In the U.S., the average lifetime nationwide cancer risk due to diesel exhaust is over 350 times greater than the level U.S. EPA considers to be "acceptable" (i.e., one cancer per million persons over 70 years).
- Residents from more than two-thirds of all U.S. counties face a cancer risk from diesel exhaust greater than 100 deaths per million population. People living in eleven urban counties face diesel cancer risks greater than 1,000 in a million – one thousand times the level EPA says is acceptable.
- People who live in metropolitan areas with a high concentration of diesel vehicles and traffic feel their impacts most acutely. The risk of lung cancer from diesel exhaust for people living in urban areas is three times that for those living in rural areas.

The vast majority of the deaths due to dirty diesels could be avoided by an aggressive program over the next 15 years to require cleanup of the nation's existing diesel fleet. Practical, affordable solutions are available that can achieve substantial reductions in diesel risk. The only thing that stands between us and dramatically healthier air is the political will to require these reductions and the funding to make it a reality.

What We Must Do to Protect Public Health from Today's Dirty Diesels.

Although the EPA has mandated the phase-in of cleaner new engines and fuels beginning in 2007 for highway vehicles and heavy equipment, EPA has limited authority to mandate emissions controls on the fleet of existing diesel vehicles. To date, EPA has adopted a "voluntary" approach. Nevertheless, in order to meet the new ambient air quality standards for fine particles, states and cities must require controls to reduce diesel emissions. Diesel cleanup is also an important next step in areas that are having difficulty meeting existing and new ambient air quality standards for ozone such as Houston and Dallas, Texas.

States can enact legislation requiring diesel cleanup as some, such as California and Texas, have already begun to do. States should also consider measures to require early engine retirement and speed fleet turnover. For vehicles like long-haul trucks, ships, and locomotives that are engaged in interstate transport, federal regulations, federal

legislation, or both may be needed. Funding for such initiatives may pose a challenge for public fleets (school buses, transit vehicles, garbage trucks, etc.), so support for expanded state and federal funding to help the cleanup of fleets owned by cash-strapped states and cities will be necessary. Local and state budget writers will need a strong commitment to come up with the necessary appropriations or bonds to fund the local share.

Particle filters combined with the use of Ultra Low Sulfur Diesel (ULSD) fuel have been found to reduce diesel particles and particle-bound toxics from diesel exhaust by up to 90 percent. Under the new engine rules, ULSD will be available for highway vehicles nationwide starting in 2006. It is already available in cities in 21 states. Not all vehicles can be retrofitted with a particle filter, but there are a variety of options available for the cleanup of every vehicle regardless of make or model year.

Cities and states should:

- Establish ambitious goals for reducing risk to their citizens by cleaning up existing diesels;
- Identify priority geographic areas and diesel “hotspots” for immediate attention;
- Adopt a package of options for reducing diesel exhaust including:
 - Retrofits accomplished by replacing mufflers with an optimal mix of filters or oxidation catalysts depending on vehicle age and type;
 - Requiring Ultra Low Sulfur Diesel and cleaner alternative fuels;
 - Closed crankcase ventilation systems to eliminate engine exhaust from penetrating the cabin of vehicles such as school and transit buses;
 - Engine rebuild and replacement requirements;
 - Truck stop electrification programs to give long-haul truckers a way to power their rigs overnight without running their engines;
 - Contract specifications requiring cleanup of trucks and construction equipment used in public works projects.
- Adopt diesel cleanup measures as federally-enforceable requirements in State Implementation Plans (SIPs) for the attainment of the fine particle and ozone air quality standards;
- Create and fund programs, such as California’s “Carl Moyer” and the Texas Emission Reduction Plan (TERP) program, which provide funding for diesel equipment

owners to replace or rebuild high-polluting diesel engines;

- Adopt and enforce anti-idling ordinances and legislation.

The Federal government should:

- Pass legislation providing funding for the cleanup of municipal and state fleet vehicles;
- Explore regulatory options for reducing emissions from existing interstate fleets such as long-haul trucks, shipping, and locomotives;
- Retain and enforce the tighter new engine and cleaner fuel standards for highway and non-road diesels.

Retrofits are effective in reducing particle emissions from heavy equipment. The tractor on the left is retrofitted with a particle emissions control device.

New Findings

While numerous medical studies have linked diesel exhaust to a host of serious adverse health outcomes, no single study has yet quantified the death and disease attributable to diesel across America – until now. Researchers estimate that as many as 60,000 people in the U.S. die prematurely each year because of exposure to fine particles from all sources.¹ And some researchers believe that this figure may even underestimate the total number of particle-related deaths.² A reanalysis of the major particle mortality study in over 150 cities suggests that particles from motor vehicles may be more toxic than average.³

We know that diesel exhaust is a hazardous mixture of gases and particles including carcinogens, mutagens, respiratory irritants or inflammatory agents and other toxins that cause a range of diverse health effects. Diesel particles act like magnets for toxic organic chemicals and metals. The smallest of these particles (ultrafine particles)

can penetrate deep into the lung and enter the bloodstream, carrying with them an array of toxins.⁴ Diesel exhaust can contain 40 hazardous air pollutants as listed by EPA, 15 of which are listed by the International Agency for Research on cancer (IARC) as known, probable or possible human carcinogens.⁵ Thousands of studies also have documented that fine particles are associated with respiratory and cardiovascular diseases and death. Additional studies have documented effects in infants and children such as Sudden Infant Death syndrome (SIDS) and retarded lung development.⁶

Now, for the first time, this report reveals the staggering toll of death and disease from diesel exhaust in our air – and the dramatic benefits of requiring the cleanup of the nation’s existing diesel fleet. Abt Associates, using peer-reviewed, state-of-the-art research methodology employed by U.S. EPA in assessing the national benefits of proposed

National Annual Diesel Fine Particle Health Impacts⁷

Annual Cases in the U.S., 2010

Premature Deaths	21,000
Lung Cancer Deaths	3,000
Hospital Admissions	15,000
Emergency Room Visits for Asthma	15,000
Non-fatal Heart Attacks	27,000
Asthma Attacks	410,000
Chronic Bronchitis	12,000
Work Loss Days	2,400,000
Restricted Activity Days	14,000,000

rules and legislation, finds that nearly 21,000 people will die prematurely in 2010 in the U.S. as a result of exposure to fine particle emissions from mobile diesel sources (i.e., all on-and non-road engines such as highway, construction, rail, and marine engines). The average number of life-years lost by those who die prematurely from exposure to fine particles is 14 years.⁸

The deaths from diesel fine particle pollution equal or exceed the death toll from other causes commonly understood to be major public policy priorities. For instance, drunk driving causes more than 17,000 deaths per year.⁹ There are more than 20,000 homicides in the U.S. each year.¹⁰ Moreover, the approximately 15,000 prema-

Cancer Risk

CATF has calculated the national average lifetime excess cancer risk posed by diesel. We base these estimates on 1999 modeled directly-emitted diesel fine particle concentrations and by applying both the EPA range of individual risk estimates and the California Air Resources Board (CARB) diesel risk factor for lung cancer over the U.S. population.¹⁵ Although EPA has found diesel exhaust to be a “likely” human carcinogen, EPA has not adopted a risk factor but has, instead, provided a range of lung cancer risk.¹⁶ Based on the national average diesel particulate matter concentration, we find average lung cancer risk ranges from 12 to 1210 per million people over a 70-year lifetime using EPA’s range of lung cancer risk.¹⁷ Using the same methodology, CATF finds that, based on the single CARB risk factor, the nationwide average lifetime cancer risk posed by diesel exhaust is over 350 times greater than EPA’s “acceptable” level of one cancer in a million.

For comparison, according to EPA’s 1999 NATA assessment, the combined risk from all other air toxics is

ture deaths per year that could be avoided by achieving a 75 percent diesel-risk-reduction target exceed the 11,000 automobile fatalities avoided each year through the use of safety belts.¹¹

The Abt Associates analysis further shows that hundreds of thousands of Americans suffer from asthma attacks, cardiac problems, and respiratory ailments associated with fine particles from diesels. These health damages result in thousands of respiratory and cardio-pulmonary related hospitalizations and emergency room visits annually as well as hundreds of thousands of lost work days each year. For instance, the study finds that diesel pollution leads to 27,000 heart attacks and 400,000 asthma attacks each year.¹²

You can find the adverse health impacts from diesel for your state, metropolitan area, and county on the web at: www.catf.us/goto/dieselhealth.

The risk from diesel exhaust can be virtually eliminated by the application of emissions control strategies available today. For example, an aggressive but feasible program to reduce diesel particle emissions nationwide 50 percent by 2010, 75 percent by 2015, and 85 percent by 2020 would save about 100,000 lives between now and 2030 – beyond those lives that will be saved under EPA’s new engine regulations.¹³ Indeed, in the year 2000, the State of California set a Diesel Risk Reduction goal of a 75 percent reduction in diesel risk by 2010 and 85 percent by 2020 and the California Air Resources Board over the past few years has begun to issue regulations to achieve it.¹⁴

48 per million.¹⁸ Therefore, diesel exhaust presents a lung cancer risk that is 7.5 times higher than the cancer risk of all other air toxics – **combined!**¹⁹ In addition, CATF has calculated the cancer risk posed by diesel for residents of each U.S. county. Residents of over two-thirds of U.S. counties experience a cancer risk greater than 100 in a million from diesel exhaust. Moreover, residents of eleven urban U.S. counties face a diesel cancer risk equal to 1,000 new cases of cancer in a population of one million.

People who live in metropolitan areas with a high concentration of diesel vehicles and traffic feel their impacts

most acutely. For example, the estimated risk of lung cancer from diesel in metropolitan areas is much higher than in areas with fewer diesels. In the rural counties we estimate a risk of 142 cancers per million based on the CARB unit risk, but three times that rate, 415 cancer per million, in urban counties. Therefore, the risk of lung cancer for people living in urban areas is three times that for those living in rural areas.²⁰

The Economic Toll of Health Effects

Respiratory distress severe enough to require a trip to the emergency room can be a terrifying experience for patients and their families. Victims of asthma attacks say that during an attack they wonder if and when their next breath will come. In addition to its serious physical and emotional costs, air pollution also takes a large monetary toll. Emergency room and hospital treatment costs can cripple a family financially, with the average stay for a respiratory ailment lasting about a week.²¹ Bouts of respiratory illness and asthma attacks mean lost workdays and lost productivity. Although life is priceless, the government often monetizes loss of life when setting policies related to health and environmental protection. Using accepted valuation methodology employed by EPA in recent regulatory impact analyses, Abt Associates finds that the total monetized cost of the U.S. diesel fleet's fine particle pollution is a staggering \$139 billion in 2010.

You can find the community cancer risk from diesel for your state, metropolitan area, and county on the web at: www.catf.us/goto/dieselhealth. Personal risk varies with location and lifestyle. For example, if you live near a bus, truck, or train terminal, highway, construction site, or warehouse, or commute to work on congested roadways, your exposure may be higher than indicated by the county-wide average estimated here.

Pollution from motor vehicles, including diesels, can obscure city vistas such as illustrated in this split view of Dallas, Texas.

State and Metropolitan Area Findings

Using modeled concentrations of directly-emitted diesel fine particles throughout the lower 48 states, Abt Associates developed health impact estimates for every state and major metropolitan area in 1999, the latest year for which EPA's best emissions inventory for diesel fine particles is available.²² Not surprisingly, heavily populated states with concentrated urban areas and significant diesel traffic fared the worst. Conversely, rural areas with a lower concentration of diesel vehicles fared much better. Similarly, metropolitan areas with large populations and heavy concentrations of diesel

vehicles feel the impacts of diesel pollution most acutely.²³ In such large metropolitan areas, many hundreds of lives are shortened every year. However, because these state and metropolitan-area health estimates include only fine particles that are **directly emitted** from diesels – excluding any secondarily-formed particles from diesel emissions of nitrogen or sulfur oxides – they significantly understate the total adverse impact of diesel-related particles on public health.²⁴ Moreover, these estimates exclude any health impacts due to diesel's contribution to ozone smog.

The Dirty Diesel Legacy

Since 1997, the U.S. EPA has promulgated major regulations that impose stringent emissions controls on new diesel vehicles, requiring tight emission standards and cleaner diesel fuel. These standards go into effect in 2007 and phase in over the next few decades. For example, the table below illustrates the progressively tighter standards

EPA Standards for New Trucks and Buses (g/bhphr)²⁵

YEAR	NO _x	PM _{2.5}
1984	10.7	0.60
1991	5.0	0.25
1998	4.0	0.10
2004	2.0	0.10
2007	0.2	0.01

for particulate matter and nitrogen oxides from trucks and buses over the next few years.

However, the emission rates of the diesel engines on the road and in use on construction sites and farms today are not affected by these rules. Considering that according to the U.S. Department of Energy the median lifetime for a heavy truck is nearly 30 years,²⁶ and a typical heavy duty diesel engine may power a truck for as long as one and a half million miles,²⁷ these vehicles will continue to pollute our air at unnecessarily high levels for years to come **unless** we act to clean them up now.

Median Heavy Truck Lifetime is Nearly 30 Years²⁸

The Most Widespread Air Pollution Risk in the U.S.

There are few other sources of widespread pollution in our environment that rival diesel exhaust as an airborne toxin. America's 13 million diesel engines release a host of harmful substances including fine particles, ozone smog-forming nitrogen oxides, carbon monoxide, and a variety of toxic metals and organic gases such as formaldehyde, acrolein, and polycyclic aromatic hydrocarbons (PAH).²⁹ In this report we focus on the respiratory, cardiovascular, and cancer effects of diesel fine particles only.³⁰

Fine Particles are Linked to Heart Attacks, Asthma Attacks, and Stunted Lung Growth.

Fine particles have been linked to a wide variety of serious health impacts, from upper and lower respiratory ailments, such as asthma attacks and possible asthma onset, to

heart attacks, stroke, and premature death, including crib death in children.³¹ How risky is breathing air polluted with particles? A study published in the Journal of the American Medical Association found that living in the most polluted U.S. cities poses a risk similar to living with a smoker.³² Based on thousands of studies compiled by EPA, federal health

How Particulate Matter Kills

Fine particles, known as "PM_{2.5}", are particles less than 2.5 microns in diameter or 1/100th the width of a human hair, so small that they are often invisible. They can be deposited deep in the lung where they can affect both the respiratory and cardiovascular systems. Researchers believe that many deaths caused by particulate matter are related to cardiovascular illness. Fine particles aggravate cardiovascular disease and trigger heart attacks by invading the bloodstream and initiating an inflammatory response, disrupting heart rate and increasing blood clotting. In a recent experimental study, diesel particles caused blood clots providing "a plausible explanation for the increase in cardiovascular morbidity and mortality accompanying urban air pollution."³³

standards were established for fine particles in 1997.³⁴

Health researchers have recently described serious health impacts of fine particles, including:

- Abnormal heart rhythms and heart attacks and atherosclerosis;³⁵
- Increased incidence of stroke;³⁶
- Permanent respiratory damage, characterized by fibrosis causing obstruction to airflow;³⁷
- Chronic adverse effects on lung development resulting in deficits in lung function.³⁸

Diesel Exhaust is a Likely Carcinogen that also Impairs Immune, Reproductive, and Nervous Systems.

In 1998, the Scientific Review Panel for the California Air Resources Board reviewed diesel exhaust as a toxic air contaminant and set a lifetime unit cancer risk from diesel particles at 3 in 10,000 persons for each microgram of annual average diesel exposure.³⁹ This is equivalent to 300 in a million excess lung cancers. In May 2002, EPA issued its Health Assessment for Diesel Exhaust which found diesel particulate matter to be a “likely” carcinogen. EPA did not settle on a unit risk factor but recommended a lifetime cancer risk range from 1 in 1,000 to 1 in 100,000.⁴⁰ The California unit risk falls within this range.⁴¹

Diesel particles are carbon at their core with toxics and carcinogenic substances attached to their surfaces.

Applying California’s cancer unit risk for diesel particulate matter to the national average concentration of directly-emitted diesel fine particles in 1999, results in a conservative estimate of 1,530 excess cases of lung cancer per year for 2005.⁴² An American Cancer Society study of 150 metropolitan areas across the U.S published in 2002 supports the particulate matter cancer link.⁴³

Other effects include:

- **Immune System Effects** – Diesel exposure is associated with numerous immune system responses in humans and animals culminating in increased allergic inflammatory responses and suppression of infection-fighting ability. These effects include disruption of chemical signals and production of antibodies, and an alteration in mobilization of infection-fighting cells.⁴⁴
- **Reproductive, Developmental, and Endocrine Effects** – Diesel emissions have also been associated with reproductive, developmental and endocrine effects in animals. Specifically, diesel exposure has been associated in animals with decreased sperm production,⁴⁵ masculinization of rat fetuses,⁴⁶ changes in fetal development (thymus,⁴⁷ bone⁴⁸ and nervous system⁴⁹) and endocrine disruption, i.e., production of adrenal and reproductive hormones.⁵⁰
- **Nervous System Effects** – In addition to animal studies that have shown neurodevelopmental effects, a human study of railroad workers suggested that diesel exposure may have caused serious permanent impairment to the central nervous system.⁵¹

Cancer-causing Pollutants in Diesel Exhaust

Pollutant	Diesel Emissions % of all Mobile 1996 ⁵²	EPA Carcinogen Status	Cancer Risk (per million/microgram in 70-yr life)
Formaldehyde	52%	probable	1 in a million
Acetaldehyde	59%	probable	1 in a million
Butadiene	8%	probable	2 in a million
Acrolein	50%	possible	n/a
Benzene	5%	known	2-8 in a million
Diesel Particulate Matter	77%	probable ⁵³	EPA: 12 to 1210 in a million; CARB: 300 in a million ⁵⁴

Children and Seniors are at Greatest Risk

Health researchers believe that children are more susceptible than adults to the adverse health effects of air pollution for a variety of reasons.⁵⁵ For example, children are more active than adults and therefore breathe more rapidly. Children also have more lung surface area compared to their body weight and therefore they inhale more air pound-for-pound than adults do. Compared to adults, children also have higher lung volume to body size, higher respiration rates, and spend more active time in the polluted outdoor environment. Fine particles have been linked in medical studies to serious health impacts in children such as slowed lung function growth, increased emergency room visits, increased incidences of asthma and bronchitis, and crib death. Furthermore, proximity to traffic has been linked to increased prevalence of asthma respiratory infections and allergic symptoms and asthma hospitalizations in children.⁵⁶

Seniors are another important population at risk. Studies of the impacts of fine particles on seniors in Boston and Baltimore suggest that changes in their heart rhythms and control mechanisms occur when particle levels rise. In Phoenix, daily mortality increased in

At a bus stop, diesel particles measured at the curb spike sharply from a conventional bus running on regular diesel fuel.

Diesel particles are virtually eliminated when the bus is run on ULSD and retrofitted with a diesel particulate filter.

Children Exposed on School Buses

CATF Study: Cabin particulate matter eliminated with retrofit emissions controls.

Twenty four million students ride to school every day on yellow school buses that travel a total of four billion miles a year. While riding on a school bus is the safest way a student can travel to school,⁵⁷ children may be exposed to harmful pollutants, a concern since students spend an average of an hour and a half a day on school buses.⁵⁸ A recent study undertaken by Clean Air Task Force in cooperation with Purdue University investigated cabin air quality on school buses in three cities (Chicago, IL; Atlanta, GA; and Ann Arbor MI). The study found that particulate matter routinely entered the bus cabin from the tailpipe and the engine through the open front door. At some stops, particulate matter in the bus

cabin exceeded levels in the outdoor air by as much as ten times. While idling or lined up in a schoolyard, rapid buildup of particulate matter in the buses also occurred. Most importantly, retrofit emissions controls worked: installation of a diesel particulate filter and the use of Ultra Low Sulfur Diesel (ULSD) fuel and a closed crankcase filtration device eliminated fine particles, ultrafine particles, black carbon and particle-bound PAH in the bus cabin. A closed crankcase filtration system by itself demonstrated major benefits and can provide immediate and low cost reductions in particulate matter levels on school buses. For a comprehensive report: www.catf.us/goto/schoolbusreport

seniors with increased levels of elemental and organic carbon (typical of diesels and other motor vehicles) and fine particles. Collectively, these studies demonstrate that

elevated fine particle levels put the elderly at risk and suggest a possible mechanistic link between fine particles and cardiovascular disease mortality.⁵⁹

Today's Dirty Diesels

- **“On-road” or highway diesels** include many types of vehicles, such as municipal and commercial trucks and buses. Heavy duty highway diesels range from 8,500 lbs to those exceeding 60,000 lbs, such as 18-wheelers. Of the seven million diesels on the road today, 400,000 are school buses and 70,000 are transit buses. Highway diesels released 100,000 tons of directly-emitted fine particles in 2002, about one third of the total from diesels. Highway diesels also released 3.4 million tons of nitrogen oxides (NO_x) in 2002, which accounted for 16 percent of all NO_x emissions and half of all diesel NO_x emissions in the U.S.⁶⁰

- **“Non-road” diesel engines and equipment** do not typically travel on roads or highways. There were approximately six million non-road diesel engines in service in 2003. Examples of these non-road diesels include construction equipment such as excavators, mining equipment and agricultural machinery. In 2002, 155,000 tons or half of all the fine particles directly emitted from diesels came from non-road engines. Non-road diesels also released 1.6 million tons of NO_x, 8 percent of all NO_x emissions and one quarter of all diesel NO_x emissions in the U.S. in 2002.⁶¹

- **Marine and river diesel** emissions are dominated by large commercial ships polluting our largest ocean and river port cities. Efforts to control pollution from shipping have focused on NO_x, although these engines also emit substantial quantities of fine particles. In 2002 marine diesel released 40,000 tons of directly-emitted fine particles, 13 percent of all diesel fine particles in the U.S. Marine diesels in the U.S. produced one million tons of diesel NO_x in 2002, 5 percent of all U.S. NO_x emissions and 14 percent of all diesel NO_x emissions.⁶²

- **Locomotive diesels** account for a significant fraction of mobile source emissions in the U.S. today. In many areas, diesel trains travel through and pollute core urban and industrial areas. Diesel locomotives released 20,000 tons of directly-emitted diesel fine particles (six percent of all diesel fine particles) and 900,000 tons NO_x (13 percent of diesel NO_x). Diesel locomotives typically have a useful life of 40 years and are commonly rebuilt 5-10 times during their long service lives. For this reason, cleaning up today's locomotives is an important priority.⁶³

Sources of Directly-Emitted Mobile Diesel Fine Particles

Source: EPA (2004)

Diesel “Hotspots”

Diesel Exhaust is Concentrated Near Roadways and Intersections.

Unlike industrial smokestack emissions, diesel typically is emitted at ground-level in places of concentrated population in our communities along busy streets and at our places of work. We often breathe diesel exhaust where it is fresh and most toxic. While air quality modeling, such as reported in our study, estimates average exposures in a community, your individual exposure may be much greater or smaller depending on a variety of factors. For example, the distance from where you live to major roadways and the nature of your commute to work may play a role.

Exposure to diesel exhaust is highest for those who:

- **Operate or work around diesel engines** – Occupational exposures to diesel are among the highest and have been associated with increased incidence of cancer. Furthermore, a study of diesel mechanics, train crewmen, and electricians working in a closed space near diesel generators suggests that diesel exposure may have caused both airway obstruction and serious impairment to the central nervous system. The report concludes that “impaired crews may be unable to operate trains safely.”⁶⁴
- **Live or work near areas where diesel emissions are concentrated** – Ambient diesel levels are highest near highways, busy roadways, bus depots, construction sites, railroad yards, ports and inland waterways with diesel boat traffic, major bridges, tunnels, or freight warehouses. People who live or work near these

facilities face the greatest risk. Numerous recent medical studies have linked roadway proximity and traffic pollution to disease, asthma hospitalizations, and shortened life expectancy.⁶⁵ For example, a 2004 study in Ontario, Canada found increased risk of mortality from heart and lung disease in people living within 100 meters of a roadway.⁶⁶ New York City studies demonstrate that diesel trucks create air toxics hot spots at crossings, bus stops, and bus depots.⁶⁷ Rail yards can be diesel hotspots as well. For example, one study found elevated risk levels – up to 500 in a million – adjacent to a California rail yard.⁶⁸ Another study found elevated cancer risk for persons living near a ferry port.⁶⁹

- **Regularly ride on school or transit buses, or commuter trains** – Children are exposed to elevated levels of diesel as a result of the buildup of diesel exhaust inside school buses – especially with windows closed.⁷⁰ Diesel exhaust levels on commuter trains and

People living and working near concentrated diesel emissions such as busy roadways have the greatest exposure to diesel exhaust.

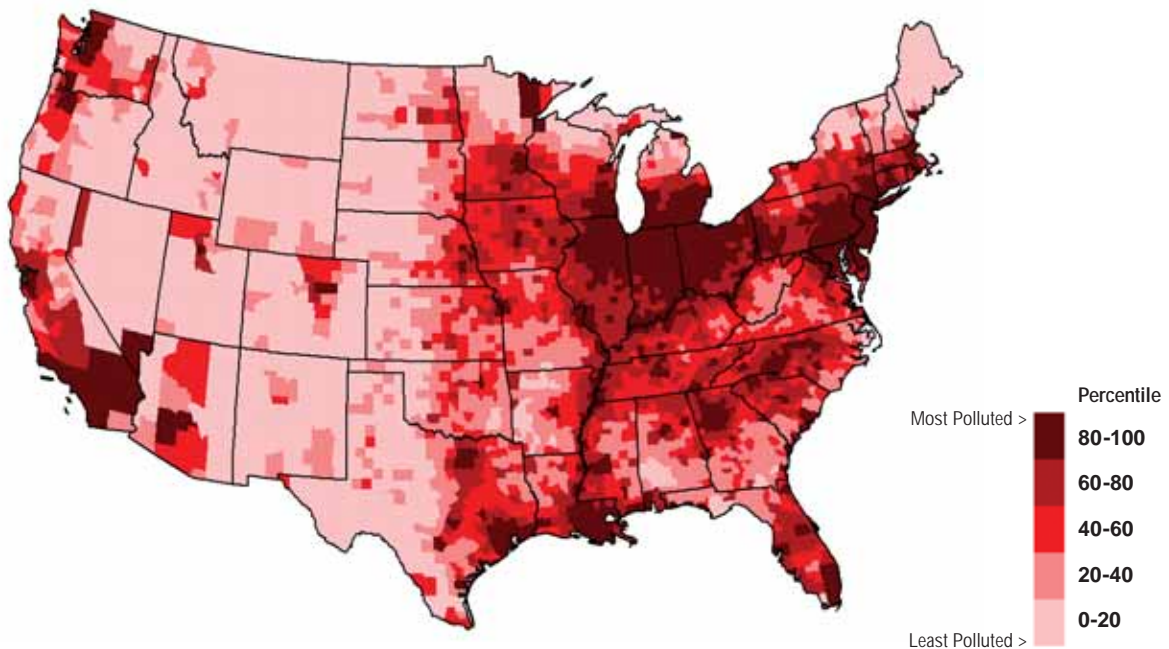

station platforms may also be high.⁷¹

- Commuter daily in heavy traffic** – Commuters are exposed to some of the highest diesel emissions in their cars due to pollutants released from trucks and buses on the road with them. Car occupants riding behind a diesel bus, for example, can experience extremely high levels of dangerous fine particles. Researchers in Los Angeles measured high fine particle levels (130 ug/m³) behind an urban transit bus making numerous stops.⁷² Exposures to drivers can have serious effects: a 2004 study suggests that young male state troopers experienced cardiac inflammation and heart rhythm changes from in-vehicle exposure to fine particles.⁷³

Diesel exhaust from trucks and buses can be found in places we don't expect. For example it can be trapped in "urban canyons" and penetrate buildings through HVAC systems.

Exposure to diesel exhaust is also an Environmental Justice issue. Concentration of minority and low-income populations are more likely to be found in cities near diesel sources. Because these neighborhoods are exposed to some of the highest diesel exhaust levels, residents are certain to experience disproportionate health impacts.

Directly-Emitted Diesel Fine Particle Concentrations by County in the U.S. (1999)

A Solution Within Our Reach

Diesel Fine Particles Can Be Virtually Eliminated by Emission Controls Available Today.

Virtually all of the health risk posed by diesel exhaust can be eliminated through the application of emissions control strategies available today. For example, an aggressive but feasible program to reduce diesel particle emissions nationwide 50 percent by 2010, 75 percent by 2015, and 85 percent by 2020 would save about 100,000 lives between now and 2030 – beyond those lives that will be saved under EPA’s new engine regulations.⁷⁴ Adopting this

“Retrofit, Rebuild, Replace”

A variety of practical strategies exist to reduce diesel particle levels in America: tailpipe retrofits, clean fuels, closed crankcase filtration systems, engine rebuild and replacement requirements, emission specifications for vehicles used in public works contracts, anti-idling ordinances and legislation, truck stop electrification programs, aggressive fleet turnover policies, and more.

The most cost-effective approach to reducing diesel exhaust is likely in many cases to be the direct application of retrofit technology. Although the purchase of new, much cleaner vehicles will remain an important remedial strategy, the replacement of the entire diesel fleet is an expensive proposition that will have to be phased in over time. What’s more, we can meet the challenge of reducing fine particles and related air toxics without replacing all vehicles right now. Current technology can easily remove particles from diesel exhaust. Retrofits that eliminate over 90 percent of fine particles from a heavy duty diesel bus engine typically cost \$3,000-\$7,500. This is a small expenditure when compared to the typical \$60,000-75,000 price tag for a new school bus or \$300,000 for a transit bus.⁷⁷

Retrofits are available from many engine manufacturers. They generally are easy to install especially on highway vehicles. Nonetheless, it is important to point out that retrofits are not a “one size fits all” proposition. Retrofitting a fleet calls for careful planning and, often, a mix of strategies that will depend on the make and model year of the engines being retrofitted and funds available. For example, some heavy-duty engines lack modern electronic engine controls and are therefore too old for some retrofit devices. Other diesel equipment simply does not have space for retrofit installation. Duty cycle is an important consideration too. Some engines do not run constantly which means that catalytic retrofit devices requiring consistent high engine temperatures do not operate as efficiently. Furthermore, some engines release

as a national goal would help states and municipalities set milestones for improvement and would be consistent with EPA’s recently announced goal of retrofitting the entire U.S. fleet of diesel vehicles by 2015.⁷⁵ Indeed, California has already set a Diesel Risk Reduction goal of 75 percent 2010 and 85 percent by 2020. Over the last few years the California Air Resources Board has begun to issue regulations to achieve these goals.⁷⁶

Installing a diesel particulate filter (DPF) in this Atlanta school bus simply required removal and replacement of the muffler and tailpipe.

pollution from crankcase ventilation in addition to the tailpipe. This calls for additional strategies. For some vehicles and model years, replacement may be the best option. As a result, fleets will need to develop individualized strategies that optimize emission reduction from their vehicles and equipment. Fortunately, this is not hard to do.

Catalyzed diesel particulate matter filters (DPF) can reduce emissions of fine particles and adsorbed air toxics by over 90 percent. DPFs have been used in thousands of on- and non-road diesel applications. Diesel oxidation catalysts (DOCs) represent a less expensive albeit less effective option. They are smaller and therefore easier to install. EPA has verified that they can reduce total particulate matter emissions by 10-30 percent. Like the DPF, the DOC is also attached to the exhaust system. Installing one on a diesel truck or bus costs about \$1,000. DOCs may be appropriate for vehicles built before 1995 that lack electronic controls and for construction equipment where there is inadequate space for a DPF to be installed. DOCs have been installed in more than 1.5 million trucks in the U.S.⁷⁸

Low Sulfur Diesel Fuels Are Requisite for Effective Retrofit Controls.

Diesel particulate filters require low sulfur fuels because sulfur in the fuel can foul the emission control device. Unfortunately, low sulfur fuels are not available everywhere in the U.S. today (see <http://www.epa.gov/otaq/retrofit/fuelsmap.htm> for the current fuel availability map). Where ULSD is available, decision makers should consider requiring installation of filters where possible. Federal regulations have established diesel fuel and additive formulation requirements for on-road vehicles, limiting fuel sulfur content to 15 ppm nationwide beginning in 2006 for use with 2007 highway vehicles. Starting in 2010, non-road equipment will be required to use ULSD.

Biodiesel is another potential low-sulfur fuel choice that

Ultra low sulfur diesel fuel will be available nationwide mid-2006.

can achieve modest reductions in emissions when used as a blend, or higher reductions when used at 100 percent. Biodiesel is an alternative diesel fuel made from either animal fats or plants such as soybeans.

Cleaning up All School Buses Within a Decade

With today's emissions controls, students need not be exposed to diesel exhaust while riding to school. EPA in the summer of 2004 announced the goal of retrofitting all existing school buses with pollution controls within a decade.⁷⁹ Funding retrofits and cleaner fuel presents the greatest obstacle facing school districts. To achieve this goal, adequate funds must be appropriated by states and the federal government.

Recommendations

Cities and States Must Act to Reduce Diesel.

The fine particle pollution problem is so widespread in the U.S. about one quarter of the U.S. population resides in areas that violate the standard. EPA recently formally designated over 200 counties in "nonattainment" with the annual fine particle standard.⁸⁰ Countless additional commuters may also spend significant time in areas exceeding the standard where they work. But the rest of the country is not safe from the risk posed by diesel particles – science tells us that particle-related health impacts don't stop once the standard is achieved. Health research has shown that there are adverse health impacts from particles even at very low concentrations.⁸¹

Cities and states that have been designated as "nonattainment" must act now to achieve meaningful reductions in fine particles. For those areas, state implementation plans must be developed and presented to EPA

for approval within three years. Controls must then be implemented and air quality standards achieved by 2010. For this reason, states and cities must start now to determine how to achieve substantial emissions reductions. With rules to reduce particles from power plants pending at EPA and expected to be finalized in the near future, diesel emissions will become the largest remaining share of the problem and the most cost-effective solution, one that largely is within the control of states and municipalities.

Cities should adopt and enforce anti-idling ordinances.

MA TURNPIKE AUTHORITY

Cities and states should:

- Establish ambitious goals for reducing risk to their citizens by cleaning up existing diesels;
- Identify priority geographic areas and diesel “hotspots” for immediate attention;
- Adopt a package of options for reducing diesel exhaust including:
 - Retrofits accomplished by replacing mufflers with an optimal mix of filters or oxidation catalysts depending on vehicle age and type;
 - Requiring Ultra Low Sulfur Diesel and cleaner alternative fuels;
 - Closed crankcase ventilation systems to eliminate engine exhaust from penetrating the cabins of school and transit buses;
 - Engine rebuild and replacement requirements;
 - Truck stop electrification programs to give long-haul truckers a way to power their rigs overnight without running their engines;
 - Contract specifications requiring cleanup of trucks and construction equipment used in public works projects.
- Adopt diesel cleanup measures as federally-enforceable requirements in State Implementation Plans (SIPs) for the attainment of the fine particle and ozone air quality standards;
- Create and fund programs to provide money for diesel equipment owners to replace or rebuild high-polluting diesel engines;
- Adopt and enforce anti-idling ordinances and legislation.

To meet this challenge, several states and cities have begun to take action. California continues to lead the way in reducing diesel emissions: adopting stricter fine particle air quality standards, developing a statewide diesel risk reduction plan, and establishing a state program to clean up on- and non-road diesel engines ranging from garbage trucks to stationary generators.⁸² When completed, the California program will regulate emissions from all existing diesels within its jurisdiction.

Washington Must Support States

States and cities cannot meet the challenge of diesel pollution alone. U.S. EPA has recognized the dangers and societal costs of diesel exhaust and set tighter emission standards for new highway and non-road diesel engines and mandated the availability beginning in 2006 of Ultra Low Sulfur Diesel (ULSD) fuel nationwide. These requirements must be retained with no backsliding. In addition, EPA has set a national goal of cleaning up all of America’s

Trucks parked at New York Thruway rest area shut off their engines and plug into IdleAire facility for heat and electricity.

In New York, over 120,000 kids now ride a school bus that has had a retrofit kit installed to reduce diesel emissions. Under city and state law all New York City-sponsored construction projects are required to use ULSD and all heavy equipment engines at the sites must be retrofitted. Likewise, Seattle, King County, and the State of Washington have made a solid start on diesel cleanup from on- and non-road vehicles, and ships including a commitment to retrofit up to 8,000 school buses using local, state, federal, and SEP monies and buy up to 250 new diesel/electric hybrid buses. Other cities also have made a start.⁸³

California and Texas have created funds – the “Carl Moyer” program in California and the Texas Emission Reduction Program (TERP) – to provide funding for diesel equipment owners to replace or rebuild high-polluting diesel engines.

NEW FLYER

Some cities are choosing Diesel Electric Hybrid buses as an alternative to conventional diesel buses.

existing diesels by 2015 and has established a voluntary retrofit program to begin to meet it.⁸⁴ However, this challenge will only be met with an aggressive set of policies and adequate funding to ensure the goal can be accomplished.

Many states do not have the resources to clean up state and municipally-owned vehicles. They will need the support of the federal government to achieve EPA’s goal.

Federal action may also be needed to clean up transient diesel vehicles, including long-haul trucks, marine diesel shipping in U.S. ports, and locomotives that typically travel from city to city dispersing their emissions along travel corridors. Because the Clean Air Act contains limited authority for EPA to establish national diesel retrofit rules, federal legislation will ultimately be needed to establish federal requirements and funding for a national retrofit program for all diesel engines as well as these interstate diesels.

The Federal government should:

- Pass legislation providing funding for the cleanup of municipal and state fleet vehicles;
- Explore regulatory options for reducing emissions from existing interstate fleets such as long-haul trucks, shipping, and locomotives;
- Retain and enforce the tighter new engine and cleaner fuel standards for highway and non-road diesels.

Sacramento, CA: California Environmental Protection Agency, Stationary Source Division Emissions Assessment Branch;. California Air Resources Board (CARB) 2003c. REVISED – Staff Report: Initial Statement of Reasons for Proposed Rulemaking: Airborne Toxic Control Measure for In-use Diesel Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets, and Facilities Where TRUs Operate. Sacramento, CA: California Environmental Protection Agency, Stationary Source Division Emissions Assessment Branch. The Union of Concerned Scientists recently estimated the costs and benefits of achieving the CARB Diesel Risk Reduction goal. See Union of Concerned Scientists, *Sick of Soot: Reducing the Health Impacts of Diesel Pollution in California* (June 2004) available online at: http://www.ucsusa.org/clean_vehicles/trucks_and_buses/page.cfm?pageID=1429
- 15 This analysis was performed by multiplying modeled ASPEN (Assessment System for Population Exposure Nationwide) 1999 county-level ambient diesel PM2.5 concentration data times: (1) the upper and lower bounds of EPA's possible diesel particulate matter cancer risk range; and (2) the California Air Resources Board diesel cancer unit risk factor. See: California Diesel Risk Reduction Plan: <http://www.arb.ca.gov/diesel/documents/rrpapp.htm>; EPA, Health Assessment Document for Diesel Exhaust, Office of Research and Development, EPA/600/8-90/057F (May 2002). The United States Public Interest Research Group previously used

- a similar methodology i.e., multiplying the CARB unit risk factor by 1996 National Air Toxics Assessment fine particle concentration data to derive national, state, and local additional cancer risk (cancers per million people) from diesel fine particles. U.S. PIRG Education Fund, *Dangers of Diesel: How Diesel Soot and Other Air Toxics Increase Americans' Risk of Cancer* (October 2002).
- 16 "The estimated possible risk ranges (10^{-5} to 10^{-3} as well as lower and zero risk) provide a perspective of the potential significance of the lung cancer hazard." EPA, Health Assessment Document for Diesel Exhaust, Office of Research and Development, EPA/600/8-90/057F (May 2002) at p. 8-15. For CARB unit risk value, see: Findings of the Scientific Review Panel on *The Report on Diesel Exhaust* as adopted at the Panel's April 22, 1998, meeting. <http://www.arb.ca.gov/toxics/dieseltac/defnds.pdf>. See also, <http://www.arb.ca.gov/regact/diesltac/diesltac.htm>. The findings in this report based on the CARB unit risk factor are consistent with EPA's possible diesel risk range e.g., 3×10^{-4} is within EPA's range of 10^{-3} to 10^{-5} .
 - 17 The number per million is the chance in a population of a million people who might be expected to get cancer over a 70-year lifetime. A potential cancer risk of 10 in a million means if one million people were exposed to a certain level of a pollutant or chemical there is a chance that 10 of them may develop cancer over their 70-year lifetime. This would be 10 new cases of cancer above the expected rate of cancer in the population. According to CARB the expected rate of cancer for all causes, including smoking, is about 200,000 to 250,000 chances in a million (one in four to five people).
 - 18 For 1999 NATA national excess cancer risk from air toxics other than diesel see: Inside EPA, Inside Washington Publishers, (December 15, 2004) <http://www.insideepa.com/>
 - 19 This finding is based on inhalation as the only exposure path and is limited to the thirty-three air toxics included in EPA's National Air Toxics Assessment (NATA). The relative cancer risk of diesel particulate matter is calculated as a ratio of the cancer risk of all air toxics tracked by EPA in the NATA divided by the risk of diesel particulate. We calculated the cancer risk for diesel PM in the U.S. based by applying the CARB cancer unit risk factor for diesel particulate matter to 1999 ASPEN model average national ambient concentration results for diesel PM. (Source for national toxic risk: Inside EPA, Inside Washington Publishers, December 15, 2004.)
 - 20 According to the EPA's categorization of counties as urban or rural, the average ASPEN 1999 ambient diesel fine particle concentration is 1.3822 ug/m^3 for urban counties and 0.4730 ug/m^3 for rural counties. The overall national average is 1.2096 ug/m^3 . These averages are population weighted. These averages convert (using the 0.0003 factor) to cancer risks of 415 per million urban, 142 per million rural, and 363 per million average.
 - 21 U.S. Centers for Disease Control and Prevention, "National Hospital Discharge Summary 1998," Advance Data #316 (June 30, 2000). Available online at: <http://www.cdc.gov/nchs>.
 - 22 This analysis was performed using 1999 county-level ambient diesel PM_{2.5} concentration data modeled using the Assessment System for Population Exposure Nationwide (ASPEN) air quality model, and then by applying a damage function model using concentration-response relationships to estimate adverse health endpoints from modeled changes in air quality. For a full discussion of the methodology used, please see: www.catf.us/goto/AbtASPEN/. For health impacts in your city and state see: <http://www.catf.us/goto/dieselhealth>.
 - 23 The new health findings provided in this report by Abt Associates are derived from average modeled estimates of ambient concentrations of diesel particulate matter for entire counties. Many people experience higher diesel exposure situations depending upon where they live and work, for example, such as working near diesel engines, living near diesel sources or commuting regularly on roadways with diesel traffic. The quantitative estimates of death and disease we provide in this report are based on average exposures only and do not represent the risks associated with high diesel exposures. Furthermore, these health findings do not include the impacts from all toxic constituents in diesel exhaust, only directly-emitted particulate matter.
 - 24 The state and metropolitan area health effects reported here exclude those associated with secondarily-formed fine particles, i.e., particles formed from gaseous emissions through post-emission atmospheric chemical reactions. Typically, these include nitrate from nitrogen oxide emissions and sulfate from sulfur dioxide emissions. Secondarily-formed fine particles may make up as much as one-third of diesel-related particles. See Lloyd, A. C., and Cackette, T.A. (2001). - 41 Findings of the California Air Resources Board's Scientific Review Panel on *The Report on Diesel Exhaust* as adopted at the Panel's April 22, 1998, meeting. <http://www.arb.ca.gov/toxics/dieseltac/de-fnds.pdf>.
- 42 The national average ambient diesel particulate matter concentration from 1999 ASPEN modeling (1.21 ug/m³) was multiplied times the CARB diesel particulate matter unit risk of 3 in 10,000 per 1.0 ug/m³ and distributed over the 2005 U.S. population to get total of 107,000 lifetime cancers assuming a 70-year lifetime of exposure to the national average ambient concentration. The annual estimated impact is calculated by dividing the 107,000 lifetime cancers by 70 years, arriving at 1,530 annual cancers attributable to diesels per year. This estimate is likely very conservative (low) because urban areas where larger populations dwell, are characterized by concentrations that are much higher than the national average.

Dirty air triggers more heart attacks than cocaine

By *Kate Kelland, Health and Science Correspondent* Kate Kelland, Health And Science Correspondent – Thu Feb 24, 8:19 am ET

LONDON (Reuters) – Air pollution triggers more heart attacks than using cocaine and poses as high a risk of sparking a heart attack as alcohol, coffee and physical exertion, scientists said on Thursday.

Sex, anger, marijuana use and chest or respiratory infections and can also trigger heart attacks to different extents, the researchers said, but air pollution, particularly in heavy traffic, is the major culprit.

The findings, published in *The Lancet* journal, suggest population-wide factors like polluted air should be taken more seriously when looking at heart risks, and should be put into context beside higher but relatively rarer risks like drug use.

Tim Nawrot of Hasselt University in Belgium, who led the study, said he hoped his findings would also encourage doctors to think more often about population level risks.

"Physicians are always looking at individual patients -- and low risk factors might not look important at an individual level, but if they are prevalent in the population then they have a greater public health relevance," he said in a telephone interview.

The World Health Organization (WHO) describes air pollution as "a major environmental risk to health" and estimates that it causes around 2 million premature deaths worldwide every year.

Nawrot's team combined data from 36 separate studies and calculated the relative risk posed by a series of heart attack triggers and their population-attributable fraction (PAF) -- in other words the proportion of total heart attacks estimated to have been caused by each trigger.

The highest risk PAF was exposure to traffic, followed by physical exertion, alcohol, coffee, air pollution, and then things like anger, sex, cocaine use, smoking marijuana and respiratory infections.

"Of the triggers for heart attack studied, cocaine is the most likely to trigger an event in an individual, but traffic has the greatest population effect as more people are exposed to (it)," the researchers wrote. "PAFs give a measure of how much disease would be avoided if the risk was no longer present."

A report published late last year found that air pollution in many major cities in Asia exceeds the WHO's air quality guidelines and that toxic cocktails of pollutants results in more than 530,000 premature deaths a year.

While passive smoking was not included in this study, Nawrot said the effects of second-hand smoke were likely to be similar to that of [outdoor air pollution](#), and noted previous research which found that bans on smoking in public places have significantly reduced heart attack rates.

British researchers said last year that a ban on smoking in public places in England led to a swift and significant drop in the number of heart attacks, saving the health service 8.4 million pounds (\$13 million) in the first year.

Tim Chico, a heart specialist at the University of Sheffield who was not involved in this research, said it would help health authorities focus on which are the most important triggers.

"However, what triggers the heart attack should be considered the "last straw." The foundations of heart disease that lead to a heart attack are laid down over many years," he said in an emailed comment. "If someone wants to avoid a heart attack they should focus on not smoking, exercising, eating a healthy diet and maintaining their ideal weight."

(Editing by Paul Casciato)

Air pollution worse than cocaine for triggering heart attacks, says study

Research into 'final straw' risk factors says traffic fumes greater population-wide threat than drug because of numbers exposed

- Press Association
- guardian.co.uk, Wednesday 23 February 2011 18.37 GMT
- [Article history](#)

Air pollution hangs over London. A study suggests that air pollution triggers up to 7% of heart attacks in a population. Photograph: Mike Hewitt/Getty Images

Air [pollution](#) is a bigger trigger of heart attacks in the population than physical exertion, alcohol and taking cocaine, a study has shown. On an individual basis, cocaine raises the risk of a [heart attack](#) 23 times, says a study published in the Lancet.

But far more people are exposed to traffic fumes and factory emissions than cocaine so air quality is a far more important population-wide threat.

Scientists looked at "final straw" risk factors for triggering heart attacks, rather than underlying causes of heart disease. The highest risk factor was traffic exposure (7.4%), followed by physical exertion (6.2%) and alcohol (5%), coffee (5%), and higher levels of small air pollutant particles known as PM10s (4.8%).

Other risk factors included negative emotions, with a PAF of 3.9%, anger (3.1%), eating a heavy meal (2.7%), positive emotions (2.4%) and sexual activity (2.2%).

Air pollution triggers 5-7% of heart attacks in the population, they say. Cocaine accounts for just 0.9% of all heart attacks.

EXECUTIVE SUMMARY

The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, Connelly) was enacted in September 1987. Under this Act, stationary sources of air pollution are required to report the types and quantities of certain substances their facilities routinely release into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, ascertain health risks posed by those facilities, notify nearby residents of significant risks and reduce emissions from significant sources.

The Technical Support Document for Cancer Potency Factors (TSD) contains cancer unit risks and potency factors for 107 of the 201 carcinogenic substances or groups of substances for which emissions must be quantified in the Air Toxics Hot Spots program. These unit risks are used in the cancer risk assessment of facility emissions.

The purposes of this revision to the TSD is to provide updated calculation procedures used to derive the estimated unit risk and cancer potency factors, and to describe the procedures used to consider the increased susceptibility of infants and children compared to adults to carcinogens. This updates cancer risk assessment methods originally laid out in the California Department of Health Services' Guidelines for Chemical Carcinogen Risk Assessment (CDHS, 1985), and more recently summarized in the previous Hot Spots technical support document Part II (OEHHA, 2005a). Summaries of cancer potency factors and the underlying data are provided in Appendix A and B. [these did not undergo revision and are not included in this review package.]

The procedures used to consider the increased susceptibility to carcinogens of infants and children as compared to adults include the use of age-specific weighting factors in calculating cancer risks from exposures of infants, children and adolescents, to reflect their anticipated special sensitivity to carcinogens

This document is one part of the Air Toxics Hot Spots Program Risk Assessment Guidelines. The other documents originally included in the Guidelines are Part I: Technical Support Document for the Determination of Acute Toxicity Reference Exposure Levels for Airborne Toxicants; Part III: Technical Support Document for Determination of Noncancer Chronic Reference Exposure Levels; Part IV: Technical Support Document for Exposure Assessment and Stochastic Analysis; Part V: Air Toxic Hot Spots Program Risk Assessment Guidelines. As a part of the same revision process which led to production of this revised TSD on cancer potencies, the original TSDs for Acute and Chronic Reference Exposure Levels have been replaced with a new unified TSD for Acute, 8-hour and Chronic Reference Exposure Levels.

The major changes to the TSD include the following:

- Based on the OEHHA analysis of the potency by lifestage at exposure, OEHHA proposes weighting cancer risk by a factor of 10 for exposures that occur from birth to 2 years of age, and by a factor of 3 for exposures that occur from 2 years through 15 years of age. We propose to apply this weighting factor to all carcinogens, regardless of purported mechanism of action, unless chemical-specific data exist to the contrary. In cases where

there are adequate data for a specific carcinogen of potency by age, we would use the data to make any adjustments to risk.

- OEHHA proposes to use the Benchmark Dose method to compute potency factors rather than the more traditional linearized multistage model (LMS), although the LMS will still be used in some instances. The BMDL model essentially uses an empirical fit to the data (usually best with the multistage model), and then extrapolates with a straight line from the 95 % lower confidence limit of the BMD (BMDL) to zero. This method is simpler and does not assume any underlying theoretical mechanisms at the low dose range. The BMDL method results in very similar estimates of potency as the LMS method.
- OEHHA will use scaling based on body weight to the $\frac{3}{4}$ power, rather than to the $\frac{2}{3}$ power.
- OEHHA's evaluations of the carcinogenicity of chemicals generally follow the guidelines laid out by IARC for identification and classification of potential human carcinogens, which are described in detail in the most recent revision of the *Preamble* to the IARC monographs series (IARC, 2006).

PREFACE

The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, Connelly) was enacted in September 1987. Under this Act, stationary sources are required to report the types and quantities of certain substances their facilities routinely release into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, ascertain health risks posed by those facilities, notify nearby residents of significant risks and reduce emissions from significant sources.

The Technical Support Document for Cancer Potency Factors (TSD) contains cancer unit risks and potency factors for 107 of the 201 carcinogenic substances or groups of substances for which emissions must be quantified in the Air Toxics Hot Spots program. These unit risks are used in risk assessment of facility emissions. The TSD provides updated calculation procedures used to derive the estimated unit risk and cancer potency factors, and procedures to consider early-life susceptibility to carcinogens. Summaries of cancer potency factors and the underlying data are provided in Appendix A and B. [these did not undergo revision and are not included in this review package.]

In this document, OEHHA is responding to the requirements of the 1999 Children's Environmental Health Protection Act, (SB25, Escutia) by revising the procedures for derivation and application of cancer potency factors to take account of general or chemical-specific information which suggests that children may be especially susceptible to certain carcinogens (OEHHA, 2001a). The revised cancer potency derivation procedures described will not be used to impose any overall revisions of the existing cancer potencies, although they do reflect updated methods of derivation. However, individual cancer potency values will be reviewed as part of the ongoing re-evaluation of health values mandated by SB 25, and revised values will be listed in updated versions of the appendices to this document as necessary. The revisions also include the use of weighting factors in calculating cancer risks from exposures of infants, children and adolescents, to reflect their anticipated special sensitivity to carcinogens. Similar legal mandates to update risk assessment methodology and cancer potencies apply to the OEHHA program for development of Public Health Goals (PHGs) for chemicals in drinking water, and Proposition 65 No Significant Risk Levels (NSRLs). The NSRLs may also be revised to reflect concerns for children's health. Revising these numbers will require the originating program to reconsider the value in an open public process. For example, OEHHA would need to release any revised potency factors for public comment and review by the Scientific Review Panel on Toxic Air Contaminants (SRP) prior to adoption under the TAC program. The procedures for outside parties to request reevaluation of cancer potency values by the programs which originated those values are listed in Appendix G.

Appendices A and B provide previously adopted Cal/EPA values which were included in the previous version of the TSD for Cancer Potency Factors (OEHHA, 2005a). Cal/EPA values were developed under the Toxic Air Contaminant (TAC) program, the PHG program, the Proposition 65 program, or in some cases specifically for the Air Toxics Hot Spots program. All the Cal/EPA values are submitted for public comments and external peer review prior to adoption by the program of origin. In the future, new values developed by the Toxic Air

Contaminants or Hot Spots programs or other suitable sources will be added as these are approved.

Some U.S. EPA IRIS cancer unit risk values were adopted under the previous versions of these guidelines, and these values will continue to be used unless and until revised by Cal/EPA. U.S. EPA has recently revised its cancer risk assessment guidelines (U.S. EPA, 2005a). Some of the recommended changes in methodology could result in slightly different potency values compared to those calculated by the previous methodology, although in practice a number of the recommendations (for example, the use of $3/4$ power of the body weight ratio rather than $2/3$ power for interspecies scaling) have been available in draft versions of the revised policy for some time and appear in many more recent assessments. U.S. EPA has stated that cancer potency values listed in IRIS will not be revisited solely for the purpose of incorporating changes in cancer potency value calculation methods contained in the revised cancer risk assessment guidelines. U.S. EPA has also issued supplementary guidelines on assessing cancer risk from early-life exposure (U.S. EPA, 2005b).

OEHHA uses a toxic equivalency factor procedure for dioxin-like compounds, including polychlorinated dibenzo-*p*-dioxins, dibenzofurans and polychlorinated biphenyls (PCBs). The Toxicity Equivalency Factor scheme (TEF_{WHO-97}) developed by the World Health Organization/European Center for Environmental Health (WHO-ECEH) is used for determining cancer unit risk and potency values for these chemicals where individual congener emissions are available (Appendix C).

This document is one part of the Air Toxics Hot Spots Program Risk Assessment Guidelines. The other documents originally included in the Guidelines are Part I: Technical Support Document for the Determination of Acute Toxicity Reference Exposure Levels for Airborne Toxicants; Part III: Technical Support Document for Determination of Noncancer Chronic Reference Exposure Levels; Part IV: Technical Support Document for Exposure Assessment and Stochastic Analysis; Part V: Air Toxic Hot Spots Program Risk Assessment Guidelines. As a part of the same revision process which led to production of this revised TSD on cancer potencies, the original TSDs for Acute and Chronic Reference Exposure Levels have been replaced with a new unified TSD for Acute, 8-hour and Chronic Reference Exposure Levels.

APPENDICES

Appendix A. A lookup table containing unit risk and cancer potency values.

Appendix B. Chemical-specific summaries of the information used to derive unit risk and cancer potency values.

Appendix C. A description of the use of toxicity equivalency factors for determining unit risk and cancer potency factors for polychlorinated dibenzo-*p*-dioxins, dibenzofurans and dioxin-like polychlorinated biphenyls.

Appendix D. A listing of Toxic Air Contaminants identified by the California Air Resources Board.

Appendix E. Descriptions of the International Agency for Research on Cancer (IARC) and U.S. Environmental Protection Agency (U.S. EPA) carcinogen classifications.

Appendix F. An asbestos quantity conversion factor for calculating asbestos concentrations expressed as 100 fibers/m³ from asbestos concentrations expressed as µg/m³.

Appendix G. Procedures for revisiting or delisting cancer potency factors by the program of origin.

Appendix H. Exposure routes and studies used to derive cancer unit risks and slope factors.

Appendix I. “Assessing susceptibility from early-life exposure to carcinogens”: Barton *et al.*, 2005 (from *Environmental Health Perspectives*).

Appendix J. “In Utero and Early Life Susceptibility to Carcinogens: The Derivation of Age-at-Exposure Sensitivity Measures” – conducted by OEHHA’s Reproductive and Cancer Hazard Assessment Branch.

Appendix K. Additions and corrections from prior document versions.

INTRODUCTION

The Technical Support Document (TSD) for Describing Available Cancer Potency Factors provides technical information support for the Air Toxics Hot Spots Program Risk Assessment Guidelines. The TSD consists of 12 sections:

1. The TSD introduction.
2. A description of the methodologies used to derive the unit risk and cancer potency values listed in the lookup table.
3. A lookup table containing unit risk and cancer potency values. (Appendix A)
4. Chemical-specific summaries of the information used to derive unit risk and cancer potency values. (Appendix B).
5. A description of the use of toxicity equivalency factors for determining unit risk and cancer potency factors for polychlorinated dibenzo-*p*-dioxins, dibenzofurans and dioxin-like polychlorinated biphenyls (Appendix C).
6. A listing of Toxic Air Contaminants identified by the California Air Resources Board (Appendix D).
7. Descriptions of the International Agency for Research on Cancer (IARC) and U.S. Environmental Protection Agency (U.S. EPA) carcinogen classifications (Appendix E).
8. An asbestos quantity conversion factor for calculating asbestos concentrations expressed as 100 fibers/m³ from asbestos concentrations expressed as µg/m³ (Appendix F).
9. Procedures for revisiting or delisting cancer potency factors by the program of origin (Appendix G).
10. Exposure routes and studies used to derive cancer unit risks and slope factors (Appendix H).
11. "Assessing susceptibility from early-life exposure to carcinogens": Barton *et al.*, 2005 (from *Environmental Health Perspectives*) (Appendix I).
12. "In Utero and Early Life Susceptibility to Carcinogens: The Derivation of Age-at-Exposure Sensitivity Measures" – conducted by OEHHA's Reproductive and Cancer Hazard Assessment Branch (Appendix J)

SELECTION OF CANCER POTENCY VALUES

The Office of Environmental Health Hazard Assessment (OEHHA) has developed a number of cancer potencies for use in the Toxic Air Contaminants and Air Toxics Hot Spots programs. This document also provides summaries of cancer potency factors which were originally developed for other California Environmental Protection Agency (Cal/EPA) programs, or by the U.S. EPA. These were reviewed for accuracy, reliance on up-to-date data and methodology, and applicability in the context of the Air Toxics Hot Spots program. Values found appropriate were adopted after public and peer review rather than devoting the resources necessary for a full *de novo* assessment. Thus, cancer potency values (CPF) included in the Technical Support Document (TSD) for Cancer Potency Factors were from the following sources:

1. Toxic Air Contaminant documents
2. Standard Proposition 65 documents
3. U.S.EPA Integrated Risk Information Systems (Office of Health and Environmental Assessment, U.S.EPA)
4. Expedited Proposition 65 documents
5. Other OEHHA assessments , for example for the drinking water program.

All the cancer potency value sources used generally follow the recommendations of the National Research Council on cancer risk assessment (NRC, 1983, 1994). All Cal/EPA program documents undergo a process of public comment and scientific peer review prior to adoption, although the procedures used vary according to the program. The publication procedure for Toxic Air Contaminant documents includes a public comment period and review by the Scientific Review Panel on Toxic Air Contaminants (SRP) before identification of a Toxic Air Contaminant by the Air Resources Board of the California Environmental Protection Agency (Cal/EPA). Furthermore, a petition procedure is available to initiate TAC document review and revision if appropriate because of new toxicity data. Documents developed for the Air Toxics Hot Spots program similarly undergo public comment and peer review by the SRP before adoption by the Director of OEHHA. The standard Proposition 65 document adoption procedure includes a public comment and external peer review by the Proposition 65 Carcinogen Identification Committee. The expedited Proposition 65 document adoption procedure included a public comment period. Risk assessments prepared for development of Public Health Goals (PHGs) for chemicals in drinking water are subject to two public comment periods before the final versions and responses to comments are published on the OEHHA Web site. PHG documents may also receive external peer review. Documents from U.S. EPA's Integrated Risk Information System (IRIS) receive external peer review and are posted on the Internet for public viewing during the external peer review period, and any public comments submitted are considered by the originating office. Additionally, public comment may be solicited during the document posting period. Future preference for use of developed cancer potency factors/unit risks will be done on a case by case basis. Preference will be given to those assessments most relevant to inhalation exposures of the California population, to the most recent derivations using the latest data sets and scientific methodology, and to those having undergone the most open and extensive peer review process.

CANCER RISK ASSESSMENT METHODOLOGIES

This section describes in general the methodologies used to derive the cancer unit risk and potency factors listed in this document. As noted in the Preface to this document, no new cancer unit risks or potency factors were developed for this document. All of the values contained here were previously developed in documents by Cal/EPA or U.S. EPA. Following the recommendations of the National Academy of Sciences (NRC, 1983), Cal/EPA and U.S. EPA have both used formalized cancer risk assessment guidelines, the original versions of which (California Department of Health Services, 1985; U.S. EPA, 1986) were published some time ago. Both these guidelines followed similar methodologies.

In the twenty years since these original guidelines were published there have been a number of advances in the methodology of cancer risk assessment. There have additionally been considerable advances in the quantity of data available not only from animal carcinogenesis bioassays and epidemiological studies, but also from mechanistic studies of carcinogenesis and related phenomena. Some of these advances have been incorporated into newer risk assessments by both agencies on a more or less *ad hoc* basis. There has also been an ongoing effort to provide updated risk assessment guidance documents. In 1995, U.S. EPA released for public comment the "Proposed and Interim Guidelines for Carcinogen Risk Assessment", which was the first of several drafts released for public comment. Many risk assessments appearing since then have used elements of the recommendations contained in that document, in spite of its draft status. A final version of the U.S. EPA's revised cancer risk assessment guidelines has now been released (U.S. EPA, 2005a). Although these new guidelines incorporate a number of substantial changes from their predecessors (U.S. EPA, 1986; 1995), U.S. EPA has stated that cancer potency values listed in IRIS will not be revisited solely for the purpose of incorporating changes in cancer potency value calculation methods.

Cal/EPA has not produced a revised cancer risk assessment guideline document to replace the original version (DHS, 1985). Rather, Cal/EPA has relied on incorporating new data and methodologies as these became available, and described the methods used on a case by case basis in the individual risk assessment documents where these went beyond the original guidance. However, this revision of the TSD for cancer potencies provides a convenient opportunity to summarize the current status of the methodology used by OEHHA for the air toxics programs, and also to highlight points of similarity to, and difference from, the recommendations of U.S. EPA (2005a).

In this document, OEHHA intends to follow the recommendations of the NRC (1994) in describing a set of clear and consistent principles for choosing and departing from default cancer risk assessment options. NRC identified a number of objectives that should be taken into account when considering principles for choosing and departing from default options. These include, "protecting the public health, ensuring scientific validity, minimizing serious errors in estimating risks, maximizing incentives for research, creating an orderly and predictable process, and fostering openness and trustworthiness". The OEHHA cancer risk methodologies discussed in this document are intended to generally meet those objectives cited above.

Hazard Identification

This section will describe: 1) how weight of evidence evaluations are used in hazard evaluation; 2) guidelines for inferring causality of effect; 3) the use of human and animal carcinogenicity data, as well as supporting evidence (e.g. genetic toxicity and mechanistic data); 4) examples of carcinogen identification schemes.

Evaluation of Weight of Evidence

In evaluating the range of evidence on the toxicity and carcinogenicity of a compound, mixture or other agent, a “weight-of-evidence” approach is generally used to describe the body of evidence on whether or not exposure to the agent causes a particular effect. Under this approach, the number and quality of toxicological and epidemiological studies, as well as the consistency of study results and other sources of data on biological plausibility, are considered. Diverse and sometimes conflicting data need to be evaluated with respect to possible explanations of differing results. Consideration of methodological issues in the review of the toxicological and epidemiological literature is important in evaluating associations between exposure to an agent and animal or human health effects. This aspect of the evaluation process has received particular emphasis with respect to epidemiological data, where concerns as to the statistical and biological significance and reliability of the data and the impacts of confounding and misclassification are pressing. Such concerns are also relevant to some extent in the interpretation of animal bioassay data and mechanistic studies. Although the test animals, laboratory environment and characterization of the test agent are usually much better controlled than the equivalent parameters in an epidemiological study, the small sample size can be problematic. In addition, there are uncertainties associated with extrapolation of biological responses from test animal species to humans.

Criteria for Causality

There has been extensive discussion over the last two centuries on causal inference. This has been particularly with regard to epidemiological data, but is also relevant to interpretation of animal studies. Most epidemiologists utilize causal inference guidelines based on those proposed by Bradford Hill (1971). OEHHA has relied on these and on recommendations by IARC (2006), the Institute of Medicine (2004), the Surgeon General’s Reports on Smoking (U.S. DHHS, 2004) and standard epidemiologic texts (e.g. Lilienfeld and Lilienfeld, 1980; Rothman and Greenland, 1998). The criteria for determination of causality used by OEHHA have been laid out in various risk assessment documents. The summary below is adapted from the Health Effects section of the document prepared to support the identification of environmental tobacco smoke (ETS) as a Toxic Air Contaminant (OEHHA, 2005b).

1. *Strength of Association.* A statistically significant strong association, which is easier to detect if there is a high relative risk, between a factor and a disease is often viewed as an important criterion for inferring causality because, all other things being equal, a strong and statistically significant association makes alternative explanations for the disease less likely. However, as discussed in Rothman and Greenland (1998), the fact that a relative risk is small in magnitude does not exclude a casual association between the risk factor

and the outcome in question. Since it is more difficult to detect (i.e., reach statistical significance) a small magnitude risk, ~~they are~~ it is just as likely to ~~be causal~~ indicate causality as a larger magnitude risks.

When assessing all evidence, it is important to consider the strength of the study design (particularly controlling for confounding variables, obtaining an unbiased sample, measurement error) and the level of statistical significance (i.e., the ability to exclude a Type I [false positive] error). The power of the study to detect biologically meaningful effects (i.e., the risk of a Type II [false negative] error) is important in considering studies that do not reach traditional (i.e., $P < .05$) statistical significance, particularly if the biological endpoint is serious. If the outcome is serious and the study small (i.e., low power), a larger P value (e.g., $P < .10$) may be adequate evidence for identifying an effect.

There are a number of examples of statistically significant, small magnitude associations that are widely accepted as causal, such as causal links between air pollution and cardiovascular/pulmonary mortality and between second-hand smoke exposure and various cancers and heart disease. From a public health perspective, even a small magnitude increase in risk for a common disease can mean large numbers of people affected by the health outcome when exposure is frequent and widespread, as measured by the population attributable risk or attributable fraction. Small magnitude of association must not be confused with statistical significance, which is much more important.

2. *Consistency of Association.* If several investigations find an association between a factor and a disease across a range of populations, geographic locations, times, and under different circumstances, then the factor is more likely to be causal. Consistency argues against hypotheses that the association is caused by some other factor(s) that varies across studies. Unmeasured confounding is an unlikely explanation when the effect is observed consistently across a number of studies in different populations.

Associations that are replicated in several studies of the same design or using different epidemiological approaches or considering different sources of exposure and in a number of geographical regions are more likely to represent a causal relationship than isolated observations from single studies (IARC, 2006). If there are inconsistent results among investigations, possible reasons are sought, such as adequacy of sample size or control group, methods used to assess exposure, or range in levels of exposure. The results of studies judged to be rigorous are emphasized over those of studies judged to be methodologically less rigorous. For example, studies with the best exposure assessment are more informative for assessing the association between ETS and breast cancer than studies with limited exposure assessment, all else being equal.

3. *Temporality.* Temporality means that the factor associated with causing the disease occurs in time prior to development of the disease. The adverse health effect should occur at a time following exposure that is consistent with the nature of the effect. For example, respiratory irritation immediately following exposure to an irritant vapor is temporally consistent, whereas ~~effects-irritation~~ noted only years later may not be. On the other hand, tumors, noted immediately following exposure, might be temporally

inconsistent with a causal relationship, but tumors arising after a latency period of months (in rodents) or years (in rodents or humans) would be temporally consistent.

4. *Coherence and Biological Plausibility.* A causal interpretation cannot conflict with what is known about the biology of the disease. The availability of experimental data or mechanistic theories consistent with epidemiological observations strengthens conclusions of causation. For example, the presence of known carcinogens in tobacco smoke supports the concept that exposure to tobacco smoke could cause increased cancer risk. Similarly, if the mechanism of action for a toxicant is consistent with development of a specific disease, then coherence and biological plausibility can be invoked. It should be noted that our understanding of the biology of disease, and therefore biological plausibility, changes in light of new information which is constantly emerging from molecular biology (including epigenetics), and from new clinical and epidemiological investigations revealing effects influenced by genetic polymorphisms, pre-existing disease, and so forth.
5. *Dose-Response.* A basic tenet of toxicology is that increasing exposure or dose generally increases the response to the toxicant. While dose-response curves vary in shape and are not necessarily always monotonic, an increased gradient of response with increased exposure makes it difficult to argue that the factor is not associated with the disease. To argue otherwise necessitates that an unknown factor varies consistently with the dose of the substance and the response under question. While increased risk with increasing levels of exposure is considered to be a strong indication of causality, absence of a graded response does not exclude a causal relationship (IARC, 2006).

The dose-response curves for specific toxic effects may be non-monotonic. Under appropriate circumstances, where the dose response shows saturation, the effect of exposures could be nearly maximal, with any additional exposure having little or no effect. In some instances, a response is seen strongly in susceptible subpopulations, and the dose-response is masked by mixing susceptible and non-susceptible individuals in a sample. Further, there are examples of U-shaped or inverted U-shaped dose-response curves, (e.g., for endocrine disrupters) (Almstrup et al., 2002; Lehmann et al., 2004). Finally, timing of exposure during development may mask an overall increase in risk with increasing dose.

6. *Specificity.* Specificity is generally interpreted to mean that a single cause is associated with a single effect. It may be useful for determining which microorganism is responsible for a particular disease, or associating a single carcinogenic chemical with a rare and characteristic tumor (e.g., liver angiosarcoma and vinyl chloride, or mesothelioma and asbestos). However, the concept of specificity is not helpful when studying diseases that are multifactorial, or toxic substances that contain a number of individual constituents, each of which may have several effects and/or target sites.
7. *Experimental evidence.* While experiments are often conducted over a short period of time or under artificial conditions (compared to real-life exposures), experiments offer the opportunity to collect data under highly controlled conditions that allow strong causal conclusions to be drawn. Experimental data that are consistent with epidemiological

results strongly support conclusions of causality. There are also “natural experiments” that can be studied with epidemiological methods, such as when exposure of a human population to a substance declines or ceases; if the effect attributed to that exposure decreases, then there is evidence of causality. One example of this is the drop in heart disease death and lung cancer risk after smoking cessation.

It should be noted that the causal criteria are guidelines for judging whether a causal association exists between a factor and a disease, rather than hard-and-fast rules. Lilienfeld and Lilienfeld (1980) note that “*In medicine and public health, it would appear reasonable to adopt a pragmatic concept of causality. A causal relationship would be recognized to exist whenever evidence indicates that the factors form part of the complex of circumstances that increases the probability of the occurrence of disease and that a diminution of one or more of these factors decreases the frequency of that disease. After all, the reason for determining the etiological factors of a disease is to apply this knowledge to prevent the disease.*” [Rothman and Greenland \(2005\) discuss the complexities of causation and the use of rules and deductive methods in causal inference. They also concur with Bradford Hill and others that a determination of causality is a pragmatic conclusion rather than an absolute verdict, and advocate that these criteria should be seen as “deductive tests of causal hypotheses”.](#)

Data sources

Human studies: epidemiology, ecological studies and case reports

The aim of a risk assessment for the California Air Toxics programs is to determine potential impact on human health. Ideally therefore, the hazard identification would rely on studies in humans to demonstrate the nature and extent of the hazard. However, apart from clinical trials of drugs, experimental studies of toxic effects in human subjects are rarely undertaken or justifiable. Pharmacokinetic studies using doses below the threshold for any toxic effect have been undertaken for various environmental and occupational agents, but are not usually regarded as appropriate for suspected carcinogens.

The human data on carcinogens available to the risk assessor therefore mostly consist of epidemiological studies of existing occupational or environmental exposures. It is easier to draw reliable inferences in situations where both the exposures and the population are substantial and well-defined, and accessible to direct measurement rather than recall. Thus, many important findings of carcinogenicity to humans are based on analysis of occupational exposures. Problems in interpretation of occupational epidemiological data include simultaneous exposure to several different known or suspected carcinogens, imprecise quantification of exposures and confounding exposures such as active or passive tobacco smoking. The historical database of occupational data has a bias towards healthy white adult males. Thus, the hazard analysis of these studies may not accurately characterize effects on women, infants, children or the elderly, or on members of minority ethnic groups. Nevertheless, the analysis of occupational epidemiological studies, [including meta-analyses](#), has proved an important source for unequivocal identification of human carcinogens.

Epidemiological evidence may also be obtained where a substantial segment of a general population is exposed to the material of interest in air, drinking water or food sources. Rigorous

cohort and case-control studies may sometimes be possible, in which exposed individuals are identified, their exposure and morbidity or mortality evaluated, and compared to less exposed but otherwise similar controls. More often at least the initial investigation is a cross-sectional study, where prevalence of exposures and outcomes is compared in relatively unexposed and exposed populations. Such studies are hypothesis-generating, but are important sources of information nevertheless, and can often also justify more costly and labor-intensive follow-up cohort and/or case-control studies.

The clinical medical literature contains many case reports where a particular health outcome is reported along with unusual exposures that might have contributed to its occurrence. These reports typically describe a single patient or a small group, and have no statistical significance. They are nevertheless useful as indications of possible associations that deserve follow-up using epidemiological methods, and as supporting evidence, addressing the plausibility of associations measured in larger studies.

Animal studies

Although the observation of human disease in an exposed population can provide definitive hazard identification, adequate data of this type are not always available. More often, risk estimates have to be based on studies in experimental animals, and extrapolation of these results to predict human toxicity. The animals used are mostly rodents, typically the common laboratory strains of rat and mouse.

Rats and mice have many similarities to humans. Physiology and biochemistry are similar for all mammals, especially at the fundamental levels of xenobiotic metabolism, DNA replication and DNA repair that are of concern in identifying carcinogens. However, there are also several important differences between rodents and humans. Rodents, with a short life span, have differences in cell growth regulation compared to longer-lived species such as the human. For instance, whereas laboratory investigations have suggested that mutations in two regulatory genes (*e.g.* H-ras and p-53) are sometimes sufficient to convert a rodent cell to a tumorigenic state, many human cancers observed clinically have seven or eight such mutations. In addition, cultured normal human cells have a very stable karyotype, whereas cultured rodent cells readily undergo tetraploidization and then aneuploidization in cell culture. Further, cultured human cells senesce and rarely undergo spontaneous immortalization (frequency is 10^{-7} or less), whereas cultured rodent cells readily undergo immortalization at frequencies on the order of 10^{-3} . The use of genomics to study chemical carcinogenesis is relatively new, but the differences at present appear to be a matter of degree rather than kind.

Differences in regulation of cell division are another likely reason for variation between species in the site of action of a carcinogen, or its potency at a particular site. A finding of carcinogenesis in the mouse liver, for instance, is a reasonably good indicator of potential for carcinogenesis at some site in the human, but not usually in human liver (Huff, 1999). The mouse liver (and to a lesser extent that of the rat) is a common site of spontaneous tumors. It is also relatively sensitive to chemical carcinogenesis. The human liver is apparently more resistant to carcinogenesis; human liver tumors are unusual except when associated with additional predisposing disease, such as hepatitis B or alcoholic cirrhosis, or exposure to aflatoxin B1, or simultaneous exposure to hepatitis B virus and aflatoxin B1. Conversely, other

tumor sites are more sensitive in the human than in experimental animals. Interspecies variation in site and sensitivity to carcinogenesis may also arise from differences in pharmacokinetics and metabolism, especially for carcinogens where metabolic activation or detoxification is important. This variability may cause important differences in sensitivity between individuals in a diverse population such as humans. Variability between individuals in both susceptibility and pharmacokinetics or metabolism is probably less in experimental animal strains that are bred for genetic homogeneity.

Animal carcinogenesis studies are often designed to maximize the chances of detecting a positive effect, and do not necessarily mimic realistic human exposure scenarios. Thus extrapolation from an experimentally accessible route to that of interest for a risk assessment may be necessary. Even for studies by realistic routes such as oral or inhalation, doses may be large compared to those commonly encountered in the environment, in order to counter the limitation in statistical power caused by the relatively small size of an animal experiment. Whereas the exposed population of an epidemiological study might number in the thousands, a typical animal study might have fifty individuals per exposure group. With this group size any phenomenon with an incidence of less than about 5% is likely to be undetectable. Statistically significant results may be obtained even with groups as small as ten animals per dose group, when incidence of a tumor that is rare in the controls approached 100% in a treated group. The consensus experimental design for animal carcinogenesis studies, which has evolved over the last 50 years of investigation, is represented by the protocol used by the U.S. National Toxicology Program (NTP) for studies using oral routes (diet, gavage or drinking water) or inhalation. These carcinogenesis bioassays usually involve both sexes of an experimental species, and most often two species. NTP has standardized the use of the C57BlxC3H F₁ hybrid mouse, and the Fischer 344 rat as the standard test species, although NTP has announced plans to substitute use of the Wistar Han rat for the Fisher 344 rat. There is now an extensive database of background tumor incidences, normal physiology, biochemistry, histology and anatomy for these strains, which aids in the interpretation of pathological changes observed in experiments. Nevertheless, there is enough variation in background rates of common tumors that the use of concurrent controls is essential for hazard identification or dose-response assessment. "Historical control" data are mainly used to reveal anomalous outcomes in the concurrent controls. The fact that a significantly elevated incidence of a tumor relative to the concurrent control group is within the range of historical controls at that site for the test sex and strain is not necessarily grounds for dismissing the biological significance of the finding.

Groups of fifty animals of each sex and species are used, with control groups, and several dose groups, the highest receiving the maximum tolerated dose (MTD). Recent study designs have emphasized the desirability of at least three dose levels covering a decade with "logarithmic" spacing (*i.e.* MTD, 1/2 MTD or 1/3 MTD, and 1/10 MTD). This extended design is aimed at providing better dose-response information, and may contribute important additional information, such as mechanistic insights, for the hazard identification phase.

Supporting evidence: genetic toxicity, mechanistic studies

Investigators have developed additional data sources that can support or modify the conclusions of animal carcinogenesis bioassays, and provide information on mechanisms of action of agents suspected of being carcinogenic based on epidemiological studies or animal bioassays.

Genetic damage in exposed organisms includes both gene mutations (point or frameshift), and larger scale effects such as deletions, gene amplification, sister-chromatid exchanges, translocations and loss or duplication of segments or whole chromosomes. These genetic effects of chemical exposures are deleterious in their own right. In addition, since carcinogenesis results from somatic mutations and similar genetic alterations, agents that cause genetic damage generally have carcinogenic potential. Conversely, many known carcinogens are also known to be genotoxic, although there is also a significant class of carcinogens that are not directly genotoxic according to the usual tests. These latter agents presumably work by some other mechanism, such as methylation of tumor suppressor genes or demethylation of cellular proto-oncogenes, although recent genetic studies have shown that even tumors induced by these agents may show mutations, deletions or amplification of growth regulatory genes.

Experimental procedures to demonstrate and measure genetic toxicity may involve exposure of intact animals, and examination of genetic changes in, for example, bone marrow cells (or cells descended from these e.g. the micronucleus test, which detects remnants of chromosomal fragments in immature erythrocytes), mutations in flies (*Drosophila*), or appearance of color spots in the coat of mice. However, many tests have employed single celled organisms or mammalian cells in culture. The best known of these tests is the *Salmonella* reverse mutation assay, popularly known as the Ames test after its inventor. This is representative of a larger class of tests for mutagenic activity in prokaryotic organisms (bacteria), which necessarily only look at gene-level mutations. Similar tests in eukaryotic microorganisms (yeasts, *Aspergillus*) and cultured mammalian cells also detect chromosomal effects. Many tests using microorganisms *in vitro* involve addition of activating enzymes (e.g. liver postmitochondrial supernatant – “S9”) to mimic the metabolism of promutagenic chemicals *in vivo*. Another type of test examines the induction in mammalian cells of morphological transformation or anchorage-independent growth. These two chemically induced, *in vitro* changes are considered two of the many changes that fibroblastic cells must undergo on their route to neoplastic transformation (tumorigenicity). These various genetic tests contribute different information, which may be used to amplify and confirm conclusions drawn from human studies or animal bioassays, or to draw conclusions in the absence of epidemiological or bioassay data. In the latter case they have also been used in prioritizing agents for further evaluation by means of bioassays.

Carcinogen Identification schemes

Some regulatory programs, such as California’s Safe Drinking Water and Toxics Enforcement Act (“Proposition 65”) and various activities of the U.S. EPA, require that explicit lists of substances having the potential to act as human carcinogens be maintained. Other such lists are developed by non-regulatory research organizations, such as the U.S. National Toxicology Program and the International Agency for Research on Cancer (IARC), an international program of the World Health Organization. The California air toxics programs do not have any statutory requirement to “identify” carcinogens. The requirement instead is to identify hazardous substances as Toxic Air Contaminants, and to determine whether or not a threshold concentration, below which no adverse effects are expected, is likely to exist:

HEALTH AND SAFETY CODE, Division 26 (Air Resources), § 39660.

(2) *The evaluation shall also contain an estimate of the levels of exposure that may cause or contribute to adverse health effects. If it can be established that a threshold of adverse health effects exists, the estimate shall include both of the following factors:*

(A) *The exposure level below which no adverse health effects are anticipated.*

(B) *An ample margin of safety that accounts for the variable effects that heterogeneous human populations exposed to the substance under evaluation may experience, the uncertainties associated with the applicability of the data to human beings, and the completeness and quality of the information available on potential human exposure to the substance. In cases in which there is no threshold of significant adverse health effects, the office shall determine the range of risk to humans resulting from current or anticipated exposure to the substance.*

In practice however this requirement amounts to the need to establish whether or not a substance is carcinogenic. Any such effects are clearly harmful. Whereas the great majority of non-cancer health effects of chemicals are regarded as having a threshold, the default assumption for carcinogens is that there is no threshold (as described below). OEHHA follows the guidelines laid out by IARC for identification and classification of potential human carcinogens, which are described in detail in the most recent revision of the *Preamble* to the IARC monographs series (IARC, 2006). The IARC Monograph series provides evaluations of the carcinogenicity of individual substances or commonly occurring mixtures. The evaluation guidelines used are similar to those used by other scientific or regulatory authorities, including U.S.EPA.

The data inputs to hazard identification for carcinogens are human epidemiological studies, animal bioassays, along with supporting evidence such as mechanistic and genotoxicity data and structure-activity comparisons. IARC also assembles data on the structure and identity of the agent. The list of agents considered includes specific chemicals and also complex mixtures, occupational and lifestyle factors, physical and biological agents, and other potentially carcinogenic exposures.

IARC evaluations determine the quality of evidence for both animal and human evidence as falling into one of four categories: sufficient evidence of carcinogenicity, limited evidence of carcinogenicity, inadequate evidence of carcinogenicity and evidence suggesting lack of carcinogenicity. Stringent requirements for data quality are imposed. In view of their crucial importance, these definitions are quoted directly from the *Preamble* (IARC 2006):

“(a) Carcinogenicity in humans

Sufficient evidence of carcinogenicity: The Working Group considers that a causal relationship has been established between exposure to the agent and human cancer. That is, a positive relationship has been observed between the exposure and cancer in studies in which chance, bias and confounding could be ruled out with reasonable confidence. A statement that there is *sufficient evidence* is followed by a separate sentence that identifies the target organ(s) or tissue(s) where an increased risk of cancer was observed in humans. Identification of a specific target organ or tissue does not preclude the possibility that the agent may cause cancer at other sites.

Limited evidence of carcinogenicity: A positive association has been observed between exposure to the agent and cancer for which a causal interpretation is considered by the Working Group to be credible, but chance, bias or confounding could not be ruled out with reasonable confidence.

Inadequate evidence of carcinogenicity: The available studies are of insufficient quality, consistency or statistical power to permit a conclusion regarding the presence or absence of a causal association between exposure and cancer, or no data on cancer in humans are available.

Evidence suggesting lack of carcinogenicity: There are several adequate studies covering the full range of levels of exposure that humans are known to encounter, which are mutually consistent in not showing a positive association between exposure to the agent and any studied cancer at any observed level of exposure. The results from these studies alone or combined should have narrow confidence intervals with an upper limit close to the null value (e.g. a relative risk of 1.0). Bias and confounding should be ruled out with reasonable confidence, and the studies should have an adequate length of follow-up. A conclusion of *evidence suggesting lack of carcinogenicity* is inevitably limited to the cancer sites, conditions and levels of exposure, and length of observation covered by the available studies. In addition, the possibility of a very small risk at the levels of exposure studied can never be excluded.

(b) Carcinogenicity in experimental animals

Carcinogenicity in experimental animals can be evaluated using conventional bioassays, bioassays that employ genetically modified animals, and other in-vivo bioassays that focus on one or more of the critical stages of carcinogenesis. In the absence of data from conventional long-term bioassays or from assays with neoplasia as the end-point, consistently positive results in several models that address several stages in the multistage process of carcinogenesis should be considered in evaluating the degree of evidence of carcinogenicity in experimental animals.

The evidence relevant to carcinogenicity in experimental animals is classified into one of the following categories:

Sufficient evidence of carcinogenicity: The Working Group considers that a causal relationship has been established between the agent and an increased incidence of malignant neoplasms or of an appropriate combination of benign and malignant neoplasms in (a) two or more species of animals or (b) two or more independent studies in one species carried out at different times or in different laboratories or under different protocols. An increased incidence of tumours in both sexes of a single species in a well-conducted study, ideally conducted under Good Laboratory Practices, can also provide *sufficient evidence*.

A single study in one species and sex might be considered to provide *sufficient evidence of carcinogenicity* when malignant neoplasms occur to an unusual degree with regard to incidence, site, type of tumour or age at onset, or when there are strong findings of tumours at multiple sites.

Limited evidence of carcinogenicity: The data suggest a carcinogenic effect but are limited for making a definitive evaluation because, e.g. (a) the evidence of carcinogenicity is

restricted to a single experiment; (b) there are unresolved questions regarding the adequacy of the design, conduct or interpretation of the studies; (c) the agent increases the incidence only of benign neoplasms or lesions of uncertain neoplastic potential; or (d) the evidence of carcinogenicity is restricted to studies that demonstrate only promoting activity in a narrow range of tissues or organs.

Inadequate evidence of carcinogenicity: The studies cannot be interpreted as showing either the presence or absence of a carcinogenic effect because of major qualitative or quantitative limitations, or no data on cancer in experimental animals are available.

Evidence suggesting lack of carcinogenicity: Adequate studies involving at least two species are available which show that, within the limits of the tests used, the agent is not carcinogenic. A conclusion of *evidence suggesting lack of carcinogenicity* is inevitably limited to the species, tumour sites, age at exposure, and conditions and levels of exposure studied.”

IARC utilizes the evaluations of animal and human data, along with supporting evidence including genotoxicity, structure-activity relationships, and identified mechanisms, to reach an overall evaluation of the potential for carcinogenicity in humans. The revised *Preamble* (IARC, 2006) includes a description of the data evaluation criteria for this supporting evidence, and indications as to the situations where the availability of supporting evidence may be used to modify the overall conclusion from that which would be reached on the basis of bioassay and/or epidemiological evidence alone. The overall evaluation is expressed as a numerical grouping, the categories of which are described below, as before by directly quoting IARC (2006):

“Group 1: The agent is *carcinogenic to humans*.

This category is used when there is *sufficient evidence of carcinogenicity* in humans. Exceptionally, an agent may be placed in this category when evidence of carcinogenicity in humans is less than *sufficient* but there is *sufficient evidence of carcinogenicity* in experimental animals and strong evidence in exposed humans that the agent acts through a relevant mechanism of carcinogenicity.

Group 2.

This category includes agents for which, at one extreme, the degree of evidence of carcinogenicity in humans is almost *sufficient*, as well as those for which, at the other extreme, there are no human data but for which there is evidence of carcinogenicity in experimental animals. Agents are assigned to either Group 2A (*probably carcinogenic to humans*) or Group 2B (*possibly carcinogenic to humans*) on the basis of epidemiological and experimental evidence of carcinogenicity and mechanistic and other relevant data. The terms *probably carcinogenic* and *possibly carcinogenic* have no quantitative significance and are used simply as descriptors of different levels of evidence of human carcinogenicity, with *probably carcinogenic* signifying a higher level of evidence than *possibly carcinogenic*.

Group 2A: The agent is *probably carcinogenic to humans*.

This category is used when there is *limited evidence of carcinogenicity* in humans and *sufficient evidence of carcinogenicity* in experimental animals. In some cases, an agent may be classified in this category when there is *inadequate evidence of carcinogenicity* in humans and *sufficient evidence of carcinogenicity* in experimental animals and strong evidence that the carcinogenesis is mediated by a mechanism that also operates in humans. Exceptionally, an agent may be classified in this category solely on the basis of *limited evidence of carcinogenicity* in humans. An agent may be assigned to this category if it clearly belongs, based on mechanistic considerations, to a class of agents for which one or more members have been classified in Group 1 or Group 2A.

Group 2B: The agent is *possibly carcinogenic to humans*.

This category is used for agents for which there is *limited evidence of carcinogenicity* in humans and less than *sufficient evidence of carcinogenicity* in experimental animals. It may also be used when there is *inadequate evidence of carcinogenicity* in humans but there is *sufficient evidence of carcinogenicity* in experimental animals. In some instances, an agent for which there is *inadequate evidence of carcinogenicity* in humans and less than *sufficient evidence of carcinogenicity* in experimental animals together with supporting evidence from mechanistic and other relevant data may be placed in this group. An agent may be classified in this category solely on the basis of strong evidence from mechanistic and other relevant data.

Group 3: The agent is *not classifiable as to its carcinogenicity to humans*.

This category is used most commonly for agents for which the evidence of carcinogenicity is *inadequate* in humans and *inadequate* or *limited* in experimental animals.

Exceptionally, agents for which the evidence of carcinogenicity is *inadequate* in humans but *sufficient* in experimental animals may be placed in this category when there is strong evidence that the mechanism of carcinogenicity in experimental animals does not operate in humans.

Agents that do not fall into any other group are also placed in this category.

An evaluation in Group 3 is not a determination of non-carcinogenicity or overall safety. It often means that further research is needed, especially when exposures are widespread or the cancer data are consistent with differing interpretations.

Group 4: The agent is *probably not carcinogenic to humans*.

This category is used for agents for which there is *evidence suggesting lack of carcinogenicity* in humans and in experimental animals. In some instances, agents for which there is *inadequate evidence of carcinogenicity* in humans but *evidence suggesting lack of carcinogenicity* in experimental animals, consistently and strongly supported by a broad range of mechanistic and other relevant data, may be classified in this group.”

The IARC hazard evaluation system provides a detailed and generally accepted scheme to classify the strength of evidence as to the possible human carcinogenicity of chemicals and other agents. This includes careful consideration of mechanistic data and other supporting evidence, the evaluation of which is also important to inform selection of models or defaults used in dose response assessment, as is described below. The extended consideration of supporting evidence is in fact the primary difference between more recent versions of the guidance from IARC, and also by other organizations including U.S. EPA, and the original versions of that guidance. In fact, the basic criteria for hazard identification based on bioassay and epidemiological data have not changed substantially in other respects from earlier guidance documents, including that originally published by California (DHS, 1985). Although as noted earlier the California Air Toxics programs do not categorize identified carcinogens, it has generally been the practice to regard any agent with an IARC overall classification in Group 1 or Group 2 as a known or potential human carcinogen. This implies the selection of various policy-based default options, including absence of a threshold in the dose-response curve, unless specific data are available to indicate otherwise. The same basic identification criteria are used by OEHHA scientific staff to determine the appropriate treatment of agents not evaluated by IARC, or for which newer data or revised interpretations suggest that an earlier IARC determination is no longer appropriate.

U.S. EPA has also proposed a scheme for carcinogen hazard identification and strength of evidence classification in their recently finalized Guidelines for Carcinogen Risk Assessment (U.S. EPA, 2005). These principally differ from the IARC guidance in recommending a more extensive narrative description rather than simply a numerical identifier for the identified level of evidence, and also to some degree in the weight accorded to various types of supporting evidence. However, for most purposes they may be regarded as broadly equivalent to the scheme used by IARC, and OEHHA has chosen to cite the IARC (2006) *Preamble* as representing the most up-to-date and generally accepted guidance on this issue.

Dose Response Assessment

The dose-response phase of a cancer risk assessment aims to characterize the relationship between an applied dose of a carcinogen and the risk of tumor appearance in a human. This is usually expressed as a cancer slope factor [“potency” – in units of reciprocal dose - usually $(\text{mg}/\text{kg}\text{-body weight}\cdot\text{day})^{-1}$ or “unit risk” – reciprocal air concentration – usually $(\mu\text{g}/\text{m}^3)^{-1}$] for the lifetime tumor risk associated with lifetime continuous exposure to the carcinogen at low doses. Cancer potency factors may also be referred to as “cancer slope factors”. (As will be described later, additional algorithms may need to be applied to determine risk for specific age groups, or at higher doses where toxicokinetic factors have significant effect.) The basic methodologies recommended in this document are similar to those described by U.S. EPA (2005a) in their Carcinogen Risk Assessment Guidelines. This document therefore refers to U.S. EPA (2005a) for explanation of detailed procedures, and will provide only a brief summary except in cases where OEHHA recommendations are different from or more explicit than those of U.S. EPA.

The following descriptions of methods for dose response assessment, and considerations in their application, apply in principle to the analysis of both animal and human (epidemiological) cancer incidence data. Indeed, the original formulation of the multistage model (Armitage and Doll, 1954) described below was developed based on human cancer incidence. Nevertheless, the

number and quality of human cancer incidence datasets is limited. The more complex analyses have usually only been possible for animal experimental data, where the interindividual variability and the exposure conditions can be both measured and controlled. Most commonly, epidemiological studies have necessarily used a form of multivariate analysis to separate the effects of several different variables relating to exposure, demographics and behaviors (e.g. smoking). In these analyses it is usually assumed that the effect measure(s) vary linearly with the exposure: any more complex variance assumptions might exceed the power of the data to determine the required model parameters. However, there are exceptions, especially for occupational studies where the critical exposure is measured as a continuous variable (rather than just categorical) and where the effect of this exposure is substantial relative to other confounding factors. For example, OEHHA (1998) used a multistage model dealing with both exposure intensity and duration in the analysis of cancer incidence in railroad workers exposure to diesel exhaust (Garshick et al., 1988)

Interspecies Extrapolation

The procedures used to extrapolate low-dose human cancer risk from epidemiological or animal carcinogenicity data are generally health-protective in that they determine an upper confidence bound on the risk experienced by an exposed population. As statistical estimates they cannot be regarded as definite predictions of the risk faced by any one specific individual, who might for a variety of reasons, including individual exposure and susceptibility, experience a risk different from the estimate. The risk assessment procedures used aim to include the majority of variability in the general human population within the confidence bound of the estimate, although the possibility that some individuals might experience either lower or even no risk, or a considerably higher risk, cannot be excluded. Additionally, differences may exist between the characteristics of the general public and those of studied populations. For example, healthy workers, the subject of most epidemiological studies, are often found to have lower rates of morbidity and mortality than the general population (Wen et al., 1983; Monson, 1986; Rothman and Greenland, 1998). Most human data are derived from studies of largely male adult workers and risk estimates cannot take into account specific physiological factors of women, children, and older populations that may affect the potency of a carcinogen, including early age-at-exposure.

Dose-response assessment based on environmental epidemiological studies may involve evaluation of health impacts at exposure levels within the range of those measured in the study population. However, more usually the source data are studies of occupationally exposed humans or of animals, in which case the exposures in the study are likely to be much higher than those of concern for risk assessments relating to community or ambient exposures. Further, even when extrapolation from animal species to humans is not required, the general population to which the URF is applied may differ in characteristics relative to the occupational population studied. It is therefore necessary to extrapolate from the available data to the population and exposure range of concern, which is done by using a dose-response model derived from the source data. The models used fall into three main classes; mechanistically based models, empirical models and (where data are lacking to support a true data-based model) default assumptions. The factors affecting the dose-response relationships for carcinogenesis may also be divided into those relating to absorption, distribution, metabolism and excretion on the one hand (*i.e.* toxicokinetics), and those relating to the underlying dose-response characteristics of carcinogenesis at the tissue or cellular level (*i.e.* toxicodynamics). In this sense the problem of

dose response assessment for carcinogens is similar to that for non-cancer toxic effects. The toxicokinetic models used may in fact be similar for both situations, but the toxicodynamic models are generally different.

Intraspecies Extrapolation and Inter-individual Variability

In estimating the impact of a particular level of exposure to a carcinogen on a target human population, it is necessary to consider the range of susceptibility in the target population. In the present case this is typically defined as the general population of the State of California, including of course women (some of whom are pregnant), infants and children, the elderly, the sick, and those with genetic polymorphisms or acquired differences which affect their susceptibility to carcinogens. In general it has been assumed that the upper-bound risk estimates obtained from the standard toxicodynamic models described below are sufficiently health-protective to cover the intrinsic variability of the adult human target population, in spite of the fact that these models do not explicitly address this type of variability, except in the few cases where an estimate is based on epidemiological data from a large and unselected study group (U.S. EPA, 2005a). However, various analyses (Drew et al., 1983; Barton et al., 2005; Appendix J) have suggested that this assumption is inadequate to cover the expected variability within a human population that includes infants and children. Accordingly both U.S. EPA (2005b) and this document (~~page 30 et seq.~~) now offer guidance on the use of age-specific adjustment factors to allow for the potentially greater sensitivity of infants and children to chemical carcinogenesis.

The ability to accommodate human variability with regard to the toxicokinetic factors affecting susceptibility to carcinogens varies with the level of detail used in the particular assessment. If the generic interspecies extrapolation approach based on body weight is used without any explicit toxicokinetic model then the assumption is made, as in the case of toxicodynamic variability, that the overall health-protective assumptions made are sufficient to cover the toxicokinetic variability. On the other hand if explicit models such as those referenced in the following paragraph are used, this variability may be more explicitly accommodated by using parameter values which are taken as point estimates from measured distributions of population values, or by using Monte Carlo techniques to include those distributions in the model (Bois et al., 1996; OEHHA, 1992; 2001b).

Toxicokinetic Models

Considerable literature exists showing the importance of understanding the toxicokinetics of carcinogens in understanding their mechanism of action, sites of impact and dose-response relationships. U.S. EPA (2005) in Section 3.1 refers to the importance of identifying an appropriate dose metric for the dose-response analysis. Early cancer risk assessments typically used applied dose as the dose metric, which is adequate in simple cases provided appropriate correction factors are applied for interspecies extrapolation. However, it is often observed that the uptake, metabolism and elimination of the carcinogenic substance (and/or a procarcinogen and metabolites) is non-linear, especially at the higher doses employed in experimental animal studies (Hoel *et al.*, 1983, Gaylor *et al.*, 1994). Extrapolation to lower doses where such relationships tend to linearity (Hattis, 1990) is aided by the use of toxicokinetic models. These may be relatively simple compartment models, or sophisticated “physiologically based pharmacokinetic (PBPK) models” which to a greater or lesser degree model the actual

biochemical and physiological events of toxicokinetic importance. Applications of both types of model may be found in various risk assessment documents prepared for the Toxic Air Contaminants program (and other OEHHA risk assessments). Since the details vary widely according to the nature of the chemical and the availability of appropriate kinetic data these general guidelines will defer to those examples rather than attempt a fuller exposition here. Further analysis of the use of toxicokinetic modeling in extrapolation from animals to humans, and in accounting for interindividual variability among adult humans, infants and children is presented in the Air Toxics Hot Spots *Technical Support Document for the Derivation of Noncancer Reference Exposure Levels* (OEHHA, ~~2007: Public Review Draft~~2008). Although this refers to the use of toxicokinetic modeling in non-cancer risk assessment, the primary considerations are similar for cancer risk assessment.

Toxicodynamic Models

An early use of mechanistic analysis to support risk assessment was the development of the Armitage-Doll multistage model of dose-response for carcinogenesis. The multistage model was initially developed on theoretical grounds, and by examination of epidemiological and animal data on time to tumor incidence. Subsequent discovery of the molecular biology of proto-oncogenes has provided a basis for explaining the model in terms of actual biological events and systems (Barrett and Wiseman, 1987). This model was developed by Crump and others into the “linearized multistage model”, which has been extensively used for carcinogen risk assessment. It leads to a number of partially verifiable predictions, including linearity of the dose-response relationship at low doses, which is observed for many genotoxic carcinogens. It also predicts the form of the dose-response relationship at higher doses, which generally follow a polynomial form (subject to sampling and background corrections) except where other identifiable factors such as pharmacokinetics intervene.

It has been argued that the simple linearized form of the multistage model has limitations as a description of carcinogenic mechanisms, which detract from its usefulness and generality. Cell proliferation is known to be important in the progression of cancer. It may actually be the primary mechanism of action for a few carcinogens, as opposed to the direct modification of DNA by the carcinogen or a metabolite which is assumed to cause the mutational event at each stage in the original multistage description. A cell proliferation model has been developed (Moolgavkar and Knudson, 1981), which retains the concept of an initiating mutational event (in most cases caused by interaction of the chemical with DNA, although it could also be a spontaneous mutation) as in the original multistage model, but also considers proliferation, death or terminal differentiation of both normal and initiated cells. This model is thought to better describe the biological events in carcinogenesis. However, it has not been used extensively in risk assessment because it requires many parameters that are difficult to define and measure (such as proliferation and death rates for various classes of cell). If these cannot be accurately determined, the model has too many free parameters and is not helpful in defining extrapolated values for risk assessment purposes. This highlights a general problem in using mechanistic models in carcinogen risk assessment, which is that the carcinogenesis data themselves are generally insufficient to define fully the dose response curve shape at low doses or provide much mechanistic information. The analysis is therefore supplemented with policy-based assumptions (such as the expectation of linearity at low doses) and, wherever possible, additional

experimental measurements relating to the mechanism of action, in order to make meaningful prediction of risk from environmental exposures to humans.

Because of the difficulties in validating simplified mechanistic models such as the basic multistage model, and the additional difficulty of parameter estimation with more complex mechanistic models, the new U.S. EPA guidelines (U.S. EPA, 2005a) and some recent California risk assessments have chosen instead to use a less overtly mechanistic approach. This approach combines benchmark dose methodology (described below) with an explicit choice of the method for low-dose extrapolation, either assuming low-dose linearity or, for certain carcinogens where data indicate that this is appropriate, a “margin of exposure” or safety/uncertainty factor based approach. This benchmark method is now normally recommended for carcinogen dose response analysis, and the results generally differ little from those derived by the linearized multistage model. Although the linearized multistage method is no longer recommended as the default approach for cancer potency estimation it remains a plausible alternative in many cases, and still has useful applications, such as for time-to-tumor analyses for which benchmark methods are not yet widely available. Additionally, a considerable number of existing cancer potencies in Appendices A and B, and used in the Air Toxics Hot Spots program were derived by this method. Many of these would not be significantly different if calculated by the benchmark approach, and are unlikely to be replaced soon by newly calculated values. The linearized multistage method will therefore also be briefly described here.

Benchmark dose methodologies

The use of benchmark dose methodology has been explored by various investigators [including Gaylor et al. (1998); van Landingham et al. (2001) and Crump (1984, 1995, 2002)] as a tool for dose response extrapolation. This has been recommended in regulatory guidelines for both carcinogenic (U.S. EPA, 2005a) and non-carcinogenic (U.S. EPA, 1995) endpoints. The basic approach is to fit an arbitrary function to the observed incidence data, and to select a “point of departure” (POD) (benchmark dose) *within the range of the observed data*. From this a low dose risk estimate or assumed safe level may be obtained by extrapolation, using an assumed function (usually linear) or by application of uncertainty factors. The critical issue here is that no assumptions are made about the nature of the underlying process in fitting the data. The assumptions about the shape of the dose response curve (linear, threshold, etc.) are explicitly confined to the second step of the estimation process, and are chosen on the basis of policy, mechanistic evidence or other supporting considerations. The benchmark chosen is a point at the low end of the observable dose-response curve. Usually a dose at which the incidence of the tumor is 10% is chosen for animal studies, although lower effect levels may be appropriate for large epidemiological data sets. Because real experimental data include variability in the response of individual subjects, and measurement errors, likelihood methodology is applied in fitting the data. A lower confidence bound (usually 95%) of the effective dose (LED₁₀), rather than its maximum likelihood estimate (MLE), is used as the point of departure. This properly reflects the uncertainty in the estimate, taking a cautious interpretation of highly variable or error-prone data. It also reflects the instability of MLE values from complex curve-fitting routines, which has been recognized as a problem also with the linearized multistage model.

For cancer dose-response estimation using the benchmark dose method, either animal bioassay data or epidemiological data provide a suitable basis. In the absence of a pharmacokinetic model

(which could provide tissue-specific dose metrics), the potency would ordinarily be based on the time-weighted average exposure during the exposure or dosing period. The model used to fit the data can be chosen from a range of available alternative quantal models, depending on which provides the best fit to the data in the observable range. In practice, the multistage polynomial fit developed for the linearized multistage model works well for most tumor data sets. Here it is being used merely as a mathematical curve-fitting tool, where the model well fits the data set, without making assumptions about its validity as a biological model of carcinogenesis.

Suitable polynomial fits and estimates of the benchmark may be obtained using U.S. EPA's BMDS software. The benchmark often used is the 95% lower confidence bound on the dose producing 10% tumor incidence. However, if data are available which include a significant dose-response at less than 10% tumor incidence, then that lower benchmark should be used (e.g. LED₀₅ or LED₀₁). Other software such as Tox_Risk, which was used for the linearized multistage model, has been used successfully, although the earlier GLOBAL program and its relatives are less suitable as curve-fitting tools for benchmark dose analysis.

Since it is usually assumed in cancer risk estimation that the low-dose response relationship is linear, risk estimates and a potency value (slope factor) may be obtained by linear extrapolation from an appropriate benchmark dose. The potency is the slope of that line ($0.1/\text{LED}_{10}$). The low dose linearity assumption is a general default for any carcinogen, and it is unlikely to be altered for genotoxic carcinogens.

A calculation using the benchmark dose approach (using a polynomial model with exponents restricted to zero or positive values), and linear extrapolation from the LED₁₀ to obtain a potency estimate is shown in Figure 1 (the figure was generated by the U.S. EPA's BMDS program). This is based on tumor incidence data from an actual experiment with vinyl bromide in rats (Benya *et al.*, 1982), with metabolized dose calculated by means of a pharmacokinetic model (Salmon *et al.*, 1992). The value of q_1^* obtained by this calculation would then be corrected for the duration of the experiment if it had lasted for less than the standard rat lifetime, and for bodyweight and route-specific pharmacokinetic factors as described below. This is in addition to the correction for exposure duration that would be necessary if the study had not lasted for 105 weeks, and the interspecies correction, both of which are described below.

Figure 1. Benchmark dose calculation for tumor data in rats exposed to vinyl bromide

Linearized Multistage Model

Quantal analyses

A "multistage" polynomial (U.S. EPA, 1986, 2005a; Anderson *et al.*, 1983), based on the mechanistic insights of the original Armitage and Doll model of cancer induction and progression, has been used extensively by U.S. EPA, OEHHA and other risk assessors to model the dose response for lifetime risk of cancer. It usually is used for analysis of animal bioassay data, although related approaches have occasionally been used with epidemiological data. In mathematical terms, the probability of dying with a tumor (P) induced by an average daily dose (d) is:

$$P(d) = 1 - \exp[-(q_0 + q_1d + q_2d^2 + \dots + q_jd^j)]$$

with constraints

$$q_i \geq 0 \text{ for all } i.$$

Equivalently,
$$A(d) = 1 - \exp [- (q_1 d + q_2 d^2 + \dots + q_k d^k)],$$
 where
$$A(d) = \frac{P(d) - P(0)}{1 - P(0)}$$
 is the extra risk over background at dose d .

The q_i model parameters are constants that can be estimated by fitting the polynomial to the data from the bioassay, *i.e.* the number of tumor bearing animals (as a fraction of the total at risk) at each dose level, including the controls. The fit is optimized using likelihood methodology, assuming that the deviations from expected values follow a χ^2 distribution, with the number of degrees of freedom (and hence the maximum number of terms allowed in the polynomial) determined by the number of points in the data set. All the coefficients of the terms are constrained to be zero or positive, so the curve is required to be straight or upward curving, with no maxima, minima or other points of inflection. In addition to the maximum likelihood estimates of the parameters, the upper 95% confidence ~~bounds-limits~~ on these parameters are calculated.

The parameter q_0 represents the background lifetime incidence of the tumor. The 95% upper confidence limit of the slope factor q_1 , ~~or more usually its upper bound~~ (q_1^*), is termed the cancer potency. The maximum likelihood estimate (MLE) of q_1 is not usually regarded as a reliable estimate for several reasons. First, it fails to reflect the uncertainty and variability in the data which affect the value of the estimate. This is an important issue for protection of public health, which is emphasized by current regulatory guidelines. Secondly, due to the variable order of the polynomial and the effect of some terms being zero as opposed to having a small but finite value, the MLE is unstable, and may show large and unpredictable changes in response to very slight changes in the input data. It may also erratically have a zero value, even when the data imply a significant positive dose-response relationship. The MLE is not a measure of central tendency for this estimate distribution (which is always asymmetrical and often multi-peaked). For small doses, the cancer potency is the ratio of excess lifetime cancer risk to the average daily dose received. Details of the estimation procedure are given in Crump (1981) and Crump, Guess, and Deal (1977). Several software programs are available to perform the necessary calculations, including U.S. EPA's BMDS, Tox_Risk and the earlier GLOBAL programs by Crump and colleagues, and Mstage, written by Crouch (1987).

When dose is expressed in units of mg/kg-d, the potency is given in units of (mg/kg-d)⁻¹. Likewise, when the model input is in units of concentration ($\mu\text{g}/\text{m}^3$, ppb), the potency is given in units of ($\mu\text{g}/\text{m}^3$)⁻¹ or (ppb)⁻¹. As in the case of potencies obtained by the benchmark approach, the experiment-based potency value needs to be corrected for less-than lifetime or intermittent exposure, and extrapolated from the test species to humans. Risk calculations using potency value estimated using the linearized multistage model predict the cancer risk at low doses only, with the higher order terms of the fitted polynomial being ignored since their contribution is negligible at low doses.

Selection of Site and Tumor Type

In developing cancer potency estimates from animal data, standard practice has been to use dose-response data for the most sensitive tumor site as the basis of the estimate (CDHS, 1985). Where tumors of more than one histological type (e.g. adenomas and carcinomas) are observed at a single site, the combined incidence, *i.e.* proportion of animals affected with at least one tumor of

any of the relevant types, is used for dose-response assessment. The same rules for combining tumor types are generally applied in determining statistical significance for carcinogen identification (IARC, 2006). Tumor types considered to represent different stages of progression following initiation of a common original normal cell type are combined, whereas tumor types having different cellular origins are generally not combined by this procedure. Other considerations that may influence choice of site for dose response estimation include the quality of the data (especially, the statistical impact of a high or variable rate of a particular tumor type and site in control animals), and biological relevance to humans. However, it is an important principle that, just as for the hazard identification phase, concordance of site or tumor type between animal models and human health effects may occur but is not assumed or required.

Carcinogens inducing tumors at multiple sites

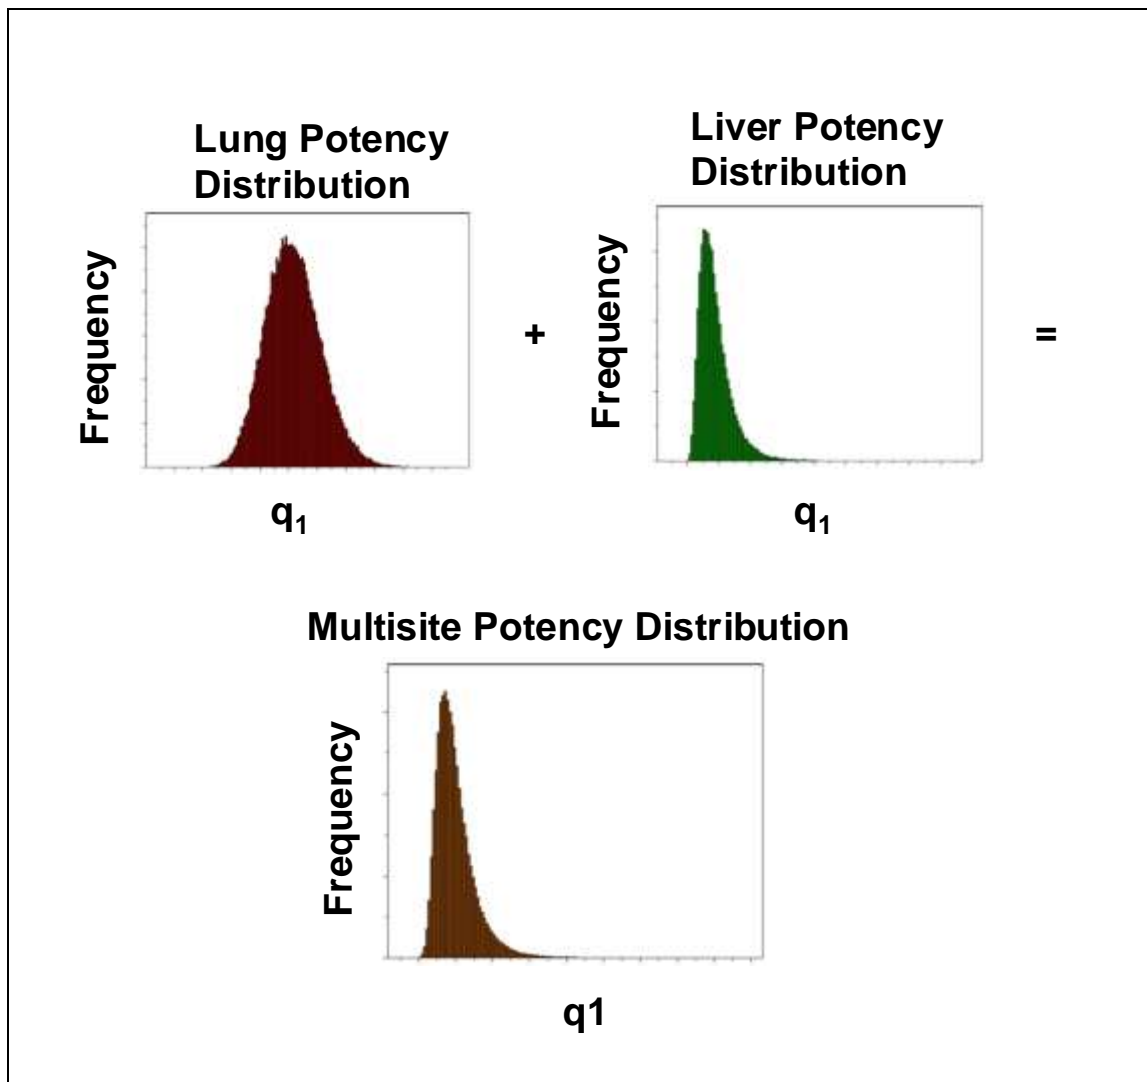

For most carcinogens, the selection of the most sensitive site in the animal studies is recognized as providing a risk estimate which is appropriate to protect human health. However, for chemicals that induce tumors at multiple sites, the single-site approach may underestimate the true carcinogenic potential. For example, the overall assessment of cancer risk from cigarette smoking (U.S. DHHS, 1982) or ionizing radiation (NRC, 1990) is not based on risk at one site, such as lung cancer. Instead, total cancer risk is estimated from all the sites at which agent-induced tumors are observed (lung, bladder, leukemia, etc), combined.

For carcinogens that induce tumors at multiple sites and/or with different cell types in a particular species and sex, OEHHA derives the animal cancer potency by probabilistically summing the potencies from the different sites and/or cell types. Using the combined potency distribution takes into account the multisite tumorigenicity and provides a basis for estimating the cumulative risk of all treatment-related tumors.

The linear term (q_1) of either the multistage model or the multistage-in-dose, Weibull-in-time model is first estimated based on the dose-response data for each of the treatment-related tumor sites. Statistical distributions, rather than point estimates, are generated at each site by tracing the profile likelihood of the linear term (q_1) (Zeise et al., 1991). The distributions of q_1 for each of the treatment-related sites are then statistically summed using a Monte Carlo approach and assuming independence (Figure 2). The sum is created by adding the linear term for each tumor site, according to its distribution, through random sampling. The upper 95 percent confidence limit on the summed distribution is taken as the multisite animal cancer potency estimate (McDonald et al., 2003, McDonald and Komulainen, 2005).

OEHHA has applied this approach in several recent dose-response analyses, including that for naphthalene presented in Appendix B of this document.

Figure 2. Addition of potency distributions for multi-site cancer potency derivations.

Early-Lifestage Cancer Potency Adjustments

In recent years, there have been growing concerns regarding the exposure of children to environmental chemicals, including the possibility that they may be more susceptible than adults to injury caused by those chemicals. The California Legislature passed the Children's Environmental Health Protection Act (Senate Bill 25, Escutia; Chapter 731, Statutes of 1999; "SB 25") to help address these concerns. Under SB25, OEHHA is mandated to consider infants and children specifically, where data permit, in evaluating the health effects of Toxic Air Contaminants (TACs).

The development of cancer is one of the adverse health effects that may occur in children as a result of exposure to environmental chemicals. The document "Prioritization of Toxic Air Contaminants under the Children's Environmental Health Protection Act" (OEHHA, 2001a) noted that risks of cancer from exposures to carcinogens occurring from conception through puberty can be different than those from exposures occurring in adulthood. Exposure to a carcinogen early in life may result in a greater lifetime risk of cancer for several reasons:

1. Cancer is a multistage process and the occurrence of the first stages in childhood increases the chance that the entire process will be completed, and a cancer produced, within an individual's lifetime.
2. Tissues undergoing rapid growth and development may be especially vulnerable to carcinogenic agents. During periods of increased cell proliferation there is rapid turnover of DNA, and more opportunity for misrepair of damage (e.g., DNA breaks, crosslinks, adducts) or alterations to result in permanent changes to the DNA (e.g., mutations, altered DNA methylation) that may ultimately lead to cancer.
3. During early development, a greater proportion of the body's cells are relatively undifferentiated stem cells, and as such represent a large target population of somatic cells capable of passing along permanent changes to the DNA during future cell divisions.
4. There may be greater sensitivity to hormonal carcinogens early in life since the development of many organ systems is under hormonal control (e.g., male and female reproductive systems, thyroid control of CNS development).
5. Other factors that may play a role in increased cancer risk from exposures during critical developmental periods include differences in immunological activity, intestinal absorption, biliary and kidney excretion, blood and fat distribution, and expression of enzyme systems that activate or detoxify carcinogens.

Data in humans and animals for a variety of carcinogens suggest that exposures to such carcinogens early in life may result in a greater lifetime risk of cancer compared to exposures later in life. Examples of this effect in humans are carcinogenicity due to ionizing radiation, diethylstilbestrol (DES), [chemotherapeutic agents](#), and [tobacco smoke](#).

Ionizing radiation exposure carries an increased risk of cancer when exposures occur early in life compared to adult exposures for a number of tumor types. Children exposed to ionizing radiation (diagnostic X-rays) *in utero* demonstrate a larger excess of leukemia cases than

children exposed to ionizing radiation postnatally (NRC, 1990). Exposure to radioisotopes (^{131}I , ^{137}Cs , ^{134}Cs , ^{90}Sr) as a consequence of the 1986 Chernobyl nuclear accident resulted in an elevated thyroid cancer incidence in children but not adults (Moysich, 2002). Treatment of children for Hodgkins lymphoma with both chemotherapeutic agents and irradiation has been shown to increase the risk of secondary tumors (Swerdlow et al., 2000; Franklin et al., 2006).

Age at irradiation in Hodgkin's disease patients treated with radiotherapy strongly influenced the risk of developing breast cancer. The relative risk (RR) of developing breast cancer was 136 for women treated before 15 years of age, 19 for women 15-24 years of age, and 7 for those 24-29 years of age. In women above 30 years of age, the risk was not increased (Hancock *et al.*, 1993).

DES was administered to pregnant women in the 1940s-1960s for the purpose of preventing pregnancy loss. In 1970, Herbst and Scully described 7 cases of vaginal adenocarcinoma (6 cases of the clear-cell type) in women aged 15-22 years. This type of cancer is extremely rare in that age range. A follow-up epidemiological study included an additional case, and noted the fact that the mothers of 7 of the 8 patients had been treated with DES during their pregnancy (Herbst *et al.*, 1971). Reports by other investigators confirmed the association between maternal use of DES during pregnancy and the development of vaginal adenocarcinoma in their female offspring (Preston-Martin, 1989). It was observed that *in utero* DES exposure resulted in female genital tract morphological changes which correlated with both dose and duration of exposure, and those changes were not related to the maternal conditions which were the reason for the DES administration. Additionally, the risk of occurrence of those morphological changes declined with increasing gestational age at first exposure (O'Brien *et al.*, 1979; Preston-Martin, 1989). In contrast, vaginal adenocarcinoma incidence did not increase in the exposed mothers themselves, indicating an increased early-life susceptibility to the carcinogenic effects of DES.

There is evidence in the epidemiological literature indicating that exposure to tobacco smoke during puberty may increase risk of breast cancer later in life, particularly among women who are NAT2 slow deacetylators (Marcus *et al.*, 2000; Morabia *et al.*, 2000; Lash and Aschengrau, 1999). Wiencke et al. (1999) report that early age at initiation of smoking is associated with a higher level of DNA adducts in lung tissue of former-smokers with lung cancer.

It has also been observed by Smith *et al.* (2006) that human *in utero* or early childhood exposure to arsenic in drinking water results in significantly increased lung cancer incidences during adult life.

Data from animal studies provide additional examples of increased sensitivity to early life (typically postnatal and juvenile) exposures. These effects span a range of target tissues, including the liver (vinyl chloride, safrole), brain (methylnitrosourea), reproductive tract (DES, tamoxifen), and lung (urethane) (OEHHA, 2001a).

In the following sections we summarize two efforts to evaluate quantitatively the effect of lifestage at exposure on carcinogenic response in experimental animal studies. The first section provides a description of OEHHA's analysis of data on the effect of age at exposure on carcinogenic potency. (Details of this analysis are in Appendix J.) The second section describes U.S. EPA's work in this area. (We also provide the published paper in Appendix I that presents the U.S. EPA analyses.) Both analyses used extant data available in the published literature. U.S. EPA used their analysis to modify the procedures they have used to estimate cancer risk by

weighting risk by specific factors for childhood exposures. The weighting factors are a policy choice supported by U.S. EPA's data analysis. The results of OEHHA's analysis, summarized below and described in detail in Appendix J, support the decision to modify policy to weight risk when exposure occurs during childhood. Thus, OEHHA is also proposing to weight risk when exposure occurs in childhood.

OEHHA Analysis of the Effect of Age at Exposure on Cancer Potency

The analysis of animal cancer studies which include early life exposure by the Reproductive and Cancer Hazard Assessment Branch (RCHAB) of OEHHA also supports the application of lifestage-specific cancer potency factor adjustments. This analysis is provided in detail as Appendix J of this document.

Early-in-life susceptibility to carcinogens has long been recognized by the scientific community and clinicians as a public health concern. Numerous scientific publications and symposia have addressed this issue over the years and the scientific literature contains a number of human clinical findings and epidemiological studies of early life cancer susceptibility. While there are many indications of increased human cancer susceptibility in early life, the magnitude of the impact has been difficult to gauge. Until recently risk assessment procedures have not in general addressed the issue. As described in the next section, in 2005 the U.S. EPA adopted an approach to weight carcinogens by age at exposure if they act via a mutagenic mode of action. The California legislature in 2000 directed OEHHA to assess methodologies used in addressing early-in-life risk, compile animal data to evaluate those methods, and develop methods to adequately address carcinogenic exposures to the fetus, infants, and children (Children's Environmental Health Initiative [AB 2872, Shelly]; California Health and Safety Code [HSC] section 901 [a] through [e]).

OEHHA assessed cancer risk assessment methodologies, and found that the existing risk assessment approaches did not adequately address the possibility that risk from early-in-life and adult exposures may differ. OEHHA further concluded that there was a need to address early-in-life cancer risk, and undertook studies to develop methods for doing so. Age-related cancer susceptibility data were identified from published animal cancer bioassays in which these issues were addressed. Two types of studies with early-in-life exposures were compiled. The first type are "multi-lifestage exposure studies." These studies have at least two groups exposed during different lifestages: One dose group is exposed to a chemical only during one of the following lifestages (Figure 3):

- prenatal (from conception to birth),
- postnatal (from birth to weaning),
- juvenile (from weaning to sexual maturity).

The second dose group is exposed for some period of time at an older age, preferably during the adult lifestage, that is, after sexual maturity. This group served as the reference group. In some cases where there was no adult exposure group, animals exposed as juveniles served as the reference group. Multi-lifestage exposure studies are available for many chemicals, enabling the exploration of patterns in early-life susceptibility across chemicals.

Figure 3. Definition of Rodent Lifestage Adopted in the OEHHA Analyses

OEHHA also conducted “chemical-specific case studies” of early-life sensitivity for two carcinogens, ethyl-N-nitrosoamine (DEN) and N-ethyl-N-nitrosourea (ENU) that combine data from a number of studies. These “chemical-specific case studies” were conducted to explore the feasibility of analyzing chemical-specific data on age susceptibility from single-lifestage exposure experiments. For these chemicals, OEHHA compiled from the literature a second type of study, “single-lifestage exposure experiments.” In these experiments dose groups were exposed only during a particular lifestage and, unlike the “multi-lifestage exposure studies,” there was no requirement that the same study also include groups exposed during a different lifestage. Thus, single-lifestage exposure experiments were identified as being either prenatal, postnatal, juvenile, or adult exposure studies. For each of the two chemicals, there were many prenatal studies conducted that were compiled, analyzed, and grouped together. Postnatal studies from different publications were similarly compiled, analyzed and grouped together, as were juvenile studies. Adult studies were not available for either DEN or ENU, thus for both chemicals juvenile exposure studies served as the referent for prenatal studies, and for postnatal studies.

Typical cancer bioassays such as those conducted in rats and mice by NTP involve exposing animals starting at six to eight weeks of age, which is the time at which these animals reach sexual maturity (late teenagers relative to humans). The experiments are run for two years, ending when the animal is in late middle age. Thus, early and very late life exposures are not included in the typical rodent bioassay (see Figure 4). If the NTP bioassay is used as a basis for estimating cancer potency, the potency and resulting risk estimates may be too low. Thus OEHHA focused on finding studies that evaluated early in life exposures.

Figure 4. Dosing Period for Typical Rodent Bioassays.

Since bioassays examining the effect of age at exposure on carcinogenesis were conducted by various investigators for different purposes, there is a great deal of variation across studies in terms of dose selection, duration of exposure, number of animals, and length of study duration. To be included in the compilation of studies with early life exposure, a study or an experimental group in a study had to meet minimum requirements.

The criteria for study inclusion are as follows:

- Treated groups were exposed to a single chemical carcinogen or a single carcinogenic chemical mixture.
- Study groups were not compromised by severe treatment-related non-cancer toxicity.
- Overall the duration of exposure period plus observation period exceeded 40 weeks, unless animals died of tumor.
- For included dose groups, the study must report age at dosing, age at sacrifice, and site-specific tumor incidence.
- Each lifestage exposure treatment group has an appropriate concurrent control group, or, for rare tumors only, an appropriate historical control.
- The studies were on mammals.
- Each treatment and control group consists of at least ten animals, unless the conduct and design of the study was well done in all other aspects (e.g., the length of the study was sufficiently long to observe treatment-related tumors) and tumor incidence was high in treated groups and very low in controls.
- Site specific tumor data were reported, not only total number of tumor bearing animals.
- The test compound was administered in the diet, water, via gavage, or by intraperitoneal (i.p.), intravenous (i.v.), or subcutaneous (s.c.) injection. For dermal and subcutaneous injection studies, distal tumor findings are utilized (for dermal, other than skin tumors; for injection, non-injection site tumors).

- While studies designed to histopathologically examine tumors at multiple sites were preferred, studies that examined only a select set of organ/tissue sites were not excluded if the sites examined were known with confidence to be the only target tissues for the chemical and lifestage in question in that particular strain of animal.

Different approaches were taken to identify animal cancer studies that included groups of animals exposed during early life stages. First, MEDLINE and TOXLINE (National Library of Medicine) databases were searched using combinations of various key words for cancer (e.g., tumor(s), neoplasm(s), cancer, neoplasia, cancerous, neoplasms-chemically induced) and for early-life exposure (e.g., age, age-at-exposure, development (al), prenatal, *in utero*, gestation (al), postnatal, neonatal, juvenile, weaning, weanling, adolescent, adolescence, young). Second, the extensive compilation of bioassays in the *Survey of Compounds which have been Tested for Carcinogenic Activity*, was reviewed. This survey, formerly maintained by the National Cancer Institute as Public Health Service Publication Number 149, or PHS 149, is now available from a private source electronically as CancerChem, 2000. Third, from bibliographies from relevant published papers additional studies were identified. Finally the Single Dose Database developed by Calabrese and Blain (1999) was obtained and utilized to identify additional publications that appeared to contain potentially useful data. All of these publications were evaluated to determine if the study dosed separate groups of animals early in life and at or near adulthood. A total of 145 publications, providing data on 84 chemicals, were identified as meeting the criteria for study inclusion. A subset of these met the criteria for inclusion in the multi-lifestage exposure analysis.

Finally, for the OEHHA multi-lifestage analyses, we define “experiment” as a study component consisting of a control group as well as a treated group(s) exposed during the same lifestage (i.e., prenatal, postnatal, juvenile or adult), and using the same experimental protocol (e.g., route of exposure, strain, species, laboratory). Thus, by our definition one publication may report multiple experiments.

In the OEHHA analysis, data from studies on 23 unique carcinogens, 20 of which are considered to act via primarily genotoxic modes of action, were analyzed. Of these 20 carcinogens, 15 are thought to require metabolic activation to the ultimate carcinogenic species ([Table 1](#)[Table 1](#)[Table 4](#)). Fourteen carcinogens, including one thought to act via primarily nongenotoxic modes of action, were included in the prenatal multi-lifestage exposure studies. Eighteen carcinogens, including two thought to act via primarily nongenotoxic modes of action, were included in the postnatal multi-lifestage exposure studies. Five carcinogens were included in the juvenile multi-lifestage exposure studies. The case study chemicals, DEN and ENU, are both genotoxic. ENU is a direct acting alkylating agent, while DEN requires metabolic activation.

Table 1. Carcinogens for which studies with multi-lifestage exposures in animal studies are available**Genotoxic carcinogens requiring metabolic activation**

Benzidine
 Benzo[a]pyrene
 Dibutylnitrosamine
 Diethylnitrosamine (DEN)
 7,12-Dimethylbenz[a]anthracene (DMBA)
 Dimethylnitrosamine (DMN)
 Di-n-propylnitrosamine (DPN)
 1-Ethyl-nitrosobiuret
 2-Hydroxypropylnitrosamine
 3-Hydroxyxanthine
 3-Methylcholanthrene (3-MC)
 4-(Methylnitrosamino)-1-(3-pyridyl)-1-butanone (NNK)
 Safrole
 Urethane
 Vinyl chloride

Genotoxic carcinogens not requiring metabolic activation

Butylnitrosourea
 1,2-Dimethylhydrazine
 Ethylnitrosourea (ENU)
 Methylnitrosourea (MNU)
 β -Propiolactone

Nongenotoxic carcinogens

1,1-Bis(p-chlorophenol)-2,2,2-trichloroethane (DDT)
 Diethylstilbestrol (DES)
 2,3,7,8-Tetrachlorodibenzodioxin (TCDD)

Cancer Potency Estimation

Statistical methods were developed and used to analyze the data and derive measures of early-life susceptibility. These are described in detail in Appendix J. In brief, a cancer potency (the slope of the dose response curve) was developed for each of the experiments selected using the linearized multistage model. This model was chosen because of widespread use in risk assessment, and its flexibility in being able to fit many different data sets needed to evaluate the effect of lifestage-at-exposure on cancer potency. The dose metric used for the potency analyses is cumulative dose normalized to body weight. The cancer potency is thus expressed as the increase in tumor probability with increasing cumulative dose in units of mg/kg body weight.

To take into account uncertainty in potency estimation, cancer potencies are depicted by a statistical distribution, rather than by a single, fixed value, using methods described in Appendix J. While these methods have typically been used to obtain and report the 95th percentile of the cancer slope parameter for cancer risk assessment purposes, here OEHHA utilized the full distribution of the cancer slope parameter to derive measures of early-life susceptibility to carcinogens. This was done to systematically take into account uncertainty in the analysis.

For experiments where treatment related tumors were observed at multiple sites or at the same site but arising from different cell types, slopes from these sites were statistically combined by summing across the potency distributions (assuming independence across the sites that were observed) to create an overall multisite cancer potency. It is not uncommon that a carcinogen causes more than one type of cancer or causes tumors at different sites depending on lifestage at exposure. For example, in humans tobacco smoke causes cancers of the lung, bladder, and certain other organs. This multi-site carcinogenicity is frequently observed in animal experiments as well. In order to account for this, all treatment-related tumors that were observed in a given lifestage were taken into account in estimating cancer potency from that particular experiment.

Addressing Early-Age Sensitivity in Estimating Cancer Risk: Age Sensitivity Factors

Inherent Sensitivity of Lifestages – Lifestage Potency Ratios

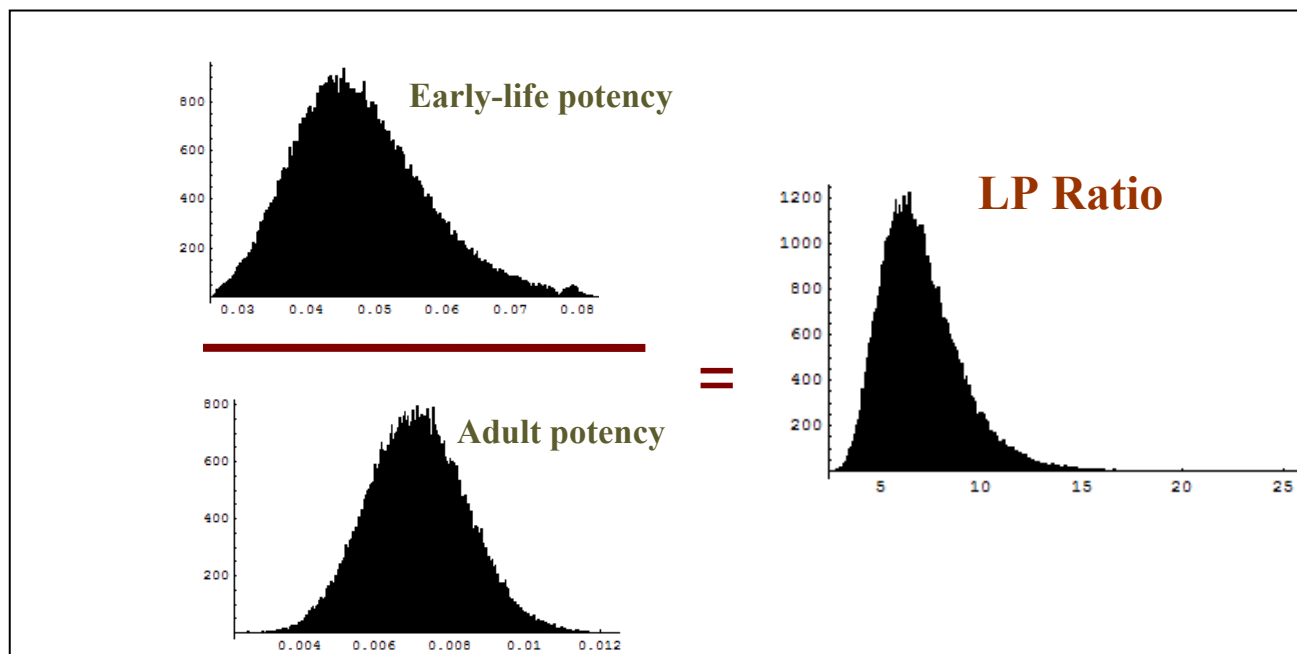

For this analysis, OEHHA calculates the ratio of cancer potency derived from an early lifestage exposure experiment(s) to that derived from an experiment(s) conducted in adult animals. OEHHA used the potency distributions for the individual lifestage exposures, rather than a point estimate, to derive the ratios. The lifestage cancer potency ratio is then described as a distribution and one can select specific percentiles from the distribution to better understand and bound the uncertainty (Figure 5). Of particular importance is the location of the ratio distribution in relation to the reference value of 1.0, which would mean no difference in risk from exposures at early versus adult lifestages. A lifestage cancer potency ratio distribution that primarily lies above the value of 1.0 indicates early life exposures to a carcinogen result in a stronger tumor response relative to adult exposure. Conversely, a lifestage cancer potency ratio distribution that mainly lies below the value of 1.0 indicates early life exposure to a carcinogen results in a weaker tumor response relative to adult exposure.

A lifestage potency (LP) ratio distribution was derived for each multi-lifestage study, resulting in 22 prenatal ratio distributions representing 14 unique carcinogens, 55 postnatal LP ratio distributions representing 18 unique carcinogens, and seven juvenile LP ratio distributions representing five unique carcinogens. The LP ratio distributions for a given early lifestage were combined into a single “LP ratio mixture distribution,” in order to show the range of susceptibilities of that lifestage to the carcinogens studied.

LP ratio mixture distributions for a given early lifestage were developed by (1) obtaining a single LP ratio distribution for each chemical (when a chemical is represented by more than one study) and then (2) equally sampling across all chemicals. When a chemical is represented by more than one study, then the LP ratio distributions from all studies of that chemical were combined by equally sampling from each LP ratio distribution via Monte Carlo methods to obtain a single

LP ratio distribution for that chemical. (Appendix J describes this in more detail, as well as a sensitivity analysis that included two alternative sampling methods.) Once each chemical is represented by a single LP ratio distribution, then the LP ratio mixture distribution for each early lifestage (prenatal, postnatal, and juvenile) is obtained by equally sampling across all of the chemicals via Monte Carlo methods.

Figure 5. Lifestage Potency Ratio (LPR) distribution.

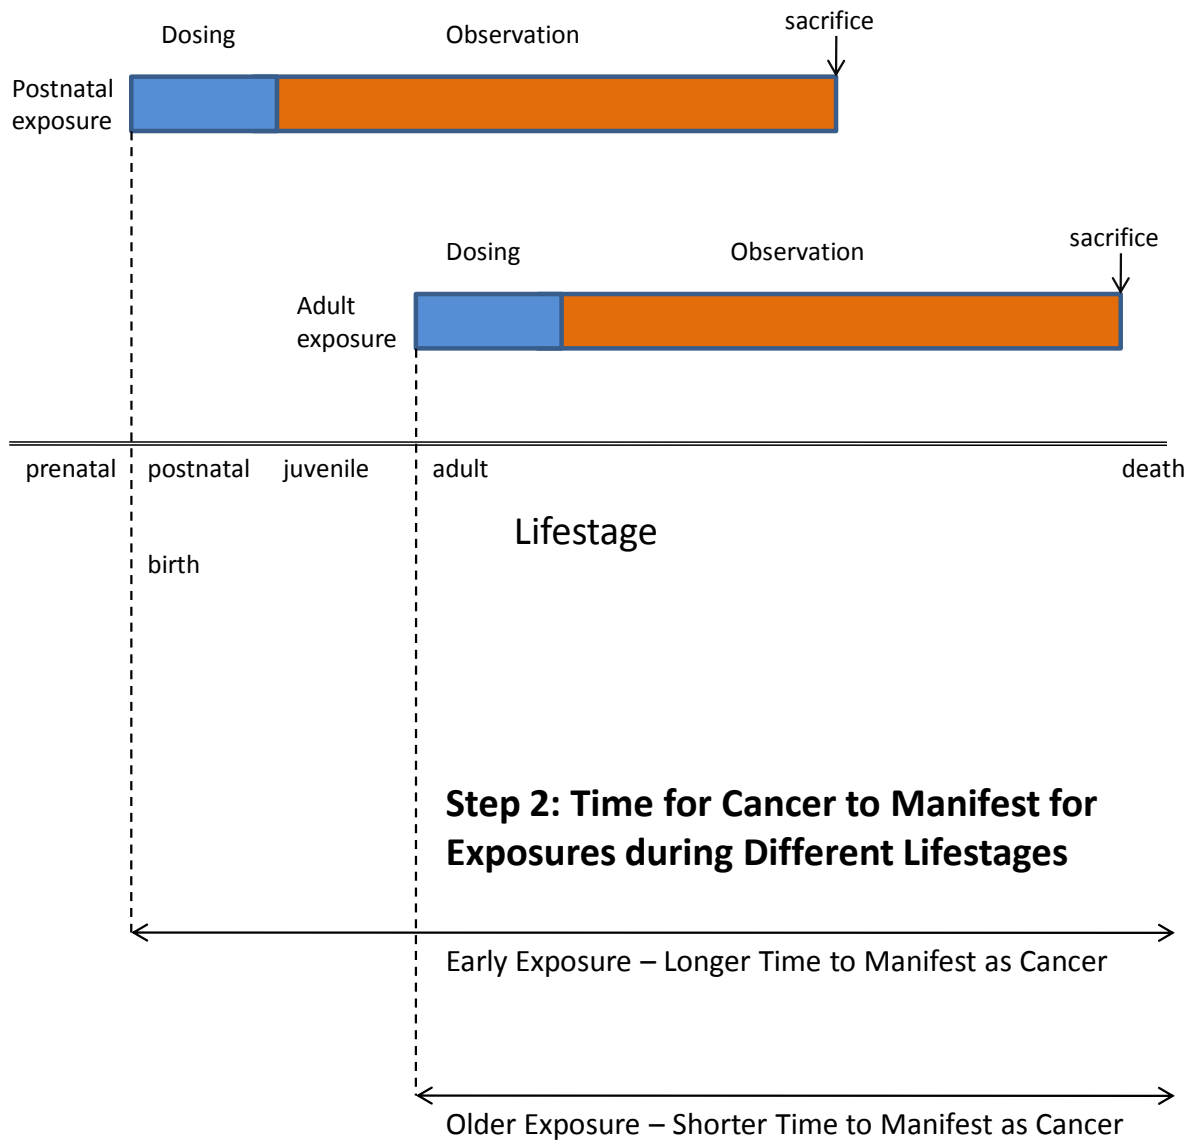

Effect of longer time period for cancer to manifest

The LP ratios described above characterize the inherent susceptibility of early lifestages to carcinogen exposure, by comparing potencies for individuals followed for similar periods of time and similarly exposed, but exposed during different lifestages. Age-specific adjustments to the cancer potency must also take into account the longer period of time that carcinogen exposure to the young has to manifest as cancer. Empirical data from studies of both humans and animals demonstrate that, for many cancers, cancer risk increases with age, or time since first exposure. While some cancers have been seen to increase by as much as the sixth power of age, a general approach taken for example by the National Toxicology Program in analyzing tumor incidences in its chronic bioassays is to assume that cancer risk increases by the third power of age. Thus, consistent with the approach used by the NTP in analyzing rodent cancer bioassay data, the longer period of time that exposed young have to develop tumors is addressed by taking into account time-of-dosing. This was done by multiplying the LP ratio by a time-of-dosing factor, to yield an age sensitivity factor (ASF). Specifically, the prenatal LP ratio is multiplied by a factor of 3.0, the postnatal LP ratio is multiplied by a factor of 2.9, and the juvenile LP ratio is multiplied by 2.7. Thus, ASFs were developed for each experiment, by first calculating the LP ratio to address inherent susceptibility of early lifestages relative to adults, and then accounting for the effect of years available to manifest a tumor following carcinogen exposure. (see Figure

6) Note that we are not using the term “sensitivity” in the immunologic sense (e.g., sensitization), but rather are using the term more generically.

Figure 6. Issues addressed by the Age-Sensitivity Factor (ASF)

Step 1: Inherent Susceptibility of Different Lifestages

Application of this approach for risk associated with lifetime exposures would include an ASF of less than 1 for exposures during the latter part of adult life for carcinogens that act on early stages. Therefore, the addition of this adjustment to the younger lifestages but not to the later part of the adult period could overestimate the risk of whole-life exposures. On the other hand, the 70 year “lifetime” used in estimating lifetime cancer risk does not reflect the longer lifespan of the U.S. population. Further, as noted above, the animal bioassays on which potency was based typically exclude pre-weaning dosing and sacrifice animals during their late middle-age. Use of cancer potencies calculated from standard assays can therefore understate lifetime cancer risk. The ASF calculated for carcinogens includes both inherent sensitivity of developing animals and the available time since exposure to develop cancer.

Results of OEHHA Analysis

The analyses indicate that both the prenatal and postnatal lifestages can be, but are not always, much more susceptible to developing cancer than the adult lifestage. The analyses also indicated that the ASFs for these age windows vary by chemical, gender and species.

Regarding prenatal lifestage exposure, few cases were indicative of equal inherent adult and prenatal susceptibility, with an LP ratio of unity. The LP ratio distribution was roughly bimodal, with LP ratios for several studies significantly greater than unity and several others significantly less than unity. Figure 7 below shows the ASFs from each of the prenatal multi-lifestage exposure studies, displayed as a cumulative frequency profile. The median of the prenatal ASF mixture distribution was 2.9 (see also Table 6 in Appendix J),

The modality in the prenatal LP ratio distribution was reflected in the DEN and ENU case studies, with results for DEN suggesting inherently less sensitivity than older animals from exposure *in utero*, and for ENU just the opposite. For the DEN and ENU case studies, the referent groups were juvenile rather than adult animals, and the results may have underestimated the LP ratio and ASF, to the extent that some of the apparent sensitivity for DEN and ENU in the prenatal period carries through to the juvenile period. ENU is a direct acting carcinogen that does not require metabolic activation, whereas DEN can not be metabolized to any significant extent by fetal tissues until relatively late in gestation. This may explain the lower fetal susceptibility of DEN. However, prenatal metabolic status is not the sole determinant of prenatal susceptibility; e.g., benzidine and safrole require metabolic activation and exhibit greater susceptibility from prenatal exposure.

The median of the postnatal ASF mixture distribution was 13.5 (see Table 7 in Appendix J). Figure 8 below shows the ASFs from each of the postnatal multi-lifestage exposure studies, displayed as a cumulative frequency profile. Thus, for the chemicals studied, there was generally greater susceptibility to carcinogens during the early postnatal compared to the adult period, particularly when the ASF accounts for the longer period cancer has to manifest when exposure occurs early in life. The DEN and ENU case studies also exhibited substantial extra susceptibility during the postnatal period. To summarize, for most of the carcinogens studied here, animals are inherently more sensitive in the postnatal period, as indicated by Figure 8.

Figure 7. Prenatal ASF Cumulative Frequency Profile

The median of the prenatal ASF mixture distribution was 2.9 (see also Table 6 in Appendix J). References are given in the legend on the next page

There were only five chemicals and seven studies, two of which were not independent, available to examine susceptibility in the juvenile period. The juvenile LP ratios indicated significantly greater susceptibility in this period for three independent studies, with the remaining studies consistent with equal inherent susceptibility to adult animals (see Figure 16 in Appendix J).

~~Figure 9~~ ~~Figure 9~~ ~~Figure 9~~ below shows the ASFs from each of the juvenile multi-lifestage exposure studies, displayed as a cumulative frequency profile. The median of the juvenile ASF mixture distribution was 4.5 (see Table 8 in Appendix J).

Figure 9. Juvenile ASF Cumulative Frequency Profile

The median of the juvenile ASF mixture distribution is 4.5. The dotted line represents the default value for weighting risk from carcinogen when exposures occur between 2 and 15 years of age (see next section).

The studies that comprise the set of multi-lifestage exposure studies available for these analyses were not homogeneous. That is, they do not represent observations from the same distribution. Sensitivity analyses were conducted to test the robustness of the findings to different procedures for analyzing data and combining results. Of the methods used to combine the LC ratio distributions for underlying studies within each lifestage, the method of equally weighting studies within a chemical appeared to best represent the available data.

In calculating the ASF, to take into account the longer period of time for early carcinogen exposures to result in tumors, the hazard function was assumed to increase with the third power of age. This assumption is standard and has been borne out by a number of observations (Bailer and Portier, 1988). If the true rate of increase with age is greater than that, then the use of these ASFs may result in underestimates of the true sensitivity of these early life stages.

As the multi-lifestage exposure and case studies show, there appears to be considerable variability in age-at-exposure related susceptibility across carcinogens. There is also variability in age-at-exposure related susceptibility among studies of the same carcinogen. The sources of variability evident in the analyzed studies include timing of exposure within a given age window, and gender, strain, and species differences in tumor response. The set of studies identified and analyzed was not sufficiently robust to fully describe the variability quantitatively. This variability raises concerns that selection of the median (the 50th percentile) estimates may considerably underestimate effects for certain agents or population groups. Relatively large variability in humans in response to carcinogens is expected to be common (Finkel, 1995). On the other hand, the numbers of carcinogens represented in the available data are limited and may not be representative of the population of carcinogens to which we are exposed (e.g., greater than 500 on the Proposition 65 list alone). Thus, the size of the weighting factors used to weight risk by age at exposure is a policy decision.

Several of the carcinogens studied induced tumors at multiple sites in the same experiment, and at different sites, depending upon the lifestage during which exposure occurred. For these cases the combined multisite potency distribution referred to above was the basis for the lifestage comparison. This approach differs from other researchers investigating early vs. late in life differences who focused on tumor site-specific measures of carcinogenic activity (e.g., Barton *et al.*, 2005; Hattis *et al.*, 2004, 2005). OEHHA believes that use of combined multisite potency distributions provides a more complete approach for considering age specific differences in carcinogenic activity. However, the observation that early life is generally a period of increased susceptibility was similarly found using the tumor site-specific approach by these other researchers.

One limitation of the approach was the focus on lifestages, without attempting to describe changes in susceptibility that occur within a lifestage. Timing of carcinogen exposure within a given age window can affect the cancer outcome. For example, experiments with 1-ethyl-1-nitroso-biuret in prenatal and adult rats showed a three-fold difference in activity between groups exposed on prenatal day -10 versus prenatal day -3. In a second example, female rats exposed early in the adult period were more than three times as sensitive to the breast cancer effects of MNU as females exposed six weeks later. In general, the adult comparison groups in the multi-lifestage exposure studies were fairly young. The extent to which this may result in an overall bias of the results presented here is unclear. Also for several cases, juvenile animals were used as the later life exposure group. In these cases the ASFs are likely underestimates of the relative sensitivity of the prenatal and postnatal lifestages, compared to that of the adult lifestage.

Excluded from the analysis were early in life studies in which the period of exposure for a specific exposure group crossed multiple lifestages. An example of results from studies of this type is provided by mouse studies for two non-genotoxic carcinogens, diphenylhydantoin (Chhabra *et al.*, 1993a) and polybrominated biphenyls (PBBs) (Chhabra *et al.*, 1993b), in which exposures began prior to conception, and continued throughout the prenatal, postnatal, and post-weaning period, up to the age of eight weeks. The data demonstrate an increased sensitivity of the early life period. Some studies that crossed multiple lifestages were included in the analyses of Barton *et al.* (2005) (Appendix I), which are consistent with the general conclusions discussed above.

Selection of Default Age-Sensitivity Factors (ASF)

Selection of appropriate values to use to weight exposures that occur early in life using default ASFs for prenatal, postnatal and juvenile exposures is complicated by the limited database of chemicals and studies available for analysis, and the broad distribution of results for different chemicals as is shown in Figure 7, Figure 8, and ~~Figure 9~~Figure 9 (see also Appendix J). In view of the variability thus shown, and the considerable uncertainty in applying conclusions from this relatively small set of chemicals to the much larger number of chemicals of concern, it is probably unreasonable to specify a default ASF with greater than half-log precision (*i.e.* values of 1, 3, 10, 30 etc.). Therefore, in the absence of chemical-specific data, OEHHA ~~will propose~~ to apply a default ASF of 10 for ages birth to 2 years, and a factor of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood. A factor of 10 for postnatal exposures falls just below the median estimate of the ASF for postnatal studies. This is also the value selected by U.S. EPA; while it is consistent with the OEHHA analysis, it may underestimate risk for some chemicals. The broad distribution of observed chemical-specific sensitivity ratios clearly indicates ~~certain number of~~ that there are some chemicals for which the sensitivity ratio is much larger than 10. Further research is needed to develop criteria for identifying these cases. Similarly, a factor of 3 for juvenile exposures is consistent with the range of estimates derived from the multi-lifestage exposure studies, and falls close to the median juvenile ASF estimate. It is acknowledged that there are few data available on which to base an estimate for the juvenile period. A factor of 3 adjusts for the longer time available for cancer to manifest, but may not fully account for some inherent differences in susceptibility to cancer, for example ~~those observed~~ the observed susceptibility of ~~in~~ breast tissue of pubescent girls exposed to radiation. For specific carcinogens where data indicate enhanced sensitivity during lifestages other than the immediate postnatal and juvenile periods, or demonstrate ASFs

different from the default ASFs, the chemical-specific data should be used in order to adequately protect public health.

The ASFs will be applied to all carcinogens, regardless of the theorized mode of action. While U.S. EPA currently intends to apply weighting factors only to those carcinogens with “a mutagenic mode of action” (U.S.EPA, 2005), OEHHA notes that there is evidence that early life is a susceptible time for carcinogens that are thought to act via non-mutagenic mode of action (DES is a prime example). Defining a mutagenic mode of action may be problematic if approached narrowly (ERG, 2008). Further, carcinogens may have multiple modes of action and one mode may predominant over other modes at different lifestages. The complexity of carcinogenesis argues against restricting the ASF to chemicals acting via a mutagenic mode of action.

~~Figure 10~~~~Figure 10~~~~Figure 10~~ provides a visual comparison of the ASF mixture distributions for the three early-life stages, prenatal, postnatal, and juvenile. In this figure, which is in log space, the policy choice for weighting factors of 10 for birth to age 2 years and 3 for the period of life from 2 to 15 years of age are indicated on the figure. ~~The x-axis represents the exponent (the figure is in log space).~~ It is apparent from this figure that weighting risk from exposures to carcinogens early in life is well-supported.

Figure 10. Prenatal, Postnatal, and Juvenile ASF Mixture Distributions and relation to default ASFs

OEHHA recognizes the limitations in the data and analyses presented, as discussed above. However, the analyses do provide some guidance on the extent risk may be over or underestimated by current approaches. While there is a great deal of variability across chemicals in the prenatal ASFs, the data indicate that the potency associated with prenatal carcinogen exposure is not zero. A factor of 3 is close to the median ASF, while a factor of 10 falls roughly at the 70th percentile of the prenatal ASF estimate. ~~This value~~An ASF could be applied as a default ~~ASF to the potency estimate~~ when calculating lifetime cancer risk in humans arising from carcinogen exposures that occur *in utero*. In view of the considerable variability in the data for different carcinogens and the limited database available for analysis, OEHHA is not ~~including~~ proposing the application of ~~this a specific~~ factor to cancer potency estimates for prenatal exposures as a default position in these Guidelines. However, given that the rodent is born at a stage of maturation similar to a third trimester fetus, it may be reasonable to include the third trimester in the potency weighting proposed for birth to age 2 years. ~~T~~the applicability of a cancer potency adjustment factor for prenatal exposure will be evaluated on a case-by-case basis, and may be used as evidence develops that supports such use. The consideration of prenatal exposures, including application of an appropriate susceptibility factor, would not make a large difference for risk estimates based on continuous lifetime exposures, due to the relatively short duration of gestation. However, risk estimates for short-term or intermittent exposures ~~might~~ would be ~~significantly-slightly~~ increased by inclusion of the risks to the fetus during the prenatal period. Thus, risk may be underestimated when this lifestage is excluded from the analysis.

Age Bins for Application of ASFs

~~The choice of human ages to which the ASFs apply is based on toxicodynamic information on functional maturation of major organ systems and toxicokinetic considerations. Important toxicodynamic factors related to susceptibility to carcinogens include and the concept that the rate of cellular proliferation and differentiation, which is quite high during organ maturation processes renders the tissue more susceptible to carcinogenesis. In addition, toxicokinetic differences by age are important, as noted earlier, due to impacts on detoxification and clearance of xenobiotics carcinogens (see following section). OEHHA's analysis of the influence of age-at-exposure on carcinogenesis broke the experimental rodent age bins data into age bins that we termed "lifestages" into including prenatal, "postnatal" (birth to weaning, about day 21) and "juvenile" (weaning to sexual maturation, or about day 22 to about day 49). Experiments were placed into the lifestage bins if exposure occurred at some time during the experimental rodent age bin. The investigations of age at exposure and cancer potency used in OEHHA's analysis were all done with dissimilar protocols, and the windows of susceptibility are quite varied by chemical and organ system.~~

~~There is no simple way to compare the rodent age groups used in the OEHHA analysis of available data to equivalent age groups in humans. Complicating factors include variations in organ system structural and functional maturation both within and between species. Further, the rodent age bins were chosen by gross indicators of development namely birth, weaning and sexual maturation, not on the basis of known susceptibility to carcinogenesis. Thus, critical factors relating to carcinogen susceptibility by age are the focus of the choice of human age bins to which the ASFs of 10 and 3 apply, rather than an attempt at exact correlation of rodent lifestage bin with human age.~~

The investigations of age at exposure and cancer potency used in OEHHA's analysis were not conducted by standardized protocol. Further, the windows of susceptibility are quite varied by chemical and organ system, even within the lifestages defined in the OEHHA analysis. Additional complications in This complicates choosing a default ASF and the human age bin to which it applies are associated with changes in the potency by age at exposure that can be large for specific chemicals. Examples from animal studies provided in the appendix include the chemical diethylnitrosamine (DEN). The cancer potency varied over several orders of magnitude depending on when during gestation and postnatal life the exposure occurred. While the inability to metabolize DEN in early gestation influences the carcinogenicity of the compound, it is unlikely the only explanation. Benzidine and saffrole also require metabolic activation but are more potent with prenatal exposure. A three-fold difference in potency between exposure on postnatal day 3 and postnatal day 10 is noted for 1-ethyl-1-nitrosobiuret in rats. There are also human examples of extensive variation of potency by age at exposure, including radiation, DES, and chemotherapeutic agents. The diversity of responses to different agents obviously underscores uncertainty in the choice of age bins to apply the default ASFs. However, the ASFs are a *default* to use when you have no chemical-specific data on influence of age-at-exposure on potency in order to protect public health. There will always be specific chemical examples where the ASF for either the birth-<2 yrs or 2-<16 yrs age bin is quite a bit larger or quite a bit smaller than the default.

In the following sections, we discuss our logic in choosingproposing age bins of birth to age <2 years, and 2 to age <16 years to which the ASFs of 10 and 3 apply, respectively, and offer risk estimate results from other possible age bins.

Toxicokinetic Factors Relevant to Age Bins

Choice of the age-bins to which the default ASFs are applied is based on our understanding of the two primary drivers of age-related sensitivity to carcinogens, namely age-related toxicokinetic factors and toxicodynamic factors. In the case of toxicokinetics, the largest postnatal differences in xenobiotic metabolic capability occur between infants and adults. As noted in OEHHA (2001) and reviewed in detail elsewhere (e.g., Cresteil et al., 1998; Ginsberg et al., 2004), hepatic drug metabolism by the cytochrome p450 family of enzymes and the Phase II conjugating enzymes undergoes a maturation process during the first few years of life. The hepatic cytochrome p450 enzymes exist in fetal isoforms at birth, and progressively change to adult isoforms at a relatively early stage of postnatal development. Thus, in humans the metabolic capability towards prototypical substrates develops over the first year of life towards adult levels. Similarly, the largest differences in metabolic capability of Phase II enzymes (conjugation of xenobiotic metabolites prior to excretion) tend to be between infants and adults. Other factors such as renal capability also are most different between neonates and adults. Thus, the first 2 years of life would encompass the increased sensitivity of early life stages due to toxicokinetic differences between early life and adulthood.

Ontogeny of cytochrome P-450 Enzymes in Humans.

Creteil (1998) describes three groups of neonatal cytochrome P450: Cyp3A7 and Cyp4A1 present in fetal liver and active on endogenous substrates; an early neonatal group including Cyp2D6 and 2E1 which surge within hours of birth; and a later developing group, Cyp3A4,

Cyp2Cs, and Cyp1A2. Total Cyp 3A protein, a major cytochrome p450 enzyme responsible for biotransformation of many xenobiotics, is relatively constant in neonates and adults. However, Cyp3A7 is the primary fetal form (Hakkola et al., 1998), while Cyp3A4 is the primary adult hepatic form of the 3A series. At one month there is about one-third of the Cyp3A4 activity as an adult liver (Lacroix et al., 1997; Hakkola et al., 1998). Allegaert *et al.* (2007) stated that Cyp3A4 (testosterone-6 β -hydroxylase) activity equaled or exceeded adult activity after 1 year of age. Cyp2E1, which metabolizes benzene, trichloroethylene and toluene, among others, increases gradually postnatally, reaching about one-third of adult levels by one year of age and attains adult levels by 10 years of age (Vieira et al., 1996; Cresteil, 1998). Cyp1A2, and Cyp2C9 and 2C19, the most abundant Cyp2 enzymes in adult human liver, appear in the weeks after birth, and reach 30% to 50% of adult levels at about 1 year of age (Treluyer et al., 1997; Hines and McCarver, 2002). Cyp1A1 is expressed in fetal liver where it can activate such xenobiotics as benzo[a]pyrene and aflatoxin B1 (Shimada et al., 1996), but is less important in adult liver (Hakkola et al., 1998).

Ontogeny of cytochrome P-450 Enzymes in Rodents.

Hart et al. (2009) report developmental profiles of a number of cytochrome P-450 enzymes (measured as levels of mRNA transcripts of the specific genes) in mice. They identified three groups of isoforms. Group 1 (Cyp3A16 in both sexes; Cyp3A41b in males) appeared rapidly after birth but declined to essentially zero at 15-20 days, which is the period of weaning in mice. A second group (Cyp2E1, Cyp3A11 and Cyp4A10 in both sexes; Cyp3A41b in females) also increased rapidly after birth, but reached a stable maximal level by postnatal day 5. The third group (Cyp1A2, Cyp2A4, Cyp2B10, Cyp2C29, Cyp2D22, Cyp2F2, Cyp3A13 and Cyp3A25) were expressed only at low levels until days 10 to 15, but reached high stable levels by day 20.

ElBarbry et al. (2007) examined the developmental profiles of two toxicologically significant cytochrome P-450 enzymes, Cyp1A2 and Cyp2E1 in rats. mRNA transcripts of these genes were very low postnatally, but thereafter increased to reach a peak at weaning (postnatal day 21 - 28 for rats). Immunoreactive Cyp1A2 and Cyp2E1 proteins were first detectable at postnatal day 3 and reached 50% of adult levels at weaning and adult levels at puberty. Differences in profiles between gene expression as MmRNA and appearance of specific proteins as determined by immunoassay may reflect changes in the relative importance of transcription and translation control process at various phases in development. Enzyme activities characteristic of Cyp1A2 and Cyp2E1 were found to parallel gene expression levels (ElBarbry et al., 2007) rather than immunodetectable protein levels, so there may also be issues of cross-reactivity between these two isoenzymes and others for which gene expression was not measured in these experiments.

In summary, the gene expression data in rats and mice show differences in details, but broadly resemble one another in that the main changes occur in the early postnatal period, with the major adjustments completed at or around the time of weaning, although the adult pattern may not be completely established until puberty. There do not appear to be substantive data for experimental species other than rats and mice, although the situation in humans appears similar in general outline and one may conclude that this pattern or some variant of it is a characteristic of mammalian species in general.

Ontogeny of Phase II enzymes

Phase II conjugating enzymes are generally less active in the neonate than the adult (Milsap and Jusko, 1994). Hence, there is concern that detoxification and elimination of chemicals is slower in infants. Expression of some of the UGT enzymes matures to adult levels in two months after birth, although glucuronidation of some drugs by the UGT1A subfamily does not reach adult levels until puberty (Levy et al., 1975; Snodgrass, 1992; McCarver and Hines, 2002). Reduced glucuronidation in neonates slows the clearance of N-hydroxyarylamines, phenol, and benzene metabolites. Acetylation by the N-acetyltransferases and sulfation by sulfotransferases are generally somewhat comparable to adult levels, although it varies by tissue and by specific sulfotransferase (McCarver and Hines, 2002). Glutathione (GSH) sulfotransferase (GST) is present as a fetal isoform which decreases postnatally, while GST-alpha and GST-mu increase over the first few years of life to adult levels (McCarver and Hines, 2002). Epoxide hydrolase, important in detoxifying reactive epoxide metabolites, is present in neonatal liver although at much reduced activity relative to adults (McCarver and Hines, 2002).

Clearances of drugs in infants and children vs. adults

Several investigators have evaluated age-related drug disposition (Renwick, 1998; Renwick et al., 2000; Ginsberg et al., 2002; Hattis et al., 2003). Renwick et al. (2000) noted higher internal doses in neonates and young infants versus adults for seven drugs that are substrates for glucuronidation, one with substrate specificity for CYP1A2, and four with substrate specificity for CYP3A4 metabolism. Ginsberg et al (2002) evaluated toxicokinetic information on 45 drugs in children and adults metabolized by different cytochrome P450 pathways, Phase II conjugations, or eliminated unchanged by the kidney. These authors noted half-lives in infants 3-9-fold longer than those of adults. It was also shown that the bulk of the elevated child/adult half-life ratios occurred primarily in the 0 to 6 month age range, and that for some compounds the clearance is actually higher in the 6 month to 2 year age grouping. In evaluating the interindividual variability by age, Hattis et al (2003) note that the largest interindividual variability occurs in the youngest children, apparently due to variability in development of critical metabolism and elimination pathways. Anderson and Holford (2008) noted that a comparison of three early-life drug clearance models (surface area, allometric $\frac{3}{4}$ power and per kilogram scaling) all demonstrated an increase in clearance over the first year of life due to the maturation of metabolic capacity.

Renal elimination depends on maturity of processes related to tubular reabsorption and secretion, and glomerular filtration rates. At birth, the glomerular filtration rate (GFR) is low (2-4 ml/min), increases in the first few days (8-20 ml/min) and slowly increases to adult values in 8-12 month old infants (Plunkett et al., 1992; Kearns et al, 2003).

Newborn and young animals have less capacity to excrete chemicals into the bile than do adult animals. A number of chemicals are excreted more slowly via bile in neonates than adult rats, including ouabain, the glucuronide conjugate of sulfobromophthalein (Klaassen, 1973), and methyl mercury (Ballatori and Clarkson, 1982), resulting in a longer half-life in neonates.

Toxicodynamic Factors Relevant to Age Bins

Important as the developmental changes in toxicokinetics are in determining sensitivity to carcinogens and other toxicants, it is likely that the toxicodynamic differences, i.e. intrinsic differences in susceptibility to carcinogenesis at the tissue or cellular level are even more influential. Changes in cell division rates and differentiation, which are thought to be important toxicodynamic determinants of susceptibility to carcinogenesis, peak in the first 2 years of life for most major organ systems. Cell division continues to accommodate growth throughout childhood and adolescence, extending in some cases even into the young adult period in both humans and experimental animals. Adolescence is an important period for organ cell division and differentiation for the mammary gland and reproductive organs.

As noted above, one of the key factors influencing susceptibility to carcinogenesis is believed to be cell division rate, which acts both by forcing error-prone repair which fixes DNA damage as mutated gene sequences (McLean et al, 1982) and by promoting expansion of mutated clones (Moolgavkar and Knudson, 1981). Actual cell division rates as a function of age are hard to determine for practical and (in the human case) ethical reasons. However, growth curves expressed as the proportional increment in body weight with time may be regarded as a reasonable although not perfect surrogate since for most tissues of the body cell size does not change markedly during growth. Both humans and rodents show remarkably high growth rates in infancy, which then drop steeply to a lower but still significant period during childhood. A growth spurt at the beginning of adolescence is noticeable in its absolute magnitude, especially in males, but does not approach the proportional growth rate seen in infancy. The time intervals proposed to reflect the period of highest sensitivity to carcinogenesis (birth to weaning, about 21 days in rodents, up to 24 months in humans) encompass the period of highest growth rate and thus is assumed the highest cell division rates, as show in the following charts:

Data from CDC NHANES 2000:

<http://www.cdc.gov/nchs/about/major/nhanes/growthcharts/datafiles.htm>

Data from [Tables A3 and A4 of Appendix J](#)

Cell division rates in adult rodents and humans are harder to relate to growth curves since at least some tissues retain active cell division as part of their ongoing functionality and repair. In humans growth in body weight slows to essentially zero at the end of adolescence (and any later increments represent tissue specific changes such as increase in muscle or adipose tissue mass rather than overall growth). On the other hand, rodents continue to increase in body size (at a modest rate compared to that seen in earlier lifestages) throughout the adult period. However, it appears reasonable to conclude from the body weight data that an essentially adult pattern of overall cell division is established by the late adolescent period (age six weeks in rodents; 16 years in humans). This clearly does not include the marked growth and increases in cell division and physiological activities seen in the reproductive system and its accessories during puberty.

Organ development

The age intervals chosen for the ASFs are generally supported by human organ system development data. Examples of supporting data are available for the lung, brain, immune system and liver. Zeltner and Burri (1987) stated that postnatal lung development consists of an alveolar stage, which lasts to about 1-1.5 years of age, and a stage of microvascular maturation, which

exists from the first months after birth to the age of 2-3 years. Pinkerton and Joad (2006) describe alveolar proliferation as occurring most prominently in the 0-2 year age range, with alveolar expansion continuing in the 2-8 year age range. Ballinoti et al. (2008) demonstrated that addition of alveoli rather than expansion is a major mode of lung growth in infants and toddlers by measuring a constant carbon monoxide diffusion capacity to lung volume from 3 through 23 months of age. Kajekar (2007) also considered the 0-2 age range to be the primary period of alveolar development, although there is continued cellular proliferation resulting in lung growth and expansion up to approximately 18 years of age.

Rice and Barone (2000) note that most of the cell proliferation phase of human radial glia and neuronal growth is finished by 2 years of age, based on evidence in Bayer et al. (1993). They note further that numerous studies have shown actively proliferating brain regions are more susceptible to anti-mitotic agents than the same structures after active proliferation ceases. Peak brain growth as a percentage of body weight occurs at birth and around post-natal day (PND) 7-8 in humans and rats, respectively (Watson *et al.*, 2006). De Graaf-Peters and Hadders-Algra (2006) reviewed the ontogeny of the human central nervous system and found that a large amount of axon and dendrite sprouting and synapse formation and the major part of telencephalic myelination take place during the first year after birth. While the brain continues to remodel itself throughout life, cellular proliferation in the whole brain peaks by about one year of age and is relatively complete by age 2. Development of the blood-brain barrier (BBB) appears to continue in humans until approximately 6 months of age. Rat BBB functionality is essentially complete by approximately two weeks after birth (Watson *et al.*, 2006).

The immune system development occurs in stages primarily prenatally in primates and both pre- and post-natally in rodents (Dietert et al., 2000). Formation and expansion of hematopoietic stem cells is followed by expansion of lineage-specific stem cells, colonization of bone marrow and thymus, and maturation of cells to immunocompetence. In the primate, this is largely complete by 1 to 2 years of age (Holsapple et al., 2003), although establishment of immune memory develops throughout childhood and beyond. In the rodent, maturation to immunocompetence occurs postnatally from birth to about 30 days of age. In terms of carcinogenesis, perhaps one of the more important immune cells is the NK cell, thought to be responsible for immune surveillance and killing of circulating transformed cells. Based on immunohistochemistry, the principal cell lines including NK cells are present at gestation day 100 in the monkey and are at about 60% of adult values at birth (Holladay and Smialowicz, 2000).

As noted above, renal and hepatic clearance are both lower in humans at birth than in adults. Nephrogenesis is complete by 35 ~~month~~weeks gestation in humans and before birth in the mouse (but after birth in the rat). The ability to concentrate urine and the development of acid-base equilibrium ~~occur~~appear in the first few months after birth (Zoetis and Hurtt, 2003). Renal clearance of drugs, a function of a number of processes in the kidney, appears to be comparable to adults within the first few months of life (Hattis et al., 2003; Ginsberg et al., 2002), while glomerular filtration, which rises rapidly over the first few postnatal months, is at adult values by two years of age (Zoetis and Hurtt, 2003). While complete anatomic maturity of the human liver is noted by 5 years of age (Walthall et al, 2005), liver function also appears to mature within the first year of life as seen by drug clearance studies cited above.

Critical Windows of Susceptibility to Carcinogens

It has been shown that there are critical windows during development both pre-and postnatally where enhanced susceptibility to carcinogenesis occurs (Anderson et al, 2000). Some of these observations relate to factors affecting the incidence of cancers in childhood, resulting from prenatal or preconception mutational events. For example, prenatal exposure to ionizing radiation and DES can result in leukemia and vaginal carcinoma, respectively, in childhood. Although obviously a source of great concern, these cancers appearing during childhood are relatively rare compared to cancers appearing later in life. Thus the concern in risk assessment for early in life exposures is to address the lifetime cancer incidence as a result of these exposures, including both cancers appearing during childhood and those appearing later.

OEHHA (see Appendix J) and other investigators (U.S. EPA, 2005; Barton et al, 2005; Hattis et al., 2004) have examined the available rodent data on sensitivity to carcinogenic exposures early in life. All these investigators found substantial increases in sensitivity to carcinogens in animal studies where exposures to young animals were compared to similar exposures to adults. Hattis et al. (2004) reported maximum likelihood estimates for the ratio of carcinogenic potency during the period from birth to weaning to the adult potency of between 8.7 and 10.5, whereas Barton et al (2005) reported a weighted geometric mean of 10.4 for the ratio of juvenile (less than 6-8 weeks) to adult potency in rodents. However, the number of experiments which provide information of this type, and the carcinogenic agents which have been studied, are relatively limited. Hattis examined several different datasets and study designs, but these covered only 13 different chemicals, while Barton et al. reported analyses for six of the 18 chemicals which they examined. OEHHA's analysis included data in rodents on 23 chemicals, and found median potency ratios of 13.5 for the postnatal period (birth to day 22) and 4.5 for the juvenile period (postnatal days 22 to 49) relative to adults (day 49 to 2 years). These potency ratios include the adjustment for time to manifest tumor (e.g., age to the power of three), unlike the earlier investigations. All these investigations identified variations in the observed lifetime potency ratio depending on the type of experimental design, the sex of the animals, the time of exposure and especially between chemicals. Nevertheless these analyses, although falling far short of a comprehensive evaluation of the age dependence of carcinogenic potency for all the chemicals of interest, do show a consistent overall trend of increasing potency for exposures early in life, especially soon after birth.

An evaluation of cancer induction by ionizing radiation also provides support for the concept of enhanced sensitivity to carcinogenesis at younger ages. Various studies of this phenomenon have been undertaken in animal models, but the important point for the present discussion is that epidemiological data exist which indicate age-dependent sensitivity in humans (U.S. EPA, 1994; 1999). The most extensive data set showing age-dependent effects is that for Japanese survivors of the atomic bomb explosions at Hiroshima and Nagasaki. Analysis of these data shows linear increases in tumor incidence at a number of sites with increasing radiation dose and younger age at exposure. There are other data suggesting humans are more susceptible to chemical carcinogens when exposure occurs in childhood. These data exist for tobacco smoke (Marcus et al., 2000; Wiencke et al., 1999) and chemotherapy and radiation (Mauch et al., 1996; Swerdlow et al., 2000; Franklin et al., 2006).

Proposed Age bins for application of default age sensitivity factors

In developing a default science-based risk assessment policy to address this general conclusion, one key variable to define is the age interval or intervals over which age-dependent sensitivity factors should be applied. Different investigators have considered different age ranges, but in general the more sensitive period has at least been defined as including the time from birth up to mid-adolescence when the major phases of growth and hormonal change are complete. ~~This can be somewhat consistently defined in the case of laboratory rodents whose genetic and environmental factors are relatively constant: a transition point in the range of 6 to 8 weeks is generally identified as the start of adulthood. For humans there is inevitably a lot more variation in the timing of developmental landmarks. The comparison of human development with that of rodents is complicated by the fact that the various organ systems have markedly different pre- and postnatal timetables, both between species and between organ systems. Thus there is no single timeline of developmental equivalence for humans and rodents. Nevertheless there is a general similarity for all mammals.~~

It is also recognized that, apart from the dramatic prenatal developmental events, the earliest postnatal stages represent the greatest differences in physiology and biochemistry from the adult. ~~This reflectsing the immaturity of many organ systems, extremely rapid growth and the incomplete maturation of various metabolic capabilities. In animal studies, as reflected in the analysis of carcinogenesis by OEHHA, an important developmental milestone is generally identified at the time of weaning, which in rodents occurs at or about postnatal day 21. As noted earlier, the rodent age bins in OEHHA's analysis were based on gross developmental milestones (birth, weaning, sexual maturity). OEHHA's analysis of studies that included exposure sometime between birth and weaning indicated this period as having the highest sensitivity to carcinogenesis. The data for the later juvenile period (postnatal days 22 to 49) are somewhat sparse, covering only three carcinogens and only one where there are corresponding data for both infant and juvenile lifestages. However, it appears based on the overall range of potency ratios observed for the juvenile period that sensitivity to many carcinogens is elevated in this period also, but to a lesser extent than during the first 22 days. [Hattis et al. (2005) and Barton et al. (2005) report analyses for exposures at any time during the juvenile period, i.e. up to 6-8 weeks, and do not separate by additional age bins].~~

Weaning is not such an obvious or consistently timed transition for humans, being subject to a wide range of cultural and economic variables. However, it is generally considered that the human infant period encompasses the first two years of life. This period includes the most rapid periods of cellular division and differentiation for the major organ systems (excluding the breast and reproductive organs). Although there is linear growth between 2 and 8 years of age, the organ development is largely although not entirely complete.

Thus, considering both the development of major organ systems and the associated differences in toxicodynamic and toxicokinetic factors, OEHHA ~~ehoseproposes~~ to apply the postnatal ASF derived from rodent studies (birth to ~21 days) to the human age intervals of ~~4~~birth - <2years. Similarly, OEHHA chose to apply the "juvenile" ASF derived from rodent studies (~22- ~49 days) to the human ages 2 - <16 years. This timetable was also selected by U.S. EPA (2005) in their supplemental guidance for assessing early-life susceptibility to carcinogens. They describe their choice of critical periods as follows:

“The adjustments described below reflect the potential for early-life exposure to make a greater contribution to cancers appearing later in life. The 10-fold adjustment represents an approximation of the weighted geometric mean tumor incidence ratio from juvenile or adult exposures in the repeated dosing studies (see Table 8). This adjustment is applied for the first 2 years of life, when toxicokinetic and toxicodynamic differences between children and adults are greatest (Ginsberg et al., 2002; Renwick, 1998). Toxicokinetic differences from adults, which are greatest at birth, resolve by approximately 6 months to 1 year, while higher growth rates extend for longer periods. The 3-fold adjustment represents an intermediate level of adjustment that is applied after 2 years of age through <16 years of age. This upper age limit represents middle adolescence following the period of rapid developmental changes in puberty and the conclusion of growth in body height in NHANES data (Hattis et al., 2005). Efforts to map the approximate start of mouse and rat bioassays (i.e., 60 days) to equivalent ages in humans ranged from 10.6 to 15.1 years (Hattis et al., 2005).”

There is general agreement that rodents are born at a maturational stage approximately equivalent to a third trimester human fetus. Thus, there is good rationale to include the third trimester of pregnancy in the age bin for application of the ASF of 10.

While there is strong evidence that growth and therefore cell proliferation rates and cell differentiation are extremely high prior to age 2, there is still residual uncertainty with respect to the cutpoint for application of the ASFs of 10 and 3. Thus, another possible approach is to move the cut point for the application of the ASF of 10 to a later age to account for this uncertainty. We present the effect on risk estimates of varying cutpoints in Tables 2 and 3.

Special consideration of puberty

In addition to the general concerns over increased sensitivity to carcinogenesis during infancy and childhood, there are specific concerns for exposure during the period when hormonal and developmental changes associated with puberty are in process, especially for carcinogens with hormonal modes of action or with impacts on the reproductive system and its accessory organs. At puberty, there is increased development of breast and reproductive organs that clearly involves rapid cellular division and differentiation. Thus, for carcinogens that induce mammary and reproductive organ cancers, puberty represents a time of increased sensitivity. As noted in the section on Selection of Default Age-Sensitivity Factors (page 48), if the risk assessor is evaluating a chemical with the potential for more than usually enhanced potency during this period, such as those which induce mammary or reproductive organ tumors (e.g., a polycyclic aromatic hydrocarbon), then the risk assessment may use a larger ASF to calculate risk from exposure during puberty. OEHHA may recommend chemical-specific ASFs for puberty to the local air quality management districts for use in the Air Toxics Hot Spots program.

Application of ASFs in Risk Assessment

The effect of using the proposed default ASFs in calculating cancer risk over a 70 year lifetime, and for a 9 year exposure common in the Hot Spots program risk assessments is demonstrated in Table 2 and Table 3 below. Ignoring for the moment the increased exposures to carcinogens that children experience, the effect of the weighting factors is to increase the lifetime cancer risk by about 2. For risks from shorter exposures, such as the commonly used 9 year exposure scenario, OEHHA proposes to evaluate risk starting at age 0 in the surrounding general population. The weighting factors in this case increase the risk to a larger extent. Depending on the exposure scenario, the use of age-specific distributions for uptake rates for air, food and water would also increase the risk estimates significantly independent of any application of ASFs. This is because the uptake rates for all these media per unit of body weight are higher in children and, especially, infants.

Assessing risks to short-term exposures to carcinogens involves additional uncertainties. The cancer potency factors are generally based on long-term exposures. However, in reality, the local air districts in California are frequently assessing risk from short term activities related to construction, mitigation of contaminated soils, and so forth. OEHHA recommends that when assessing such shorter term projects, the districts assume a minimum of 2 years of exposure and apply the slope factors and the 10 fold ASF to such assessments. Exposure durations longer than 2 years would use the method for the remaining years as noted above.

U.S. EPA addressed the potential for increased susceptibility to cancer caused by environmental chemicals when the exposure occurs during an early lifestage in “Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens” (U.S. EPA, 2005b) (referred to henceforth as the Supplemental Guidance). This document is intended to be a companion to the revised “Guidelines for Carcinogen Risk Assessment” (U.S. EPA, 2005a). We present a summary of their analysis, which support the policy decision to weight cancer potency and therefore risk by age-at-exposure. As previously noted, there are several methodological differences between the U.S. EPA analysis and the OEHHA analysis. Of note, in the OEHHA analysis all treatment-related tumors that were observed in a given lifestage exposure experiment were taken into account in estimating cancer potency. Thus in comparing cancer potencies

associated with early life vs. adult exposure, OEHHA compared the total cancer risk associated with exposure during a given lifestage, rather than comparing the risk for cancers at one single site in each lifestage, as the U.S. EPA did. In addition, the age groupings are a bit different in the U.S. EPA analysis than those used by OEHHA in their analysis (described above). For example, prenatal (*in utero*) exposures were not part of the analysis performed by U.S. EPA, and that Agency's analyses did not distinguish between postnatal and juvenile exposures.

U.S. EPA oral exposure cancer risk methodology relies on estimation of the lifetime average daily dose, which can account for exposure factor differences between adults and children (e.g. eating habits and body weight). However, early lifestage susceptibility differences have not been taken into consideration when cancer potency factors were calculated. The Supplemental Guidance document focused on studies that define the potential duration and degree of increased susceptibility that may arise from early-life exposures. An analysis of those studies including a detailed description of the procedures used was published in Barton *et al.* (2005) (included as Appendix I). The criteria used to decide if a study could be included in the quantitative analysis are as follows (excerpted from U.S. EPA, 2005b):

1. Exposure groups at different post-natal ages in the same study or same laboratory, if not concurrent (to control for a large number of potential cross-laboratory experimental variables including pathological examinations),
2. Same strain/species (to eliminate strain-specific responses confounding age-dependent responses),
3. Approximately the same dose within the limits of diets and drinking water intakes that obviously can vary with age (to eliminate dose-dependent responses confounding age-dependent responses),
4. Similar latency period following exposures of different ages (to control for confounding latency period for tumor expression with age-dependent responses), arising from sacrifice at >1 year for all groups exposed at different ages, where early-life exposure can occur up to about 7 weeks. Variations of around 10 to 20% in latency period are acceptable,
5. Postnatal exposure for juvenile rats and mice at ages younger than the standard 6 to 8 week start for bioassays; prenatal (*in utero*) exposures are not part of the current analysis. Studies that have postnatal exposure were included (without adjustment) even if they also involved prenatal exposure,
6. "Adult" rats and mice exposure beginning at approximately 6 to 8 weeks old or older, i.e. comparable to the age at initiation of a standard cancer bioassay (McConnell, 1992). Studies with animals only at young ages do not provide appropriate comparisons to evaluate age-dependency of response (e.g., the many neonatal mouse cancer studies). Studies in other species were used as supporting evidence, because they are relatively rare and the determination of the appropriate comparison ages across species is not simple, and
7. Number of affected animals and total number of animals examined are available or reasonably reconstructed for control, young, and adult groups (i.e., studies reporting only percent response or not including a control group would be excluded unless a reasonable estimate of historical background for the strain was obtainable).

Cancer potencies were estimated from a one-hit model (a restricted form of the Weibull time-to-tumor model), which estimates cumulative incidence for tumor onset. U.S. EPA (2005b) compared the estimated ratio of the cancer potency from early-life exposure to the estimated cancer potency from adult exposure. The general form of the equation for the tumor incidence at a particular dose, [P(dose)] is:

$$P(\text{dose}) = 1 - [1 - P(0)] \exp(-\text{cancer potency} * \text{dose})$$

where $P(0)$ is the incidence of the tumor in controls. The ratio of juvenile to adult cancer potencies at a single site were calculated by fitting this model to the data for each age group. The model fit depended upon the design of the experiment that generated the data. Studies evaluated by U.S. EPA had two basic design types: experiments in which animals were exposed either as juveniles or as adults (with either a single or multiple dose in each period), and experiments in which exposure began either in the juvenile or in the adult period, but once started, continued through life.

The model equations for the first study type are:

$$P_A = P_0 + (1 - P_0) (1 - e^{-m_A \delta_A})$$

$$P_J = P_0 + (1 - P_0) (1 - e^{-m_A e^{\lambda} \delta_J})$$

where A and J refer to the adult and juvenile period, respectively, λ is the natural logarithm of the juvenile:adult cancer potency ratio, P_0 is the fraction of control animals with the particular tumor type being modeled, P_x is the fraction of animals exposed in age period x with the tumor, m_A is the cancer potency, and δ_x is the duration or number of exposures during age period x .

The goal of the model is to determine λ , which is the logarithm of the estimated ratio of juvenile to adult cancer potencies. This serves as a measure of potential susceptibility for early-life exposure.

For the second study type, the model equations take into account that exposures that were initiated in the juvenile period continue through the adult period. The model equations for the fraction of animals exposed only as adults with tumors in this design are the same as in the first study type, but the fraction of animals whose first exposure occurred in the juvenile period is:

$$P_J = P_0 + (1 - P_0) (1 - e^{-m_A e^{\lambda} (\delta_J - \delta_A) - m_A \delta_A})$$

δ_J includes the duration of exposure during the juvenile period and the subsequent adult period.

Parameters in these models were estimated using Bayesian methods and all inferences about the ratios were based on the marginal posterior distribution of λ . A complete description of these procedures (including the potential effect of alternative Bayesian priors that were examined) was published in Barton *et al.* (2005) (Appendix I). This method produced a posterior mean ratio of the early-life to adult cancer potency, which is an estimate of the potential susceptibility of early-life exposure to carcinogens. Ratios of greater or less than one indicate greater or less susceptibility from early-life exposure, respectively.

U.S. EPA reviewed several hundred studies reporting information on 67 chemicals or complex mixtures that are carcinogenic via perinatal exposure. Eighteen chemicals were identified which had animal study designs involving early-life and adult exposures in the same experiment. Of those 18 chemicals, there were overlapping subsets of 11 chemicals involving repeated exposures during early postnatal and adult lifestages and 8 chemicals using acute exposures (usually single doses) at different ages. Those chemicals are listed in [Table 4](#).

Table 4 Chemicals having animal cancer study data available with early-life and adult exposures in the same experiment.

Chemical	Study Type
Amitrole	repeat dosing
Benzidine	repeat dosing
Benzo[a]pyrene (BaP)	acute exposure
Dibenzanthracene (DBA)	acute exposure
Dichlorodiphenyltrichloroethane (DDT)	lifetime exposure, repeat dosing
Dieldrin	lifetime exposure, repeat dosing
Diethylnitrosamine (DEN)	acute exposure, lifetime exposure
Dimethylbenz[a]anthracene (DMBA)	acute exposure
Dimethylnitrosamine (DMN)	acute exposure
Diphenylhydantoin, 5,5-(DPH)	lifetime exposure, repeat dosing
EthylNitrosourea (ENU)	acute exposure
Ethylene thiourea (ETU)	lifetime exposure, repeat dosing
3-Methylcholanthrene (3-MC)	repeat dosing
Methylnitrosourea (NMU)	acute exposure
Polybrominated biphenyls (PBBs)	lifetime exposure, repeat dosing
Safrole	lifetime exposure, repeat dosing
Urethane	acute exposure, lifetime exposure
Vinyl chloride (VC)	repeat dosing

U.S. EPA calculated the difference in susceptibility between early-life and adult exposure as the estimated ratio of cancer potency at specific sites from early-life exposure over the cancer potency from adult exposure for each of the studies that were determined qualitatively to have appropriate study designs and adequate data. The results were grouped into four categories: 1) mutagenic chemicals administered by a chronic dosing regimen to adults and repeated dosing in the early postnatal period (benzidine, diethylnitrosamine, 3-methylcholanthrene, safrole, urethane and vinyl chloride); 2) chemicals without positive mutagenicity data administered by a chronic dosing regimen to adults and repeated dosing in the early postnatal period (amitrole, dichlorodiphenyltrichloroethane (DDT), dieldrin, ethylene thiourea, diphenylhydantoin, polybrominated biphenyls); 3) mutagenic chemicals administered by an acute dosing regimen

(benzo[*a*]pyrene, dibenzanthracene, diethylnitrosamine, dimethylbenzanthracene, dimethylnitrosamine, ethylnitrosourea, methylnitrosourea and urethane); 4) chemicals with or without positive mutagenicity data with chronic adult dosing and repeated early postnatal dosing.

The acute dosing animal cancer studies were considered qualitatively useful by U.S. EPA because they involve identical exposures with defined doses and time periods demonstrating that differential tumor incidences arise exclusively from age-dependent susceptibility. However, they were not used to derive a quantitative cancer potency factor age adjustment, primarily because most of the studies used subcutaneous or intraperitoneal injection as a route of exposure. These methods have not been considered quantitatively relevant routes of environmental exposure for human cancer risk assessment by U.S. EPA, for reasons including the fact that these routes of exposure are expected to have a partial or complete absence of first pass metabolism which could affect potency estimates. Additionally, U.S. EPA decided that cancer potency estimates are usually derived from chronic exposures, and therefore, any adjustment to those potencies should be from similar exposures.

The repeated dosing studies with mutagenic chemicals using exposures during early postnatal and adult lifestages were used to develop a quantitative cancer potency factor age adjustment. Studies with repeated early postnatal exposure were included in the analysis even if they also involved earlier maternal and/or prenatal exposure, while studies addressing only prenatal exposure were not used in the analysis. The weighted geometric mean susceptibility ratio (juvenile to adult) for repeated and lifetime exposures in this case was 10.4 (range 0.12 – 111, 42% of ratios greater than 1).

USEPA suggests the use of age-dependent-adjustment factors (ADAF) for chemicals acting through a mutagenic mode of action, based on the results of the preceding analysis, which concluded that cancer risks generally are higher from early-life exposure than from similar exposure doses and durations later in life:

1. For exposures before 2 years of age (i.e., spanning a 2-year time interval from the first day of birth until a child's second birthday), a 10-fold ADAF.
2. For exposures between 2 and <16 years of age (i.e., spanning a 14-year time interval from a child's second birthday until their sixteenth birthday), a 3-fold ADAF.
3. For exposures after turning 16 years of age, no adjustment (ADAF=1).

The ADAF of 10 used for the 0 – 2 years of age range is approximately the weighted geometric mean cancer potency ratio from juvenile versus adult exposures in the repeated dosing studies. U.S. EPA considered this period to display the greatest toxicokinetic and toxicodynamic differences between children and adults. Data were not available to calculate a specific dose-response adjustment factor for the 2 to <16-year age range, so EPA selected an ADAF of 3 because it was half the logarithmic scale difference between the 10-fold adjustment for the first two years of life and no adjustment (i.e., 1-fold) for adult exposure. The ADAF of 3 represents an intermediate level of adjustment applied after 2 years of age through <16 years of age. The upper age limit (16 years of age) reflects the end of puberty and the attainment of a final body height. U.S. EPA recognizes that the use of a weighted geometric mean of the available study

data to develop an ADAF for cancer potencies may either overestimate or underestimate the actual early-life cancer potency for specific chemicals, and therefore emphasizes in the Supplemental Guidance that chemical-specific data should be used in preference to these default adjustment factors whenever such data are available.

U.S. EPA is recommending the ADAFs described above only for mutagenic carcinogens, because the data for non-mutagenic carcinogens were considered to be too limited and the modes of action too diverse to use this as a category for which a general default adjustment factor approach can be applied. OEHHA considers this approach to be insufficiently health protective. There is no obvious reason to suppose that the toxicokinetics of non-mutagens would be systematically different from those of mutagens. It would also be inappropriate to assume by default that non-mutagenic carcinogens are assumed to need a toxicodynamic correction factor of 1. Most if not all of the factors that make individuals exposed to carcinogens during an early-lifestage potentially more susceptible than those individuals exposed during adulthood also apply to non-mutagenic carcinogen exposures (*e.g.*, rapid growth and development of target tissues, potentially greater sensitivity to hormonal carcinogens, differences in metabolism). It should also be noted that carcinogens that do not cause gene mutations may still be genotoxic by virtue of causing chromosomal damage. Additionally, many carcinogens do not have adequate data available for deciding on a specific mode of action, or do not necessarily have a single mode of action. For these reasons, OEHHA will apply the default cancer potency factor age adjustments described above to all carcinogens unless data are available which allow for the development of chemical-specific cancer potency factor age adjustments. In those cases, an agent-specific model of age dependence (based on observational or experimental data) might be used, or alternative (larger or smaller) adjustment factors and age ranges may be applied where understanding of the mechanism of action and target tissues makes this appropriate.

Other Source Documents for Cancer Risk Assessment Guidance

As noted previously, the cancer potencies and unit risks tabulated in this technical support document have been developed by various programs over a number of years. The methods used therefore necessarily varied according to the date of the assessment and the program responsible. The following section summarizes the sources and procedures most commonly applied, and their historical context where this is apposite.

United States Environmental Protection Agency (U.S. EPA)

The U.S. EPA was one of the first regulatory agencies to develop and apply cancer risk assessment methodology. Their guidance documents and technical publications have been influential for many programs, including the California Air Toxics (Toxic Air Contaminants and Hot Spots) programs.

Guidelines for Carcinogen Risk Assessment (U.S. EPA, 1986)

Prior to the more recent guidelines updating project which, after nearly ten years of internal and public review drafts culminated in the 2005 final revision (see below), U.S. EPA carcinogen risk assessment procedures were generally as described in Anderson *et al.* (1983) and “Guidelines for Carcinogen Risk Assessment” (U.S. EPA, 1986). These methods, which are outlined below, were used to calculate the Integrated Risk Information System (IRIS) cancer potency values, some of which are cited in this document. U.S. EPA has always indicated that cancer risk estimates based on adequate human epidemiologic data are preferred if available over estimates based on animal data. Although the newer guidelines offer alternative methods for dose-response analysis of animal bioassays, and updated consideration of specific topics such as lifestage-related differences in sensitivity, and mechanism of action for some types of carcinogen, the underlying principles, and many of the specific procedures developed in these original guidelines are still applicable and in use.

U.S. EPA Calculation of Carcinogenic Potency Based on Animal Data

In extrapolating low-dose human cancer risk from animal carcinogenicity data, it is generally assumed that most agents that cause cancer also damage DNA, and that the quantal type of biological response characteristic of mutagenesis is associated with a linear non-threshold dose-response relationship. U.S. EPA stated that the risk assessments made with this model should be regarded as conservative, representing the most plausible upper limit for the risk. The mathematical expression used by U.S. EPA in the 1986 guidelines to describe the linear non-threshold dose-response relationship at low doses is the linearized multistage procedure developed by Crump (1980). This model is capable of fitting almost any monotonically increasing dose-response data, and incorporates a procedure for estimating the largest possible linear slope at low extrapolated doses that is consistent with the data at all experimental dose levels. A description of the linearized multistage procedure has been provided above (page [292928](#)). U.S. EPA used an updated version (GLOBAL86, Howe *et al.*, 1986) of the computer program GLOBAL79 developed by Crump and Watson (1979) to calculate the point estimate and the 95% upper confidence limit of the extra risk $A(d)$.

U.S. EPA separated tumor incidence data according to organ sites or tumor types. The incidence of benign and malignant tumors was combined whenever scientifically defensible. U.S. EPA considered this incidence combination scientifically defensible unless the benign tumors are not considered to have the potential to progress to the associated malignancies of the same histogenic origin. The primary comparison in carcinogenicity evaluation is tumor response in dosed animals as compared to contemporary matched control animals. However, U.S. EPA stated that historical control data could be used along with concurrent control data in the evaluation of carcinogenic responses, and notes that for the evaluation of rare tumors, even small tumor responses may be significant compared to historical data. If several data sets (dose and tumor incidence) are available (different animal species, strains, sexes, exposure levels, exposure routes) for a particular chemical, the data set used in the model was the set where the incidence is statistically significantly higher than the control for at least one test dose level and/or where the tumor incidence rate shows a statistically significant trend with respect to dose level. The data set generating the highest lifetime cancer risk estimate (q_1^*) was chosen where appropriate. An example of an inappropriate data set would be a set which generates an artifactually high risk estimate because of a very small number of animals used. If there are 2 or more data sets of comparable size for a particular chemical that are identical with respect to species, strain, sex and tumor sites, the geometric mean of q_1^* estimated from each of those data sets was used for risk estimation. U.S. EPA assumed that mg/surface area/day is an equivalent dose between species. Surface area was further assumed to be proportional to the $2/3$ power of the weight of the animal in question. Equivalent dose was therefore computed using the following relationship:

$$d = \frac{l_e * m}{L_e * W^{2/3}}$$

where L_e = experimental duration, l_e = exposure duration, m = average dose (mg/day) and W = average animal weight. Default average body weights for humans, rats and mice are 70, 0.35 and 0.03 kg, respectively.

Exposure data expressed as ppm in the diet were generally converted to mg/day using the relationship $m = \text{ppm} * F * r$, where ppm is parts per million of the chemical in the diet, F is the weight of the food consumed per day in kg, and r is the absorption fraction (assumed to be 1 in the absence of data indicating otherwise). The weight of food consumed, calories required, and animal surface area were generally all considered to be proportional to the $2/3$ power of the animal weight, so:

$$m \propto \text{ppm} * W^{2/3} * r, \text{ or } \frac{m}{rW^{2/3}} \propto \text{ppm}$$

The relationship could lead to the assumption that dietary ppm is an equivalent exposure between species. However, U.S. EPA did not believe that this assumption is justified, since the calories/kg food consumed by humans is significantly different from that consumed by laboratory animals (primarily due to differences in moisture content). An empirically derived food factor, $f = F/W$ was used, which is the fraction of a species' body weight consumed per day as food. U.S. EPA (1986) gave the f values for humans, rats and mice as 0.028, 0.05 and 0.13, respectively.

Dietary exposures expressed as concentrations in ppm were converted to mg/surface area using the following relationship:

$$\frac{m}{r * W^{2/3}} = \frac{\text{ppm} * F}{W^{2/3}} = \frac{\text{ppm} * f * W}{W^{2/3}} = \text{ppm} * f * W^{2/3}$$

Exposures expressed as mg/kg/day ($m/Wr = s$) were converted to mg/surface area using the relationship:

$$\frac{m}{rW^{2/3}} = s * W^{2/3}$$

The calculation of dose when exposure is via inhalation was performed for cases where 1) the chemical is either a completely water-soluble gas or aerosol and is absorbed proportionally to the amount of inspired air, or 2) where the chemical is a partly water-soluble gas which reaches an equilibrium between the inspired air and body compartments. After equilibrium is attained, the rate of absorption is proportional to metabolic rate, which is proportional to the rate of oxygen consumption, which is related to surface area.

Exposure expressed as mg/day to completely water-soluble gas or aerosols can be calculated using the expression $m = I * v * r$, where I is the inspiration rate/day in m^3 , v is the concentration of the chemical in air (mg/m^3), and r is the absorption fraction (assumed to be the same for all species in the absence of data to the contrary; usually 1). For humans, the default inspiration rate of 20 m^3 has been adopted. Inspiration rates for 113 g rats and 25 g mice have been reported to be 105 and 34.5 liters/day, respectively. Surface area proportionality can be used to determine inspiration rate for rats and mice of other weights; for mice, $I = 0.0345 (W / 0.025)^{2/3} \text{ m}^3/\text{day}$; for rats, $I = 0.105 (W / 0.113)^{2/3} \text{ m}^3/\text{day}$. The empirical factors for air intake/kg/day (i) for humans, rats and mice are 0.29, 0.64 and 1.3, respectively. Equivalent exposures in mg/surface area can be calculated using the relationship:

$$\frac{m}{W^{2/3}} = \frac{Ivr}{W^{2/3}} = \frac{iWvr}{W^{2/3}} = iW^{1/3}vr$$

Exposure expressed as mg/day to partly water-soluble gases is proportional to surface area and to the solubility of the gas in body fluids (expressed as an absorption coefficient r for that gas). Equivalent exposures in mg/surface area can be calculated using the relationships $m = kW^{2/3} * v * r$, and $d = m/W^{2/3} = kvr$. The further assumption is made that in the case of route-to-route extrapolations (e.g., where animal exposure is via the oral route, and human exposure is via inhalation, or vice versa), unless pharmacokinetic data to the contrary exist, absorption is equal by either exposure route.

Adjustments were made for experimental exposure durations shorter than the lifetime of the test animal; the slope q_1^* was increased by the factor $(L/L_e)^3$, where L is the normal lifespan of the experimental animal and L_e is the duration of the experiment. This assumed that if the average dose d is continued, the age-specific rate of cancer will continue to increase as a constant function of the background rate. Since age-specific rates for humans increase by at least the 2nd power of the age, and often by a considerably higher power (Doll, 1971), there is an expectation

that the cumulative tumor rate, and therefore q_1^* , will increase by at least the 3rd power of age. If the slope q_1^* is calculated at age L_e , it would be expected that if the experiment was continued for the full lifespan L at the same average dose, the slope q_1^* would have been increased by at least $(L/L_e)^3$.

U.S. EPA Calculation of Carcinogenic Potency Based on Human Data

U.S. EPA stated that existing human epidemiologic studies with sufficiently valid exposure characterization are always used in evaluating the cancer potency of a chemical. If they showed a carcinogenic effect, the data were analyzed to provide an estimate of the linear dependence of cancer rates on lifetime cancer dose (equivalent to the factor q_1^*). If no carcinogenic effect was demonstrated and carcinogenicity had been demonstrated in animals, then it was assumed that a risk does exist, but it is smaller than could have been observed in the epidemiologic study. An upper limit of cancer incidence was calculated assuming that the true incidence is just below the level of detection in the cohort studied, which is largely determined by the cohort size. Whenever possible, human data are used in preference to animal data. In human epidemiologic studies, the response is measured as the relative risk of the exposed cohort of individuals compared to the control group. The excess risk ($R(X) - 1$, where $R(X)$ is relative risk) was assumed to be proportional to the lifetime average exposure X , and to be the same for all ages. The carcinogenic potency is then equal to $[R(X) - 1]/X$ multiplied by the lifetime risk at that site in the general population. According to this original procedure, the confidence limit for the excess risk was not usually calculated: this decision was ascribed to the difficulty in accounting for inherent uncertainty in the exposure and cancer response data. More recent assessments have taken the opposite view and attempted to calculate and characterize this uncertainty by determining confidence limits, *inter alia*.

Guidelines for Carcinogen Risk Assessment (U.S. EPA, 2005a)

U.S. EPA revised its “Guidelines for Carcinogen Risk Assessment” (referred to henceforth as the “U.S. EPA Guidelines”) in 2005. Compared to the 1986 version of this document, more emphasis is placed on establishing a “mode of action” (MOA). The following excerpt provides a definition of this term:

“The term “mode of action” is defined as a sequence of key events and processes, starting with interaction of an agent with a cell, proceeding through operational and anatomical changes, and resulting in cancer formation. A “key event” is an empirically observable precursor step that is itself a necessary element of the mode of action or is a biologically based marker for such an element. Mode of action is contrasted with “mechanism of action,” which implies a more detailed understanding and description of events, often at the molecular level, than is meant by mode of action”.

Cancer risk assessments performed under the prior U.S. EPA Guidelines sometimes included a MOA description. However, the 1986 U.S. EPA Guidelines did not explicitly mandate the development of a MOA description in cancer risk assessments.

The MOA information is then used to govern how a cancer risk assessment shall proceed. Tumor incidence data sets arising from a MOA judged to be not relevant to humans are not used

to extrapolate a cancer potency factor. If an MOA cannot be determined or is determined to have a low-dose linear dose-response and a nonmutagenic MOA, then a linear extrapolation method is used to develop a cancer potency factor. The same linear extrapolation is used for all lifestages, unless chemical specific information on lifestage or population sensitivity is available. Carcinogens that act via an MOA judged to have a nonlinear low-dose dose response are modeled using MOA data, or the RfD/RfC risk assessment method is used as a default. Adjustments for susceptible lifestages or populations are to be performed as part of the risk assessment process.

If a carcinogen is deemed to act via a mutagenic MOA, then the data from the MOA analysis is evaluated to determine if chemical-specific differences between adults and juveniles exist and can be used to develop a chemical-specific risk estimate incorporating lifestage susceptibility. If this cannot be done, then early-life susceptibility is assumed, and age-dependent adjustment factors (ADAFs) are applied as appropriate to develop risk estimates. In cases where it is not possible to develop a toxicokinetic model to perform cross-species scaling of animal tumor data sets which arise from oral exposures, the U.S. EPA Guidelines state that administered doses should be scaled from animals to humans on the basis of equivalence of $\text{mg/kg}^{3/4}\text{-d}$ (milligrams of the agent normalized by the $3/4$ power of body weight per day). This is a departure from the 1986 U.S. EPA guidelines, which used a $2/3$ power of body weight normalization factor. Other adjustments for dose timing, duration and route are generally assumed to be handled in similar fashion to that described for the 1986 guidelines, although of course updated parameter values would be used where available.

The 2005 U.S. EPA Guidelines also use benchmark dose methodology (described above, page 27) to develop a “point-of departure” (POD) from tumor incidence data. For linear extrapolation, the POD is used to calculate a cancer potency factor, and for nonlinear extrapolation the POD is used in the calculation of a reference dose (RfD) or reference concentration (RfC).

It should be noted that none of the cancer potency factors listed in this document were obtained from U.S. EPA risk assessments performed under the 2005 U.S. EPA Guidelines. All U.S. EPA IRIS cancer potency values contained in this document were obtained from risk assessments using the 1986 U.S. EPA Guidelines.

Office of Environmental Health Hazard Assessment (OEHHA), California Environmental Protection Agency

The cancer risk assessment procedures originally used by the Office of Environmental Health Hazard Assessment (OEHHA) are outlined in “Guidelines for Chemical Carcinogen Risk Assessments and their Scientific Rationale” (referred to below as the Guidelines) (CDHS, 1985). These procedures were generally used in generating Toxic Air Contaminant (TAC) cancer potency values, standard Proposition 65 cancer potency values and Public Health Goal (PHG) cancer potency values. Expedited Proposition 65 cancer potency values depart somewhat from those procedures and are discussed separately below.

OEHHA cancer risk assessment methodology as described by CDHS (1985) generally resembled that used at that time by U.S. EPA (Anderson *et al.*, 1983; U.S. EPA, 1986). OEHHA risk

assessment practice similarly reflects the evolution of the technical methodology (e.g. as described in U.S. EPA, 2005a) since the original guidelines were published. The basic principles and procedures described below are still considered applicable. More recent additions to OEHHA cancer risk assessment methods such as the use of benchmark dose methodologies and early-lifestage cancer potency adjustments are discussed above. The Guidelines state that both animal and human data, when available, should be part of the dose-response assessment.

OEHHA Calculation of Carcinogenic Potency Based on Animal Data

The procedures used to extrapolate low-dose human cancer risk from animal carcinogenicity data assumed that a carcinogenic change induced in a cell is transmitted to successive generations of cell descendants, and that the initial change in the cell is an alteration (e.g. mutation, rearrangement, etc.) in the cellular DNA. Non-threshold models are used to extrapolate to low-dose human cancer risk from animal carcinogenicity data.

Several models were proposed for extrapolating low-dose human cancer risk from animal carcinogenicity data in the original Guidelines. These models include the Mantel-Bryan method (log-probit model), the one-hit model, the linearized multistage procedure, the gamma multihit model, and a number of time-to-tumor models. The Guidelines stated that time-to-tumor models (i.e., a Weibull-in-time model) should be used for low-dose extrapolation in all cases where supporting data are available, particularly when survival is poor due to competing toxicity. However, the Guidelines also noted the difficulty of determining the actual response times in an experiment. Internal tumors are generally difficult to detect in live animals and their presence is usually detected only at necropsy. Additionally, use of these models often requires making the determination of whether a tumor was the cause of death, or was found only coincidentally at necropsy when death was due to other causes. Further, competing causes of death, such as chemical toxicity, may decrease the observed time-to-tumor for nonlethal cancers by allowing earlier necropsy of animals in higher dose groups. The linearized multistage (LMS) procedure was noted as being an appropriate method for dose extrapolation in most cases, with the primary exception being a situation in which sufficient empirical data are available to indicate a dose-response curve of a “quasi-threshold” type (e.g., flat for two or three dose levels, then curving sharply upwards). In this case, the LMS procedure may underestimate the number of stages and overestimate the low-dose risks. In this case, the gamma multihit model was suggested as being a potential alternative. The Mantel-Bryan model was described as having little biological basis as applied to carcinogenesis, and being likely to underestimate risks at low doses. The Guidelines stated that this model should not be used for low dose extrapolation. More recent practice has departed from these original guidelines in some respects, for instance by experimenting with cell-proliferation based models in a few cases: however the LMS model remained the preferred extrapolation model for most purposes. Some of the difficulties in achieving a satisfactory fit to tumor incidence data were found to be alleviated by application of toxicokinetic models and use of an internal rather than applied dose metric with the LMS model. This has resulted in the alternative models originally advocated (Gamma multihit, Mantel-Bryan) being mostly abandoned. As noted above (Dose-Response Assessment, page 23), the use of allegedly biologically based statistical models such as LMS has fallen from favor in recent years, and benchmark dose methodology has become the preferred method for extrapolating cancer potency values from animal cancer incidence data. However, it should also be noted that results

generated by the LMS model and benchmark dose methodology from the same data set are often quite similar.

The 1985 Guidelines stated that both animal and human data, when available, should be part of the dose-response assessment. Although preference was given to human data when these were of adequate quality, animal studies may provide important supporting evidence. Low-dose extrapolation of human cancer risk from animal carcinogenicity data was generally based on the most sensitive site, species and study demonstrating carcinogenicity of a particular chemical, unless other evidence indicates that the data set in question is not appropriate for use. Where both benign and malignant tumors are induced at the same site and the benign tumors are considered to have the potential to progress to malignant tumors, the incidence data for both types of tumors could be combined to form the basis for risk assessment. Pharmacokinetic data on chemical metabolism, effective dose at target site, or species differences between laboratory test animals and humans were considered in dose-response assessments when available. In performing exposure scaling from animals to humans, the “surface area” correction (correcting by the 2/3 power of body weight) was used unless specific data indicates that this should not be done. The Guidelines assumed that in the absence of evidence to the contrary, chemicals that cause cancer after exposure by ingestion will also cause cancer after exposure by inhalation, and vice versa. These original proposals have continued in use with little change except that currently, TAC and PHG cancer potency factor calculations use a 3/4 power of body weight correction for interspecies scaling, in line with current U.S. EPA practice. The standard Proposition 65 cancer potency factor calculations still use a 2/3 power correction because the cancer potency calculation method is specified in regulation (California Health and Safety Code 25249.5 *et seq.*).

Cancer unit risk factors [in units of $(\mu\text{g}/\text{m}^3)^{-1}$] have been calculated from cancer potency factors [in units of $(\text{mg}/\text{kg}\text{-day})^{-1}$] using the following relationship:

$$\text{UR} = \frac{\text{CPF} * 20 \text{ m}^3}{70 \text{ kg} * \text{CV}}$$

where UR is the cancer unit risk, CPF is the cancer potency factor, 70 kg is the reference human body weight, 20 m³ is the reference human inspiration rate/day, and CV is the conversion factor from mg to μg (= 1000). The cancer unit risk describes the excess cancer risk associated with an inhalation exposure to a concentration of 1 $\mu\text{g}/\text{m}^3$ of a given chemical; the cancer potency factor describes the excess cancer risk associated with exposure to 1 mg of a given chemical per kilogram of body weight.

It should be noted that although this default method is still used in deriving published cancer unit risk values, for site-specific risk assessments age-appropriate distributions and percentile values are used in the current version of the Hot Spots exposure assessment document. Where exposure to children occurs (as it does in most exposures to the general population surrounding a source site) it is also necessary to apply the age-specific adjustment factors for the appropriate durations in accordance with the guidance offered above (Page 30 *et seq.*).

OEHHA Calculation of Carcinogenic Potency Based on Human Data

Human epidemiologic studies with adequate exposure characterization are used to evaluate the cancer potency of a chemical. If they show a carcinogenic effect, the data are analyzed to provide an estimate of the linear dependence of cancer rates on lifetime cancer dose. The 1985 Guidelines stated that with continuous exposure, age-specific incidence continues to increase as a power function (e.g., t^3 or t^4) of the elapsed time since initial exposure. Lifetime risks can be estimated by applying such a power function to the observed data and extrapolating beyond the actual followup period. OEHHA has generally undertaken the calculation of study power and confidence bounds on the potency estimate as important tools to establish the credibility of the estimate obtained and in comparing this with other estimates (from other human studies or from animal data). Due to the diversity in quality and type of epidemiological data, the specific approaches used in OEHHA risk assessments based on human epidemiologic studies vary on a case by case basis rather than following explicit general guidelines. Examples of the methods used can be observed in the Toxic Air Contaminant documents (these documents are listed in Appendix D: the methods used are described in the compound summaries provided in Appendix B).

Expedited Proposition 65 Cancer Risk Assessment Methodology

Expedited cancer potency values developed for several agents listed as carcinogens under Proposition 65 (California Health and Safety Code 25249.5 *et seq.*) were derived from selected animal carcinogenicity data sets of the Carcinogenic Potency Database (CPDB) of Gold *et al.* (1984, 1986, 1987, 1989, 1990, 1997) using default procedures specified in the administrative regulations for Proposition 65 (Title 22 California Code of Regulations [CCR] 12703). OEHHA hazard assessments usually describe all relevant data on the carcinogenicity (including dose-response characteristics) of the chemical under examination, followed by an evaluation of any pharmacokinetic and mechanistic (e.g. genotoxicity) data. An evaluation of the data set for the chemical may indicate that adjustments in target dose estimates or use of a dose response model different from the default are appropriate. The procedure used to derive expedited Proposition 65 cancer potency values differs from the usual methodology in two ways. First, it relies on cancer dose response data evaluated and extracted from the original literature by Gold *et al.* Second, the choice of a linearized multistage procedure for generating cancer potency values is automatic, and pharmacokinetic adjustments are not performed. The methods used to develop expedited cancer potency values incorporate the following assumptions:

1. The dose response relationship for carcinogenic effects in the most sensitive species tested is representative of that in humans.
2. Observed experimental results can be extrapolated across species by use of the interspecies factor based on "surface area scaling."
3. The dose to the tissue giving rise to a tumor is assumed to be proportional to the administered dose.
4. The linearized multistage polynomial procedure can be used to extrapolate potency outside the range of experimental observations to yield estimates of "low" dose potency.
5. Cancer risk increases with the third power of age.

The Carcinogenic Potency Database of Gold *et al.* (1984, 1986, 1987, 1989, 1990) contains the results of more than 4000 chronic laboratory animal experiments on 1050 chemicals by combining published literature with the results of Federal chemical testing programs (Technical Reports from the Carcinogenesis Bioassay Program of the National Cancer Institute (NCI)/National Toxicology Program (NTP) published prior to June 1987). The published literature was searched (Gold *et al.*, 1984) through the period December 1986 for carcinogenicity bioassays; the search included the Public Health Service publication "Survey of Compounds Which Have Been Tested for Carcinogenic Activity" (1948-1973 and 1978), monographs on chemical carcinogens prepared by the International Agency for Research on Cancer (IARC) and Current Contents. Also searched were Carcinogenesis Abstracts and the following journals: British Journal of Cancer, Cancer Letters, Cancer Research, Carcinogenesis, Chemosphere, Environmental Health Perspectives, European Journal of Cancer, Food and Cosmetics Toxicology, Gann, International Journal of Cancer, Journal of Cancer Research and Clinical Oncology (formerly Zeitschrift für Krebsforschung und Klinische Onkologie), Journal of Environmental Pathology and Toxicology, Journal of Toxicology and Environmental Health, Journal of the National Cancer Institute, and Toxicology and Applied Pharmacology. Studies were included in the database if they met the following conditions:

1. The test animals were mammals.
2. Chemical exposure was started early in life (100 days of age or less for hamsters, mice and rats).
3. Route of administration was via the diet, drinking water, gavage, inhalation, intravenous injection or intraperitoneal injection.
4. The test chemical was administered alone (not in combination with other chemicals).
5. Chemical exposure was chronic (*i.e.*, duration of exposure was at least one-fourth the standard lifespan for that species), with not more than 7 days between exposures.
6. The experiment duration was at least half the standard lifespan for the species used.
7. The study design included a control group and at least 5 animals/exposure group.
8. No surgical interventions were performed.
9. Pathology data were reported for the number of animals with tumors (not total number of tumors).
10. All results reported were original data (not analysis of data reported by other authors).

Included in their data set tabulations are estimates of average doses used in the bioassay, resulting tumor incidences for each of the dose levels employed for sites where significant responses were observed, dosing period, length of study and histopathology. Average daily dose levels were calculated assuming 100% absorption. Dose calculations follow procedures similar to those of Cal/EPA and U.S. EPA; details on methods used and standard values for animal lifespans, body weights, and diet, water and air intake are listed in Gold *et al.* (1984). OEHHA (1992) reviewed the quality assurance, literature review, and control procedures used in compiling the data and found them to be sufficient for use in an expedited procedure. Cancer potency estimates were derived by applying the mathematical approach described in the section below to dose response data in the Gold *et al.* database.

The following criteria were used for data selection:

1. Data sets with statistically significant increases in cancer incidence with dose ($p \leq 0.05$) were used. (If the authors of the bioassay report considered a statistically significant result to be unrelated to the exposure to the carcinogen, the associated data set was not used.)
2. Data sets were not selected if the endpoint was specified as "all tumor-bearing animals" or results were from a combination of unrelated tissues and tumors.
3. When several studies were available, and one study stood out as being of higher quality due to numbers of dose groups, magnitude of the dose applied, duration of study, or other factors, the higher quality study was chosen as the basis for potency calculation if study results were consistent with those of the other bioassays listed.
4. When there were multiple studies of similar quality in the sensitive species, the geometric mean of potencies derived from these studies was taken. If the same experimentalists tested two sexes of the same species/strain under the same laboratory conditions, and no other adequate studies were available for that species, the data set for the more sensitive sex was selected.
5. Potency was derived from data sets that tabulate malignant tumors, combined malignant and benign tumors, or tumors that would have likely progressed to malignancy.

Cancer potency was defined as the slope of the dose response curve at low doses. Following the default approach, this slope was estimated from the dose response data collected at high doses and assumed to hold at very low doses. The Crump linearized multistage polynomial (Crump *et al.*, 1977) was fit to animal bioassay data:

$$\text{Probability of cancer} = 1 - \exp[-(q_0 + q_1d + q_2d^2 + \dots)]$$

Cancer potency was estimated from the upper 95 % confidence bound on the linear coefficient q_1 , which is termed q_1^* .

For a given chemical, the model was fit to a number of data sets. As discussed in the section above, the default was to select the data for the most sensitive target organ in the most sensitive species and sex, unless data indicated that this was inappropriate. Deviations from this default occur, for example, when there are several bioassays or large differences exist between potency values calculated from available data sets.

Carcinogenicity bioassays using mice and/or rats will often use an exposure duration of approximately two years. For standard risk assessments, this is the assumed lifespan for these species. Animals in experiments of shorter duration are at a lower risk of developing tumors than those in the standard bioassay; thus potency is underestimated unless an adjustment for experimental duration is made. In estimating potency, short duration of an experiment was taken into account by multiplying q_1^* by a correction factor equal to the cube of the ratio of the assumed standard lifespan of the animal to the duration of the experiment (T_e). This assumes that the cancer hazard would have increased with the third power of the age of the animals had they lived longer:

$$q_{\text{animal}} = q_1^* * (104 \text{ weeks}/T_e)^3$$

In some cases excess mortality may occur during a bioassay, and the number of initial animals subject to late occurring tumors may be significantly reduced. In such situations, the above described procedure can, at times, significantly underestimate potency. A time-dependent model fit to individual animal data (i.e., the data set with the tumor status and time of death for each animal under study) may provide better potency estimates. When Gold *et al.* indicated that survival was poor for a selected data set, a time-dependent analysis was attempted if the required data were available in the Tox Risk (Crump *et al.*, 1991) data base. The Weibull multistage model (Weibull-in-time; multistage-in-dose) was fit to the individual animal data.

To estimate human cancer potency, q_{animal} values derived from bioassay data were multiplied by an interspecies scaling factor (K; the ratio of human body weight (bw_h) to test animal body weight (bw_a), taken to the 1/3 power (Anderson *et al.*, 1983)):

$$K = (bw_h/bw_a)^{1/3}$$

Thus, cancer potency = $q_{\text{human}} = K * q_{\text{animal}}$

Chemical-specific Descriptions of Cancer Potency Value Derivations

Unit Risk and potency values for chemicals whose cancer potency values were obtained from Toxic Air Contaminant documents, standard or expedited Proposition 65 documents, U.S. EPA's Integrated Risk Information System (IRIS) documents and Health Effects Assessment Summary Table (HEAST) entries, or from other documents prepared by OEHHA's Air Toxicology and Epidemiology Branch or Pesticide and Environmental Toxicology Branch are presented in Appendix A. Information summaries for these chemicals are presented in Appendix B.

Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning

A Reference for Local Governments Within the South Coast Air Quality Management District

This guidance document is prepared by the South Coast Air Quality Management District (AQMD) as a reference for cities and counties within AQMD's jurisdiction. It provides suggested policies that local governments can use to prevent or reduce potential air pollution impacts and protect public health in their General Plans or through local planning. The objective of the guidance document is to facilitate stronger collaboration between local governments and the AQMD to reduce community exposure to source-specific and cumulative air pollution impacts. It is recognized that local governments, to make the best decisions for the benefit of their residents, must weigh and balance multiple issues, demands and concerns, including, but not limited to, the need for housing, existing development and development patterns, environmental responsibilities and more when making land use decisions.

May 6, 2005

Acknowledgements

The AQMD would like to acknowledge and thank the Western Riverside Council of Governments and the Orange County Council of Governments for their assistance in the preparation of the initial draft of the model air quality element and this subsequent guidance document. The AQMD staff appreciates the ideas and suggestions received from the many stakeholders that participated in the development of this document.

PREFACE

The South Coast Air Quality Management District (AQMD) environmental justice program is designed to protect the rights of the residents in the South Coast basin to live and work in an environment of clean air, free of airborne health threats. The guiding principle of the program is based on “equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution.” In suggesting enhancements to the AQMD’s 2002 environmental justice program, stakeholders proposed the development of a model air quality element for cities and counties within AQMD’s jurisdiction that considers the health risks to community residents associated with local government land use planning and decision-making. To that end, the AQMD is making this guidance document available to local governments as a tool to assist them as they develop or update their General Plans and make other planning decisions. The primary users will likely be local government planners within the geographic boundaries of the South Coast air district; however, the ideas, technical issues, and references in the guidance document are also intended for use by private developers, residents, and community organizations. The use of this document by local governments is strictly voluntary. The AQMD recognizes that local governments, to make the best decisions for the benefit of their residents, must weigh and balance multiple issues, demands and concerns, including, but not limited to, the need for housing, existing development and development patterns, environmental responsibilities and more when making land use decisions.

Neither state or federal law mandates separate air quality elements in General Plans. Similarly, the AQMD does not require that cities or counties include a “stand alone” air quality element in their plans, but we encourage local governments to use the information presented in this guidance document to: (1) help develop a separate air quality element, (2) update their current air quality element or (3) integrate air quality policies in other elements of their General Plans such as Land Use and Circulation. We recognize that each community must address a unique combination of air quality and community development issues in their General Plans; therefore, the suggested goals, objectives and policies/strategies presented in this document will not apply uniformly in every jurisdiction. The format and scope of suggested air pollution policies and strategies for each local jurisdiction should be tailored to be consistent with the structure and content of the existing General Plan. Local jurisdictions have complete discretion to select the appropriate mix of pertinent air quality goals and objectives and determine the level of detail of policies and implementation measures that will effectively reduce air pollution and protect public health in their communities.

The combined implementation of the suggested strategies throughout the region will strengthen the local government partnership with the AQMD to achieve state and federal clean air standards and demonstrate the resolve of cities and counties in the district to provide environmental equity and protect public health. The AQMD will

update this document periodically to make available the most current air quality information, the results of local health effects studies related to air pollution and the state of air pollution control technologies to help local governments update their General Plans and make other planning decisions.

INTRODUCTION

California state law requires each city and county to adopt a General Plan “for the physical development of the county or city, and any land outside its boundaries which bears relation to its planning”. The General Plan must contain seven “elements:” land use, circulation, housing, open-space, conservation, noise and safety. The policies in the required General Plan elements are the basis for most land use decisions. General Plan policies and practices have the potential to exacerbate localized air pollution impacts and adversely affect public health. State law offers the flexibility to go beyond the mandatory elements, to adopt “any other elements or address any other subjects, which in the judgment of the legislative body, relate to the physical development of the county or city.” Many cities and counties in the district have addressed air quality in other sections of their General Plan, such as land use, circulation, and conservation. While an air quality element is not mandatory, two counties (San Bernardino and Riverside) and 44 cities within AQMD’s jurisdiction have adopted separate air quality elements in their General Plans (see Appendix A). The fact that Southern California continues to be faced with some of the most serious air pollution problems in the United States is a strong case for the topic of air quality to be included as a stand alone element in General Plans. It is recognized that local governments, to make the best decisions for the benefit of their residents, must weigh and balance multiple issues, demands and concerns, including, but not limited to, the need for housing, existing development and development patterns, environmental responsibilities and more when making land use decisions.

The South Coast basin exceeds federal standards for ozone and particulate matter (PM₁₀ and PM_{2.5}). Although the AQMD is moving forward in implementing both near and long term control measures that aggressively seek to reduce air quality emissions, the basin is currently one of only two areas in the nation classified as “extreme” non-attainment for ozone. Clean air for all the residents in the basin cannot be accomplished by air quality agencies alone. Achieving the mutual goals of protecting public health and providing environmental equity to residents throughout the basin can only be accomplished through a strong partnership with local jurisdictions. The involvement of local governments to establish public policies that support AQMD strategies is essential for this region to meet state and federal air quality goals. The General Plan, as the foundation for all local planning and development, is an important tool to implement local government policies and programs that are vital to achieving clean air standards. Cities and counties have the flexibility and authority to address air quality issues through General Plans that guide the development of local circulation systems, transportation services, and land use. The AQMD and CARB have strong, comprehensive regulatory programs in place for new and existing sources of air pollution. However, local policies in conjunction with air agency efforts can greatly enhance the effectiveness of these programs by addressing cumulative impacts in local areas. Many land use decisions that involve siting, zoning and permitting actions provide opportunities to complement local and state air regulations and prevent or

minimize adverse health impacts. The development of land use policy and the authority to site sensitive land uses are local government functions. In local planning and policy development, sensitive land uses should be given special consideration to best protect those individuals that are especially vulnerable to the effects of air pollution. The intent of this document is to provide information that will lead to general plan policies and local decision making that considers potential air quality impacts on public health. The suggested policies and strategies are intended to guide land use planners in developing approaches tailored to their community that reduce exposure to source-specific air pollution and lower the health risk associated with cumulative air pollution impacts.

Chapter 1 presents an overview of regulated air pollutants in the South Coast air district and summarizes the effects of air pollution on public health and welfare.

REGULATED AIR POLLUTANTS

Air pollutants regulated by the federal and California Clean Air Acts or other laws fall under three categories:

- criteria air pollutants,
- toxic air contaminants (TAC),
- global warming and ozone-depleting gases.

Pollutants in each of these categories are monitored and regulated differently. Criteria air pollutants are measured by sampling concentrations in the ambient air; toxic air contaminants are measured at the source and in the general atmosphere; and, global warming and ozone-depleting gases are not monitored but are subject to federal and regional policies that call for their reduction and eventual phase out. The U.S. Environmental Protection Agency (USEPA) has established ambient air quality standards for the following air pollutants:

- ozone (O₃)
- nitrogen dioxide (NO₂)
- carbon monoxide (CO)
- sulfur dioxide (SO₂)
- lead (Pb)
- particulate matter (PM₁₀ and PM_{2.5})

The California Air Resources Board (CARB) has also established ambient air quality standards for the six pollutants regulated by the USEPA. Some of the California ambient air quality standards are more stringent than the national ambient air quality standards (NAAQS). In addition, California has established ambient air quality standards for the following pollutants or air quality conditions:

- hydrogen sulfide
- sulfates

- vinyl chloride
- visibility

NAAQS and California ambient air quality standards for the criteria pollutants are listed in Appendix B.

Criteria Air Pollutants

Criteria air pollutants are defined as those pollutants for which the federal and state governments have established air quality standards for outdoor or ambient concentrations to protect public health. The national and state ambient air quality standards have been set at levels to protect human health with a determined margin of safety. For some pollutants, there are also secondary standards to protect the environment. The following is a description of the ambient air pollutants and the attainment status of each pollutant in the South Coast basin. A discussion of the health effects of the ambient air pollutants is found in Appendix C.

Carbon Monoxide. Carbon monoxide (CO) is a colorless, odorless gas formed by the incomplete combustion of fuels. Motor vehicles are the main source of this gas. CO competes with oxygen, often replacing it in the blood, thus reducing the blood's ability to transport oxygen to vital organs in the body. The ambient air quality standard for carbon monoxide is intended to protect persons whose medical condition already compromises their circulatory system's ability to deliver oxygen. These medical conditions include certain heart ailments, chronic lung diseases, and anemia. Persons with these conditions have reduced exercise capacity even when exposed to relatively low levels of CO. Fetuses are at risk because their blood has an even greater affinity to bind with CO. Smokers are also at risk from ambient CO levels because smoking increases the background level of CO in their blood. The South Coast basin is designated as a serious non-attainment area for carbon monoxide by both USEPA and CARB. However, there have been no violations of the CO standard in the past three years, and AQMD has submitted to EPA a request for redesignation to attainment status.

Nitrogen Dioxide. Nitrogen dioxide (NO₂) is a byproduct of fuel combustion. The principal form of nitrogen oxide produced by combustion is nitric oxide (NO), but NO reacts quickly to form NO₂, creating the mixture of NO and NO₂ commonly called NO_x. NO₂ acts as an acute irritant and, in equal concentrations, is more injurious than NO. At atmospheric concentrations, however, NO₂ is only potentially irritating. There is some indication of a relationship between NO₂ and chronic pulmonary fibrosis. Some increase in bronchitis in young children has also been observed at concentrations below 0.3 parts per million (ppm). NO₂ absorbs blue light which results in a brownish red cast to the atmosphere and reduced visibility. Although NO₂ concentrations have not exceeded national standards since 1991 and the state hourly standard since 1993, NO_x emissions remain of concern because of their contribution to the formation of O₃ and particulate matter.

Ozone. Ozone (O_3) is one of a number of substances called photochemical oxidants that are formed when volatile organic compounds (VOC) and NO_x react in the presence of ultraviolet sunlight. O_3 concentrations in the South Coast basin are typically among the highest in the nation, and the damaging effects of photochemical smog, which is a popular name for a number of oxidants in combination, are generally related to the concentrations of O_3 . Individuals exercising outdoors, children, and people with pre-existing lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the subgroups most susceptible to O_3 effects. Short-term exposures (lasting for a few hours) to O_3 at levels typically observed in southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. In recent years, a correlation between elevated ambient O_3 levels and increases in daily hospital admission rates, as well as mortality, has also been reported. The South Coast basin is designated by both the USEPA and the CARB as an extreme non-attainment area for ozone. Although O_3 concentrations declined between 1991 and 2004 to the lowest levels since monitoring began, the South Coast basin continues to have peak O_3 levels that exceed both state and federal standards. In 2004, the peak concentration (1-hr standard) exceeded the federal standard 131 percent and the state standard 163 percent.

In 1997, the USEPA issued a new ozone air quality standard based on an 8-hour average exposure (the current federal ozone air quality standard is based on a 1-hour average period). The new 8-hour average ozone air quality standard provides for greater health protection. Current regulatory controls which are directed toward attaining the 1-hour ozone standard will also have benefits toward attaining the 8-hour ozone standard.

Particulate Matter. Inhalable fine particulate matter (PM_{10}) consists of extremely small suspended particles or droplets 10 microns or smaller in diameter that can lodge in the lungs, contributing to respiratory problems. PM_{10} arises from such sources as re-entrained road dust, diesel soot, combustion products, tire and brake abrasion, construction operations, and fires. It is also formed in the atmosphere from NO_x and SO_2 reactions with ammonia. PM_{10} scatters light and significantly reduces visibility.

Inhalable particulates pose a serious health hazard, alone or in combination with other pollutants. More than half of the smallest particles inhaled will be deposited in the lungs and can cause permanent lung damage. Inhalable particulates can also have a damaging effect on health by interfering with the body's mechanism for clearing the respiratory tract or by acting as a carrier of an absorbed toxic substance. USEPA designates the South Coast basin as serious non-attainment for PM_{10} , while CARB designates the South Coast basin simply as non-attainment.

In 1997, the USEPA established a new particulate matter $PM_{2.5}$ standard, in addition to the PM_{10} standard. $PM_{2.5}$ is defined as particulate matter with a diameter less than 2.5 microns and is a subset of PM_{10} . $PM_{2.5}$ consists mostly of products from the reaction of NO_x and SO_2 with ammonia, secondary organics, finer dust particles, and the

combustion of fuels including diesel soot. Deadlines for meeting this standard will be ten years after the region is designated as non-attainment by the USEPA.

Sulfur Dioxide. Sulfur dioxide (SO₂) is a colorless, pungent gas formed primarily by the combustion of sulfur-containing fossil fuels. Health effects include acute respiratory symptoms and difficulty in breathing for children. Individuals with asthma may experience constriction of airways with exposure to SO₂. Though SO₂ concentrations have been reduced to levels well below state and federal standards, further reductions in SO₂ emissions are needed because SO₂ is a precursor to sulfate and PM₁₀. The South Coast basin is considered a SO₂ attainment area by USEPA and CARB.

Lead. Lead (Pb) concentrations once exceeded the state and federal air quality standards by a wide margin, but have not exceeded state or federal air quality standards at any regular monitoring station since 1982. Though special monitoring sites immediately downwind of lead sources recorded very localized violations of the state standard in 1994, no violations were recorded at these stations in 1996. Consequently, the South Coast basin is designated as an attainment area for lead by both the USEPA and CARB.

Volatile Organic Compounds. It should be noted that there are no state or federal ambient air quality standards for VOCs because they are not classified as criteria pollutants. VOCs are regulated, however, because a reduction in VOC emissions reduces certain chemical reactions which contribute to the formation of ozone. VOCs are also transformed into organic aerosols in the atmosphere, contributing to higher PM₁₀ and lower visibility levels.

Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations of VOC. Some hydrocarbon components classified as VOC emissions are hazardous air pollutants. Benzene, for example, is a hydrocarbon component of VOC emissions that is known to be a human carcinogen.

Criteria air pollutant concentrations are typically higher in the South Coast basin than in any other area of the country because of the region's climate, geographical setting, and high concentrations of industry and motor vehicles. Although still high, pollutant concentrations have declined sharply throughout the 1990s. Air quality in 2004, aided by favorable weather conditions, was the best recorded since air pollution agencies began monitoring air pollution in this region in the 1940s prior to the creation of the AQMD. Table 1-1 lists the primary emission sources of the criteria pollutants and some of the harmful effects of the pollutants.

Table 1-1

Primary Sources and Effects of Criteria Pollutants

Pollutants	Source	Primary Health and Welfare Effects
Lead (Pb)	Contaminated soil	Behavioral and hearing disabilities in children; Nervous system impairment
Sulfur Dioxide (SO ₂)	Combustion of sulfur-containing fossil fuels; Smelting of sulfur-bearing metal ores; Industrial processes	Aggravation of respiratory diseases (asthma, emphysema); Reduced lung function
Carbon Monoxide (CO)	Incomplete combustion of fuels and other carbon-containing substances, such as motor vehicle exhaust; Natural events, such as decomposition of organic matter	Aggravation of some heart diseases (angina); Reduced tolerance for exercise; Impairment of mental function; Impairment of fetal development; Death at high levels of exposure
Nitrogen Dioxide (NO ₂)	Motor vehicle exhaust; High-temperature stationary combustion; Atmospheric reactions	Aggravation of respiratory illness
Ozone (O ₃)	Atmospheric reaction of organic gases with nitrogen oxides in sunlight	Aggravation of respiratory and cardiovascular diseases; Reduced lung function, Increased cough and chest discomfort
Fine Particulate Matter (PM ₁₀ and PM _{2.5})	Stationary combustion of solid fuels; Construction activities; Industrial processes; Atmospheric chemical reactions	Reduced lung function; Aggravation of respiratory & cardio-respiratory diseases; Increases in mortality rate; Reduced lung function growth in children

The AQMD measures current air quality and provides forecasts on the AQMD website in several formats. Current information on air pollution levels may be viewed in text form on the "Current Air Quality Readings" page, or retrieved from a clickable map on the "Animated Air Quality Map" page. Air quality data, trends, and studies are available via the "Air Quality Data" page, and a forecast of pollution levels for the following day is available on the "Daily Air Quality Forecast" page. Also, meteorological data needed for the air dispersion model applications may be downloaded from this website at no charge.

Toxic Air Contaminants

Toxic Air Contaminants (TACs) are often referred to as "non-criteria" air contaminants because ambient air quality standards have not been established for them. There are hundreds of TACs, and exposure to these pollutants is associated with elevated risk of cancer and non-cancer health effects such as birth defects, genetic damage, and other

adverse health effects. Effects may be chronic (i.e., of long duration) or acute (i.e., of short duration) on human health. Acute health effects are attributable to short term exposure to air toxics. These effects include nausea, skin irritation, respiratory illness, and, in extreme cases, death. Chronic health effects result from long-term exposure. The effect of major concern for this type of exposure is cancer, which may develop up to 30 years after exposure. The USEPA regulates TACs through technology-based requirements which are implemented by state & local agencies. California regulates TACs through the air toxics program (H&SC §§ 39660 et seq.) and the Air Toxics “Hot Spots” Information and Assessment Act (H&SC §§ 44300 et seq.).

The CARB, working in conjunction with the Office of Environmental Health Hazard Assessment (OEHHA), identifies TACs. Air Toxic Control Measures (ATCMs) must then be adopted by CARB to reduce the identified TACs. Where there are federal standards, CARB must, at minimum, adopt the standards established by the USEPA. If there is a threshold below which there would be no significant adverse health impacts, CARB must create an ATCM to reduce emissions so there are no adverse health effects. If there is not a threshold below which there would be no significant adverse health impacts CARB must create an ATCM that reduces TAC emissions using the best available control technologies. Local air quality control agencies must implement ATCMs, or adopt equal or more stringent control measures as rules, within six months of adoption by CARB.

The Air Toxics “Hot Spots” Information and Assessment Act, codified in the Health and Safety Code, requires operators of specified facilities in the South Coast air district to submit to the AQMD comprehensive emissions inventories and reports by specified dates. The AQMD reviews the reports and then places the facilities into high-, intermediate-, and low-priority categories, based on the potency, toxicity, quantity, and volume of emissions and on the proximity of receptors, including sensitive receptors, to the facility. Facilities designated as high priority must prepare a health risk assessment. If the risk is above specified levels, facilities are required to notify the surrounding population and may be required to develop and implement a risk reduction plan.

The AQMD has also developed “industry-wide” inventories and assessed risks of small business facilities with emissions that are easily characterized. Some of the facilities in the industry-wide program are gas stations, small auto body shops, small dry cleaners, plating shops, and fiberglass product manufacturers. This information can then be used as an initial screening tool to determine whether a particular site is advisable for siting a sensitive receptor, or vice versa. Additional information is available on control strategies to minimize cumulative impacts of toxic emissions at http://www.aqmd.gov/rules/CIWG/final_white_paper.pdf and the AQMD Air Toxics “Hot Spots” Program (AB2588) at <http://www.aqmd.gov/prdas/AB2588/AB2588.html>. Information is also available from the AQMD Office of Engineering and Compliance to determine if a facility is operating under AQMD permits and what types of pollutants are emitted.

AQMD also adopts other rules that are not part of the federal or state programs and works with other agencies to encourage TAC reductions in their purview. The emissions inventory data are to be updated every four years. In addition to implementing federal and state toxic requirements, AQMD has an Air Toxics Control Plan and a Cumulative Impacts Reduction Strategy to further reduce TACs and their impacts on the communities in the South Coast basin.

Global Warming and Ozone-Depleting Gases

“Stratospheric ozone depletion” refers to the slow destruction of naturally occurring ozone, which lies in the upper atmosphere (called the stratosphere) and which protects Earth from the damaging effects of solar ultraviolet radiation. Certain compounds, including chlorofluorocarbons (CFCs,) halons, carbon tetrachloride, methyl chloroform, and other halogenated compounds, accumulate in the lower atmosphere and then gradually migrate into the stratosphere. In the stratosphere, these compounds participate in complex chemical reactions to destroy the upper ozone layer. Destruction of the ozone layer increases the penetration of ultraviolet radiation to the Earth’s surface, a known risk factor that can increase the incidence of skin cancers and cataracts, contribute to crop and fish damage, and further degrade air quality.

Some gases in the atmosphere affect the Earth’s heat balance by absorbing infrared radiation. This layer of gases in the atmosphere functions much the same as glass in a greenhouse (i.e., both prevent the escape of heat). This is why global warming is also known as the “greenhouse effect.” Gases responsible for global warming and their relative contribution to the overall warming effect are carbon dioxide (55 percent), CFCs (24 percent), methane (15 percent), and nitrous oxide (6 percent). It is widely accepted that continued increases in greenhouse gases will contribute to global warming although there is uncertainty concerning the magnitude and timing of the warming trend.

Global warming gases and ozone-depleting gases include, but are not limited to, the following:

- **Carbon dioxide.** Carbon dioxide results from fossil fuel combustion in stationary and mobile sources. It contributes to the greenhouse effect, but not to stratospheric ozone depletion. In the South Coast basin, approximately 48 percent of carbon dioxide emissions come from transportation, residential and utility sources contribute approximately 13 percent each, 20 percent come from industry, and the remainder come from a variety of other sources.
- **Chlorofluorocarbons.** Chlorofluorocarbons (CFCs) are emitted from blowing agents used in producing foam insulation. They are also used in air conditioners and refrigerators and as solvents to clean electronic microcircuits. CFCs are primary contributors to stratospheric ozone depletion and to global warming. Sixty-three percent of CFC emissions in the South Coast basin come from the industrial sector. Federal regulations require service practices that maximize recycling of ozone-depleting compounds (both CFCs, hydro-chlorofluorocarbons and their blends) during the servicing and disposal of air-conditioning and

refrigeration equipment. AQMD Rule 1415 – Reduction of Refrigerant Emissions from Stationary Refrigeration and Air Conditioning Systems requires CFC refrigerants to be reclaimed or recycled from stationary refrigeration and air conditioning systems. AQMD Rule 1405 – Control of Ethylene Oxide and Chlorofluorocarbon Emissions From Sterilization or Fumigant Processes requires recovery of reclamation of CFCs at certain commercial facilities and eliminates the use of some CFCs in the sterilization processes. Some CFCs are classified as TACs and regulated by AQMD Rule 1401 – New Source Review of Toxic Air Contaminants and AQMD Rule 1402 Control of Toxic Air Contaminants from Existing Sources.

- **Halons.** These compounds are used in fire extinguishers and behave as both ozone-depleting and greenhouse gases. Halon production ended in the United States in 1993. AQMD Rule 1418 – Halon Emissions From Fire Extinguishing Equipment requires the recovery and recycling of halons used in fire extinguishing systems and prohibits the sale of halon in small fire extinguishers.
- **Hydro-chlorofluorocarbons.** HCFCs are solvents, similar in use and chemical composition to CFCs. The hydrogen component makes HCFCs more chemically reactive than CFCs, allowing them to break down more quickly in the atmosphere. These compounds deplete the stratospheric ozone layer, but to a much lesser extent than CFCs. HCFCs are regulated under the same AQMD rules as CFCs.
- **Methane.** Methane is emitted from biogenic sources, incomplete combustion in forest fires, landfills, and leaks in natural gas pipelines. It is a greenhouse gas and traps heat 40-70 times more effectively than carbon dioxide. In the South Coast basin, more than 50 percent of human-induced methane emissions come from natural gas pipelines, while landfills contribute 24 percent. Methane emissions from landfills are reduced by AQMD Rule 1150.1 - Control of Gaseous Emissions from Active Landfills. Methane emissions from petroleum sources are reduced by a number of rules in AQMD Regulation XI that control fugitive emissions from petroleum production, refining and distribution.
- **1,1,1-trichloroethane (TCA).** TCA (methyl chloroform) is a solvent and cleaning agent commonly used by manufacturers. It is less destructive on the environment than CFCs or HCFCs, but its continued use will contribute to global warming and ozone depletion. 1,1,1-trichloroethane (TCA) is a synthetic chemical that does not occur naturally in the environment. No TCA is supposed to be manufactured for domestic use in the United States after January 1, 2002 because it affects the ozone layer. TCA had many industrial and household uses, including use as a solvent to dissolve other substances, such as glues and paints; to remove oil or grease from manufactured metal parts; and as an ingredient of household products such as spot cleaners, glues, and aerosol sprays. AQMD regulates this compound as a toxic air contaminant under Rules 1401 and 1402.

The Montreal Protocol on Substances That Deplete the Ozone Layer controls the phase-out of ozone depleting compounds (ODCs). Under this international agreement, several organizations report on the science of ozone depletion, implement projects to help move away from ODCs, and provide a forum for policy discussions. The AQMD supports state, federal and international policies to reduce levels of ozone depleting gases through its Global Warming Policy and rules. Further, AQMD has developed ODC Replacement Guidelines to facilitate transition from ODCs to substances that are the most environmentally benign.

EFFECTS OF AIR POLLUTION ON HEALTH AND WELFARE

The residents of Southern California bear the cost of air pollution by:

- reduced visibility
- increased episodes of respiratory infections and other illnesses
- increased number of days of discomfort
- absent days from work and school
- increased symptoms related to respiratory disease, including asthma
- slowed lung function growth and increased asthma risk in children
- heart disease
- shortened life spans

Polluted air also damages agriculture, the natural environment, and human-made materials. Improving air quality enhances public health and produces economic benefits that more than offset the costs of attaining clean air. The overall strategy for reducing air pollution for criteria pollutants in the South Coast air district is contained in the Air Quality Management Plan (AQMP). The AQMP provides control measures that reduce emissions to attain federal ambient air quality standards by their applicable deadlines. The cost benefit analysis for the plan is conducted as part of the AQMP development. However, not all the health benefits associated with implementing the AQMP can be quantified. Further, the Air Toxic Control Plan amended in 2003 outlines the strategies pursued by the AQMD, CARB, and USEPA to reduce air toxic emissions.

THE ROLE OF FEDERAL, STATE, AND LOCAL AGENCIES TO REDUCE AIR POLLUTION

U.S. Environmental Protection Agency

The U.S. Environmental Protection Agency (USEPA) is responsible for establishing the national ambient air quality standards and enforcing the federal Clean Air Act. This agency also regulates emission sources under the exclusive authority of the federal government, such as aircraft, certain types of ships and locomotives. The USEPA has jurisdiction over emission sources outside state waters (e.g., beyond the outer continental shelf) and establishes various emission standards, including those for

vehicles sold in states other than California. Automobiles sold in California must also meet the often stricter emission standards established by the California Air Resources Board (CARB). For additional information about the USEPA, contact the USEPA's general internet address at www.epa.gov. Information on the programs and activities in USEPA Region IX, which includes California, can be found at www.epa.gov/region9, and additional information on mobile source emissions is available from the Office of Mobile Sources at www.epa.gov/otaq/index.htm.

California Air Resources Board

The CARB became part of the California Environmental Protection Agency (CalEPA) in 1991. The agency is responsible for ensuring implementation of the California Clean Air Act, meeting state requirements of the federal Clean Air Act, and establishing state ambient air quality standards. It is also responsible for setting vehicle emission standards and fuel specifications, and regulating emissions from other sources such as consumer products and certain types of mobile equipment (e.g., lawn & garden equipment, industrial forklifts). The internet address for CalEPA is www.calepa.ca.gov; the internet address for CARB is www.arb.ca.gov.

South Coast Air Quality Management District

Because Southern California has one of the worst air quality problems in the nation, the AQMD was created by the 1977 Lewis Air Quality Management Act. Four county air pollution control agencies were merged into one regional district to better address the issue of improving air quality in Southern California. Under the act, revised and renamed the Lewis-Presley Air Quality Management Act in 1988, the AQMD is the agency principally responsible for comprehensive air pollution control in the South Coast basin. Specifically, the AQMD is responsible for monitoring air quality and planning, implementing, and enforcing programs designed to attain and maintain state and federal ambient air quality standards in the district. Programs developed include air quality rules and regulations that regulate stationary source emissions, including area and point sources and certain mobile source emissions. The AQMD is also responsible for establishing permitting requirements and issuing permits for stationary sources and ensuring that new, modified, or relocated stationary sources do not create net emissions increases. The AQMD enforces air quality rules and regulations through a variety of means, including inspections, educational and training programs, and fines.

The AQMD has jurisdiction over an area of 10,743 square miles, referred to in this document as the South Coast air district. This area includes all of Orange county, all of Los Angeles county except for the Antelope Valley, the non-desert portion of western San Bernardino county, and the western and Coachella Valley portions of Riverside county. The South Coast basin is a sub-region of the district and covers an area of 6,745 square miles. The South Coast basin includes all of Orange county and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties. Figure 1-1 shows the jurisdictional boundaries of the South Coast air district and the South Coast basin.

Both the district and the South Coast basin are surrounded by mountains, which tend to restrict air flow and concentrate pollutants in the valleys or "basins" below. The South Coast basin is almost entirely urban, and its pollution is typically related to dense population and associated area sources, heavy vehicular traffic, and industrial sources. In the Coachella Valley, pollution problems are associated primarily with ozone transport from the South Coast basin and with particulate emissions from heavy construction, travel on paved and unpaved roads, and agriculture.

public. This committee, therefore, offers local governmental agencies the opportunity to comment on the AQMD's rule-making and planning processes.

The second branch of the AQMD is the Hearing Board, which is a quasi-judicial panel authorized to provide relief to regulated facilities from AQMD regulations. Relief from regulations can only occur under specific circumstances, such as emergencies, etc. State law requires that the Hearing Board be appointed by the Governing Board, but the Hearing Board acts independently of the Governing Board. The third branch is management/staff, which is the bulk of the agency and reports to the AQMD Governing Board. This branch includes the divisions responsible for: developing rules and rule amendments; permitting of air pollution sources and rule compliance; planning programs such as the AQMP; air quality monitoring; public outreach and small business assistance; and prosecuting cases of rule violations. Additional information on the AQMD is available at AQMD's internet address - www.aqmd.gov.

Local Governments

Air quality issues in the South Coast air district are addressed through the efforts of federal, state, regional, and local government agencies. These agencies and the legislation that authorizes them to regulate air quality are shown in Figure 1-2. Local governments work in concert with their Councils of Governments and the AQMD to improve air quality through a variety of programs, including regulatory actions, policy making, and education programs. **Local governments have the flexibility to address air quality issues through ordinances, local circulation systems, transportation services, and land use. No other level of government has that authority, including the AQMD.** This document recognizes the vital role of local government policies and programs that are designed to complement and support both local and state air regulations. These policies, particularly in land use, transportation and energy, are essential to achieve state and federal air pollution standards and reduce localized air pollution impacts. For many local governments in the district, the General Plans consolidate air quality related goals, objectives and policies into an optional air quality element. A stand alone air quality element gives direction for sound decision making on air quality-related issues and provides a solid basis to inform the public, as well as developers, about air quality policies to protect public health.

Local governments, which include both city and county agencies, have the ability to control or mitigate air pollution through their police powers and land use decision-making authority. Local ordinances can also provide mechanisms for reducing air pollution. Many cities in the South Coast air district have adopted air quality elements into their General Plans, coordinating these elements with the Air Quality Management Plan (AQMP) and the congestion management program requirements required by state law. Local design standards such as requirements for bicycle racks and bicycle paths may result in reducing motor vehicle trips, and administrative actions can be taken that reduce air pollution, such as creating a telecommunication program that enables employees to work at home. Also, capital improvement programs can fund transportation infrastructure projects such as bus turnouts, energy-efficient street lights, and synchronized traffic signals that contribute to improved air quality.

Government	Legislation	Implementing Agencies

Figure 1-2
Authorizing Legislation with Air Quality Components

THE REGIONAL COMPREHENSIVE PLAN

The Regional Comprehensive Plan (RCP) is being developed by SCAG as a useful resource for local governments within the SCAG region to implement regional plans and policy objectives. The goals, policies and strategies of four regional plans are described in the RCP:

- 2004 Regional Transportation Plan
- 2004 Regional Transportation Plan Environmental Impact Report
- 2004 Transportation Improvement Plan
- Regional Growth Strategy ("Compass Growth Vision")

Similar to this Guidance Document for Addressing Air Quality in General Plans and Local Planning, the RCP is an advisory document that lays out steps that local governments and other stakeholders may take to support regional objectives.

THE REGIONAL AIR QUALITY MANAGEMENT PLAN

The AQMD has authority to reduce emissions from stationary sources, some area sources, and certain indirect sources. The AQMD is the lead agency in charge of, with input from the Southern California Association of Governments (SCAG) and CARB, developing the AQMP. The AQMP is a comprehensive plan that includes control strategies for stationary and area sources, as well as for on-road and off-road mobile sources. SCAG has the primary responsibility for providing future growth projections and the development and implementation of transportation control measures. CARB in coordination with federal agencies provides the control element for mobile sources.

ENVIRONMENTAL JUSTICE

California state law defines environmental justice as the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies (California Government Code sec.65040.12). In 1997, AQMD implemented 10 environmental justice initiatives designed to protect district residents' right to live and work in an environment of clean air, free of airborne health threats. The AQMD defines environmental justice as "equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution."

AQMD's environmental justice program was expanded in 2002 to include 23 enhancements that serve as the basis for further outreach and problem-solving activities regarding environmental justice issues. The goal of developing a model air quality element for local government General Plans is one of the program enhancements established to reduce health risks associated with exposure to air pollution. The progress of AQMD's environmental justice program is reviewed each year and a new workplan is established for the coming year. Public input on the workplan is solicited through a series of public consultation meetings. Prior to being adopted by the AQMD Governing Board, environmental justice work plans are reviewed by the Ethnic Community Advisory Group, an ethnically-diverse committee of residents and businesspeople. For an update on AQMD's environmental justice initiatives, visit <http://www.aqmd.gov/ej/index.htm>.

Often, local governments broadly define "environmental justice" in general plans to balance air quality with other environmental, economic, and social objectives. Broad definitions supported by specific goals, objectives and polices prevent possible procedural inequities (e.g., public meeting times that limit attendance by certain groups)

and geographical inequities (e.g., heavy industrial land uses adjacent to certain neighborhoods). California General Plan Guidelines recommend incorporating policies that support environmental justice in all mandatory and optional elements. Local jurisdictions may choose to define “environmental justice” and consolidate all environmental justice policies in an optional environmental justice element. As stated in the California General Plan Guidelines, the definition of environmental justice clearly leads to policies and planning principles that prevent incompatible land uses that pose threats to the health, safety, and welfare of the community. Furthermore, the definition of “environmental justice” and the policies to achieve environmental equity in an air quality element must not conflict with policies in other elements.

FORMAT OF THE DOCUMENT

This guidance document is formatted with six topics that are typically addressed in an air quality element of a general plan. Air quality issues are described as they are related to each topic, and a menu of strategies and suggested policies are listed that will integrate air quality issues into the general plan. Not all suggested policies are pertinent or applicable for all jurisdictions. The severity of local air pollution problems in various regions of the district (e.g., windblown dust or localized TAC concentrations) will influence the number and scope of air pollution-related strategies that jurisdictions consider for adoption in their General Plans.

The six topics discussed in this document are:

- Chapter 2 - Land Use
- Chapter 3 - Transportation
- Chapter 4 - Stationary Sources of Pollution
- Chapter 5 - Reduction of Fugitive Dust Emissions
- Chapter 6 - Energy Conservation
- Chapter 7 - Public Awareness and Education

The State Guidelines closely adhere to statute and case law and rely upon commonly accepted principles of contemporary planning practice. A four-tier format for general plan elements is suggested, using the terms “goal,” “objective,” “policy,” and “implementation measure” as follows:

1. **Goal** - A goal statement expresses an end, not an action.
2. **Objective** - An objective describes a specified end, condition, or state that is an intermediate step toward attaining a goal. It should be achievable and, when possible, measurable and time-specific.
3. **Policy** - A policy statement guides decision-making and indicates a commitment of the local legislative body to a particular course of action. A policy is based on and

helps implement a general plan's objectives. A policy is carried out by implementation measures.

4. **Implementation Measure** - An implementation measure is an action, procedure, program, or technique that carries out general plan policy. Each policy has at least one corresponding implementation measure.

This guidance document includes a three-tier format (goals, objectives, and policies/strategies) which closely parallels the four-tier format outlined in state guidelines. A number of stakeholders suggested that the "policies/strategies" category is more helpful and less prescriptive, and allows more flexibility to interpret and craft policy statements that are specific to the needs of the local jurisdiction. During the implementation phase, staff will continue to solicit feedback from stakeholders. If necessary, AQMD staff will move toward a four-tier format in the future and consider an additional subcategory of "implementation measures".

CHAPTER 2

AIR QUALITY ISSUES REGARDING LAND USE

- **LOCAL GOVERNMENT SITING CRITERIA FOR SENSITIVE RECEPTORS**
- **JOB-HOUSING BALANCE**
- **SUGGESTED GOAL, OBJECTIVES AND POLICIES/STRATEGIES RELATED TO LAND USE**

AIR QUALITY ISSUES REGARDING LAND USE

Local government land use authority in planning, zoning, and permitting can be a very effective tool to minimize air pollutant emissions and associated health risks. However, it is important to recognize that traditional assumptions about planning and zoning compatibility to protect the public may not always eliminate adverse health impacts of air pollution. While it is recognized that local governments, to make the best decisions for the benefit of their residents, must weigh and balance multiple issues, demands and concerns, including, but not limited to, the need for housing, existing development and development patterns, environmental responsibilities and more when making land use decisions, some projects being considered by local land use decision-makers may comply with zoning and air pollution control requirements but still result in adverse health impacts on nearby sensitive receptors. These health impacts may result from emissions released at a single site, along a transportation corridor or a combination of co-located air pollution sources in a community. For example, the co-location of residential and commercial zones often minimize transportation-related emissions, but in some situations this mixed land use may also increase health risks if commercial facilities that emit toxic chemicals are over concentrated. While mixed-use zoning offers economic, social, and environmental benefits compared to single-use zoning, this chapter describes certain industrial, commercial and transportation uses that may pose health concerns with residences, schools, and other sensitive sites. This document introduces land use related policies that rely on design and distance parameters to minimize emissions and lower potential health risk.

LOCAL GOVERNMENT SITING CONSIDERATIONS FOR SENSITIVE RECEPTORS

There is a strong connection between health risk and the proximity of the source of air pollution. Local jurisdictions have the responsibility for determining land use compatibility for sensitive receptors. A sensitive receptor is a person in the population who is particularly susceptible to health effects due to exposure to an air contaminant. The following are land uses (sensitive sites) where sensitive receptors are typically located:

- schools, playgrounds and childcare centers
- long-term health care facilities
- rehabilitation centers
- convalescent centers
- hospitals
- retirement homes
- residences

Facilities and Operations That Emit Odors and Dust

Both the AQMD and local governments receive complaints about dust and offensive odors. Odors and dust are air pollutants that can have negative health impacts. While

almost any source may emit objectionable odors, some land uses will be more likely to produce odors or dust because of their operation. The types of facilities or operations that are prone to generate odors, and dust, and other air pollutants can be identified from complaints received by the AQMD (Table 2-1). While AQMD records indicate these facilities have the potential to emit odor or dust that may impact sensitive receptors, individual equipment and operations within each source category do not necessarily generate dust or odor. Special care needs to be given to the initial siting and design of operations and facilities listed in Table 2-1. Assessing potential impacts depends on a number of variables such as wind speed and direction, design features of the proposed facility such as stack height, and the physical distance from the source and the sensitive receptors. Local governments should identify both new projects that have a probability of pollution-related complaints and new developments that may be affected by existing upwind sources. Ideally, potential odor and dust emissions from new projects should be identified and evaluated while the project is still in its initial design phase. This early effort could provide an opportunity to change the project design to minimize or eliminate emissions before the facility becomes operational. Potential odor and dust sources that can be identified and mitigated before construction of a project begins will minimize health impacts and enforcement problems. Local governments are advised to contact the AQMD's Office of Engineering and Compliance to determine if complaints have been filed by property owners or occupants in the general vicinity of a proposed project site to help evaluate the potential for dust or odor complaints.

Table 2-1

Sources of Odor and Dust Complaints Received by the AQMD

Sources of Odors	Sources of Dust
Agriculture (farming and livestock) Chemical Plants Composting Operations Dairies Fiberglass Molding Landfills Refineries Rendering Plants Rail Yards Wastewater Treatment Plant	Agricultural (Land Tilling) Asphalt and Cement Plants Auto Body Facilities Construction Activities Diesel Engines/Vehicles Composting Operations Fertilizer Operations Fiberglass Molding Furniture Manufacturing - Sawdust Landfills and Transfer Stations Refineries Roofing Operations Rubber Manufacturing Sand and Gravel Operations Sandblasting Silk Screening Wood dust

Toxic Air Contaminants

Sensitive receptors (and the facilities that house them) in proximity to sources of air pollutants that emit TACs are of particular concern. Exposure to TACs can increase the risk of contracting cancer or result in adverse non-cancer health effects. Non-cancer health risks associated with TAC exposure include birth defects and other reproductive damage, neurological disorders, and damage to the respiratory system. A comprehensive monitoring study of TACs was initiated as part of AQMD's environmental justice program. The Multiple Air Toxics Exposure Study (MATES-II) included fixed sites characterizing neighborhood-scale conditions and a complementary microscale study to sample potential localized influences of toxic-emitting sources near residential neighborhoods. Inventories of TACs were utilized in computer simulation models to depict toxic risks for the entire South Coast basin. The MATES-II project represents one of the most comprehensive air toxics monitoring programs ever conducted in a major urban area in the country, and it has been recognized as a model program. Findings from the study revealed the following:

- Average cancer risk from ambient measurements in the South Coast basin was found to be 1400 in a million;
- Diesel exhaust is responsible for about 70 percent of the total cancer risk from air pollution;
- Emissions from mobile sources -- including cars and trucks as well as ships, trains and planes -- account for about 90 percent of the cancer risk. Emissions from businesses and industry are responsible for the remaining 10 percent; and
- The highest cancer risk occurs in south Los Angeles county -- including the port area -- and along major freeways.

In 2005, the AQMD plans to release the results of another intensive one-year study that examined current levels of cancer-causing TACs and the risk they pose to district residents. This study will help gauge the effectiveness of current regulations and serve as a vital tool in helping shape future air quality and environmental justice policies. MATES-III will monitor 21 TACs and four other substances at 10 sites across the Los Angeles basin. The AQMD will use mobile monitoring stations to sample at neighborhood sites near toxic emission sources or in areas where community members are concerned about health risks from air pollution. Such neighborhood sites could be near airports, rail yards, warehouses, landfills, high-volume vehicle traffic, or multiple commercial or industrial facilities. Sampling at each neighborhood site lasts for up to two months. The goal of MATES-III is to update TAC levels and toxic emission inventories, determine the cancer and non-cancer health risk from air toxics across the district. Also, the study will investigate potential toxic "hot spots" in local communities.

The potential impacts of new facilities on sensitive sites will depend on a variety of factors including the amount and toxicity of pollutants emitted, the type of air pollution control equipment at the facility, design features of the facility, the distance from the

source of emissions to the sensitive receptor, and local meteorology. All these factors should be carefully evaluated when siting a source of air pollution. Typically, the siting process followed by land use agencies to avoid the location of sensitive sites (e.g., residences, health clinics, etc.) near sources of air pollution does not involve the AQMD. The potential for public health impacts remains unchanged when siting sensitive receptors near a pollution source or a pollution source near a sensitive receptor. Therefore, local policies should allow for a thorough evaluation of the air quality impacts for both scenarios.

Where possible, CARB recommends a minimum separation between new sensitive land uses and the following eight categories of existing sources (Table 1-1 in CARB's Proposed Air Quality and Land Use Handbook: A Community Health Perspective, March 2005, or subsequent versions adopted by CARB):

- high-traffic freeways and roads
- distribution centers
- rail yards
- ports
- refineries
- chrome plating facilities
- perchloroethylene dry cleaners
- large gasoline stations

It is recommended that the AQMD be consulted to obtain facility-specific emissions information and accepted assessment methods for determining relative exposure and health risk for proposed projects.

Recent studies have found an increased incidence of adverse effects among those who live near busy roadways; these include increased respiratory disease and increased mortality (Wilhelm, M., et al 2003; Kim, J. et al 2004). These studies found that residential proximity to traffic was associated with increased risk of low birth weight, increased medical visits for asthma and increased respiratory symptoms in children. Studies conducted near freeways in Southern California show that traffic emissions, such as carbon monoxide, ultra-fine particulates, and black carbon (soot) are several times higher next to freeways than the background concentrations. These concentrations fell to lower levels with increasing distance from the roadway, decreasing about 60-80 percent within 100 meters (Zhu, Yifang, et al, 2002).

Recent results from the Children's Health Study have shown strong evidence of adverse effects in children exposed to ambient levels of traffic-related pollutants. This study followed children in 12 communities in Southern California from 4th grade through 12th grade (McConnell, K., et al, 2002). Children in communities with high levels of NO_x, PM_{2.5}, acid vapors, and elemental carbon showed reduced lung function growth over the study period. Additionally, a higher level of asthma was found in the children that lived nearest to busy roadways. In a report prepared for CARB, researchers concluded that the current levels of ambient air pollution in Southern California are associated with

clinically important chronic health effects that have substantial health and economic impacts (Peters, 2004).
