Industrial Projects: Since the majority of GHG emissions in the district are comprised of CO₂ emissions from burning natural gas rather than other types of fossil fuel, staff compiled reported annual natural gas consumption for 1,297 ~~115~~ permitted facilities for 2006-2007 and rank-ordered the facilities to estimate the 90th percentile of the cumulative natural gas usage for all permitted facilities. Operators of these facilities are required to report their emissions and associated throughput under the SCAQMD's Annual Emission Reporting (AER) Program if any of their criteria pollutant emissions exceed four tons per year (100 tons per year for CO) or if the facility has any reportable air toxics emission. Figure 3-2 shows that approximately 10 percent of facilities evaluated comprise more than 90 percent of the total natural gas consumption, which corresponds to 10,000 metric tons per year (tpy) of CO₂ emissions. This value represents a boiler with a rating of approximately 27 million British thermal units per hour (mmbtu/hour) of heat input, operating at ~~an 25-80~~ percent capacity factor. If the screening threshold of 10,000 MTCO₂eq./yr is implemented, based on the permitting activities for 2006-2007 it will result in at least 31 additional MNDs or EIRs being prepared by the SCAQMD as the lead agency unless another tier option is selected to demonstrate no significant impacts for GHG emissions. It should be noted that this analysis did not include other possible GHG pollutants such as methane, N₂O; a life-cycle analysis; mobile sources; or indirect electricity consumption. Therefore, under a 10,000 MTCO₂eq./yr screening level more projects would be required to go through an MND or EIR environmental analysis than is currently the case. Furthermore, when the SCAQMD acts as a lead agency, the stationary source equipment employed as part of the proposed project typically must comply with BACT or other SCAQMD rules, regulations, programs that require reducing criteria pollutants or air toxics. Therefore, staff is proposing to replace the 6,500 MTCO₂/yr screening level with the 10,000 MTCO₂eq/yr as the screening level in tier III for industrial projects when the SCAQMD is the lead agency for the project.

Residential and Commercial Projects: To achieve the same 90 percent GHG emission capture rate for this segment of projects GHG emissions from residential and commercial sectors were compared to the GHG emissions from the industrial sector including the in-state power plants. The draft AB32 scoping plan indicates that based on statewide 2002-2004 average GHG emissions, the residential and commercial sectors account for approximately nine percent of the total statewide GHG inventory, while the industrial sector (including instate power plants) accounts for approximately 30 percent of the statewide GHG emission inventory. The inventory methodology for both sectors includes only on-site energy use, consistent with the staff approach taken in deriving the 10,000 tpy threshold. Assuming similar emission characteristics also exist for the residential and commercial sector (i.e., large residential or commercial projects, although fewer in numbers, contribute substantially more to the total emissions), it is estimated that at a threshold of approximately 3,000 MTCO₂eq/yr emissions (10,000 x (9 percent / 30 percent)) would capture 90 percent of the GHG emissions from new residential or commercial projects. A series of sensitivity analyses was performed by the staff using URBEMIS to assess the likely project size for 3,000 MTCO₂eq/yr emissions. Table 3-3 illustrates various projects by size and shape.

*Offsite electricity use, water use, or other potential life cycle emissions not included.

As shown in Table 3-3, this threshold would represent a residential development of about 70 single-family dwelling units. It should be noted that the sensitivity analysis did not include GHG emissions from electricity use and water use. As a result, similar to the earlier discussion of industrial projects, this screening level of 3,000 MTCO₂eq/yr could capture development projects less than 70 single-family dwelling units.

In CAPCOA’s White Paper, it is suggested that a thresholds of 900 MTCO₂eq/yr would capture 90 percent of all development projects, which should translate into at least 90 percent of GHG emissions from the residential and commercial sectors². According to CAPCOA 900 MTCO₂eq/yr equates to approximately 50 single-family dwelling units. This information appears to corroborate the SCAQMD staff’s finding that the policy objective of capturing 90 percent of all GHG emissions for this region can be achieved with a screening level of 3000 MTCO₂eq/yr. Therefore, staff is recommending that this value be used by lead agencies for residential and commercial developments, including industrial parks, warehouses, etc.

- **Tier 4 – Decision Tree Options:** consists of three decision tree options to demonstrate that a project is not significant for GHG emissions. The three compliance options are as follows.

Compliance Option 1 – the lead agency would calculate GHG emissions for a project using a BAU methodology. Once GHG emissions are calculated, the project proponent would need to incorporate design features into the project and/or implement GHG mitigation measures to demonstrate a 30 percent reduction from BAU. Although a 30 percent reduction below BAU is consistent with the target objectives of AB 32, it will continue to reduce GHG emissions beyond 2020, thus, contributing to GHG reductions pursuant to the Governor’s Executive Order S-3-05 (a 90 percent reduction compared to current GHG emissions). A 30 percent reduction is also considered to be an achievable GHG reduction target based on current technologies.

Compliance Option 2 – this option consists of early compliance with AB 32 through early implementation of CARB’s Scoping Plan Measures. The intent of this compliance option is to accelerate GHG emission reductions from the various

² Although the CAPCOA White Paper implies that 900 metric tons per year equates to a 90 percent capture rate, there is no explicit information provided in the White Paper that demonstrates this correlation. Indeed, the CAPCOA authors state that 900 metric tons, which represents approximately 50 residential units, corresponds to widely divergent capture rate percentile rankings depending on the project location (see discussion on page 43 of the White Paper). Percentile rankings were based on a survey of four cities in California. A project of 900 metric tons per year representing a 90 percent capture rate appears to be a working assumption for which there appears to be no factual basis. Further, although not explicitly stated, it is assumed that the 900 metric tons were derived using the URBEMIS2007 model. It should be noted that that the URBEMIS2007 model only quantifies CO₂ emissions and direct emissions primarily from on-road mobile sources. It does not capture other GHG pollutants or indirect GHG emissions such as emissions from energy generation, water conveyance, etc. Therefore, it is likely that a 50-unit residential project would actually generate higher GHG emissions than 900 metric tons per year.

sectors subject to CARB’s Scoping Plan to eliminate GHG emission, especially for those GHGs that have a long atmospheric lifetime such as CO₂, sulfur hexafluoride, etc., to minimize future projected impacts to California from global climate change.

Compliance Option 3 – this compliance option consists of establishing sector-based performance standards. For example, it may be possible to use the 1990 inventory required under AB 32 to establish an efficiency standard such as pounds per person, pounds per worker, pounds per square feet, pounds per item manufactured, etc. When calculating GHG emissions from a project, if they are less than the established efficiency standard the project would not be significant relative to GHG emissions, while projects exceeding the efficiency standard would be significant.

If the lead agency or project proponent cannot achieve the performance standards on any of the compliance options in Tier 4, GHG emissions would be considered significant.

- **Tier 5** – under this tier, the lead agency would quantify GHG emissions from the project and the project proponent would implement offsite mitigation (GHG reduction projects) or purchase offsets to reduce GHG emission impacts to less than the proposed screening level. In addition, the project proponent would be required to provide offsets for the life of the project, which is defined as 30 years. If the project proponent is unable to obtain sufficient offsets, incorporate design features, or implement GHG reduction mitigation measures to reduce GHG emission impacts to less than the screening level, then GHG emissions from the project would be considered significant. Since it is currently uncertain how offsite mitigation measures, including purchased offsets, interact with future AB 32 Scoping Plan measures, the AQMD would allow substitution of mitigation measures that include an enforceable commitment to provide mitigation prior to occurrence of emissions and to prevent mitigating the same emissions twice.

Mitigation Preference – If a project generates significant adverse impacts, CEQA Guidelines §15126.4 requires identification of mitigation measures to minimize potentially significant impacts. Because GHG emissions contribute to global change, mitigation measures could be implemented locally, nationally, or internationally and still provide global climate change benefits. Because reducing GHG emissions may provide co-benefits through concurrent reductions in criteria pollutants, when considering mitigation measures when the AQMD is the lead agency under CEQA, staff will implement mitigation measures that are real, quantifiable, verifiable, and surplus in the following order of preference.

- Incorporate GHG reduction features into the project design, e.g., increase a building’s energy efficiency, use materials with a lower global warming potential than conventional materials, purchase building materials locally, etc.
- Implement onsite measures that provide direct GHG emission reductions onsite, e.g., replace onsite combustion equipment (boilers, heaters, steam

generators, etc.) with more efficient combustion equipment, replace existing high global warming potential refrigerants with low global warming refrigerants, eliminate or minimize fugitive emissions, etc.

- Implement neighborhood mitigation measure projects that could include incentives for installing solar power, increasing energy efficiency by exceeding Title 24 building standards through replacing low efficiency water heaters with high efficiency water heaters, increasing building insulation, using fluorescent bulbs, replacing old inefficient refrigerators with efficient refrigerators using low global warming potential refrigerants, etc.
- Implement in-district mitigation measures such as any of the above identified GHG reduction measures; reducing vehicle miles traveled (VMT) through greater rideshare incentives, transit improvements, etc.
- Implement in-state mitigation measures, which could include any of the above measures.
- Implement out of state mitigation measure projects, which may include purchasing offsets if no other options are available.

CARB's Interim GHG Significance Threshold Proposal

In October 2008 CARB released its interim GHG significance threshold proposal and held a public workshop on October 27, 2008. CARB's threshold is considered to be an interim threshold because CARB staff intends to periodically review and change its threshold proposal as necessary. CARB's Preliminary Draft Staff Proposal (Proposal) states that non-zero GHG significance thresholds can be supported by substantial evidence. Further, different GHG significance thresholds may be established for different sectors. Therefore, as part of its initial interim GHG significance threshold proposal CARB is proposing two separate GHG significance thresholds, one for new industrial projects and another for residential/commercial projects subject to CEQA. CARB's proposal uses a tiered approach (see Table 3-4).

Table 3-4
 Comparison of CARB’s and AQMD’s Interim GHG Significance Thresholds Approaches

	<u>Stationary/Industrial Sector Projects</u>		<u>Residential/Commercial Sector Projects</u>	
	<u>CARB</u>	<u>AQMD</u>	<u>CARB</u>	<u>AQMD (Not Recommended at this Time)</u>
<u>Policy Objective</u>	<u>Capture 90% of statewide stationary project emissions</u>	<u>Capture 90% of district wide GHG emissions (industrial)</u>	<u>Capture X% of statewide residential/commercial project emissions</u>	<u>Capture 90% of district wide residential/commercial project GHG emissions</u>
<u>Exemption</u>	<u>Apply applicable exemption</u>	<u>Apply applicable exemption</u>	<u>Apply Applicable Exemption</u>	<u>Apply Applicable Exemption</u>

<u>Determination</u>	<u>GHG emissions significant, EIR is prepared, if meeting none of the above</u>	<u>GHG emissions significant, EIR is prepared, if meeting none of the above</u>	<u>GHG emissions significant, EIR is prepared, if meeting none of the above</u>	<u>GHG emissions significant, EIR is prepared, if meeting none of the above</u>

CARB’s interim GHG significance threshold for industrial sources was developed to capture “the vast majority (~90% statewide) of the GHG emissions from new industrial projects being subject to CEQA’s requirement to impose feasible mitigation.” According to CARB’s Proposal, CARB staff used data from a survey of industrial boilers performed by the Oak Ridge National Laboratory in which it was concluded that small boilers with an input capacity of 10 MMBtu/hr corresponded to 93 percent of total industrial boiler input capacity, or 4,660 MTCO₂e/yr. Using this result and accounting for process losses, purchased electricity, and water usage and wastewater discharge, CARB staff is recommending 7,000 MTCO₂eq/yr as a GHG significance threshold for industrial projects. The following bullet points summarize CARB’s proposed interim GHG significance threshold for industrial sources.

- Box 1 – Apply any applicable categorical or statutory exemptions. If the project does not qualify for an exemption, move to Box 2.
- Box 2 – The industrial project must meet both of the following performance standards or equivalent mitigation measures to be deemed insignificant for GHGs:
 - Construction – Project must meet an interim performance standard for construction- related emissions (performance standard not yet defined).
 - Transportation – Project must meet an interim performance standard for transportation (performance standard not yet defined).

AND

- Project with mitigation will emit no more than 7,000 MTCO₂eq/yr. If the project does not qualify for either of the performance standards or exceeds 7,000 MTCO₂eq/yr, move to Box 3.
- Box 3 – Project is deemed significant and an EIR must be prepared.
- CARB’s Preliminary Draft Proposal for Residential and Commercial projects is summarized in the following bullet points.
- Box 1 – Apply any applicable categorical or statutory exemptions. If the project does not qualify for an exemption, move to Box 2.
- Box 2 – Project complies with a previously approved plan that addresses GHG emissions and must: include a GHG reduction target consistent with AB 32; be consistent with transportation-related target adopted by CARB pursuant to SB 375; include a GHG inventory and mechanism for monitoring GHG emissions; include enforceable GHG requirements; include a mechanism for periodic updates to plan; and have a certified CEQA document. If the project is

consistent with a GHG plan that includes all of these elements, it is presumed to be insignificant for GHGs. If the project is not consistent with a GHG plan or there is no adopted GHG plan that includes all of the above elements, move to Box 3.

- Box 3 – The residential/commercial project must meet all of the following performance standards or equivalent mitigation measures to be deemed insignificant for GHGs:
 - Construction – Project must meet an interim performance standard for construction- related emissions (performance standard not yet defined).
 - Operations – Project must meet the following performance standards: energy use performance standard defined in CEC’s Tier II Energy Efficiency goal; an interim performance standard for water use (performance standard not yet defined); an interim performance standard for waste (performance standard not yet defined); and an interim performance standard for transportation (performance standard not yet defined).

AND

The project with performance standards or equivalent mitigation will emit no more than X MTCO₂eq/yr (criterion to be developed). If the project does not qualify for any one of the performance standards or exceeds X MTCO₂eq/yr, move to Box 4.

- Box 4 – Project is deemed significant and an EIR must be prepared.

For a detailed description of CARB’s interim GHG significance threshold proposal, refer to the following URL:
<http://www.arb.ca.gov/cc/localgov/ceqa/meetings/102708/prelimdraftproposal102408.pdf>.

CARB is currently accepting comments on its Draft Proposal and has scheduled a second public workshop on December 9, 2008. CARB staff currently anticipates taking their proposal to their Board in February 2009.

CHAPTER 4

CONSIDERATIONS WHEN ANALYZING GHG EMISSIONS

Introduction

GHG Analysis Recommendations

INTRODUCTION

As noted in Chapter 1, on June 19, 2008, OPR, in collaboration with the California Resources Agency, the California Environmental Protection Agency and the California Air Resources Board, released a *Technical Advisory* containing informal guidance for public agencies as they address the issue of climate change in their CEQA documents. With regard to analyzing GHG emission impacts OPR states,

“Each public agency that is a lead agency for complying with CEQA needs to develop its own approach to performing a climate change analysis for projects that generate GHG emissions. A consistent approach should be applied for the analysis of all such projects, and the analysis must be based on best available information... Lead agencies should determine whether greenhouse gases may be generated by a proposed project, and if so, quantify or estimate the GHG emissions by type and source.”

Other than this general advice, the *Technical Advisory* does not provide explicit details for quantifying GHG emissions.

CAPCOA’s White Paper provides a comprehensive discussion of modeling tools that are currently available for analyzing GHG emissions³. As indicated in the White Paper, no one model is currently available that is capable of estimating all of a project’s direct and indirect GHG emissions. It is likely, however, that the Urban Emissions (URBEMIS) Model will be the most commonly used model for calculating GHG emissions because it currently calculates CO₂ emissions (in addition to criteria pollutant emissions) during both construction and operation of proposed projects, it is publicly available, and already widely used in California. Statewide use of the URBEMIS model would provide consistency throughout California with regard to quantifying GHG emissions. For a list of currently available models that calculate GHG emissions and summaries of the capabilities, advantages, and disadvantages of each model refer to Table 10 on pages 75 through 78 in the CAPCOA White Paper.

The purpose of this chapter is to provide more explicit guidance to CEQA practitioners with regard to quantifying GHG emissions than OPR’s *Technical Advisory*, while building on the information provided CAPCOA’s White Paper.

GHG ANALYSIS RECOMMENDATIONS

Direct/Indirect Impacts

As noted in Chapter 3 of this Guidance Document, consistent with CEQA, indirect and direct impacts of the project, typically within California, are required to be analyzed in the CEQA document for a proposed project. The analysis of direct GHG impacts is

³ For maximum transparency with regard to quantifying GHG emissions and disclosure to the public, SCAQMD staff recommends using only publicly available models.

relatively straightforward as onsite GHG sources or directly related offsite GHG sources, such as worker commute trips, are generally readily identifiable. Indirect GHG emission sources are less obvious, but may include some of the sources identified in the following paragraphs. In general, for most projects information on direct and indirect emissions may be available, rather than a full life-cycle analysis of emissions. The lead agency has typically been expected to address emissions that are closely related and within the capacity of the project proponent to control and/or influence.

Direct Impacts - are primary effects that are caused by a project and occur at the same time and place, such as emissions from boilers, heaters, or other onsite emissions sources. Direct impacts generated by a project may include offsite sources directly related to the project such as emissions from worker commute trips, haul truck trips to import raw materials and/or export finished products or other goods. The following paragraphs provide general guidance on quantifying direct GHG emissions.

CAPCOA's White Paper provides a comprehensive discussion of modeling tools that are currently available for analyzing GHG emissions. Further, no one model is currently available that is capable of estimating all of a project's direct and indirect GHG emissions. Although there are a number of modeling tools available to calculate GHG emissions the following discussion focuses on a combination of approaches using the URBEMIS model as the basis for analyzing GHG emission impacts. Other approaches for calculating GHG emissions can be used, as long as they are supported by scientific evidence and include publicly available information.

The URBEMIS model is a publicly available model that is currently used statewide to calculate criteria pollutant emissions from construction and operation activities for a wide variety of land use projects. The model is regularly updated through a collaboration of air pollution control agencies, including the SCAQMD, to reflect the most current data, methodologies, and emission factors for quantifying criteria pollutant emissions. The most current update to the model is URBEMIS2007 version 9.2.4, which quantifies CO₂ emissions in addition to criteria pollutant emissions.

Currently, there are several disadvantages to using the URBEMIS model to calculate GHG emissions from a proposed project and, as a result, it should not be the only tool used to calculate GHG emissions. For example, currently the URBEMIS model only quantifies CO₂ emissions and not other GHG pollutants, with the exception of methane from mobile sources, which is converted to CO₂eq. emissions. Since CO₂ emissions comprise the bulk of GHG emissions from most projects, URBEMIS GHG results are fairly representative of GHG emissions from a project.

To quantify mobile source emissions from on-road mobile sources, the URBEMIS model uses trip rate information from the Institute of Transportation Engineers Trip Generation Handbook (ITE, 2001) as the trip rate default factor for all land uses. ITE trip rate information is widely used and is considered legally defensible as they rely on substantial reports and surveys of trip rates in cities with little or no transit. As a result, the ITE trip rates are also considered to provide a conservative estimate of trip

rates and associated emissions. The model, however, treats each trip as a separate trip and doesn't consider that a single trip may be used for more than one purpose, referred to as "internalization." The model also does not fully account for interaction between land uses in its estimation of mobile source operational emissions. URBEMIS does allow the user to overwrite the default trip rates and characteristics with more project-specific data from a traffic study prepared for a project.

In spite of the disadvantages of the URBEMIS model described above, it can be used as the first step in quantifying GHG emissions for typical land use projects because it establishes default parameters for the most common emission sources from a project including construction equipment types and activity profiles, area of site disturbed during construction, building size, number vehicle trips, etc., if the level of information about the project is low. If more information about the project is available such as a precise profile of construction equipment and activity levels, number of vehicle trips based on a traffic study prepared for the project, etc., this information can be incorporated into the model. The model can then quantify CO₂ emissions from both construction and operation.

The URBEMIS construction analysis quantifies criteria pollutant and CO₂ emissions from both off-road sources (primarily construction equipment) and on-road sources (worker commute trips, haul truck trips, etc.). To further flesh out the construction analysis, the lead agency would have to identify emission factors for other GHG pollutants likely to be emitted during construction, i.e., methane and nitrous oxide⁴, for both off-road and on-road emissions sources and then quantify the GHG emission results using spreadsheets or other available tools.

The off-road CO₂ emission factors in the URBEMIS model are generated from CARB's off-road model (<http://www.arb.ca.gov/msei/offroad/offroad.htm>). Methane emission factors for off-road equipment can also be obtained from CARB's OFFROAD2007 model. CO₂ and methane emission factors for off-road equipment that are based on CARB's OFFROAD2007 model can also be found on the SCAQMD's CEQA webpages at the following URL: <http://www.aqmd.gov/ceqa/handbook/offroad/offroad.html>. Other sources of off-road GHG emissions factors for equipment used in California may be used, as long as they are supported by scientific evidence and are publicly available.

The URBEMIS model is able to quantify mobile source CO₂ emissions during construction from on-road mobile sources such as construction worker commute trips, heavy-duty truck trips to haul away demolition debris, soil hauling to and from the site etc., and during operation, primarily vehicle trips using ITE's Trip Generation Manual (ITE, 2001). The on-road CO₂ emission factors in the URBEMIS model for both construction and operation are generated from CARB's on-road mobile source emissions model, EMFAC2007 (<http://www.arb.ca.gov/msei/onroad/onroad.htm>). Methane emission factors for on-road mobile sources can also be obtained from

⁴ Hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride are not combustion emissions, so would not normally be emitted during construction.

CARB's EMFAC2007 model. CO₂ and methane emission factors for on-road mobile sources that are based on CARB's EMFAC2007 model can also be found on the SCAQMD's CEQA webpages at the following URL: <http://www.aqmd.gov/ceqa/handbook/onroad/onroad.html>.

The analysis of operation emissions from all types of land uses in the URBEMIS model focuses primarily on mobile source emissions and some area sources. The model does not quantify emissions from stationary sources. For stationary sources that require a permit from the SCAQMD, emission calculation procedures and methodologies are available in the SCAQMD's Best Available Control Technology Guidelines (<http://www.aqmd.gov/bact/partd7-9-2004update.pdf>). Examples of facilities that use stationary sources requiring a permit from the SCAQMD include: fossil fuel power plants⁵, cement plants, landfills, wastewater treatment plants, gas stations, dry cleaners and industrial boilers. The SCAQMD has procedures and methodologies for projects subject to SCAQMD permits to calculate criteria pollutants and air toxics. It is anticipated that these same procedures and methodologies could be extended to estimate a permitted facility's GHG calculations. For any stationary and area sources that do not require SCAQMD permits, the same methodologies used for permitted sources could be used. It will be necessary to contact the SCAQMD to obtain information on GHG emission calculation methodologies applicable to stationary source equipment.

Indirect Impacts - Indirect or secondary effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems (CEQA Guidelines §15358)(a)(2)). The examples of facilities that use stationary sources requiring a permit from the SCAQMD that may contribute to direct environmental impact (fossil fuel power plants, cement plants, landfills, wastewater treatment plants, gas stations, dry cleaners and industrial boilers) may also contribute to indirect impacts and, therefore, should be included, as necessary in the CEQA analysis of GHGs.

Quantification Methodologies and GHG Emission Factors

Methodologies for calculating GHG emissions and GHG emission factors are currently not readily available. Until such time as GHG calculation methodologies and emission factors become well established and more readily available, lead agencies may want to consult the following references to identify acceptable methodologies and emission factors.

1. The first useful reference for GHG emission factors for stationary sources is EPA's Air Pollutant (AP)-42, which is a compilation of air pollutant emission

⁵ According to CEQA Guidelines §15227, CEQA does not apply to projects outside of California. The California Attorney General's Office has rendered an opinion stating that the definition of the environment in CEQA does not stop at the borders of California. Further, California public agencies that take an action outside of California is still bound by the requirements of CEQA to prepare an EIR if the action may cause a significant effect on the environment.

- factors for stationary point and area sources. Each of the first 13 chapters of AP-42 is dedicated to a specific source activity such as solid waste disposal, petroleum industry, and metallurgical industry. Since the publication of the fifth edition (and supplementals) in 2001, there have been a number of updates to the various specific stationary sources such as hot asphalt plants, organic liquid storage tanks, and coke production. In addition to the criteria pollutant emissions, some of the updated AP-42 chapters provide GHG emission factors for a variety of sources. For example, Chapter 15 of AP-42 focuses on GHG emissions from biogenic sources such as soils, termites, lightning, and enteric fermentation (animal digestive fermentation).
2. Second, the California Climate Action Registry (C-CAR) has prepared a General Reporting Protocol (GRP), which is a relatively easy-to-follow user's manual that outlines the principles, concepts, calculation methodologies and procedures required for effective participation in the California Registry. The appendices of the GRP provide GHG emissions factors, specifically CO₂, CH₄ and N₂O, for electricity use, mobile combustion and stationary combustion based on fuel usage type.
 3. Third, a thorough internet search should be conducted to find reliable sources of emissions factors that would assist in accurately determining GHG emissions from a specific source being evaluated. Again, all potential GHGs, such as CO₂, CH₄ and N₂O, should be evaluated to the best of one's ability to locate dependable information.
 4. Finally, a material balance approach also may provide reliable average emission estimates for specific sources. A material balance is when one accounts for (or "balances") all the materials going into and coming out of the process in order to make a credible emissions estimation. For some sources, a material balance may provide a better estimate of emissions especially in situations where a high percentage of material is lost to the atmosphere (e. g., sulfur in fuel, or solvent loss in an uncontrolled coating process.) In other cases, material balances may be inappropriate where material is consumed or chemically combined in the process, or where losses to the atmosphere are a small portion of the total process throughput.

Reporting GHG Emissions – Daily vs. Annual Emissions

The analysis of GHGs is a much different analysis than the analysis of criteria pollutants for the following reasons. For criteria pollutants, significance thresholds are based on daily emissions because attainment or non-attainment is based on daily exceedances of applicable ambient air quality standards. Further, several ambient air quality standards are based on relatively short term exposure effects on human health, e.g., one-hour and eight-hour. Since the half-life of CO₂ is approximately 100 years, the effects of GHGs are longer-term, affecting global climate over a relatively long time frame (see also Table 3-1).

Typical GHG emission inventories (EPA5, ARB6, etc.) represent directly emitted GHGs during a given year. As a result, the current convention is to present GHG emissions as annual emissions. The URBEMIS model can be set to calculate annual emissions for a project. When using the URBEMIS model to calculate annual GHG emissions, it may be useful to modify the trip rate for each land use using a weighted trip rate average to more accurately reflect annualized trip rates. A weighted trip rate average reflects the trip rates during the week, as well as trip rates during Saturdays and Sundays. Trip rate information for weekdays and weekend days can be found in the ITE Trip Rate Handbook.

CHAPTER 5

CONCLUSION

Introduction

Future Action Items

INTRODUCTION

CEQA Guidelines §15064.7(a) encourages lead agencies to establish thresholds of significance to determine the significance of an environmental impact. Further, thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence (CEQA Guidelines §15064.7(b)). Staff's proposed interim GHG significance threshold proposal has been developed through a public process consisting of a series of Stakeholder Working Group meetings. Staff proposals have been modified over time based on written and oral feedback from the Working Group. Staff's intent was to reach consensus to the extent feasible, but for some items staff could not find common ground with some of the stakeholders.

The next immediate step for SCAQMD staff is to present a final interim GHG significance threshold proposal to the SCAQMD Governing Board for consideration. If the Governing Board approves staff's final interim GHG significance threshold proposal, then staff will embark on a number of short-term and intermediate term activities to provide outreach to public agencies that might use staff's interim GHG significance threshold to determine whether or not their projects' GHG emissions are significant, periodically revisit and revise as necessary the interim proposal, and accommodate stakeholders' requests for more information on GHG calculation methodologies and mitigation measures. The following sections provide discussions on future anticipated action items

FUTURE ACTION ITEMS

Interim GHG Significance Threshold Outreach Program

It is currently anticipated that staff's interim GHG significance threshold proposal will be presented to, and considered by the Board at the November 7, 2008 public hearing. Consistent with other significance threshold proposals adopted by the Governing Board, if the draft GHG significance threshold proposal is adopted, staff will meet with local cities, councils of governments, and leagues of cities to discuss the staff proposal and address any questions or concerns.

Once the interim GHG significance threshold is adopted, this Guidance Document will be posted on the SCAQMD's CEQA web pages. Staff will also send notice of the adoption of the staff proposal to all agencies, organizations, and individuals on the SCAQMD's CEQA "Interested Parties" mailing list. In addition, it is expected that staff will prepare and make available an informational brochure that summarizes information about the interim GHG significance proposal in addition to this Guidance Document.

Starting in January 2009, as part of its intergovernmental review (IGR) responsibilities under CEQA, where the SCAQMD reviews and CEQA documents prepared by other public agencies, SCAQMD will begin more thorough evaluations of CEQA documents with regard to their GHG analyses and the basis by which they make a determination of significance. Staff will begin recommending use of the staff's interim GHG significance threshold proposal or other available GHG significance thresholds based on substantial evidence in comment letters on notices of preparation of an EIR. As of March 1, 2009, staff will formally recommend use of staff's interim GHG significance threshold proposal or other available GHG significance thresholds based on substantial evidence in comment letters on NDs and MNDs. As of July 1, 2009, staff will formally recommend use of staff's interim GHG significance threshold proposal or other available GHG significance thresholds based on substantial evidence in comment letters on EIRs.

Compile Lists of GHG Design Features and Mitigation Measures

CEQA Guidelines §15126.4 requires an EIR to “describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy.” Ideally, it is desirable to avoid impacts altogether through incorporating design features into the proposed project. Because staff's recommended interim GHG significance threshold includes performance standards (see tier 4 compliance options 1 and 3) or a project proponent may try to reduce GHG emissions to less than the applicable screening levels, mitigation measures or design features are important components of the overall GHG significance threshold strategy. As a result, a number of GHG Working Group stakeholders has requested that SCAQMD compile lists of design features or mitigation measures to assist with reducing GHG emissions for all land use types.

In response to the request from GHG Working Group stakeholders to develop GHG design features and mitigation measures, over the next year SCAQMD staff will compile lists of GHG reduction strategies, including control efficiencies, by sector and make the lists available online with other recommended mitigation measures. There is already a robust body of mitigation measures available (see in particular the CAPCOA bullet point discussion below), but in most cases, they do not include control efficiencies. SCAQMD staff will use the following mitigation sources as a basis from which to compile mitigation strategies.

- **CEQA Guidelines, Appendix F** – this appendix includes a list of general energy conservation measures that may be used as a basis to identify GHG reduction strategies. The measures do not contain GHG control efficiencies, so they would need further review to determine if control efficiencies are available.
- **CAPCOA White Paper** – this document provides a comprehensive discussion of GHG reduction strategies and specific mitigation measures are listed in Table 16 in Appendix B. The mitigation measures are grouped by emissions source type, such as transportation measures, parking measures, commercial and residential design features, etc. Table 16 also provides other useful information about each

- mitigation measure including source of each measure, comments and descriptions about each control measure, etc. Most importantly, for many of the mitigation measures CAPCOA has included an emission reduction score. In most cases, the emission reduction score is given as a range. As a result, further evaluation would be necessary to provide a single more precise emission reduction score or a defensible average. Otherwise, it is likely that the high end of the emission reduction score would be used.
- **CARB** - is actively working to develop and adopt GHG protocols to support the Climate Change Program. CARB is working in collaboration with other agencies and organizations, including the California Climate Action Registry, to adopt consistent and standardized methods to accurately report GHG emissions. There are two kinds of GHG protocols, a reporting protocol and a project protocol. The project protocol may be useful as it sets standards and provides specific guidance to define GHG reduction projects and quantify and report GHG reductions from project activities. Some example protocols include manure management and urban forestry. It is expected that additional protocols will be developed and adopted by CARB. It is also expected that CARB's Scoping Plan may provide guidance on regulatory guidance that could be used to develop GHG emission reduction measures. GHG reduction strategies that may also serve as GHG mitigation measures to be developed by CARB over the next two years are shown in Table 5-1.

Table 5-1
California Air Resources Board GHG Emission Reduction Strategies

Strategy	Description of Strategy
Other Light Duty Vehicle Technology	New standards would be adopted to phase in beginning in the 2017 model year
Hydrofluorocarbon Reduction	1) Ban retail sale of HFC in small cans; 2) Require that only low global warming potential (GWP) refrigerants be used in new vehicular systems; 3) Adopt specifications for new commercial refrigeration; 4) Add refrigerant leak-tightness to the pass criteria for vehicular Inspection and Maintenance programs; 5) Enforce federal ban on releasing HFCs.
Transportation Refrigeration Units, Off-Road Electrification, Port Electrification	Strategies to reduce emissions from TRUs, increase off-road electrification, and increase use of shore-side/port electrification.
Manure Management	San Joaquin Valley Rule 4570 (adopted 6/15/06) reduces volatile organic compounds from confined animal facilities through implementation of control options.
Alternative Fuels: Biodiesel Blends	CARB would develop regulations to require the use of 1 to 4 percent biodiesel displacement of California diesel fuel.

Table 5-1 (Concluded)
California Air Resources Board GHG Emission Reduction Strategies

Strategy	Description of Strategy
Alternative Fuels: Ethanol	Increased use of ethanol fuel.
Heavy-Duty Vehicle Emission Reduction Measures	Increased efficiency in the design of heavy duty vehicles and an education program for the heavy duty vehicle sector.
Reduced Venting and Leaks in Oil and Gas Systems	Rule considered for adoption by the Air Pollution Control Districts for improved management practices.
Hydrogen Highway	The California Hydrogen Highway Network (CA H2 Net) is a State initiative to promote the use of hydrogen as a means of diversifying the sources of transportation energy.
Achieve 50% Statewide Recycling Goal	Achieving the State's 50 percent waste diversion mandate as established by the Integrated Waste Management Act of 1989, (AB 939, Sher, Chapter 1095, Statutes of 1989), will reduce climate change emissions associated with energy intensive material extraction and production as well as methane emission from landfills. According to the California Integrated Waste Management Board, in 2005 the statewide waste diversion rate was 52 percent. ⁶
Landfill Methane Capture	Install direct gas use or electricity projects at landfills to capture and use emitted methane.
Zero Waste - High Recycling	Additional recycling beyond the State's 50% recycling goal.

- CEC and CPUC – These agencies are actively developing GHG emission reduction strategies that may also be used to develop GHG mitigation measures for specific energy production sources. Examples of CEC and CPUC GHG emission reduction strategies are shown in Table 5-2.

Other sources of potential GHG emission reduction measures will be evaluated and incorporated, as applicable into any GHG mitigation measure lists developed by the SCAQMD.

⁶ CIWMB, 2007; <http://www.ciwmb.ca.gov/LGCentral/Rates/Diversion/2005/Default.htm>

Table 5-2
GHG Emission Reduction Strategies Implemented by CEC and CPUC

Strategy	Description of Strategy
ENERGY COMMISSION (CEC)	
Building Energy Efficiency Standards in Place and in Progress	Public Resources Code 25402 authorizes the CEC to adopt and periodically update its building energy efficiency standards (that apply to newly constructed buildings and additions to and alterations to existing buildings).
Appliance Energy Efficiency Standards in Place and in Progress	Public Resources Code 25402 authorizes the Energy Commission to adopt and periodically update its appliance energy efficiency standards (that apply to devices and equipment using energy that are sold or offered for sale in California).
Cement Manufacturing	Cost-effective reductions to reduce energy consumption and to lower carbon dioxide emissions in the cement industry.
Municipal Utility Strategies	Includes energy efficiency programs, renewable portfolio standard, combined heat and power, and transitioning away from carbon intensive generation.
Alternative Fuels: non-Petroleum Fuels	Increasing the use of non-petroleum fuels in California’s transportation sector, as recommended in the CEC’s 2003 and 2005 Integrated Energy Policy Reports.
PUBLIC UTILITIES COMMISSION (PUC)	
Accelerated Renewable Portfolio Standard (33 percent by 2020)	The Governor has set a goal of achieving 33 percent renewables in the State’s resource mix by 2020. The joint PUC/Energy Commission September 2005 Energy Action Plan II (EAP II) adopts the 33 percent goal.
California Solar Initiative	The solar initiative includes installation of 1 million solar roofs or an equivalent 3,000 MW by 2017 on homes and businesses, increased use of solar thermal systems to offset the increasing demand for natural gas, use of advanced metering in solar applications, and creation of a funding source that can provide rebates over 10 years through a declining incentive schedule.
Investor-Owned Utility	This strategy includes energy efficiency programs, combined heat and power initiative, and electricity sector carbon policy for investor owned utility.

Periodically Review the Interim GHG Significance Threshold

SCAQMD staff will periodically review and revise staff’s GHG proposal to incorporate applicable updated information on GHGs and GHG reduction strategies resulting from regulatory requirements or advances in technology. Some areas of the current proposal that may be reevaluated include the tier 3 screening levels, and the tier 4 compliance option 1 GHG reduction target objective. Further, staff will evaluate whether or not sector based performance standards can be developed for tier 4 compliance option 3.

If a statewide GHG significance threshold is developed by CARB, staff will review that threshold and report to the Governing Board [by March 2009 considering such a](#)

~~threshold for adoption regarding any implementation issues and ways to transition into the recommended GHG significance threshold within six months of formal approval by the CARB Board.~~

APPENDIX B

SUMMARIES OF WORKING GROUP MEETINGS

WORKING GROUP MEETING #1 (APRIL 30, 2008)

At the first Working Group meeting SCAQMD staff presented the Working Group with a number of policy objectives and design criteria for consideration to establish the framework for developing a GHG significance threshold. Policy objectives include the following concepts. First, the GHG significance threshold should minimize environmental degradation, that is, it should not make impacts worse. To this end, it may be useful to develop a GHG significance threshold that achieves GHG emissions reductions that are consistent with the goals of AB 32 estimated to be approximately 30 percent reduction of GHG emissions from business-as-usual. Although CEQA or a GHG significance threshold established pursuant to CEQA may be useful tools in reducing GHG emissions, they would act in parallel with regulatory requirements, e.g., AB 32, but they do not replace them. As a result, there is no requirement that a GHG significance threshold must reduce GHG emissions consistent with AB 32 or EO S-3-05.

In addition to policy considerations, a number of GHG significance threshold design criteria were also considered. An important consideration in developing a GHG significance threshold is the potential administrative burden it may create on lead agencies through increased resource impacts such as increased costs and staff if the significance threshold is established too low. For example, a zero threshold might result in eliminating or substantially reducing the number of projects that qualify for a categorical exemption, a negative declaration, or a mitigated negative declaration. Other design considerations discussed included establishing a single GHG threshold, such as a “bright line” numerical threshold or multiple thresholds, such as the tiered approaches identified by CAPCOA, etc.

WORKING GROUP MEETING #2 (MAY 28, 2008)

At the second Working Group meeting, staff presented design criteria recommendations based on the discussion at the first Working Group meeting and correspondence received subsequent to the first Working Group meeting. With regard to analyzing life cycle GHG emissions, staff’s initial recommendation was to exclude an analysis of life cycle emissions because life cycle process are not well established. Instead, the GHG emissions analysis should focus on direct and indirect impacts, consistent with current CEQA requirements (CEQA Guidelines §15064(d)). Feedback from the Working Group suggested that a CEQA analysis may be considered deficient without making an effort to conduct a life cycle analysis. Further, if life cycle emissions data are not available, the lead agency should note this consider further analysis speculative and terminate the discussion (CEQA Guidelines §15145).

Another design criteria recommendation made by staff was to take into consideration the administrative burden and resources impacts when establishing a GHG significance threshold. Staff recommended that the GHG significance threshold

should not be set too low, which could result in all projects going through the EIR process. It was pointed out that requiring an EIR for all projects does not necessarily result in more mitigation, no meaningful mitigation may be available for small projects, and it may provide a disincentive for implementing mitigation if the measures are unable to reduce GHG impacts to less than significant.

Other design criteria recommended by staff included analyzing the six Kyoto GHGs, any GHG significance threshold established would be considered interim and would be periodically evaluated and updated as necessary, etc. Staff also introduced the concept of preferred GHG mitigation strategies using a hierarchy from the most to least preferred strategies as shown below.

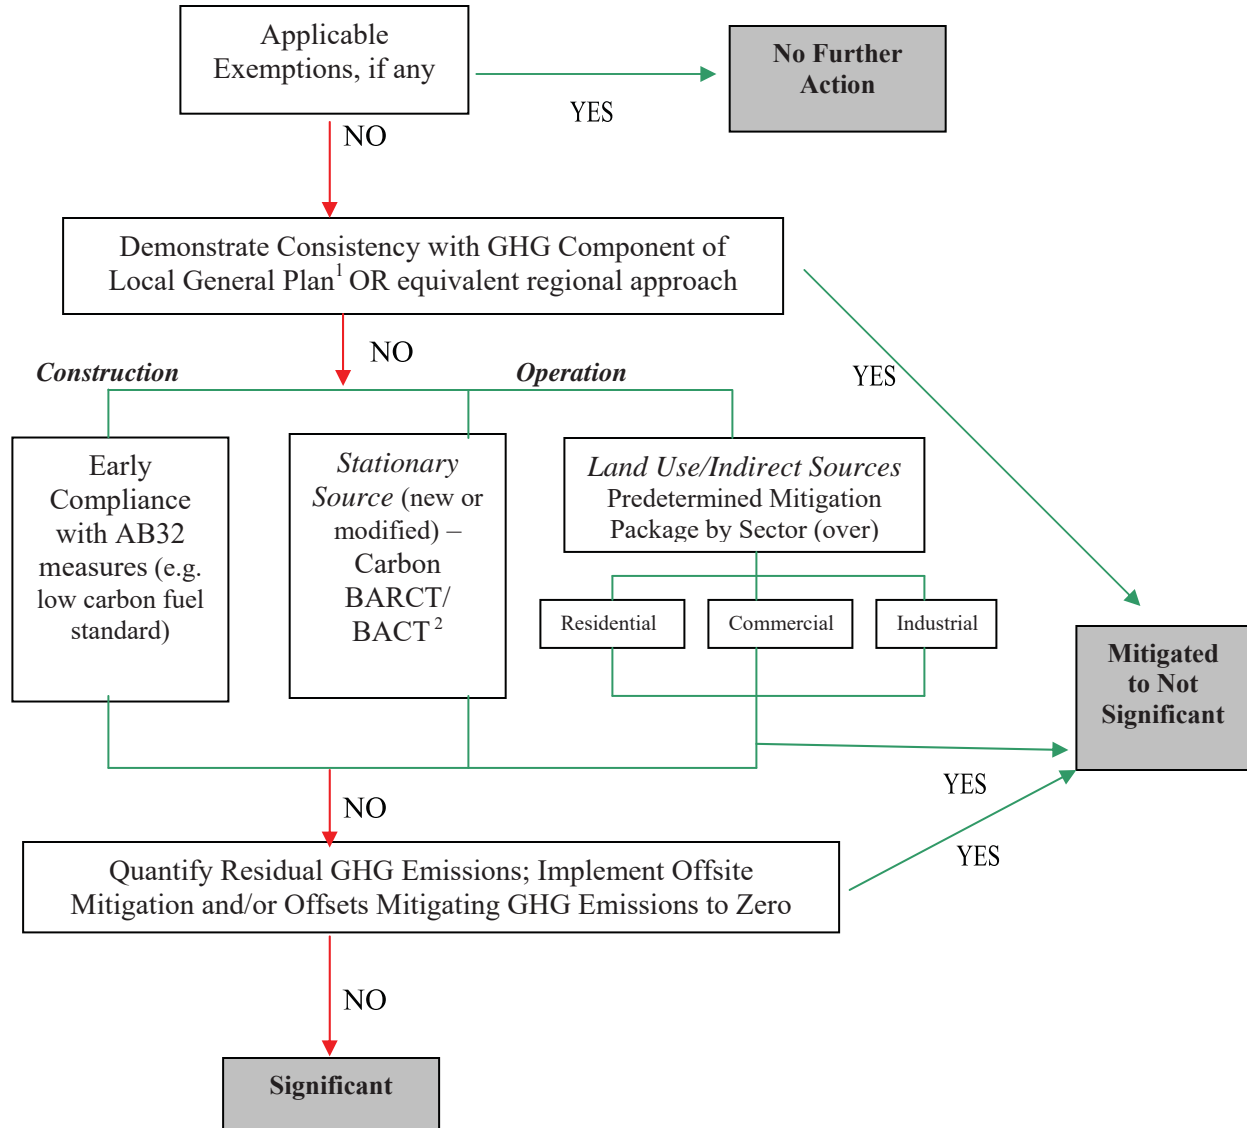

1. Incorporate GHG reduction strategies into project design
2. Mitigate GHGs from other onsite sources for modification projects
3. Mitigate offsite GHG emission reduction projects
4. Mitigate both construction & operational GHG impacts
5. Consider feasible mitigation based on economic factors (cost) pursuant to CEQA Guidelines §15364
6. Purchase acceptable GHG offsets with preference toward GHG reduction projects occurring in-basin or in-state (offset cost a consideration). The following points should be considered:
 - a. Offset market still developing, so it is necessary to ensure offsets are obtained from a credible source
 - b. Offsets should be provided for at least 10 years of project operation (see SJVAPCD indirect source Rule 9510 §6.2 mitigation requirements)

Finally, SCAQMD staff introduced the initial staff proposal. The initial staff proposal consisted of a tiered approach, similar to CAPCOA's Approach 2 with mandatory GHG mitigation measures. Each tier of this proposal is briefly described in the following bullet points and shown graphically in Figure B-1.

- The first tier consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA. For example, SB 97 specifically exempts a limited number of projects until it expires in 2010. If the project qualifies for an exemption, no further action is required. If the project does not qualify for an exemption, then move to the next tier.

Figure B-1
Initial Staff Proposal – Proposed Tiered Approach – May 28, 2008

Significance determination of Cumulative Impacts from GHG emissions:

1. Local General Plans, at a minimum, must comply with AB32 reduction goals; have been analyzed under CEQA, and have a certified Final CEQA document; emission estimates approved by CARB or SCAQMD; include a GHG inventory tracking mechanism; and a commitment to remedy the excess emissions if AB32 goals are not met.
2. SCAQMD will work with CAPCOA to develop a list of mitigation measures.

Attachment: WLC Responses to Appeal_9JUNE2020_Part 2 (4074 : World Logistics Center)

- The second tier consists of determining whether or not the project is consistent with a GHG reduction plan that is part of a local general plan for example. The GHG reduction plan must, at a minimum, comply with AB 32 reduction goals; include emission estimates approved by CARB or SCAQMD, have been analyzed under CEQA, and have a certified Final CEQA document. Further, the GHG reduction plan must include a GHG inventory tracking mechanism; process to monitor progress in achieving GHG emission reduction targets, and a commitment to remedy the excess emissions if AB 32 goals are not met (enforcement). If the proposed project is consistent with the local GHG reduction plan, it is not significant for GHG emissions.

The concept of consistency with a GHG reduction plan, is similar to the concept of consistency in CEQA Guidelines §15125(d). If the proposed project does not comply with the local GHG reduction plan or no GHG reduction plan has been adopted, then move to the third tier.

- Under the third tier there are three options that can be used to demonstrate that a project would not have significant emissions. The first significance option is early compliance with AB 32 Scoping Plan measures. The second significance option, primarily for stationary source equipment, would be to install carbon best available retrofit control technology (BARCT) or best available control technology (BACT). Carbon BARCT/BACT would be established by the SCAQMD. The third significance option for industrial, commercial, and residential land use projects would be to implement a menu of prescribed mitigation measures. Mitigation measures would be developed for each land use sector by SCAQMD staff. Implementing one of these three options would result in a determination that GHG emission impacts from the proposed project are not significant. If the proposed project is unable to implement any one of these three options or cannot fully implement any option, then it would move to the fourth tier.
- Under the fourth tier, the lead agency would quantify GHG emissions from the project and implement offsite mitigation (GHG reduction projects) or purchase offsets. Under this tier, GHG emission impacts the lead agency would be required to mitigate or offset GHG emissions to zero. If GHG emissions can be offset to zero, GHG emissions from the project are concluded to be insignificant. If GHG impacts cannot be reduced to zero, the project is concluded to be significant for GHGs.

WORKING GROUP MEETING #3 (JUNE 19, 2008)

Subsequent to Working Group meeting #2, SCAQMD staff received feedback on the initial staff proposal. Issues and concerns raised by the stakeholders on the initial staff proposal were addressed at the third Working Group meeting and are summarized in the following bullet points.

- The staff proposal does not explicitly state any quantitative or qualitative target objectives. If there are no explicit target objectives, how is it possible to determine whether or not a project is insignificant for GHG emissions?

- Concerns were raised regarding the lack of detail relative to the sector-specific mitigation measures and the potentially lengthy lag time between implementing the GHG significance threshold and developing the mitigation measures.
- For most projects, GHG emissions would not need to be calculated as long as the prescribed menu of sector-specific mitigation measures is implemented. Without quantifying GHG emissions and the control efficiencies of the mitigation measures, a project would be vulnerable to a “Fair Argument” that GHG emissions are still significant even after implementing prescribed mitigation measures.
- A CEQA document may be vulnerable in court if control efficiencies of mitigation measures are not identified.
- Is the staff proposal really a zero GHG significance?

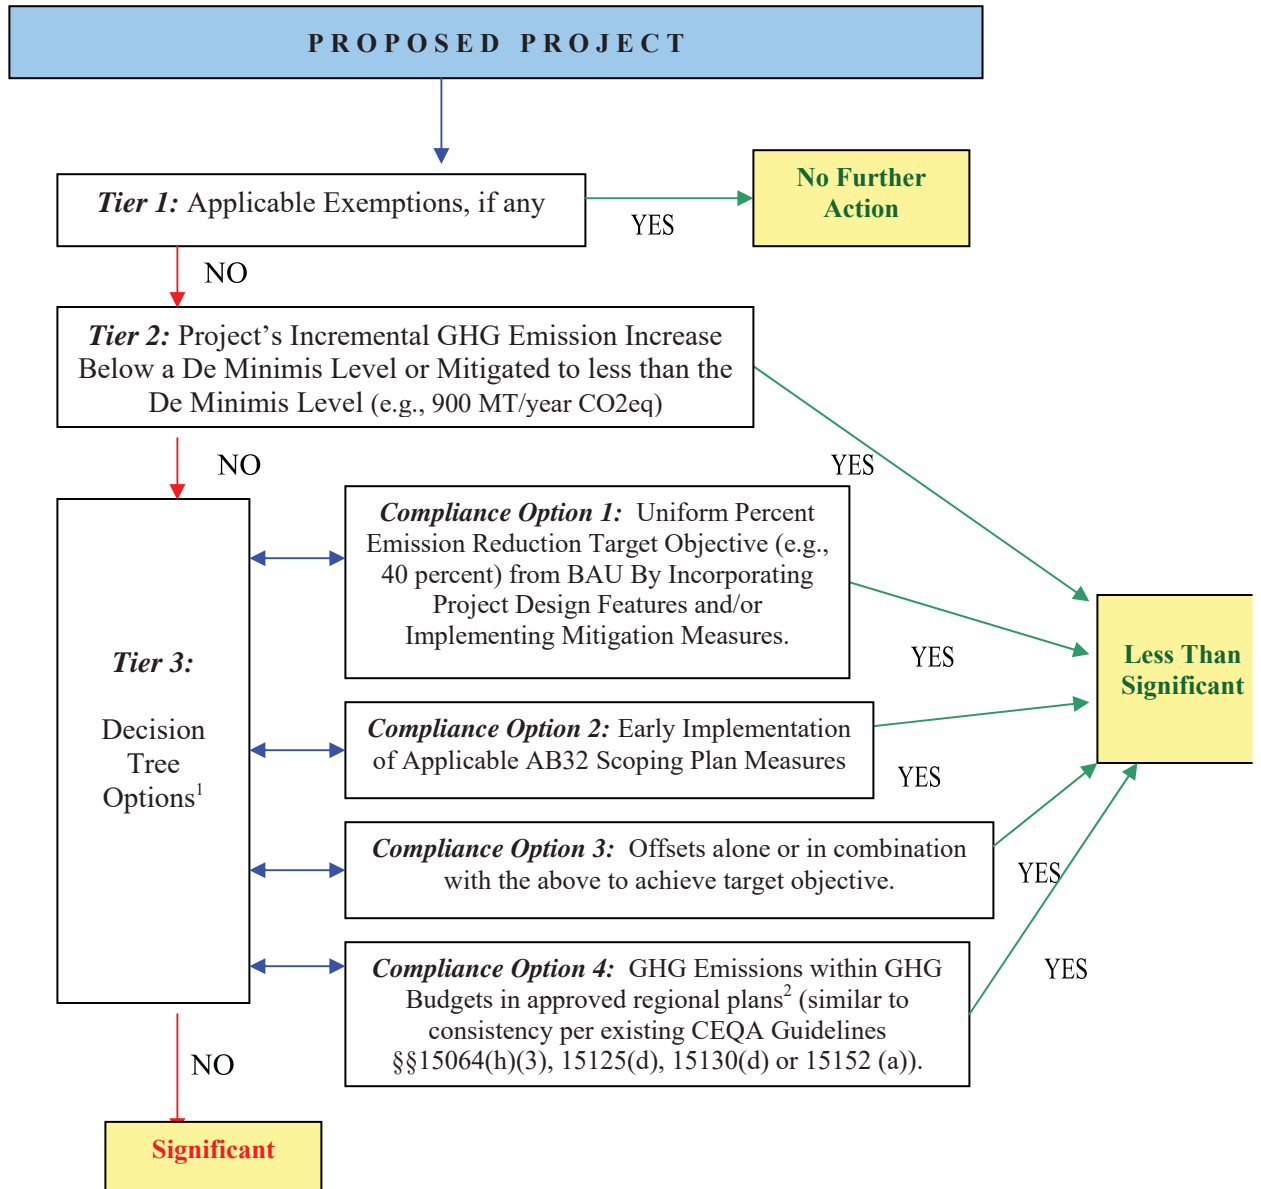

Based on Working Group feedback, staff presented revised staff proposal #1, which consisted of a tiered decision tree approach. The components of revised staff proposal #1 are described in the following bullet points and shown graphically in Figure B-2. As shown in Figure B-2, some of the tier components of the revised staff proposal are similar to those in the initial staff proposal.

- **Tier 1** – no change from the initial proposal.
- **Tier 2** – is a new component of the revised staff proposal. Tier 2 attempts to identify small projects that would not likely contribute to significant cumulative GHG impacts. The de minimis or screening level of 900 metric tons per year is the level that is estimated by CAPCOA to capture 90 percent of the residential units or office space in pending application lists⁷. CAPCOA infers that projects that emit less than 900 metric ton per year would not likely be considered cumulatively considerable. Further, the 900 metric ton per year level would capture 90 percent

⁷ Although the CAPCOA White Paper implies that 900 metric tons per year equates to a 90 percent capture rate, there is no explicit information provided in the White Paper that demonstrates this correlation. Indeed, the CAPCOA authors state that 900 metric tons, which represents approximately 50 residential units, corresponds to widely divergent capture rate percentile rankings depending on the project location (see discussion on page 43 of the White Paper). Percentile rankings were based on a survey of four cities in California. A project of 900 metric tons per year representing a 90 percent capture rate appears to be a working assumption for which there appears to be no factual basis. Further, although not explicitly stated, it is assumed that the 900 metric tons were derived using the URBEMIS2007 model. It should be noted that that the URBEMIS2007 model only quantifies CO₂ emissions and direct emissions primarily from on-road mobile sources. It does not capture other GHG pollutants or indirect GHG emissions such as emissions from energy generation, water conveyance, etc. Therefore, it is likely that a 50-unit residential project would actually generate higher GHG emissions than 900 metric tons per year.

Figure B-2

Revised Staff Proposal #1 Tiered Decision Tree Approach – June 19, 2008

Significance Determination of Cumulative Impacts from GHG Emissions:

1. Substitution for equivalent reductions allowed.
2. Local General Plans or other local plans local plans that, at a minimum, comply with the overall target objective or the sector-based CARB Scoping Plan; have been analyzed under CEQA, and have a certified Final CEQA document; emission estimates approved by CARB or SCAQMD; include a GHG inventory; tracking mechanism; enforcement; and a commitment to remedy the excess emissions if commitments are not met.

of all pending projects, which means that 90 percent of all projects would have to implement GHG reduction measures.

If a project is less than 900 MT/year CO₂eq or can mitigate to less than 900 MT/year CO₂eq, it would be considered insignificant for GHGs. Projects larger than 900 MT/year CO₂eq would move to tier 3.

- Tier 3 Decision Tree Options – consists of four decision tree options to demonstrate that a project is not significant for GHG emissions. The four compliance options are as follows.

Compliance Option 1 – the lead agency would calculate GHG emissions for a project using a business-as-usual (BAU) methodology. Once GHG emissions are calculated, the project proponent would have to incorporate design features into the project and/or implement GHG mitigation measures to demonstrate a 40 percent reduction from BAU. A 40 percent reduction below BAU was selected for the following reason. To comply with the AB 32 requirement of reducing GHG emissions to 1990 levels, an approximately 30 percent reduction from current BAU is necessary.

Since CEQA is not applicable to all GHG emission sources, i.e., existing projects that are not undergoing expansion or modifications, staff chose a 40 percent reduction below BAU requirement, which goes beyond the target GHG reduction objective of AB 32, but is still a potentially feasible GHG reduction for a variety of different projects.

Compliance Option 2 – this option is the same as the early compliance with AB 32 option in the third tier of the initial staff proposal.

Compliance Option 3 – this option is similar to the fourth tier of the initial staff proposal where GHG emissions would be reduced through offsite GHG reduction projects and/or use of offsets. This compliance option, however, would require offsetting GHG emissions by the same target objective as compliance option 1, that is, 40 percent below BAU instead of reducing GHG emissions to less than the de minimis or screening level.

Compliance Option 4 – this option is the same as the consistency with the greenhouse gas reduction plan component in the second tier of the initial staff proposal.

If the lead agency or project proponent cannot implement any of the compliance options in Tier 3, GHG emissions would be considered significant.

WORKING GROUP MEETING #4 (JULY 30, 2008)

Subsequent to Working Group meeting #3, SCAQMD staff received feedback on the revised staff proposal #1. Issues and concerns raised by the stakeholders on the initial

staff proposal were addressed at the third Working Group meeting and are summarized in the following bullet points.

- Compliance with a GHG reduction plan should not be a compliance option in Tier 3, but should be its own tier, earlier in the tiering process.
- There is a large disconnect between screening level and remaining emissions under the Tier 4 compliance options. For example, large projects that can reduce GHG emissions by the target objective of 40 percent would do so, which means GHG emissions would not be significant, could have substantially higher emissions than projects with GHG emissions less than the screening level.
- Compliance with a target objective should not be through offsets alone. Because of the uncertainties regarding the validity of offsets, preferred mitigation should consist of actual GHG emission reductions.
- The Tier 3 compliance option 1, GHG emissions reductions from BAU, is not the proper metric for determining significance. How can a lead agency be sure that the projected BAU emissions for a project are not artificially inflated to make it easier to achieve the required target objective?
- The Tier 3 compliance option 1, reducing GHG emission reductions from BAU, could penalize projects in environmentally progressive areas where BAU may be much lower than in other areas, thus, making it more difficult to achieve the target objectives.

Based on Working Group feedback and internal discussions, staff presented revised staff proposal #2, which further refined the previous tiered decision tree approach. The components of revised staff proposal #2 are described in the following bullet points and shown graphically in Figure B-3. As shown in Figure B-3, some of the tier components of the revised staff proposal are similar to those in the initial staff proposal.

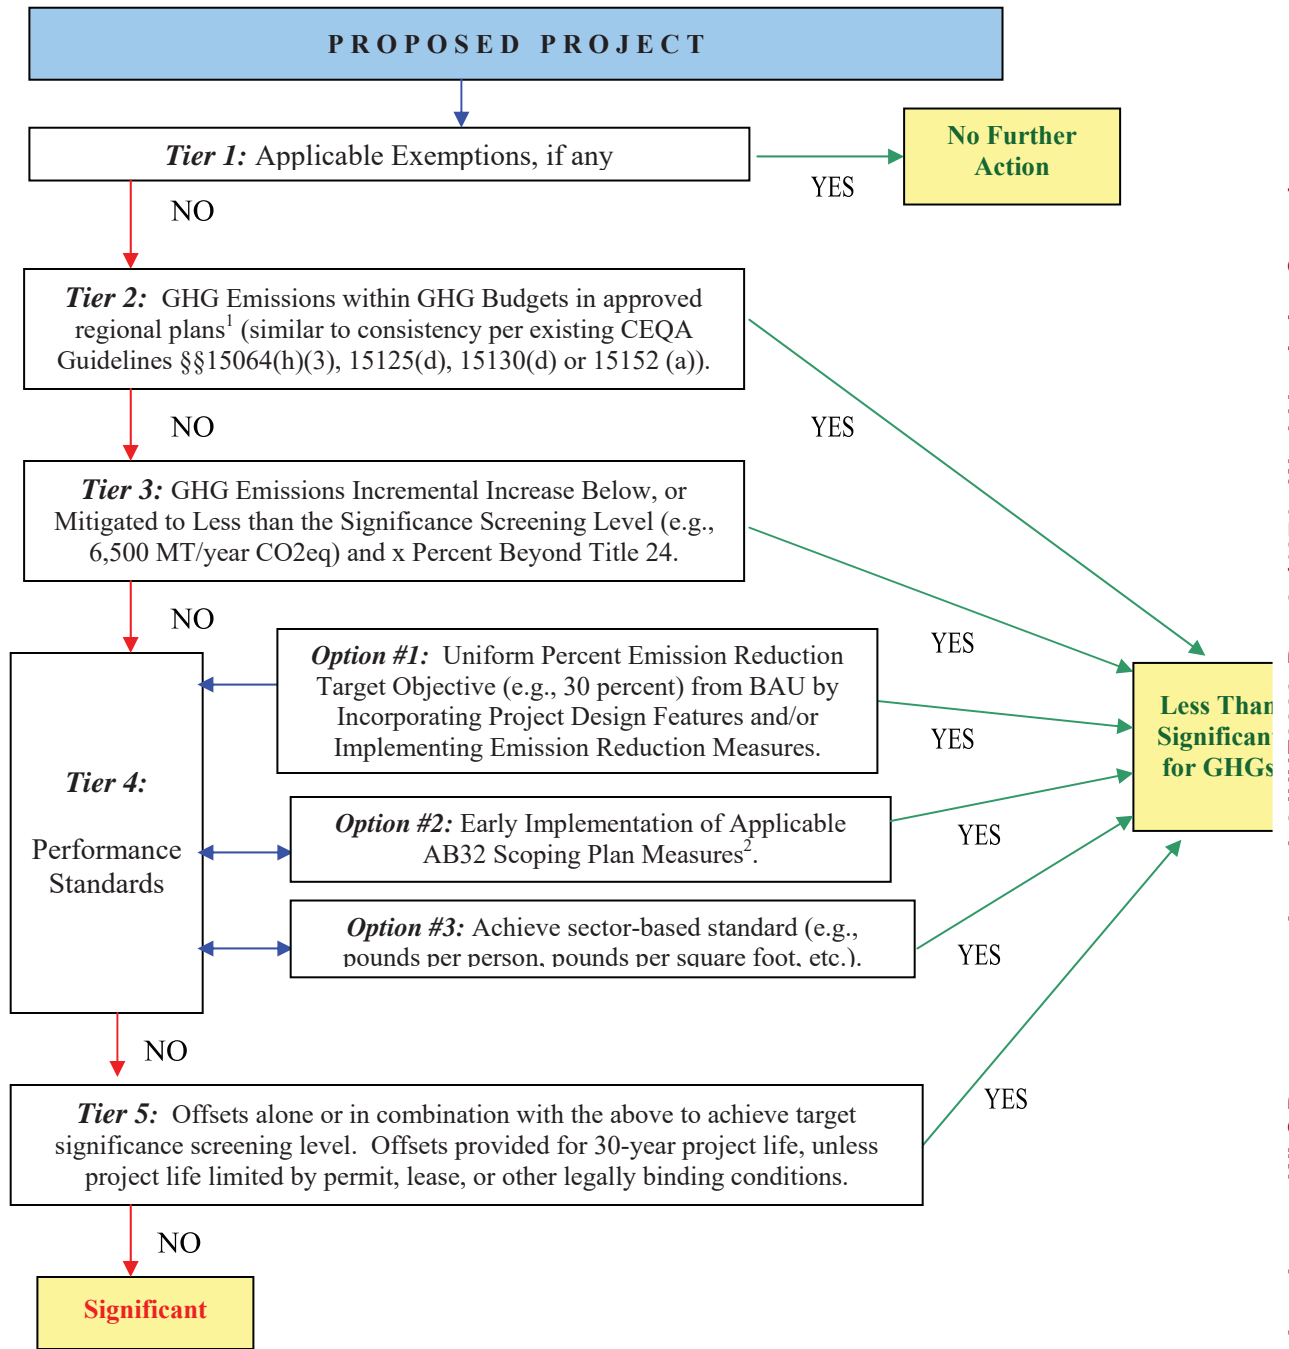

- **Tier 1** – no change from the initial proposal.
- **Tier 2** – compliance option 4 in Tier 3 has been moved back a stand-alone tier.
- **Tier 3** – the screening level that was previously Tier 2 has been moved to Tier 3. In response to feedback from the Working Group, the screening level has been increased to 6,500 MT/year CO₂eq. The new screening level was derived using the SCAQMD's existing NO_x operational threshold as a basis. The daily NO_x operational significance threshold, 55 pounds per day was annualized, which results in 10 tons of NO_x per year. Using the URBEMIS2007 model, staff initially modeled a mixed-use project that emits just under 10 tons per year to determine what the equivalent CO₂ emissions would be. Resulting CO₂ emissions from the mixed use project were approximately 6,500 MT/year CO₂. To further corroborate the 6,500 MT/year CO₂ staff performed 19 modeling runs on a variety of projects including residential, commercial, industrial, and various combinations of land uses. In addition, since the analysis was an annual

analysis, a weighted trip rate was derived for each land use category to obtain a more accurate estimate of trip rates throughout the week. Although the results from the 19 modeling runs were approximately 16 percent higher than staff's original estimate of 6,500 MT/year CO₂, 7,304 to 7,723 MT/year CO₂, staff continued to recommend the 6,500 MT/year CO₂ provides a margin of safety when deriving CO₂ emissions based on the annualized NO_x level of 10 tons per year and when evaluating different types of land use projects.

Projects with GHG emissions less than the screening level are considered to be small projects, that is, they would not likely be considered cumulatively considerable. However, because of the magnitude of increasing global temperatures from current and future GHG emissions, staff recommended that all projects must implement some measure or measures to contribute to reducing GHG emissions. Therefore, Tier 3 includes a requirement that all projects with GHG emissions less than the screening level must include efficiency components that reduce to a certain percentage beyond the requirements of Title 24 (Part 6, California Code of Regulations), California's energy efficiency standards for residential and nonresidential buildings.

- Tier 4 Performance Standards – Tier 3 from the revised staff proposal #1 has been moved to Tier 4 and renamed.

Figure B-3
 Proposed Tiered Decision Tree Approach – July 30, 2008
Significance Determination of Cumulative Impacts from GHG Emissions:

Attachment: WLC Responses to Appeal_9JUNE2020_Part 2 (4074 : World Logistics Center)

1. Local General Plans or other local plans local plans that, at a minimum, comply with the overall target objective or the sector-based CARB Scoping Plan; have been analyzed under CEQA, and have a certified Final CEQA document; emission estimates approved by CARB or SCAQMD; include a GHG inventory; tracking mechanism; enforcement; and a commitment to remedy the excess emissions if commitments are not met.
2. Substitution for equivalent reductions allowed.

Compliance Option 1 – is essentially the same as the previously recommended, except that the target objective has been changed from reducing GHG emissions 40 percent below BAU to 30 percent below BAU to be more consistent with AB 32 target objectives.

Compliance Option 2 – no change from the previous proposal.

Compliance Option 3 – this is a new compliance option and consists of establishing sector-based performance standards. For example, it may be possible to use the 1990 inventory required under AB32 to establish an efficiency standard such as pounds per person, pounds per worker, pounds per square feet, pounds per item manufactured, etc. When calculating GHGs from a project, if they are less than the established efficiency standard the project would not be significant relative to GHG emissions, while projects exceeding the efficiency standard would be significant.

Projects that cannot comply with any of the compliance options in Tier 4 would then move on to Tier 5.

- **Tier 5** – consists generally of the Tier 3 compliance option 3 from the previous staff proposal. The only difference is that the project proponent would be required to provide offsets for the life of the project, which is defined as 30 years. If the project proponent is unable to obtain sufficient offsets, incorporate design features, or implement GHG reduction mitigation measures, then GHG emissions from the project would be considered significant.

WORKING GROUP MEETING #5 (AUGUST 27, 2008)

Subsequent to Working Group meeting #3, SCAQMD staff received feedback on the revised staff proposal #2. Issues and concerns raised by the stakeholders on the initial staff proposal were addressed at the third Working Group meeting and are summarized in the following bullet points.

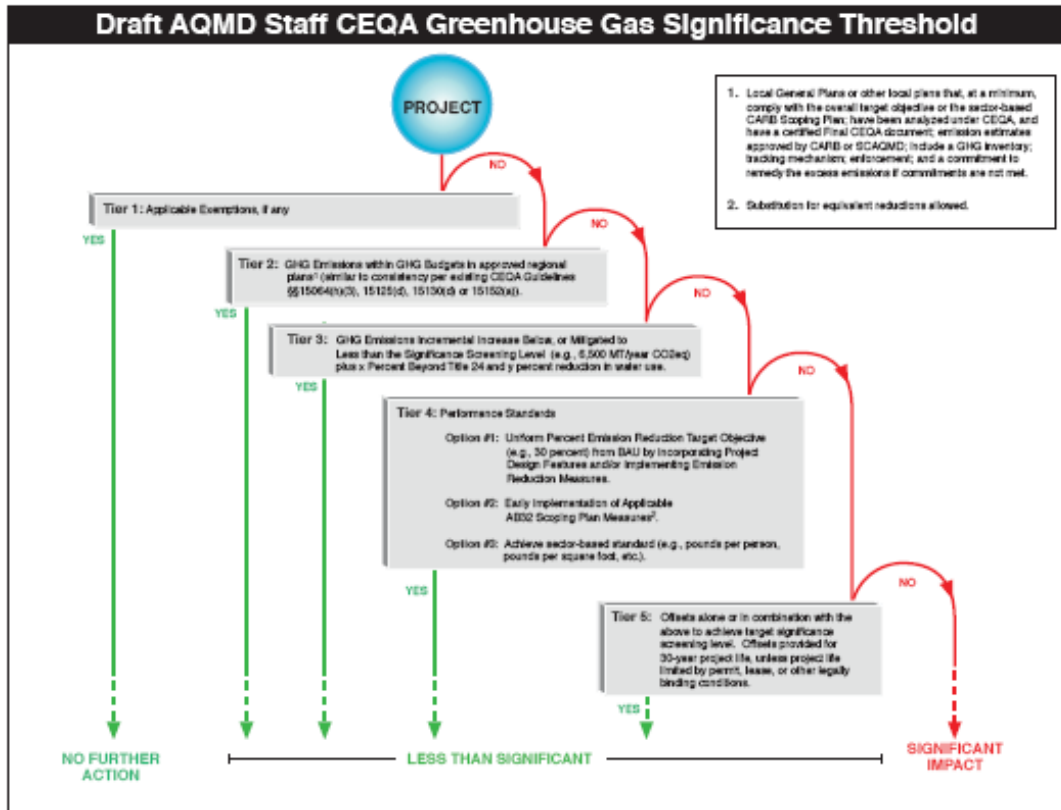

- A recommendation was made to modify the target objective of Tier 5 to be consistent with the target objective of Tier 4 compliance option 1, that is require emissions to be offset 30 percent from BAU rather than offset down to the screening level.
- A Working Group member asked for clarification on the early implementation of applicable AB 32 Scoping Plan measures in Tier 4-Option 2. In addition, a question was asked regarding whether or not this compliance option was applicable after the requirements of AB 32 have become effective.

At Working Group meeting #5, staff presented revised staff proposal #3, which consisted primarily of minor refinements to the previous tiered decision tree approach

in revised staff proposal #2. The components of revised staff proposal #3 are shown graphically in Figure B-4.

Aside from changing the graphic layout of the staff proposal to make it easier to understand, revised staff proposal #3 has only one minor modification. A second energy efficiency requirement has been added to the screening level in Tier 3. In addition to requiring projects to go a certain percentage beyond Title 24, projects would also have to reduce by a specified percentage electricity demand from water use, primarily electricity used for water conveyance.

1. INTRODUCTION

1.1 History of GHG Thresholds of Significance and Need for Update

The Sacramento Air Quality Management District (SMAQMD) is one of 35 regional air quality districts in California responsible for local air quality planning, monitoring, and stationary source and facility permitting. SMAQMD covers all of Sacramento County, including the cities of Sacramento, Citrus Heights, Folsom, Rancho Cordova, Elk Grove, Galt, Isleton, and unincorporated Sacramento County. Under the California Environmental Quality Act (CEQA) review process for proposed projects, SMAQMD may serve as the lead agency, a responsible agency with limited discretionary authority, or a reviewing agency providing comment on the air quality impacts of a proposed project or plan. CEQA requires that lead agencies identify significant environmental impacts, including impacts from greenhouse gas (GHG) emissions, and to avoid or mitigate those impacts if feasible.

To assist lead agencies in determining significance, in October 2014 SMAQMD adopted the current GHG thresholds of significance which include a construction threshold (1,100 metric tons GHG/year), a land use operational threshold (1,100 metric tons GHG/year), and a stationary source operational threshold (10,000 metric tons GHG/year). Projects whose emissions are expected to meet or exceed the significance criteria will have a potentially significant adverse impact on global climate change. Originally, SMAQMD recommended a 21.7% mitigation from Business as Usual scenario for projects that exceeded the operational thresholds, based on the Business as Usual approach presented in the California Air Resources Board (CARB) 2011 Final Supplement to the 2008 Climate Change Scoping Plan.¹ As a result of the California Supreme Court decision in *Center for Biological Diversity v. California Department of Fish and Wildlife and Newhall Land and Farming* in January 2016, SMAQMD recommended suspending the use of Business as Usual analysis and the recommended 21.7% mitigation level for projects exceeding the operational thresholds. This left agencies with the 1,100 metric tons GHG/year screening threshold and the need to demonstrate all feasible mitigation for projects exceeding the threshold. SMAQMD encouraged local agencies in Sacramento County to develop a climate action plan (CAP) or GHG reduction plan that could be used by the local agency to reduce GHG emissions and streamline CEQA review for development projects, which can provide adequate mitigation for GHG impacts by demonstrating consistency with the reduction measures adopted in the CAP. As of August 2019, the following local lead agencies within SMAQMD either have adopted or are in the process of preparing a CAP or GHG reduction plan:

Jurisdiction	CAP or GHG Plan Status	Target Years
County of Sacramento	Government Operations Only, Adopted 2012	2020
City of Sacramento	Adopted 2012	2020, 2035, 2050
City of Elk Grove	Adopted 2019	2020, 2030, 2050

¹ The regulations, court cases, and GHG plans cited in this section are described in further detail in the Regulatory Background Section 1.2 of this report.

City of Folsom	Adopted 2018	2020, 2030, 2040, 2050
City of Citrus Heights	Adopted 2011	2020
City of Rancho Cordova		
City of Galt	In development	2030, 2050
City of Isleton		

As shown in the table above, a limited number of jurisdictions have adopted plans with longer-term targets. Therefore, SMAQMD CEQA thresholds of significance are needed to support jurisdictions which have not yet adopted a qualified CAP or GHG reduction plan with the appropriate horizon year for given projects. Even for jurisdictions with adopted CAP or GHG reduction plans, the jurisdiction may also choose to pursue projects that do not demonstrate consistency with a local agency's CAP, so the ability to instead show compliance with the SMAQMD thresholds would allow flexibility.

Furthermore, changes in State legislation and approval of the 2017 Climate Change Scoping Plan since the adoption of the SMAQMD's 2014 thresholds of significance have established the need for a threshold review and update. In September 2016, Senate Bill 32 (SB 32) established the State target to reduce GHG emissions 40% below 1990 levels by 2030. Additionally, the California Air Resources Board (CARB) adopted its Climate Change Scoping Plan in December 2017, which provided recommended per capita community emission targets that could support the State's efforts to reach climate goals. Those targets include achieving 6 metric tons GHG/year/person by 2030 and 2 metric tons GHG/year/person by 2050. Additionally, CARB recognized that GHG reduction efforts being undertaken by Metropolitan Planning Organizations in compliance with SB 375, through Metropolitan Transportation Plans/Sustainable Community Strategies (MTP/SCS), would not provide sufficient reductions in GHG emissions and vehicle miles traveled to meet the 2050 State climate goals.

For these reasons, SMAQMD is proposing an update to the its CEQA GHG thresholds of significance, to assist lead agencies in determining significance for proposed projects through 2030 and beyond. **Section 1.2** of this report provides additional background on the regulation of GHGs at the federal, state, and local levels, and the recent legislation and court decisions that prompted the need for updates to the SMAQMD significance thresholds. **Section 2** of this report provides an overview of the strategy used to develop the updated significance thresholds. **Section 3** estimates Sacramento County GHG emissions in 2030, and from this, **Section 4** estimates 2030 GHG emissions by sector for new and existing development within Sacramento County. This analysis sets the stage for the establishment of 2030 GHG targets and Best Management Practices (BMPs) by place type (**Section 4**), and GHG targets for project buildouts beyond 2030 (**Section 5**). **Section 6** describes requirements to show consistency with longer-term State targets.

1.2 Regulatory Background: Federal, State, and Local

1.2.1 Federal

1.2.1.1 U.S. Supreme Court Ruling on GHGs

In *Massachusetts et al. v. Environmental Protection Agency*, 549 US 497 (2007), the U.S. Supreme Court held that the United States Environmental Protection Agency (USEPA) was authorized by the Clean Air Act to regulate CO₂ emissions from new motor vehicles. The Court did not mandate that the USEPA enact regulations to reduce GHG emissions, but found that the only instances in which the USEPA could avoid taking action were if it found that GHGs do not contribute to climate change or if it offered a "reasonable explanation" for not determining that GHGs contribute to climate change.

On December 7, 2009, the USEPA issued an "endangerment finding" under Section 202(a) of the Clean Air Act, concluding that GHGs threaten the public health and welfare of current and future generations and that motor vehicles contribute to GHG pollution. These findings provide the basis for adopting new national regulations to mandate GHG emission reductions under the federal Clean Air Act.

1.2.1.2 Stationary Sources

On September 22, 2009, the USEPA issued the Final Mandatory Reporting of Greenhouse Gases Rule (40 CFR Part 98). The rule requires annual reporting to the USEPA of GHG emissions from certain large industrial and commercial sources that emit 25,000 metric tons or more a year of GHGs. The rule is intended to collect accurate and timely emissions data to guide future policy decisions on climate change.

1.2.1.3 Mobile Sources

Also in response to the *Massachusetts et al. v. USEPA* ruling discussed above, an Executive Order was issued on May 14, 2007 directing the USEPA, the Department of Transportation (DOT), and the Department of Energy (DOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. Subsequently, the USEPA and National Highway Traffic Safety Administration (NHTSA) issued a series of joint rulemakings that regulate fuel efficiency and GHG emissions from cars and light-duty trucks of model year 2011 (March 2009 rule), model years 2012-2016 (May 2010 rule), model years 2017-2021 (October 2012 rule), and model years 2021-2026 (August 2018 proposed rule, currently pending). The USEPA and NHTSA also established fuel efficiency and GHG standards for medium- and heavy-duty trucks of model years 2014-2018 (August 2011 rule) and model years 2018-2027 (August 2016 rule).

1.2.1.4 Other Sources

In addition to the rules and regulations developed with respect to stationary and mobile sources, discussed above, various other federal developments have occurred that aim to reduce GHGs from other sources, including land use activities.

- Created under the Energy Policy Act of 2005, the Renewable Fuel Standards (RFS) program established the first renewable fuel volume mandate in the United States, for blending renewable fuel into gasoline. Under the 2007 Energy Independence and Security Act (EISA), the RFS program was expanded to include diesel, and required the USEPA to apply lifecycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

- The 2007 EISA also included several other provisions to reduce national GHG emissions: it issued energy efficiency standards and labeling for heating, cooling, consumer electronic, and home appliance products; set requirements for phasing out incandescent light bulbs and improving light bulb efficiency; and promoted green jobs and research in alternative energy and carbon capture.
- The 2009 American Recovery and Reinvestment Act (ARRA) was passed in response to the economic crisis of the late 2000s, with the primary purpose of maintaining existing jobs and creating new jobs. Among the secondary objectives of ARRA was investment in “green” energy programs such as funding private companies developing renewable energy technologies; local and state governments implementing energy efficiency and clean energy programs; research in renewable energy, biofuels, and carbon capture; and the development of high efficiency or electric vehicles.
- The 2015 Clean Power Plan (80 FR 64510-64660) prescribed how states must develop plans to reduce GHG emissions from existing fossil-fuel-fired electric generating units and established CO₂ emission performance standards. Implementation of the Clean power Plan was stayed by the U.S. Supreme Court pending resolution of several lawsuits. In August 2018 the USEPA issued the proposed Affordable Clean Energy (ACE) Rule to replace the Clean Power Plan; rulemaking proceedings are currently pending.
- The USEPA has also developed a number of voluntary programs to provide opportunities for industry, the USEPA, and other organizations in both the public and private sectors to work together to reduce GHG emissions. These include the Center for Corporate Climate Leadership, the Green Power Partnership, the National Clean Diesel Campaign, and State and Local Climate and Energy Programs.

1.2.2 State

California has adopted various administrative initiatives and also enacted a variety of legislation relating to climate change, much of which sets aggressive goals for GHG emissions reductions within the state. However, none of this legislation provides definitive direction regarding the treatment of climate change in environmental review documents prepared under CEQA. In particular, the amendments to the CEQA Guidelines do not require or suggest specific methodologies for performing an assessment of thresholds of significance, and do not specify GHG reduction mitigation measures. Instead, the CEQA Guidelines amendments continue to rely on lead agencies to choose methodologies and make significance determinations based on substantial evidence, as discussed in further detail below. Consequently, no State agency has promulgated binding regulations for analyzing GHG emissions, determining their significance, or mitigating any significant effects in CEQA documents.

The discussion below provides a brief overview of CARB and Office of Planning and Research (OPR) documents, and of the primary legislation and court cases that relate to climate change and informed the development of the proposed SMAQMD significance thresholds. It begins with an overview of the primary regulatory acts that have driven GHG regulation in California, which underlie many of the GHG rules and regulations that have been developed.

1.2.2.1 Executive Order S-3-05 (Statewide GHG Targets for 2010, 2020, and 2050)

California Executive Order S-03-05 (June 1, 2005) establishes the goal of reducing GHG emissions to 2000 levels by 2010, to 1990 levels by 2020, and to 80% below 1990 levels by 2050.

1.2.2.2 Executive Order B-30-15 (Statewide GHG Targets for 2030)

In April 2015, Governor Brown signed Executive Order B-30-15, which established the following GHG emission reduction goal for California: by 2030, reduce GHG emissions to 40 percent below 1990 levels. This Executive Order also directed all state agencies with jurisdiction over GHG-emitting sources to implement measures designed to achieve the new interim 2030 goal, as well as the pre-existing, long-term 2050 goal identified in Executive Order S-3-05 (see discussion above). Additionally, the Executive Order directed CARB to update its Scoping Plan (see discussion below) to address the 2030 goal.

The Legislature adopted SB 32 to enact the Executive Order's 2030 goal, as described further below.

1.2.2.3 Assembly Bill 32 (Statewide GHG Reductions)

Assembly Bill (AB) 32 (Nunez, 2006), the California Global Warming Solutions Act of 2006, was enacted after considerable study and expert testimony before the Legislature. The heart of AB 32 is the requirement that statewide GHG emissions be reduced to 1990 levels by 2020. In order to achieve this reduction mandate, AB 32 requires CARB to adopt rules and regulations in an open public process that achieve the maximum technologically feasible and cost-effective GHG reductions.

Of relevance to this analysis, in 2007, CARB approved a statewide limit on the GHG emissions level for year 2020 consistent with the determined 1990 baseline. CARB's adoption of this limit is in accordance with Health & Safety Code Section 38550, as codified through enactment of AB 32.

Per Health & Safety Code Section 38561(b), CARB also is required to prepare, approve and amend a scoping plan that identifies and makes recommendations on "direct emission reduction measures, alternative compliance mechanisms, market-based compliance mechanisms, and potential monetary and nonmonetary incentives for sources and categories of sources that [CARB] finds are necessary or desirable to facilitate the achievement of the maximum feasible and cost-effective reductions of greenhouse gas emissions by 2020."

2008 Scoping Plan

In 2008, CARB adopted the *Climate Change Scoping Plan: A Framework for Change* (2008 Scoping Plan) in accordance with Health & Safety Code Section 38561. During the development of the 2008 Scoping Plan, CARB created a planning framework that is comprised of eight emissions sectors: (1) transportation; (2) electricity; (3) commercial and residential; (4) industry; (5) recycling and waste; (6) high global warming potential (GWP) gases; (7) agriculture; and, (8) forest net emissions.

The 2008 Scoping Plan establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions from the eight emissions sectors to 1990 levels by 2020. In the Scoping Plan, CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of approximately 28.5 percent from the otherwise projected 2020 emissions level; i.e., those emissions that would occur in 2020,

absent GHG-reducing laws and regulations (referred to as “Business-As-Usual” [BAU]).² For example, in further explaining CARB’s BAU methodology, CARB assumed that all new electricity generation would be supplied by natural gas plants, no further regulatory action would impact vehicle fuel efficiency, and building energy efficiency codes would be held at 2005 standards.

To achieve the necessary GHG reductions to meet AB 32’s 2020 target, CARB developed a series of reduction measures in the Scoping Plan covering a range of sectors and activities. Broadly, the reduction measures can be separated into capped sectors (i.e., covered by the Cap-and-Trade Program discussed below) and uncapped sectors.

Multiple Scoping Plan measures broadly cover emissions associated with land use development, including, but not limited to:

- *Energy Efficiency/Green Buildings*. The Scoping Plan highlights the importance of energy efficiency efforts in reducing GHG emissions from residential and commercial development and indicates that zero net energy (ZNE) should be the overarching and unifying concept for energy efficiency.
- *Regional Transportation-Related GHG Targets (SB 375)*. The Scoping Plan relies on Senate Bill (SB) 375, discussed below, as an important mechanism to reduce mobile GHG emissions by integrating land use planning and transportation planning at the regional and local level.
- *Vehicle Emissions*. The Scoping Plan relies on various engine, fuel and other efficiency improvement programs and increasing electrification of the vehicle fleet.
- *Cap-and-Trade Program*. The Scoping Plan identifies the Cap-and-Trade program as a lynchpin, overarching strategy for California to reduce GHG emissions. As explained in the Scoping Plan, the program’s implementing regulations provide assurance that California’s 2020 limit will be met because the regulation sets a firm limit on 85 percent of California’s GHG emissions.

In the 2011 *Final Supplement to the AB 32 Scoping Plan Functional Equivalent Document* (2011 Final Supplement), CARB revised its estimates of the projected 2020 emissions level in light of the economic recession and the availability of updated information about GHG reduction regulations. Based on the new economic data, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of 21.7 percent (down from 28.5 percent) from the BAU conditions. When the 2020 emissions level projection also was updated to account for newly implemented regulatory measures, including Pavley I (model years 2009–2016) and the Renewable Portfolio Standard (12 percent to 20 percent), CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of 16 percent (down from 28.5 percent) from the BAU conditions.

2014 First Update to the Scoping Plan

In 2014, CARB adopted the *First Update to the Climate Change Scoping Plan: Building on the Framework* (2014 First Update).³ The stated purpose of the 2014 First Update is to

² CARB. 2008. Climate Change Scoping Plan: A Framework for Change. December. Available at: https://www.arb.ca.gov/cc/scopingplan/document/adopted_scoping_plan.pdf. Accessed: March 2020.

³ Health & Safety Code Section 38561(h) requires CARB to update the Scoping Plan every five years.

“highlight[...] California’s success to date in reducing its GHG emissions and lay[...] the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80 percent below 1990 levels by 2050.”⁴ The First Update found that California is on track to meet the 2020 emissions reduction mandate established by AB 32, and noted that California could reduce emissions further by 2030 to levels squarely in line with those needed to stay on track to reduce emissions to 80 percent below 1990 levels by 2050, if the State attains the expected benefits of existing policy goals.

In conjunction with the 2014 First Update, CARB identified “six key focus areas comprising major components of the State’s economy to evaluate and describe the larger transformative actions that will be needed to meet the State’s more expansive emission reduction needs by 2050.”⁵ Those six areas are: (1) energy; (2) transportation (vehicles/equipment, sustainable communities, housing, fuels, and infrastructure); (3) agriculture; (4) water; (5) waste management; and (6) natural and working lands. The First Update identifies key recommended actions for each sector that will facilitate achievement of the 2050 reduction target.

Based on CARB’s research efforts, it has a “strong sense of the mix of technologies needed to reduce emissions through 2050.”⁶ Those technologies include energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies.

As part of the 2014 First Update, CARB recalculated the State’s 1990 emissions level using the GWPs identified by the Intergovernmental Panel on Climate Change’s Fourth Climate Change Assessment (2007). Using the recalculated 1990 emissions level and the revised 2020 emissions level projection identified in the 2011 Final Supplement, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of approximately 15.3 percent (instead of 28.5 percent or 16 percent) from the “BAU” conditions.

The 2014 First Update included a strong recommendation from CARB for setting a mid-term statewide GHG emissions reduction target. CARB specifically recommended that the mid-term target be consistent with: (i) the United States’ pledge to reduce emissions 42 percent below 2005 levels (which translates to a 35-percent reduction from 1990 levels in California); and (ii) the long-term policy goal of reducing emissions to 80 percent below 1990 levels by 2050.

2017 Scoping Plan

In 2017, CARB adopted *California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target* (2017 Scoping Plan).⁷ This 2017 Scoping Plan addresses Executive Order B-30-15 (described earlier) and SB 32 (described in a later

⁴ CARB. 2014. First Update to the Climate Change Scoping Plan: Building on the Framework. May. Available at: http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf. Accessed: March 2020.

⁷ CARB. 2017. California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target. November. Available at: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed: March 2020.

section), which extend the goals of AB 32 and set a 2030 goal of reducing emissions 40 percent below 1990 levels. The 2017 Scoping Plan includes the following major elements for reaching the 2030 Target:

1. SB 350

The objective of this policy element is to enhance existing programs and implement SB 350, with a target of achieving 50 percent Renewables Portfolio Standard (RPS) and a doubling of energy efficiency savings in natural gas and electricity end uses statewide by 2030.

2. Low Carbon Fuel Standard (LCFS)

The objective of this policy element is to transition to cleaner/less-polluting transportation fuels that have a lower carbon intensity, with a goal of a 20 percent reduction in carbon intensity statewide by 2030.

3. Mobile Source Strategy

This strategy will reduce GHGs and other pollutants from the transportation sector through transition to zero- and low-emission vehicles, cleaner transit systems, and reduction of vehicle miles traveled (VMT). Highlights of this strategy include a target of 4.2 million zero-emission vehicles on the road by 2030; reduction in GHGs from medium- and heavy-duty vehicles via the Phase 2 Medium- and Heavy-Duty GHG Standards; a suite of innovative clean transit options including requirements for the deployment of zero-emission buses, and emissions standards for new natural gas and diesel buses; a new "Last Mile Delivery" regulation for certain delivery trucks that would result in the use of cleaner engines and zero-emission vehicles; and reduction in VMT to be achieved in part by the continued implementation of regional Sustainable Community Strategies pursuant to SB 375 (described in a later section) and other statewide strategies.

4. SB 1383

This Short-Lived Climate Pollutant strategy will achieve a 40 percent reduction in methane and hydrofluorocarbon emissions and a 50 percent reduction in anthropogenic black carbon emissions below 2013 levels by 2030.

5. California Sustainable Freight Action Plan

This plan will improve freight system efficiency by 25 percent by 2030, deploy over 100,000 zero emission freight vehicles and equipment, and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.

6. Post 2020 Cap-and-Trade Program

CARB will continue the existing Cap-and-Trade Program after 2020 with declining caps.

With the exception of the post-2020 Cap-and-Trade Program, the above measures and policies are considered "known commitments" meaning that they were existing programs or required by statute prior to the adoption of the 2017 Scoping Plan. (Since adoption of the 2017 Scoping Plan, legislation was enacted extending the horizon year of the Cap-and-Trade Program to 2030.)

The 2017 Scoping Plan also addressed how CEQA can be used to further statewide GHG reduction goals. The Plan recommends GHG reduction goals that can apply to plan- or

project-level analyses to be incorporated into environmental documentation in support of CEQA. The Plan states that a per capita GHG target is "appropriate for the plan level (city, county, subregional, or regional level), but not for specific individual projects, because [CARB's metric] includes all emissions sectors in the State." Project-level goals may be supported by local governments or lead agencies and include potential strategies such as tiering from a geographically specific GHG reduction plan, comparing to service population emissions targets, implementing all feasible mitigation measures, achieving zero net GHG emissions, or emitting less than bright-line numerical thresholds.

Cap-and-Trade Program

The California Global Warming Solutions Act of 2006 (AB 32) allowed, but did not require, CARB to include among the mechanisms intended to reduce GHG emissions a "system of market-based declining annual aggregate emission limits." In turn, the Scoping Plan, approved by CARB on December 11, 2008, directed CARB staff to develop, among other programs, a cap-and-trade mechanism that would apply a declining aggregate cap on GHG emissions⁸ and provide a flexible compliance system using tradable instruments.

On July 25, 2017, the Governor of California approved AB 398 which extended the cap-and-trade program to 2030. Under AB 398, the statewide GHG emissions goal is 40 percent below 1990 levels by 2030.

Co-Pollutant Benefits

Implementation of the cap-and-trade program will also reduce statewide emissions of criteria and toxic air pollutants. Because GHG emissions are largely the result of fuel combustion, as the cap decreases and combustion decreases, criteria and toxic air pollutants associated with combustion will also decrease. CARB also evaluated the potential for localized impacts from short-term increases in construction and operational emissions at facilities modifying operations in response to cap-and-trade compliance obligations. CARB's analysis indicated that localized impacts are unlikely due to existing local and state air quality regulations; however, where there is potential for significant impact from a proposed project, it would be addressed by local permitting agencies and CEQA lead agencies through the permitting and CEQA processes in which mitigation measures are evaluated.

1.2.2.4 Senate Bill 32 and Assembly Bill 197 (Statewide GHG Targets for 2030)

Enacted in 2016, SB 32 (Pavley, 2016) codifies the 2030 emissions reduction goal of Executive Order B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40 percent below 1990 levels by 2030.

SB 32 was coupled with a companion bill: AB 197 (Garcia, 2016). Designed to improve the transparency of CARB's regulatory and policy-oriented processes, AB 197 created the Joint Legislative Committee on Climate Change Policies, a committee with the responsibility to ascertain facts and make recommendations to the Legislature concerning statewide programs, policies and investments related to climate change. AB 197 also requires CARB to make certain GHG emissions inventory data publicly available on its website; consider the social costs of GHG emissions when adopting rules and regulations designed to achieve GHG

⁸ The cap-and-trade regulation applies to the following GHGs: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF₆), and nitrogen trifluoride (NF₃).

emission reductions; and include specified information in all Scoping Plan updates for the emission reduction measures contained therein.

1.2.2.5 Executive Order B-55-18 (Carbon Neutrality)

In September 2018, Governor Brown signed EO B-55-18, which established a new statewide goal “to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter.” This EO directs CARB to “work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal.”

In January 2019, CARB held a workshop regarding carbon neutrality in California, during which CARB staff explained that the definitional parameters and meaning of the term – carbon neutrality – are still being explored. CARB intends to hold additional workshops to explore specific topics related to the pursuit of carbon neutrality, engage with other experts in the field and stakeholders, and conduct research to ensure that any path to carbon neutrality balances scientific, economic and social justice principles.

1.2.2.6 Regulation of Energy-Related Sources

Renewables Portfolio Standard (SB 100)

As most recently amended by SB 100 (2018), California’s Renewables Portfolio Standard requires retail sellers of electric services and local publicly-owned electric utilities to increase procurement from eligible renewable energy resources to 50 percent of total retail sales by 2026, and 60 percent of total retail sales by 2030. SB 100 also established a state policy goal to achieve 100 percent renewables by 2045.

GHG Emissions Standard for Baseload Generation (SB 1368)

SB 1368 (September 29, 2006) prohibits any retail seller of electricity in California from entering into a long-term financial commitment for baseload generation if the GHG emissions are higher than those from a combined-cycle natural gas power plant. This performance standard applies to electricity generated out-of-state as well as in the state, and to publicly owned as well as investor-owned electric utilities.

1.2.2.7 Regulation of Mobile Sources

Senate Bill 375 (Land Use Planning)

SB 375 provided for a new planning process to coordinate land use planning, regional transportation plans, and funding priorities in order to help California meet the GHG reduction goals established in AB 32. SB 375 requires Metropolitan Planning Organizations (MPOs), including the Sacramento Area Council of Governments (SACOG), to incorporate a “sustainable communities strategy” (SCS) in their regional transportation plans (RTPs) that will achieve GHG emission reduction targets set by CARB, primarily by reducing VMT from light-duty vehicles through development of more compact, complete, and efficient communities.

SB 375 also required CARB to appoint a Regional Targets Advisory Committee (RTAC) to recommend factors and methodologies for CARB to use in setting GHG emission reduction targets (Regional Targets) for each region. On September 29, 2009, the RTAC released its recommendations to CARB, who, on September 23, 2010, adopted Regional Targets for the years 2020 and 2035. The 2010 Regional Targets were 7% for 2020 and 16% for 2035 for

the area under SACOG's jurisdiction, which includes Sacramento County. In 2018, CARB revised these Regional Targets to 7% for 2020 and 19% for 2035.⁹

In February 2016, SACOG issued the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) for the Sacramento region. The MTP/SCS supports the 2004 Sacramento Region Blueprint, which implements smart growth principles, including housing choice, compact development, mixed-use development, natural resources conservation, use of existing assets, quality design and transportation choice.¹⁰ The Sacramento Region Blueprint and the MTP/SCS are discussed further in Regional Regulatory Background **Section 1.2.3** below.

Mobile Source Reductions (Pavley) (AB 1493)

AB 1493 required CARB to adopt regulations by January 1, 2005, to reduce GHG emissions from non-commercial passenger vehicles and light-duty trucks of model years 2009 through 2016. The bill required the California Climate Action Registry to develop and adopt protocols for the reporting and certification of GHG emissions reductions from mobile sources for use by CARB in granting emission reduction credits. The bill authorizes CARB to grant emission reduction credits for reductions of GHG emissions prior to the date of the enforcement of regulations, using model year 2000 as the baseline for reduction.

In 2004, CARB applied to the USEPA for a waiver under the federal Clean Air Act to authorize implementation of these regulations. The waiver request was formally denied by the USEPA in December 2007 after California filed suit to prompt federal action. In January 2008, the State Attorney General filed a new lawsuit against the USEPA for denying California's request for a waiver to regulate and limit GHG emissions from these vehicles. In January 2009, President Obama issued a directive to the USEPA to reconsider California's request for a waiver. On June 30, 2009, the USEPA granted the waiver to California for its GHG emission standards for motor vehicles. As part of this waiver, the USEPA specified the following provision: CARB may not hold a manufacturer liable or responsible for any non-compliance caused by emission debits generated by a manufacturer for the 2009 model year.

Low Carbon Fuel Standard

Executive Order S-1-07, as issued by Governor Schwarzenegger, called for a 10 percent or greater reduction in the average fuel carbon intensity for transportation fuels in California by 2020.¹¹ In response, CARB approved the LCFS regulations in 2009, which became fully effective in April 2010. In September 2015, CARB re-adopted the LCFS regulations following the resolution of a lawsuit.

In January 2019, CARB adopted amendments to the LCFS regulation to support the objectives of the 2017 Scoping Plan in achieving the statewide GHG target of 40 percent below 1990 levels by 2030. The amended regulation targeted a 20 percent reduction in fuel

⁹ CARB. 2019. SB 375 Regional Plan Climate Targets. Available at: <https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets>. Accessed: March 2020. If SACOG is not able to secure the funding and commitments to implement their proposed pilot project, CARB staff would evaluate the SCS performance against an 18 percent target.

¹⁰ SACOG. 2016. Metropolitan Transportation Plan/Sustainable Communities Strategy. February. Available at: <https://www.sacog.org/metropolitan-transportation-plansustainable-communities-strategy>. Accessed: March 2020.

¹¹ Carbon intensity is a measure of the GHG emissions associated with the various production, distribution and use steps in the "lifecycle" of a transportation fuel.

carbon intensity from a 2010 baseline by 2030. Specifically, it strengthened the carbon intensity benchmarks for gasoline, diesel, and jet fuel substitutes from 2019 to 2030, and added new credit generating fuels and vehicle categories to incentivize further reductions, including alternative jet fuels.¹² The LCFS would reduce GHG emissions by reducing the carbon intensity of transportation fuels used in California by at least 10% by 2020 and, as most recently amended in 2018, by at least 20% by 2030.

Clean Cars

In January 2012, CARB approved the Advanced Clean Cars Program, which established an emissions control program for cars and light-duty trucks (such as SUVs, pickup trucks, and minivans) of model years 2017-2025. When the program is fully implemented, new vehicles will emit 75% less smog-forming pollutants than the average new car sold today, and GHG emissions will be reduced by nearly 35%. The program also requires car manufacturers to offer for sale an increasing number of zero-emission vehicles (ZEVs) each year, including battery electric and fuel cell vehicles.

In December 2012, CARB adopted regulations allowing car manufacturers to comply with California's GHG emissions requirements for model years 2017-2025 through compliance with the USEPA GHG requirements for those same model years.¹³

1.2.2.8 CEQA Guidelines Amendments

2009 CEQA Guidelines Amendments (SB 97)

The 2009 CEQA Guidelines amendments adopted pursuant to SB 97 state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines amendments note that an agency may identify emissions either by selecting a "model or methodology" to quantify the emissions or by relying on "qualitative analysis or other performance based standards."¹⁴ Section 15064.4(b) provides that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment:

- The extent a project may increase or reduce GHG emissions as compared to the environmental setting.
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a state-wide, regional, or local plan for the reduction or mitigation of GHG emissions.¹⁵

¹⁴ CNRA. 2009. Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of GHG Emissions Pursuant to SB97. Available at: http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf. Accessed: March 2020.

¹⁵ CNRA. 2009. Revised Text of Proposed Guideline Amendments. Sacramento, CA. Available at: http://resources.ca.gov/ceqa/docs/Adopted_and_Transmitted_Text_of_SB97_CEQA_Guidelines_Amendments.pdf. Accessed: March 2020.

In addition, Section 15064.7(c) of the CEQA Guidelines amendments specifies “[w]hen adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence”¹⁶. Similarly, the revision to Appendix G, Environmental Checklist Form, which is often used as a basis for lead agencies’ selection of significance thresholds, does not prescribe specific thresholds. Rather, Appendix G asks whether the project would:

1. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment? or
2. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

This indicates that the determination of what is a significant effect on the environment should be left to the lead agency.

Accordingly, the CEQA Guidelines amendments do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Amendments emphasize the lead agency’s discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA.

The CEQA Guidelines amendments indicate that lead agencies should consider all feasible means, supported by substantial evidence and subject to monitoring and reporting, of mitigating the significant effects of GHG emissions. These potential mitigation measures, set forth in Section 15126.4(c), may include (1) measures in an existing plan or mitigation program for the reduction of GHG emissions that are required as part of the lead agency’s decision; (2) reductions in GHG emissions resulting from a project through implementation of project design features; (3) off-site measures, including offsets, to mitigate a project’s emissions; and (4) carbon sequestration measures.¹⁷

Among other things, the California Natural Resources Agency (CNRA) noted in its Public Notice for these changes that impacts of GHG emissions should focus on the cumulative impact on climate change. The Public Notice states:

While the Proposed Amendments do not foreclose the possibility that a single project may result in GHG emissions with a direct impact on the environment, the evidence before [CNRA] indicates that in most cases, the impact will be cumulative. Therefore, the Proposed Amendments emphasize that the analysis of GHG emissions should center on whether a project’s incremental contribution of GHG emissions is cumulatively considerable.¹⁸

Thus, the CEQA Guidelines amendments continue to make clear that the significance of GHG emissions is most appropriately considered on a cumulative level.

¹⁷ Ibid.

¹⁸ CNRA. 2009. Notice of Public Hearings and Notice of Proposed Amendment of Regulations Implementing the California Environmental Quality Act. Available at: http://resources.ca.gov/ceqa/docs/Notice_of_Proposed_Action.pdf. Accessed: March 2020.

As described in the Final Statement of Reasoning¹⁹ for the 2009 CEQA Guidelines amendments, the CEQA Guidelines specifically do not address lifecycle emission for two reasons. First, there are different interpretations of the meaning of “lifecycle” amongst lead agencies, which could lead to confusion on how to evaluate the contribution of lifecycle emissions to a project. Furthermore, requiring an analysis of lifecycle emissions may be inconsistent with CEQA, as the emissions may be outside the scope of the “indirect emissions” that are evaluated with a project.

2018 CEQA Guidelines Amendments

In late 2018, the CNRA finalized amendments to the CEQA Guidelines including changes to CEQA Guidelines section 15064.4, which addresses the analysis of GHG emissions. The amendments became effective on December 28, 2018, and clarified several points, including the following:²⁰

- Lead agencies must analyze the GHG emissions of proposed projects. (See CEQA Guidelines, § 15064.4, subd. (a).)
- The focus of the lead agency’s analysis should be on the project’s incremental contribution to climate change, rather than simply focusing on the quantity of emissions and how that quantity of emissions compares to statewide or global emissions. (See CEQA Guidelines, § 15064.4, subd. (b).)
- The impacts analysis of GHG emissions is global in nature and thus should be considered in a broader context. A project’s incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. (See CEQA Guidelines, § 15064.4, subd. (b).)
- Lead agencies should consider a timeframe for the analysis that is appropriate for the project. (See CEQA Guidelines, § 15064.4, subd. (b).)
- A lead agency’s analysis must reasonably reflect evolving scientific knowledge and state regulatory schemes. (See CEQA Guidelines, § 15064.4, subd. (b).)
- Lead agencies may rely on plans prepared pursuant to section 15183.5 (Plans for the Reduction of Greenhouse Gases) in evaluating a project’s GHG emissions. (See CEQA Guidelines, § 15064.4, subd. (b)(3).)
- In determining the significance of a project’s impacts, the lead agency may consider a project’s consistency with the State’s long-term climate goals or strategies, provided that substantial evidence supports the agency’s analysis of how those goals or strategies address the project’s incremental contribution to climate change and its conclusion that the project’s incremental contribution is consistent with those plans, goals, or strategies. (See CEQA Guidelines, § 15064.4, subd. (b)(3).)
- The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project’s

¹⁹ CNRA. 2009. Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of GHG Emissions Pursuant to SB97. Available at: http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf. Accessed: March 2020.

incremental contribution to climate change. (See CEQA Guidelines, § 15064.4, subd. (c).)

21

1.2.2.9 Senate Bill 743 (Transit Oriented Infill Projects)

Public Resources Code Section 21099(c)(1), as codified through enactment of SB 743, was enacted with the intent to change the focus of transportation analyses conducted under CEQA. SB 743 reflects a legislative policy to balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of GHG emissions. SB 743 requires OPR to establish “alternative metrics to the metrics used for traffic levels of service for transportation impacts outside transit priority areas.”²² Under SB 743, the new metrics or significance criteria must promote the reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses. SB 743 dictates that once the CEQA Guidelines are amended to include new thresholds, automobile delay, as described by level of service or similar measures of vehicular capacity or congestion, shall no longer be considered a significant impact under CEQA in all locations in which the new thresholds are applied. The Legislature gave OPR the option of applying the new thresholds only to transit priority areas, or more broadly to areas throughout the State. OPR proposed to apply the new thresholds throughout the State.

In January 2016, OPR issued its *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA* (Revised SB 743 Proposal). Included in the Revised SB 743 Proposal were proposed new CEQA Guidelines Section 15064.3 and related revisions to Appendix G. Under the proposed new Guidelines, the analysis of transportation impacts in the CEQA context would shift from a levels of service metric to a vehicle miles traveled (VMT) metric. In proposing the new approach, OPR noted the relationship between VMT and GHG emissions.

A VMT metric was adopted as part of the 2018 CEQA Guidelines Amendments (described above), which became effective on December 28, 2018. As described in the Final Statement of Reasoning²³ for the 2018 CEQA Guidelines amendments: “The current emphasis on traffic congestion in transportation analyses tends to promote increased vehicle use. This new guidance instead focuses on a project’s effect on vehicle miles traveled, which should promote project designs that reduce reliance on automobile travel.”

1.2.2.10 Building Energy Efficiency Standards

The Energy Efficiency Standards for Residential and Nonresidential Buildings, as specified in Title 24, Part 6, of the California Code of Regulations, were established in 1978 in response to a legislative mandate to reduce California’s energy consumption. The standards are updated periodically to incorporate new energy efficiency technologies and methods for

SB-743 Environmental quality: transit oriented infill projects, judicial review streamlining for environmental leadership development projects, and entertainment and sports center in the City of Sacramento. Available at: http://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=201320140SB743. Accessed: March 2020.

²³ CNRA. 2018. Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines. Available at: http://resources.ca.gov/ceqa/docs/2018_CEQA_Final_Statement_of%20Reasons_111218.pdf. Accessed: March 2020.

building features such as space conditioning, water heating, lighting, and whole envelope. The 2005, 2008, and 2013 updates to the efficiency standards included provisions such as cool roofs on commercial buildings, increased use of skylights, and higher-efficiency lighting, heating, ventilation and air conditioning (HVAC), and water heating systems. Additionally, some standards focus on broader concepts such as reducing electricity loads at peak periods and seasons and improving the quality of energy-saving installations. Past updates to the Title 24 standards have proved very effective in reducing building energy use, with the 2013 update estimated to reduce energy consumption in residential buildings by 25% and energy consumption in commercial buildings by 30%, relative to the 2008 standards.²⁴ The California Energy Commission (CEC) recently adopted another update in 2019, which will become effective on January 1, 2020.²⁵ The 2019 updates include a requirement for solar photovoltaic systems for new homes, requirements for newly constructed healthcare facilities, additional high-efficiency lighting requirements, high-performance attic and walls, higher-efficiency water and space heaters, and high-efficiency air filters. Relative to the 2016 standards, the 2019 standards are expected to reduce high-rise residential and non-residential electricity consumption by approximately 10.7% and natural gas consumption by 1%, and require new low-rise residential buildings to achieve zero net electricity consumption using a combination of building efficiency and on-site renewable electricity generation.²⁶

In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as CalGreen Building Standard (CalGreen), and establishes voluntary and mandatory standards pertaining to the planning and design of sustainable site development, energy efficiency, water conservation, material conservation, and interior air quality. Like Part 6 of Title 24, the CalGreen standards are periodically updated, with increasing energy savings and efficiencies associated with each code update.

1.2.2.11 Zero Emission Vehicles

Zero emission vehicles (ZEVs) include hydrogen fuel cell electric vehicles and battery-electric vehicles with no tailpipe emissions.

In its 2014 First Update to the Climate Change Scoping Plan, CARB recognized that the light-duty vehicle fleet "will need to become largely electrified by 2050 in order to meet California's emission reduction goals."²⁷ Accordingly, CARB's Advanced Clean Cars (ACC) program requires about 15 percent of new cars sold in California in 2025 to be a plug-in hybrid, battery electric, or fuel cell vehicles.²⁸

²⁷ CARB. 2014. First Update to the Climate Change Scoping Plan: Building on the Framework. May. p. 48.

²⁸ Id. at p. 47.

Two Executive Orders established milestones to encourage statewide ZEV usage. In 2012, Governor Brown issued EO B-16-12, which calls for the increased penetration of ZEVs into California's vehicle fleet to help California achieve transportation sector GHG emissions reductions of 80 percent below 1990 levels by 2050. In support of this target, the EO also calls upon CARB, the CEC and the California Public Utilities Commission to establish benchmarks that will: (1) allow over 1.5 million ZEVs to be on California roadways by 2025, and (2) provide the State's residents with easy access to ZEV infrastructure.

EO B-16-12 specifically directed California to "encourage the development and success of zero-emission vehicles to protect the environment, stimulate economic growth, and improve the quality of life in the state."²⁹ In January 2018, Governor Brown issued EO B-48-18 to "boost the supply of zero-emission vehicles and charging and refueling stations in California."³⁰ These Executive Orders established several milestones organized into four time periods:

By 2015:

- The State's major metropolitan areas will be able to accommodate zero-emission vehicles, each with infrastructure plans and streamlined permitting;
- The State's manufacturing sector will be expanding zero-emission vehicle and component manufacturing;
- The private sector's investment in zero-emission vehicle infrastructure will be growing; and
- The State's academic and research institutions will be contributing to zero-emission vehicle research, innovation, and education.

By 2020:

- The State's zero-emission vehicle infrastructure will be able to support up to one million vehicles;
- The costs of zero-emission vehicles will be competitive with conventional combustion vehicles;
- Zero-emission vehicles will be accessible to mainstream consumers;
- There will be widespread use of zero-emission vehicles for public transportation and freight transport;
- Transportation sector greenhouse gas emissions will be falling as a result of the switch to zero-emission vehicles;
- Electric vehicle charging will be integrated into the electricity grid; and
- The private sector's role in the supply chain for zero-emission vehicle component development and manufacturing State will be expanding.

By 2025:

²⁹ Executive Order B-16-2012. March 2012. Available at: <https://www.ca.gov/archive/gov39/2012/03/23/news17472/index.html>. Accessed: March 2020.

³⁰ Executive Order B-48-2018. January 2018. Available at: <http://opr.ca.gov/planning/transportation/zev.html>. Accessed: March 2020.

- Over 1.5 million zero-emission vehicles will be on California roads and their market share will be expanding;
- Californians will have easy access to zero-emission vehicle infrastructure; and
- California's clean, efficient vehicles will annually displace at least 1.5 billion gallons of petroleum fuels.

By 2030:

- 5 million zero-emission vehicles will be on California roadways.

In furtherance of those goals, in February 2013, the Governor's Interagency Working Group on Zero-emission Vehicles issued the *2013 ZEV Action Plan: A roadmap toward 1.5 million zero-emission vehicles on California roadways by 2025*.³¹ The 2013 ZEV Action Plan identifies four broad goals for state government to advance ZEVs: 1) Complete needed infrastructure and planning; 2) Expand consumer awareness and demand; 3) Transform fleets; and 4) Grow jobs and investment in the private sector. As part of these goals, some highlighted strategies and actions include: i) supporting ZEV infrastructure planning and investment by private entities; ii) enabling universal access to ZEV infrastructure for California drivers; iii) reducing upfront purchase costs for ZEVs; iv) promoting consumer awareness of ZEVs; and v) helping to expand ZEVs in bus fleets. The Action Plan discusses the challenges of ZEV expansion, which include the need to enable electric vehicle chargers in homes, increase consumer awareness, address up-front costs and operational limitations, and address that ZEVs are not commercially available for all categories of vehicles.

In October 2016, the Governor's Interagency Working Group on Zero-emission Vehicles issued the *2016 ZEV Action Plan: A roadmap toward 1.5 million zero-emission vehicles on California roadways by 2025*.³² This report provides an update on progress toward achieving the 2013 goals and highlights the following four top priorities for the upcoming years: 1) Raise consumer awareness and education about ZEVs; 2) Ensure ZEVs are accessible to a broad range of Californians; 3) Make ZEV technologies commercially viable in targeted applications in the medium-duty, heavy-duty, and freight sectors; and 4) Aid ZEV market growth beyond California. The broad goals to advance ZEV adoption are: i) Achieve mainstream consumer awareness of ZEV options and benefits; ii) Make ZEVs an affordable and attractive option for drivers; iii) Ensure convenient charging and fueling infrastructure for greatly expanded use of ZEVs; iv) Maximize economic and job opportunities from ZEV technologies; v) Bolster ZEV market growth outside of California; and vi) Lead by example by integrating ZEVs into state government. The goals and strategies proposed in the 2013 Action Plan will continue to be implemented. Additional strategies are proposed to help achieve the new goals, including setting targets to increase home charging stations in multi-unit dwellings and disadvantaged communities and for public transit and school bus electrification. The 2016 Action Plan describes challenges toward achieving the 2025 goal of 1.5 million ZEVs in California, such as that most consumers are still not aware of the benefits of passenger ZEVs and that over 1,000,000 charge points will be needed at homes,

³¹ Governor's Interagency Working Group on Zero-emission Vehicles. 2013. Available at: [http://opr.ca.gov/docs/Governors_Office_ZEV_Action_Plan_\(02-13\).pdf](http://opr.ca.gov/docs/Governors_Office_ZEV_Action_Plan_(02-13).pdf). Accessed: March 2020.

³² Governor's Interagency Working Group on Zero-emission Vehicles. 2016. 2016 ZEV Action Plan. Available at: https://www.ca.gov/archive/gov39/wp-content/uploads/2018/01/2016_ZEV_Action_Plan-1.pdf. Accessed: March 2020.

workplaces, and public locations but only 11,000 non-home charge points are installed as stated in the 2016 ZEV Action Plan.

In January 2018, Governor Brown signed EO B-48-18 issuing a “Priorities Update”: An update to the 2016 Zero-Emission Vehicle Action Plan to help expand private investment to the zero-emission vehicle infrastructure, particularly in the low income and disadvantaged communities. The initiative is focused on deploying charging and fueling infrastructure through multi-stakeholder efforts, thus increasing both ownership and operations of ZEVs. The 2018 Priorities Update focuses specifically on state agency actions and is designed to serve three fundamental purposes: 1) Provide direction to state agencies on the most important actions to be executed in 2018 to enable the progress toward the 2025 targets and 2030 vision; 2) Give stakeholders transparency into the actions state agencies plan to take (or are taking) this year to further the ZEV market; and 3) Create a platform for stakeholder engagement, feedback, and collaboration.³³

California is incentivizing the purchase of ZEVs through implementation of the Clean Vehicle Rebate Project (CVRP), which is administered by a non-profit organization (The Center for Sustainable Energy) for CARB and currently subsidizes the purchase of passenger near-zero and zero emission vehicles as follows:

- Hydrogen Fuel Cell Electric Vehicles: \$5,000
- Battery Electric Vehicles: \$2,500
- Plug-In Hybrid Electric Vehicles: \$1,500
- Neighborhood Electric Vehicles and Zero Emission Motorcycles: \$900

In July 2017, CARB approved the first of Volkswagen’s (VW) four 30-month ZEV Investment Plans (Plan).³⁴ This Plan is required by California’s partial settlement for \$800 million with VW resulting from the automaker’s use of illegal defeat devices in its 2.0-liter diesel cars sold in the state from model years 2009 to 2015. The Plan describes how VW proposes to spend the first \$200 million in California on ZEV charging infrastructure (including the development and maintenance of ZEV charging stations), public awareness, increasing ZEV access, and a green city demonstration. In December 2018, CARB approved VW-subsiary Electrify America’s Cycle 2 California ZEV Investment Plan, which continues to support the goals established in the first funding cycle but adds in new metropolitan and regional charging corridors. It also expands investments for charging stations to support ZEV bus fleets, ride-hail services, and autonomous vehicle charging.³⁵

Many other statewide and regional initiatives are helping spur ZEV uptake.

Senate Bill 391 (California Transportation Plan)

SB 391 requires that Caltrans updates the California Transportation Plan by December 31, 2015, and every five years thereafter, accounting for a wide variety of measures, including the use of alternative fuels, new vehicle technology, tailpipe emissions reductions, and the expansion of public transit, bicycling, and walking. The California Transportation Plan was updated in 2015.³⁶

1.2.2.12 Other State GHG Regulatory Activities***Executive Order S-13-08 (Climate Adaptation Strategy)***

On November 14, 2008, Governor Arnold Schwarzenegger signed Executive Order S-13-08, which called on State agencies to develop a strategy for identification of and preparation for expected climate change impacts in California. The resulting *2009 California Climate Adaptation Strategy* report was developed by the CNRA in coordination with the Climate Action Team (CAT). The report presents the best available science relevant to climate impacts in California and proposes a set of recommendations for decision-makers to assess vulnerability and promote resiliency to reduce California's vulnerability to climate change. Guidance regarding adaptation strategies is general in nature and emphasizes incorporation of strategies into existing planning policies and processes. The report has since been updated in 2014 and 2018 and is now known as the Safeguarding California Plan, which is a roadmap for the state's programmatic and policy actions to achieve an integrated climate change adaptation strategy.³⁷

Other Regulations or Policies**Senate Bill X7 7 (Water Conservation Act of 2009)**

The Water Conservation Act of 2009 sets an overall goal of reducing per-capita urban water use by 20% by December 31, 2020. The state is required to make incremental progress toward this goal by reducing per-capita water use by at least 10% by December 31, 2015. Reduction in water consumption directly reduces the necessary energy and the associated emissions to convey, treat, distribute, and eventually treat the water.

California Integrated Waste Management Act

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 (Public Resources Code Sections 40000 et seq.) to include a provision declaring that it is the policy goal of the state that not less than 75 percent of solid waste generated be source-reduced, recycled, or composted by 2020, and annually thereafter.³⁸ In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the State's policy goal.³⁹ CalRecycle conducted several stakeholder workshops and published a discussion document in May 2012 titled California's New Goal: 75

³⁸ Cal. Pub. Res. Code § 41780.01(a).

³⁹ Cal. Pub. Res. Code § 41780.02.

Percent Recycling, which identifies concepts that CalRecycle believes would assist the state in reaching the 75 percent goal by 2020.⁴⁰

AB 1826 (2014) further amended the California Integrated Waste Management Act of 1989 to require commercial businesses to recycle organic waste, which includes food waste and green waste, with phased-in requirements based on the volume of waste generated. It also required local jurisdictions to adopt an organic waste recycling program.

In March 2017, CARB released its Short-Lived Climate Pollution Reduction Strategy which included a provision for CalRecycle to develop regulations to reduce statewide organic waste disposal by 50% of 2014 levels by 2020 and 75% of 2014 levels by 2025. These regulations will take effect on or after January 1, 2022.⁴¹

1.2.2.13 Court Rulings

Several recent court rulings affect the derivation and applicability of GHG thresholds for CEQA. These are summarized below.

Newhall Ranch: Center for Biological Diversity v. Department of Fish and Wildlife, 62 Cal. 4th 204 (2016)

In the Newhall Ranch decision, the California Supreme Court recognized that an individual project's emissions alone will most likely not have any appreciable impact on global GHG emissions, but an individual project will contribute to the significant cumulative impact caused by GHG emissions from other sources around the globe. The question therefore becomes whether the project's incremental addition of GHGs is cumulatively considerable in light of the global problem, and thus significant. The Court acknowledged that the fact that emissions are global rather than local gives rise to an argument that a certain amount of GHG emissions "is as inevitable as population growth." The Court stated "Under this view, a significance criterion framed in terms of efficiency is superior to a simple numerical threshold because CEQA is not intended as a population control measure."

Golden Door: Golden Door Properties, LLC v. County of San Diego/Sierra Club, LLC v. County of San Diego, Cal. App. 5th (2018)

In the Golden Door decision, the Court ruled that San Diego County's 2016 Guidance Document for analyzing GHG impacts violated CEQA because it was not adopted by ordinance, resolution, rule, or regulation, or through a public review process. The Court further ruled that the Guidance Document's GHG efficiency metric of 4.9 metric tons of CO₂e per service population per year was not supported by substantial evidence that explained why use of statewide GHG reduction levels was appropriate for all projects in San Diego County.

Together, the Newhall Ranch and Golden Door court decisions suggest that data used to support thresholds should be local, and the applicability of one threshold to all land use types or emission sectors may not be appropriate.

1.2.3 Regional

1.2.3.1 Sacramento Region Blueprint

SACOG adopted the Sacramento Blueprint in 2004 as a smart growth vision for the region. The Blueprint integrates land use and transportation planning in an effort to reduce sprawl, vehicle emissions, and traffic congestion by incorporating smart growth principles that encourage housing options closer to centers of employment, shopping, and recreation hubs. The key planning principles of the Blueprint include: transportation choice, compact development, mixed use development, housing choice and diversity, use of existing assets, natural resource conservation, and quality design.⁴² The Blueprint establishes 2050 targets including percent distribution of housing types (rural residential, large-lot single family, small-lot single family, attached homes); percent distribution of new housing vs. new jobs; square miles of new land for urban uses; and square miles of agricultural land to be converted to urban and public-use open space. The Blueprint conceptual map and growth principles are updated regularly to include new information, no less frequently than the update cycle for the MTP/SCS.⁴³

1.2.3.2 Sacramento Metropolitan Transportation Plan/Sustainable Communities Strategy

The Sacramento Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) supports the Sacramento Region Blueprint and links land use, air quality, and transportation needs. As the state and federally-designated MPO for the region, SACOG is responsible for developing the MTP/SCS in coordination with Sacramento, Yolo, Yuba, Sutter, El Dorado, and Placer counties. The MTP/SCS includes a long-range regional transportation plan covering a 20-year planning horizon (the MTP component), as well as policies and strategies to reduce GHG emissions from passenger vehicles based on targets set by CARB (the SCS component) pursuant to SB 375.⁴⁴ In 2018, CARB set SACOG's GHG emissions reduction targets to 7% for 2020 and 19% for 2035.⁴⁵

The most recent version of the MTP/SCS was adopted in November 2019 and covers the period from 2020 to 2040. The 2020 MTP/SCS is a multimodal transportation plan that is required to be financially feasible, achieve health standards for clean air, and address statewide climate goals. It is guided by four priority policy areas: build vibrant places for today's and tomorrow's residents; foster the next generation of mobility solutions; modernize the way we pay for transportation infrastructure; and build and maintain a safe, reliable, and multimodal transportation system. The MTP/SCS includes a regional growth forecast and projected land use pattern (residential and employment) to accommodate estimated increases in population, employment, and housing. It also reports on historical

VMT data, observed VMT trends, and forecasted VMT through 2040.⁴⁶ Data from the 2020 MTP/SCS is used to establish Sacramento County's share of future transportation emissions for new developments, as described later in this report.

1.2.4 Local

1.2.4.1 County of Sacramento Climate Action Plan

The County of Sacramento adopted its Government Operations CAP in 2012, which addresses GHG emissions from the County's operations including County-owned facilities, vehicles, equipment, and employee commute. It identified an action plan to reduce County government GHG emissions to a level 15% below baseline 2005 levels by 2020.⁴⁷

The County is currently developing a Communitywide Greenhouse Gas Reduction and Climate Change Adaptation Plan (Communitywide CAP), which will update the government operations GHG inventory and CAP measures, update the unincorporated County's GHG inventory and forecasts, identify GHG reduction targets for 2020, and propose measures to achieve the required GHG reductions for the entire County. It will also conduct a climate change vulnerability assessment and develop an adaptation strategy. So far, a memorandum documenting the existing and projected Business-as-Usual emissions inventories has been released.⁴⁸

1.2.4.2 City Climate Action and GHG Reduction Plans

In 2011, the City of Citrus Heights adopted its Greenhouse Gas Reduction Plan with a GHG reduction target of 10-15% below 2005 baseline emission levels by 2020.⁴⁹

In 2012, the City of Sacramento adopted its Climate Action Plan, and in 2015 it was incorporated into the City's 2035 General Plan. The CAP/2035 General Plan identified how City operations as well as the broader community could reduce GHG emissions to achieve 22% and 15% reductions below 2005 baseline levels by 2020 for municipal and community emissions, respectively. It also set longer-term reduction targets of 49% by 2035 and 83% by 2050.⁵⁰ In 2016, the City of Sacramento updated its Climate Action Plan for Internal Operations. The plan documented the City's attainment of a 24% GHG emissions reduction from municipal operations from 2005 to 2013, thus exceeding the adopted CAP/2035 General Plan target of 22% reduction by 2020. The 2016 update set a new target to achieve

33% reduction by 2020.⁵¹ The City is currently developing the 2040 General Plan, which will include an ambitious update to the Climate Action Plan with the goal of establishing Sacramento as a climate leader.⁵²

In 2018, as part of its 2035 General Plan, the City of Folsom set GHG reduction targets of 15%, 40%, 51%, and 80% below 2005 baseline levels by 2020, 2030, 2040, and 2050, respectively.⁵³

In 2019, the City of Elk Grove updated its CAP as part of its General Plan. The updated CAP set per capita emissions targets of 7.6 MTCO₂e per capita by 2020, 4.1 MT CO₂e per capita by 2030, and 1.4 MT CO₂e per capita by 2050.⁵⁴

The City of Galt's CAP is currently under development.⁵⁵ The cities of Rancho Cordova and Isleton have not yet developed CAPs.

The State CEQA Guidelines describe the technical and procedural conditions needed to be a Qualified CAP.

1.2.4.3 The Mayor's Commission on Climate Change

In 2018, Mayor Darrell Steinberg of Sacramento and Mayor Christopher Cabaldon of West Sacramento⁵⁶ established the Mayors' Commission on Climate Change. The Commission aims to develop a common vision and strategies for both cities to achieve net zero greenhouse gas emissions, referred to as Carbon Zero, by 2045. Specifically, the Commission's objectives are to: (1) establish goals and priority areas of action to achieve Carbon Zero by 2045, (2) strengthen local and regional partnerships to address climate change and increase resiliency, (3) engage community members and business leaders to build political support for robust climate action, (4) provide a forum to develop and vet the guiding principles of ambitious strategies within the City of Sacramento and West Sacramento's Climate Action Plans, (5) advance social equity and economic prosperity, and (6) attract additional investments into the region.⁵⁷

Key focus sectors include the built environment, mobility, and community health and resiliency. The Commission will issue a Final Recommendations Report that highlights priority strategies to achieve Carbon Zero to inform future updates to the cities' Climate Action

⁵⁷ The Mayor's Commission on Climate Change. Available online at: <https://www.lgc.org/climatecommission/>. Accessed: March 2020.

Plans. Current adopted strategies for the built environment include mandating new construction to be all-electric to eliminate fossil fuel use in new buildings by 2023, transitioning 25% of existing residential and small commercial buildings to all-electric by 2030, and supporting infill to ensure that 90% of growth is in the established and center/corridor communities and 90% small-lot and attached homes by 2040, consistent with the regional MTP/SCS.⁵⁸ The Climate Commission's adopted mobility strategies are to expand and enhance accessibility to low-stress connected infrastructure for walking and rolling (e.g., bicycling), prioritizing improvements that address specific community and neighborhood concerns and needs, so that 30% of all trips are by active transportation by 2030 and 40% by 2045; expand and improve transit and shared mobility services to be more accessible, affordable, timely, and attractive than single-occupancy vehicle use, so that 30% of all trips are by transit and pooled share mobility by 2030 and 50% by 2045; and develop a comprehensive package of incentives, disincentives, and policies to encourage the adoption of ZEVs so that they make up 70% of new vehicle registrations by 2030 and achieve 100% electrification of all public, private, and shared fleets by 2045.⁵⁹ Draft strategies for the community health and resiliency sector are still under development as of the writing of this report.

2. OVERVIEW OF STRATEGY FOR THRESHOLD DEVELOPMENT

As described in Section 1, there is a need for substantiated GHG thresholds for purpose of CEQA that are consistent with achieving the portion of the State's targeted GHG emissions reductions specific to the quantities and sectors of emissions from Sacramento County. The thresholds developed in this document supplement the thresholds and modeling methodologies already available in the SMAQMD CEQA Guide and the SMAQMD Recommended Guidance for Land Use Emissions Reductions.^{60,61} The overall modeling and reporting strategy for CEQA climate change sections will generally follow existing SMAQMD guidance, but with updates to default assumptions and significance thresholds as described in Sections 4 and 5. These thresholds are developed and applied in four steps, described in more detail below:

1. Determine Sacramento County's share of statewide 2030 GHG emissions by sector consistent with the CARB Scoping Plan (See Section 3).
2. Determine share of Sacramento County 2030 emissions from existing development vs new development (See Section 4).
3. Allocate 2030 GHG emissions from new development among land uses and place types to set numeric thresholds (See Section 4).
4. Set Best Management Practices by land use and place types that achieve numeric thresholds (See Section 5).

The land use types to which these thresholds apply include a range of residential and commercial uses. Examples of the land uses types that these thresholds are intended to cover include:⁶²

- Residential
- Commercial
- Retail
- Educational
- Recreational
- Light industrial
- Mixed-Use

These thresholds are not intended to address projects from which the majority of emissions are not related to building energy or mobile vehicle traffic, or that relate to sectors not

⁶⁰ SMAQMD. 2018. Chapter 6 Greenhouse Gas Emissions. Available online at: <http://www.airquality.org/LandUseTransportation/Documents/Ch6GHGFinal5-2018.pdf>.

⁶¹ SMAQMD. 2017. Recommended Guidance for Land Use Reductions. Available online at: <http://www.airquality.org/LandUseTransportation/Documents/SMAQMDLandUseEmissionReductions4.0Final.pdf>.

⁶² Definitions and land use subtypes for these categories are available in the CalEEMod® Users Guide, Table 1. 2017. Available at: http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4.

captured here. These thresholds are only intended to address GHG emissions and are not intended to address other regulatory considerations. Other sectors analyzed in the 2017 Scoping Plan include agriculture and industrial emissions. Projects in those sectors are relatively unique and should be evaluated on a case-by-case basis. This includes agriculture, industrial, transportation, infrastructure, stadiums, military bases, and hospitals. Projects such as hospitals should consult with SMAQMD to determine whether and how to apply these thresholds.

3. SACRAMENTO COUNTY GHG EMISSIONS IN 2030

The first step in threshold development requires the derivation of the GHG emissions in 2030 by sector in Sacramento County that would be needed to be consistent with the CARB Scoping Plan. First, the Scoping Plan assumptions are reviewed to determine the assumptions that are either geographically-specific or specific to new developments as compared to existing developments. Next, the analysis determines the share and total amount of emissions in the Scoping Plan scenario that can reasonably be attributed to Sacramento County.

3.1 Scoping Plan Assumptions

The 2017 CARB Scoping Plan projects emissions by sector to achieve California's 2030 GHG target of 40 percent below 1990 levels. The Scoping Plan assumptions and assessments are just one potential set of modeling assumptions to achieve the State's targets; the targets could be achieved by other methods, policies, or technologies, but those used in the modeling are considered reasonable, and are used as the basis for these guidelines. The assumptions are detailed by Environment, Economics, and Energy (E3)'s PATHWAYS modeling outputs and described in more detail in the Scoping Plan Appendix D.⁶³ Assumptions by sector and their relationship to geographic locations and new and existing developments are summarized below. The analyzed sectors include building energy, water, mobile sources, waste, entities included under cap-and-trade and other sectors.

3.1.1 Building Energy (natural gas and electricity):

Scoping Plan assumptions: The Scoping Plan assumes that the SB 350 goal of doubling additional achievable energy efficiency by 2030 is met. This includes measures such as a 50% increase in energy efficiency for new appliances (appliances, water heating, space heating, lighting, cooking) compared to 2015, and small reductions in heating (3%), cooling (4.4%), and lighting (2%) loads due to behavior changes and better windows. The assumptions for this sector also assume achievement of 50% RPS by 2030, plus 18 gigawatts of behind-the-meter solar PV. The scenario does not assume any additional electrification or renewable natural gas.

Conclusion: Improvements in energy efficiency and renewables generation are not geographically specific, and the assumed improvements could be met through a variety of pathways. As described in Section 1.2.2, the Title 24 Building Energy Efficiency Standards have improved energy efficiency in new buildings with each triennial update cycle. The standards are required to be cost effective over the lifespan of a building.⁶⁴ The 2019 standards require low-rise residential buildings to generate on-site renewable electricity. Currently, the 2022 Title 24 standards update is underway, with an expected focus on nonresidential and multifamily buildings and decarbonization.⁶⁵ Therefore, new developments

⁶³ CARB. 2017. 2030 Scoping Plan Appendix D: PATHWAYS. Available at: https://www.arb.ca.gov/cc/scopingplan/2030sp_appd_pathways_final.pdf. Accessed: March 2020.

⁶⁴ CEC. 2019 Building Energy Efficiency Standards Frequently Asked Questions. Available at: https://ww2.energy.ca.gov/title24/2019standards/documents/2018_Title_24_2019_Building_Standards_FAQ.pdf. Accessed: March 2020.

⁶⁵ California Energy Commission. 2019. April 24 Staff Workshop on Triennial California Energy Code Measure Proposal Template. Available at: <https://efiling.energy.ca.gov/getdocument.aspx?tn=227863>. Accessed: March 2020.

will include more efficient buildings and appliances than existing buildings and an increase in renewables generation due to code compliance and economic considerations.

3.1.2 Water

Scoping Plan assumptions: The Scoping Plan includes a 10% reduction in water heating demand due to urban water efficiency measures.

Conclusion: Reductions in water demand are overall not geographically specific (though total water consumption may vary by climate zone and land use type). Water reductions apply to both new and existing developments.

3.1.3 Mobile

Scoping Plan assumptions: The Scoping Plan scenario uses the CARB's "Clean Technologies and Fuels" VISION model scenario plus incorporates additional ZEVs, biofuels, and a reduction in light-duty VMT. The end result of the assumptions is equivalent to achieving all of the prior SB 375 SCS targets (as adopted prior to the Scoping Plan's analyses in 2016) plus an additional ~15% reduction in VMT per capita, as noted in CARB's January 2019 white paper.⁶⁶

Conclusion: The SCS targets are geographically specific, but the 4 major MPOs all have similar targets (set 19% in 2035 for the SCS targets as adopted in 2018).⁶⁷ Therefore, it is reasonable to assume a similar per-capita reduction percentage is required for each region. Reductions for different place types within each region may be tailored to the region. Note that the SCS target percentages refer to reductions in light-duty vehicle GHG emissions compared to a 2005 baseline, so are not directly comparable to SB 743 targets or CARB's related supporting documentation, which are based on VMT reductions compared to 2015-2018 existing conditions.

The 2019 CARB white paper describes how per capita VMT reductions related to new projects as follows:

"It is reasonable for new development to achieve a fair share of per capita VMT and GHG emissions reductions necessary to achieve statewide climate goals and to continue to work towards additional VMT and GHG emissions reductions through other measures. The remainder of this document presents quantitative information about the rate of per capita VMT reduction needed on a statewide average basis compared to existing conditions to achieve the State's long-term climate goals. This rate of per capita VMT reduction is scalable to a fair share reduction at the project level."

The ~15% VMT per capita reduction target from existing conditions described in CARB's 2019 white paper as consistent with the Scoping Plan is also consistent with SB 743 requirements for new developments' transportation analyses for CEQA purposes. As described further below, the thresholds developed here are based on CARB's analyses and

⁶⁶ CARB. 2019. California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals. January. Available at: <https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate>. Accessed: March 2020.

⁶⁷ CARB. 2019. SB 375 Regional Plan Climate Targets. Available at: <https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets>. Accessed: March 2020. If SACOG is not able to secure the funding and commitments to implement their proposed pilot project, CARB staff would evaluate the SCS performance against an 18 percent target.

are meant to show consistency with the mobile emissions reductions needed to achieve the Scoping Plan target.

3.1.4 Waste

Scoping Plan assumptions: The Scoping Plan scenario includes a 14% reduction in waste emissions due to organic diversion of waste.

Conclusion: Reductions in waste emissions are not geographically specific as it applies to municipal solid waste. This reduction applies to both new and existing developments.

3.1.5 High-GWP Gases:

Scoping Plan assumptions: High-GWP gases include methane, hydrofluorocarbons (HFCs) and anthropogenic black carbon. The Scoping Plan scenario is generally consistent with the mitigation scenario in the Short-Lived Climate Pollutant (SLCP) Strategy per SB 1383, which mandates a 40 percent reduction in methane and HFC emissions by 2030 and a 50 percent reduction in anthropogenic emissions of black carbon by 2030.⁶⁸ Several components of non-energy GHGs are not evaluated here because they are associated with industrial or agricultural land uses. Black carbon is not evaluated here because it is not part of the State's GHG inventory that tracks progress toward the State's climate targets.⁶⁹ Emissions categories associated with residential and commercial land use types include solid waste disposal and a portion of refrigerant use (F-gases, HFCs). As described in Section 3.1.4, the Scoping Plan scenario includes a 14% reduction in waste emissions due to organic diversion of waste (on top of the reductions required by SB 1383 by 2020). In addition, the Scoping Plan scenario includes a 63% reduction in F-gases.

As described in the SLCP Strategy, "HFCs are synthetic gases used in refrigeration, air conditioning, insulating foams, solvents, aerosol products, and fire protection...The major concern with respect to HFCs is that their contribution to climate forcing is expected to increase rapidly in the future as they continue to replace ozone depleting substances (ODS), such that they will become very significant contributors." HFCs from transportation are expected to decrease due to the California and USEPA light-duty vehicle GHG emission standards.⁷⁰ Refrigerant HFC emissions are expected to decrease significantly due to State and International HFC phasedown agreements, but not enough to meet the 2030 reduction goal. Additional measures are being considered to further reduce emissions, with a menu of potential actions presented in the SLCP Strategy. The SLCP Strategy states, "Early action...can avoid locking-in the use of high-GWP refrigerants in new or retrofitted systems in the coming years. For example, as effective alternatives become available, ARB will consider developing limitations on the use of high-GWP refrigerants in new refrigeration and air-conditioning equipment where lower-GWP alternates are feasible and readily available" (page 90). The safety and feasibility of low-GWP refrigerants (e.g., hydrofluoro-olefin blends, ammonia, CO₂) is not fully established for all uses. Other actions include financial incentive programs for low-GWP refrigeration early adoption and a prohibition on sales of very-high GWP refrigerants. California's Significant New Alternatives Policy (SNAP), comprised of the

⁶⁸ CARB. 2017. Final Short-Lived Climate Pollutant Reduction Strategy. March. Available at: <https://ww2.arb.ca.gov/resources/documents/final-short-lived-climate-pollutant-reduction-strategy-march-2017>. Accessed: March 2020.

⁶⁹ CARB. 2017. California's 2017 Climate Change Scoping Plan. (page 11). Available at: https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed: March 2020.

⁷⁰ The effects of the recent federal actions to roll back vehicle efficiency standards have not yet been quantified.

CARB HFC Regulation and SB 1013, took effect on January 1, 2019, and will require HFC emissions reductions from non-mobile sources.⁷¹ This includes refrigerant prohibitions for new household refrigerators and freezers, retail food refrigeration, cold storage warehouses, foams, and aerosols, among other substances, with effective dates ranging from January 1, 2019, to January 1, 2021.

Conclusion: As discussed in Section 3.1.4, reductions in waste emissions are not geographically specific as it applies to municipal solid waste, and this reduction applies to both new and existing developments. F-gas emissions may vary geographically based on refrigeration and air conditioning requirements. Per the SLCP Strategy, “[e]xisting equipment using high-GWP HFCs has an average lifetime of 15-20 years, and can be expected to continue operating and emitting high-GWP HFCs well past 2030” (page 97). Emissions reductions will occur during replacement and maintenance of existing refrigeration equipment or purchase or installation of new equipment, so would apply both to existing and new developments. However, due to the length scale for HFC replacement, emissions reductions would be more heavily weighted toward new developments.

3.1.6 Other Sectors:

Scoping Plan assumptions: The Scoping Plan includes emissions and reduction strategies from several other sectors that include agriculture, industrial, and offroad sources such as landscaping equipment. The natural and working lands sector includes forests, rangelands, farms, wetlands, and soils, and California’s climate objective is to maintain these as a net carbon sink. The State continues to develop quantification methodology and implementation scenarios to incorporate into future climate policies that affect natural and working lands. However, the Scoping Plan does not assume any GHG reductions in the natural and working lands sector.⁷²

Conclusion: The Scoping Plan includes emissions and reduction strategies from several other sectors that are not generally controlled by the types of developments covered by this report and are not disclosed in a geographically specific manner. However, project proponents should be generally aware of these sectors and not conflict with reduction strategies therein. Projects should comply with federal permitting requirements for high-value sequestering lands such as wetlands and agricultural land.^{73,74}

3.1.7 Cap-and-Trade:

Scoping Plan assumptions: Any ‘gap’ in reductions to achieve the State’s goals that are not explicitly included in other sectors are assumed to be met through Cap-and-Trade.

Conclusion: Cap-and-Trade assumptions are not geographically specific. This is an overarching emissions reduction strategy in the 2017 Scoping Plan that does not apply

specifically to the residential and commercial land use developments, although it could drive energy efficiency and vehicle efficiency as fuel gets more expensive.

3.2 Sacramento County GHG Share

To determine the Sacramento County GHG emissions as a percentage of statewide totals by sector requires assumptions about historical consumption, growth, and future expected emissions reductions. Sacramento County is expected to grow in population and employment at a faster rate than the State, on average, through 2030 and 2050.⁷⁵ As a conservative approach to set the Sacramento County maximum allowed emissions, for all emissions sectors of interest other than mobile sources, the proportion of statewide emissions from historical data in Sacramento County is assumed to remain constant in 2030 with no adjustment factor to account for its more rapid growth than the rest of the state. This is conservative, because as the population increases, Sacramento County could otherwise feasibly claim it should be allocated a larger share of total state emissions. As described further below, for the mobile sector, data from CARB's EMFAC2017 program and additional reductions to show consistency with the State target are used to project the County's share of future transportation emissions. While most of the emissions reductions are similar across California, the fraction of each sector represented in Sacramento will be different than in other areas of the state. This will result in a location-specific evaluation. **Appendix A** shows the detailed calculations used to inform the summary statistics presented below.

3.2.1 Building Energy:

Building energy emissions include natural gas combustion, indirect emissions from electricity generation required for both electricity consumption and electricity used to supply, treat, and distribute water and wastewater. Natural gas combustion is included in the 2017 Scoping Plan sector "Residential and Commercial", while electricity is separated into the sector "Electric Power". The percent of statewide emissions is based on historical consumption data for electricity and natural gas for Sacramento County residential and commercial sectors out of State totals.^{76,77,78} This data is shown in **Table A-1** for electricity and **Tables A-2** and **A-3** for natural gas.

3.2.2 Mobile

As described in Section 1.2, the currently adopted 2016 MTP/SCS provides a roadmap to achieving the SB 375 targets as included in the Scoping Plan's assumptions. For the SACOG region, this includes a 15% reduction in light-duty vehicle GHG emissions per capita from a 2005 baseline by 2035. However, meeting statewide 2030 and 2050 climate goals would require a 16.8% reduction in per capita light-duty VMT or a 14.3% reduction in total per capita VMT from 2015-2018 conditions, based on CARB's January 2019 white paper; this is not directly comparable to the SB 375 reduction target but rather aligns with the SB 743

⁷⁵ California Department of Finance (CDOF). 2019. P-1: State Population Projections (2010-2060), Total Population by County. Available at: http://www.dof.ca.gov/Forecasting/Demographics/Projections/documents/P1_County_1yr_interim.xlsx. Accessed: March 2020.

⁷⁶ California Energy Commission (CEC). 2016. Electricity Consumption by Entity. Available at: <http://www.ecdms.energy.ca.gov/elecbyutil.aspx>. Accessed: March 2020.

⁷⁷ CEC. 2016. Gas Consumption by County. Available at: <https://ecdms.energy.ca.gov/gasbycounty.aspx>. Accessed: March 2020.

⁷⁸ CEC. 2016 Gas Consumption by Entity. Available at: <http://www.ecdms.energy.ca.gov/gasbyutil.aspx>. Accessed: March 2020.

15% reduction targets recommended by the Office of Planning and Research (OPR) as described further in Section 4.3. The CARB paper states:

“An RTP/SCS that meets the applicable SB 375 targets alone will not produce the GHG emissions reductions necessary to meet state climate goals in 2030 nor in 2050... Certain land use development projects located in areas that would produce rates of total VMT per capita that are approximately 14.3 percent lower than existing conditions, or rates of light-duty VMT per capita that are approximately 16.8 percent lower than existing conditions (either lower than the regional average or other appropriate planning context) could be, by virtue of their location and land use context, interpreted to be consistent with the transportation assumptions embedded in the 2017 Scoping Plan and with 2050 State climate goals.”.⁷⁹

Two steps are followed to determine the share of statewide emissions corresponding to this sector. First, the projected gasoline and diesel fuel use from on-road mobile vehicles for Sacramento County is calculated using CARB’s EMFAC2017 for calendar year 2030. Then, a reduction of 14.3% is taken to show consistency with the State’s 2030 GHG target, as described above. **Table A-4** shows how EMFAC2017 fuel uses are converted to GHG emissions.

3.2.3 Waste:

CalRecycle provides historical waste disposal data for each jurisdiction. Sacramento County’s share of statewide recycling and waste emissions is based on historical waste disposal data for Sacramento County out of State totals, as shown in **Table A-5**.

3.2.4 High-GWP Gases:

As described in Section 3.1.5, HFCs are the primary high-GWP gases of interest for the residential and commercial sectors. HFCs are expected to comprise 21% of the total high-GWP gas emissions if the State achieves its 2030 target. As shown in the SLCP Strategy, California’s 2030 HFC emission sources with existing measures are expected to be comprised of 37% commercial refrigeration, 9% industrial refrigeration, 20% residential refrigeration, 5% residential aerosol use, 17% foam (insulation in products and materials), 10% transportation refrigeration, 1% other aerosols, and 1% solvents and fire suppression. The residential and commercial sectors are assumed to include 78% of HFC emissions based on the categories of commercial, residential and transportation refrigeration; residential aerosols; and a portion of the foam emissions.⁸⁰ The percent of statewide emissions in Sacramento County is estimated based on the projected population of Sacramento County out of State totals in 2030. Air conditioning and cooling needs may be higher in Sacramento County than more temperate areas of the state (e.g., San Francisco Bay Area, northern California, Lake Tahoe region), so this is likely underestimating. This calculation is shown in **Table A-6**.

⁷⁹ CARB. 2019. California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals. January. Available at: <https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate>. Accessed: March 2020.

⁸⁰ 35% of foam emissions are assumed to be associated with the residential and commercial portions of emissions, based on Table 8 of CARB. 2015. California’s High Global Warming Potential Gases Emission Inventory: Methodology and Technical Support Document. Available at: https://ww3.arb.ca.gov/cc/inventory/slcp/doc/hfc_inventory_tsd_20160411.pdf. Accessed: March 2020.

3.2.5 Localized Emissions by Sector

Localized emissions by sector consistent with the Scoping Plan using the methodology described above are summarized in Table 1.

Table 1: Localized Greenhouse Gas Emissions by Sector, 2030			
Sector	Statewide (MT CO ₂ e) ^a	Sacramento County 2030 Emissions for Residential & Commercial Development Consistent with Scoping Plan ^b	
	Updated Scoping Plan	% of Statewide	Emissions (MT CO ₂ e)
Agriculture	23,854,810	N/A	N/A
Residential and Commercial Natural Gas Combustion	38,078,729	1.4%	548,714
Electric Power	53,014,776	3.4%	1,817,830
High GWP	10,655,327	0.7%	70,523
Industrial	82,560,459	N/A	N/A
Recycling and Waste	9,167,237	2.1%	195,538
Transportation (Incl. TCU)	103,055,723	3.9%	3,967,853
Total	320,387,064	N/A	6,600,457

4. GHG EMISSIONS BY SECTOR FROM NEW VS EXISTING DEVELOPMENT

The second step in thresholds development uses the Scoping Plan assumptions and emissions by sector derived in Section 3 to determine the GHG targets by sector for new developments in Sacramento County. As detailed below, for the residential and commercial sector, projected emissions from existing development are summarized and subtracted from the sector-specific emissions targets shown in Table 1. Any remaining emissions are allocated to new developments. Consistency between new and existing developments with the electric power and solid waste sector targets are qualitatively achieved through regulatory compliance. Consistency between new and existing development with the mobile targets is achieved through per capita VMT reductions consistent with the directives of SB 743.

4.1 Residential and Commercial

The emissions included in this sector as analyzed in the Scoping Plan are from natural gas combustion for heating, cooking, and other uses within buildings (including natural gas use for fireplaces or hearths). Other emissions sources associated with buildings are included in separate sectors such as Electric Power and Solid Waste. To determine the natural gas target for new developments, projections were used to establish the amount of natural gas emissions from existing commercial and residential buildings. Natural gas-related GHG emissions in new developments would be represented by the difference between projected emissions from natural gas in existing developments and the sector target shown in **Table 1**, as natural gas use in existing development is unlikely to grow as appliances become increasingly efficient.

Data from the Sacramento County Communitywide CAP (SCCCAP) technical memo #1 was used to evaluate the total emissions from residential and commercial buildings and the projected change in emissions from 2015 to 2030 under the business-as-usual scenario.⁸¹ This percent change is assumed to be similar for Unincorporated Sacramento County (as shown in the SCCCAP) and the rest of the County. The percent change is then applied to Countywide historical (2015) natural gas usage data to estimate natural gas use and emissions totals from existing and new developments Countywide in 2030. **Table A-7** shows the methodology and results.

As shown in Table A-7, there is **no** remaining emissions budget for natural gas from new developments; in fact, existing developments will need to reduce their natural gas use to meet the 2030 sector target.⁸² This seems reasonable based on increasing energy efficiency for new appliances as they replace existing appliances in existing uses. Based on this

⁸¹ Available at: http://www.per.saccounty.net/PlansandProjectsIn-Progress/Documents/Climate%20Action%20Plan/2015%20Greenhouse%20Gas%20Emissions%20Inventory%20and%20Forecasts_Rev.pdf. Accessed: March 2020.

⁸² In the CARB Scoping Plan, E3 performed stock-based modeling of space heaters and water heaters for residential and commercial buildings that would result in emissions totals that meet the State's 2030 target. In the Scoping Plan scenario, new heating systems were mainly assumed to be natural gas, with the resulting gap in emissions necessary to meet the State target assumed to be reduced through Cap-and-Trade. In the Alternative 1 (no Cap-and-Trade) scenario, E3 assumed nearly 100% of new water and space heaters would be high-efficiency electric heat pumps by 2030. Available at: https://ww3.arb.ca.gov/cc/scopingplan/pathways_stock_charts_101917.xlsm. Accessed: March 2020.

analysis, new projects will need to either be electrified, reduce emissions beyond requirements from other sectors, or fund off-site GHG emissions reductions. These options are discussed further in Section 5.

4.2 Electric Power

The emissions included in this sector are indirect GHG emissions that occur when electricity is used, typically from generation from offsite power plant locations. Typical electricity uses are for building energy (air conditioning, lighting, electronic appliances and equipment, etc.) and electricity used to convey, treat, and distribute water and wastewater.

New developments must comply with more stringent Building Energy Efficiency Standards (Title 24, Part 6) and Green Building Standards (Title 24, Part 11) than evaluated in the Scoping Plan. Further, SB 100 (De León, 2018) requires utilities to achieve 60% renewables by 2030, a more stringent target than contemplated in the Scoping Plan. In addition, new developments must achieve consistency with the latest State and local water conservation requirements. Water reductions reduce the amount of electricity needed to supply, treat, and transport the water and treat the resulting wastewater and therefore also reduce GHG emissions. Therefore, through regulatory compliance, new developments are assumed to achieve their “fair share” of reductions for the electric power sector.

4.3 Mobile

The emissions included in this sector are direct emissions from the combustion of gasoline, diesel, or compressed natural gas fuel. As described in Section 3.2.2, achievement of the currently adopted SCS targets per SB 375 are insufficient to reach the statewide GHG targets for 2030 in the Scoping Plan or longer-term 2045 or 2050 targets. Therefore, additional reductions in per capita VMT are needed. These reductions include both existing and new developments, where new developments should cover their fair share. The metrics described below are designed to show consistency with the State’s climate goals while reducing the need for extra traffic modeling and reporting beyond that to be required by SB 743.

OPR’s December 2018 Technical Advisory on Evaluating Transportation Impacts in CEQA⁸³ proposes the following thresholds, and references the CARB January 2019 memorandum⁸⁴ that confirms these targets are consistent with the 2017 Scoping Plan’s 2030 and 2050 trajectories. It also states that “meeting the targets described above (for overall climate change) will require substantial reductions in existing VMT per capita...” In other words, the Technical Advisory acknowledges that people in both new and existing developments will need to reduce single-occupancy vehicle use, but still suggests an additional reduction for new development.

4.3.1 Regional VMT Targets

Projects should use consistency with SB 743 to determine required VMT reductions that show consistency with the GHG targets. As described by OPR, these targets are as follows:

⁸³ OPR. December 2018. Technical Advisory on Evaluating Transportation Impacts in CEQA. Available at: http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf. Accessed: March 2020.

⁸⁴ CARB. 2019. California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals. January. Available at: <https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate>. Accessed: March 2020.

- Residential projects: A proposed project below a level of 15 percent below existing VMT per capita may indicate a less than significant transportation impact. Existing VMT per capita may be measured as regional VMT per capita or as city VMT per capita.
- Office projects: A proposed project below a level of 15 percent below existing regional VMT per employee may indicate a less than significant transportation impact.
- Retail projects: A net increase in total VMT may indicate a significant transportation impact.

For jurisdictions with SB 743 targets already established, projects that show consistency with those established targets will show consistency with the SMAQMD GHG targets. For jurisdictions without established SB 743 targets, regional targets have been developed using SACOG data for the 2020 MTP/SCS. This data was used to derive historical average Sacramento County regional VMT per resident and VMT per worker (based on 2016 data, which falls within the 2015-2018 data that represents existing conditions in CARB's January 2019 white paper). This VMT per capita is then reduced by 15% to determine targets consistent with the State targets. For Sacramento County, these values are shown below in **Table 2**.

Table 2: VMT per Capita for Sacramento County GHG Targets			
Type	2016 VMT per Capita	VMT per Capita to Shown Consistency with Target	
	(miles/capita)^a	% Reduction	(miles/capita)
Residential	15.9	15%	13.5
Worker	17.2	15%	14.6
Notes: ^a Data provided by SACOG as used in the 2020 MTP/SCS. <u>Abbreviations:</u> MTP/SCS – Metropolitan Transportation Plan/Sustainable Communities Strategy VMT – vehicle miles traveled N/A – not applicable			

4.3.2 Projects with de Minimis Mobile GHG Impacts

Certain projects may be assumed to have a negligible contribution toward total GHG emissions or be consistent with the targets and will not be required to perform a full VMT evaluation. This methodology adopts slight variations on the *de minimis* significance thresholds from the OPR December 2018 Technical Advisory and exempts the following types of projects, provided that project-specific or location-specific information do not indicate that the project will still generate significant levels of VMT as described by OPR.⁸⁵

- Small projects that generate or attract fewer than 110 trips per day

⁸⁵ See pages 13 to 15 of OPR. 2018. Technical Advisory on Evaluating Transportation Impacts in CEQA. Available at: http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf. Accessed: March 2020.

- Residential and office projects in areas with low VMT (currently below threshold VMT) that incorporate similar features (i.e., density, mix of uses, transit accessibility), including affordable housing infill development.
- Residential, retail, office, or mixed-use projects within ½ mile walking distance of an existing major transit stop or existing stop along a high quality transit corridor, *unless the primary use of the site is auto-oriented (e.g., car dealership, car wash, gas station)*.

4.4 Solid Waste

The emissions included in this sector as analyzed in the Scoping Plan cover all aspects of solid waste and materials management including reduction/reuse; recycling; remanufacturing of recovered material; composting and in-vessel digestion; biomass management; municipal solid waste transformation; and landfilling. Following legislative and CARB action discussed earlier, CalRecycle is required to adopt regulations to (1) achieve a 75% statewide solid waste recycling rate by 2020; (2) reduce landfilling of organic waste by 50% below 2014 levels by 2020; (3) reduce landfilling of organic waste by 75% below 2014 levels by 2025; and (4) recover at least 20% of edible food destined for organic waste and divert to feed people in need by 2025.^{86,87} Existing and new developments must comply with all applicable CalRecycle or other local requirements including those for diversion, recycling, and composting. Therefore, through regulatory compliance, new developments are assumed to achieve their “fair share” of reductions for the solid waste sector.

4.5 High-GWP Gases

The emissions included in this sector as analyzed in the Scoping Plan include HFCs, anthropogenic black carbon, and methane emissions. As described in Section 3.1.5, California’s SNAP and other regulations will reduce HFC emissions. However, these regulations are not yet determined to be sufficient to achieve the targets. Through regulatory compliance, new developments are expected to achieve their “fair share” of reductions for the high-GWP sector. However, if low-GWP refrigeration substitutes become available prior to their regulatory requirement, new developments would be expected to use these substitutes to ensure their consistency with the State target.

⁸⁶ CARB. 2017. California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target. November. Available at: https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed: March 2020.

⁸⁷ CalRecycle. 2018. Legislation and Regulations. Available online at: <https://www.calrecycle.ca.gov/Laws/>. Accessed: March 2020.

5. GHG TARGETS AND BEST MANAGEMENT PRACTICES BY PLACE TYPE

5.1 Best Management Practices

To demonstrate consistency with the GHG targets by sector for new developments described in Section 4, project proponents shall commit to a menu of best management practices (BMPs). Based on the targets derived above, there are two tiers of BMPs: Tier 1: Required for all projects to avoid conflicting with long-term State goals, and Tier 2: Required for projects that do not screen out of further requirements (e.g., large or inefficient projects). Approximate GHG reductions expected due to the BMPs are described in Section 5.5. These BMPs may be revised over time to incorporate regulatory or technological advances.

Tier 1: BMPs Required for all Projects

- BMP 1: No natural gas: Projects shall be designed and constructed without natural gas infrastructure.
- BMP 2: Electric vehicle ready: Projects shall meet the current CalGreen Tier 2 standards, except all EV Capable spaces shall instead be EV Ready. **Appendix B** provides definitions and estimated costs and notes on current and future regulatory requirements.

Alternatives may be proposed that demonstrate the same level of GHG reductions as BMPs 1 and 2. Example alternative reductions are described in Section 5.3. As described in Section 6, at a minimum, for purposes of evaluating consistency with 2045 statewide carbon neutrality, a project would need to offset any natural gas emissions and require all pre-wiring necessary so that the building is ready for a future retrofit to all-electric (e.g., such that electric space heating, water heating, drying, and cooking appliances could be installed).

Small, efficient projects may screen out of further requirements. This includes projects that screen out due to OPR's *de minimis* VMT criteria as discussed in Section 4.3, and projects that emit less than 1,100 MT CO₂e/year prior to implementation of BMP 1 and 2.⁸⁸ SMAQMD recently reviewed 102 Environmental Impact Reports (EIRs) and Mitigated Negative Declarations (MNDs) in Sacramento County between 2014 and 2018. Of these projects, a screening level of 1,100 MT CO₂e/year would result in 43 projects below the screening level but would still capture over 98% of the total GHG emissions. SMAQMD has prepared an operational screening table of project sizes by land use subtype that are below the 1,100 MT CO₂e/year threshold to assist in these designations.⁸⁹ The 1,100 MT threshold was adopted by the Board with substantial evidence and documented through staff reports.⁹⁰

Tier 2: BMP Required for Large or Inefficient Projects

- BMP 3: As described in more detail in Section 4.3.1, residential projects shall achieve a 15% reduction in VMT per resident, and office projects should achieve a 15% reduction in VMT per worker compared to existing average VMT per capita for the county, or for the

⁸⁸ 1,100 MT CO₂e/year is the current SMAQMD *de minimis* threshold. By complying with BMPs 1, and 2 above (removing natural gas, EV-ready), small projects would reduce emissions to be consistent with State goals.

⁸⁹ SMAQMD. 2018. SMAQMD Operational Screening Levels. Available at: <http://www.airquality.org/LandUseTransportation/Documents/Ch4+Ch6OperationalScreening4-2018.pdf>

⁹⁰ SMAQMD. 2020. CEQA Guidance and Tools. Available at: <http://www.airquality.org/businesses/ceqa-land-use-planning/ceqa-guidance-tools>.

city if a more local SB 743 target has been established. Retail projects should achieve no net increase in total VMT, as required to show consistency with SB 743. These reductions can be achieved by many strategies, such as:

- Locate in an area that already has low VMT due to location, transit service, etc.
- Adopt CAPCOA measures
- Adopt measures noted in Sacramento's CAP checklist
- Join a Transportation Management Association
- Incorporate traffic calming measures
- Incorporate pedestrian facilities and connections to public transportation
- Promote electric bicycle or other micro-mobility options

Quantification methodology for these strategies is described in the SMAQMD Recommended Guidance for Land Use Emission Reductions (AQMP) guidance.⁹¹ Projects that are located in areas with existing VMT per capita above the county or city average VMT per capita shall also provide sufficient electrical capacity (e.g., transmission lines and substation sites) such that 100% of project vehicles have the potential to be zero-emission vehicles in future years.⁹²

If a project cannot incorporate the required BMPs, other reductions or purchasing and retiring GHG/carbon offsets from a registry approved by the SMAQMD may be required. Carbon offsets are instruments that can be bought, sold, and traded. Like a stock or equity that represents a unit of ownership in a company, a carbon offset represents a unit of greenhouse gas emissions reductions. Each offset is essentially a certification that a certain quantity of greenhouse gas emissions has been avoided, prevented, or sequestered. Offset registries that the SMAQMD may approve have developed a broad consensus around the standards that are necessary to ensure that offsets are environmentally sound, namely, that offsets be real, permanent, quantifiable, verifiable, enforceable, and additional. Approved registries may include but are not limited to any of the following: (i) the Climate Action Reserve, the American Carbon Registry and Verra, which are all approved by CARB; (ii) any entity approved at any time by CARB to act as an "offset project registry" under the state's cap-and-trade program; (iii) or voluntary credits with the concurrence of the SMAQMD.

In addition to the BMPs, projects need to show consistency with the 2045 statewide carbon neutrality target, as described further in Section 6.

5.2 Modeling Unmitigated and Mitigated Emissions

Emissions should be quantified for projects that are either required to comply with the Tier 2 BMPs or would not comply with the Tier 1 BMPs (for example, they choose to use natural gas). The California Emissions Estimator Model (CalEEMod[®]) is typically used to model GHG and criteria air pollutants for project operations for CEQA purposes and has been recommended by SMAQMD in its Recommended Guidance for Land Use Emission Reductions.

⁹¹ SMAQMD. 2018. Recommended Guidance for Land Use Emission Reductions. Available at: <http://www.airquality.org/residents/ceqa-land-use-planning/mitigation>

⁹² Projects in areas with below-average VMT per capita tend to be urban or infill locations with limited parking facilities where additional electrical capacity may be infeasible, but also where public or fast charging are likely to be targeted nearby by programs such as the VW fund.

⁹³ The most current version of CalEEMod[®] should be run to calculate operational emissions for the buildout year for the proposed project land use subtypes and climate zone. Most of the inputs and descriptions for modeling emissions will be consistent with the SMAQMD guidance.⁹⁴ Differences are described below.

Building Energy:

Natural Gas and Electricity: The unmitigated natural gas use should assume compliance with the most current version of the Title 24, Part 6 Building Energy Efficiency Standards. The mitigated natural gas use should include assumed compliance with BMP-1 and therefore should include no natural gas use (including in the area source – hearths and fireplaces inputs). This will allow a project proponent to accurately assess the emissions reductions necessary if they do not comply with BMP-1.

The CO₂ intensity factor for electricity should be based on consistency with SB 100. To derive this factor, the historical emissions from delivered electricity and the percent of RPS-eligible renewable electricity for the relevant utility (e.g., Sacramento Metropolitan Utility District, SMUD) should be used to calculate the emissions from non-RPS-eligible renewables per megawatt-hour (MWh) delivered. This factor should be assumed to remain constant, and the percent of renewables required by SB 100 should be incorporated for the project buildout year.⁹⁵ The year-by-year projections that should be used for projects that receive power from SMUD is shown in **Table A-8**. The unmitigated electricity use should assume compliance with the most current version of the Title 24, Part 6 Building Energy Efficiency Standards. The mitigated electricity use should include any additional electricity needed to replace natural gas.

Energy use conversion from major natural gas appliances to their equivalent electric replacements tends not to be straightforward given that most significant gas appliances (e.g. water heaters, space heaters, ovens and cooktops) have varying input-to-output efficiencies and losses from product to product. Equivalent electric appliances also have differing efficiencies, and usage patterns for these equivalent appliances may differ in some way. However, the increase in electricity use as a result of natural gas to electric switchover can be estimated more easily with the aid of average end use consumption data for equivalent gas and electric appliance types.

Table A-9 shows average energy use rates per dwelling unit or area for major natural gas commercial and residential end uses. Any full or partial reduction in natural gas end uses or appliance types can be estimated by multiplying the percentage of natural gas reduction by the percent of total natural gas consumption for a given gas appliance. That reduction percentage can then be subtracted from an existing total gas consumption rate (e.g. CalEEMod default energy use intensities). The additional electricity use can be estimated by multiplying the electric energy use rate by the number of dwelling units or commercial square footage and adding this to the CalEEMod[®] default total electricity consumption rate. For example, a single family residence that complies with BMP 1 would remove all natural

⁹³ SMAQMD. 2018. Recommended Guidance for Land Use Emission Reductions. Available at: <http://www.airquality.org/residents/ceqa-land-use-planning/mitigation>. Accessed: March 2020.

⁹⁴ SMAQMD. 2018. Recommended Guidance for Land Use Emission Reductions. Available at: <http://www.airquality.org/residents/ceqa-land-use-planning/mitigation>. Accessed: March 2020.

⁹⁵ If SMUD fails to achieve its SB 100 targets or shows significant changes in its non-RPS-eligible power generation source types, this table should be updated to reflect more current information.

gas use from the CalEEMod® default (“Title 24” and “Non-Title 24” natural gas categories) and add 4,650 kWh to the electricity total. In contrast, a residence that keeps natural gas cooking would use Table A-9 to show that it should keep 9% of the CalEEMod® default natural gas use and should add (4,650 minus 310 equals 4,340) 4,340 kWh to the electricity total.

For energy consumption estimates not broken down by appliance groups, total natural gas consumption rates per dwelling unit or area are presented for the three most significant gas appliance types, along with total consumption rates for these appliances’ electric equivalents.

Appendix C includes additional supporting documentation used to derive Table A-9.

Water: The unmitigated and mitigated water use rates should use CalEEMod® defaults. As described in Section 3.1.2, projects are assumed to meet a 10% reduction target through regulatory compliance. If a project reduces water use beyond regulatory requirements, this can be included in the mitigated run.

Mobile:

CalEEMod® contains default mobile trip generation rates, lengths, and trip types based on the Institute for Transportation Engineers (ITE) data that generally applies to suburban development nationwide. Adjustments to the defaults can be applied to reduce emissions based on either Project-specific traffic modeling or standard mitigation assumptions related to the land use location, density, mixed-use type, or other metrics that may reduce VMT. In September 2019, SACOG prepared updated default data on trip lengths and trip types based on traffic modeling for each of its counties; if this has not yet been incorporated into CalEEMod® by the time these GHG thresholds are used, users should replace the CalEEMod® defaults with the more current data.

Modeling GHG emissions and VMT to show consistency with the metrics in Section 4.3 likely requires adjustments to typical CalEEMod® emissions modeling. The SB 743 thresholds that will be used for the SMAQMD GHG thresholds apply to trips from light-duty vehicles for residential and office projects only. However, all mobile emissions from all land uses should be disclosed in the GHG section, including those from non-passenger vehicles and for land uses other than residential and office. CalEEMod® defaults should be adjusted to account for Sacramento County-specific VMT and to determine the necessary VMT reduction for the Project. If projects are located in jurisdictions with more local data and methodologies that are SB 743 compliant, that data can be used rather than the Sacramento County-overall data.

A lookup map has been prepared using the SACOG 2020 MTP/SCS data that shows adjustment factors to apply to the CalEEMod® default VMT for relevant land use subtypes in Sacramento County. This map is available at <http://sb743-sacog.opendata.arcgis.com/>. These adjustment factors are based on the 2016 relative VMT per capita based on the location-specific traffic modeling.

Project proponents should use the (new) defaults from CalEEMod multiplied by the relevant adjustment factor for their unmitigated CalEEMod® emissions modeling. To calculate the adjustment factor, the project proponent should zoom into the proposed project location in the map. The map will contain hexagon-shaped areas with data on VMT per capita for each hexagon (“hex-level VMT per capita”). The project proponent should divide the hex-level VMT per capita by the Sacramento County VMT per capita to derive the adjustment factor. For example, a project located in a center or corridor community in downtown Sacramento

might see its VMT reduced by 60% compared to the countywide average; its adjustment factor to the CalEEMod[®] defaults trip generation rate would thus be 60%. The mitigated run then needs to demonstrate a 15% VMT reduction below the Sacramento County average resident per capita and worker per capita VMT as shown in Table 2. The example in downtown Sacramento would already be consistent with this reduction requirement. The 15% reduction could be due to project design features or mitigation measures, as described further in Section 5.1, but should not double-count features that are already incorporated in SACOG's default modeling (e.g., mixed-use features for established communities).

For retail uses, there are several alternative means that might be used to demonstrate no net increase in VMT. For chains, loyalty "club" card data for the nearby stores may be used, where available, to determine the origins and distance traveled for store users of that type (e.g., supermarket, hardware store) and similar locations. Another option is to look at the distance from population centroids as compared to competitor distance. A third option is to evaluate the nexus to public transportation as opposed to competitors.

For other land use types, the defaults can be used and the emissions disclosed.

Note that vehicle emission reductions (e.g., zero emission vehicles) cannot be substituted for VMT reductions; CARB has concluded that VMT reductions are needed in addition to cleaner vehicles and fuels to meet statewide goals.⁹⁶

Waste:

The unmitigated waste disposal rates should use CalEEMod[®] defaults. As described in Section 4.4, projects are assumed to meet the State targets through regulatory compliance. If a project reduces waste disposal beyond regulatory requirements, this can be included in the mitigated run.

Other Sectors:

The other sectors should use CalEEMod[®] defaults and project-specific data, where available. If the project reduces emissions beyond regulatory requirements, this can be included in the mitigated run.

5.3 Alternative Greenhouse Gas Reduction Measures

As described in Section 5.1, if applicants cannot or choose not to incorporate the required BMPs, they may propose alternative GHG reduction strategies that achieve equivalent reductions, provided that they are surplus to the reductions needed to achieve the State's targets. This guidance is intended to allow applicants to pursue innovative and cost-effective measures and is not intended to restrict the reduction measures to those described here. However, example strategies include the following, among many others:

- Use natural refrigerants: Projects can participate in SMUD's pilot program to use lower-GWP or natural alternates for refrigeration and air conditioning. Natural refrigerants include ammonia, CO₂, or hydrocarbons. To quantify the benefits of this measure, the applicant should work with SMUD or CARB tools to calculate high-GWP emissions from traditional refrigerants (as these emissions are not typically included in CEQA emissions

⁹⁶ CARB. 2017 Scoping Plan, page 75. Available at:
https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf.

- inventories and would not be added to the unmitigated emissions totals) and then calculate the reduction due to the lower-GWP refrigerants.
- Increase vegetation sequestration: Projects can increase carbon sequestration in natural and working lands through planting and management techniques. To quantify the benefits of these commitments, the applicant should use calculational methodology such as CARB's approved offsets protocols, California Climate Initiatives (CCI) tools and calculators, and/or CalEEMod®.
 - Install electric vehicle charging stations: Projects can install EV charging stations in addition to the electrical infrastructure required by BMP 2. To quantify the benefits of this measure, the applicant should use Project-specific or applicable published literature to calculate the projected amount of charging that will be provided by the chargers, then subtract the indirect emissions from electricity used by the chargers from the gasoline- or diesel-combustion tailpipe emissions that would otherwise be produced by internal combustion-powered vehicles. The applicant should take care not to double-count GHG reductions with reductions already assumed by the State in its base EV projections.
 - Solar water heaters and other water heating reductions: Projects can install solar water heaters to replace the need for natural gas or electricity for water heating. Since the unmitigated default to show compliance with BMP 1 is to assume no natural gas, the GHG benefit should be the reduction in electricity that would otherwise be used to heat water.
 - Increase water and waste reductions beyond regulatory compliance: As described in Section 5.2, projects can demonstrate GHG reductions beyond defaults based on project-specific studies and initiatives and can quantify these reductions using CalEEMod® methodology.
 - Reduce gas- or diesel-powered landscaping equipment use: Project proponents design for reduced landscaping equipment (xeriscaping) or contract with a parks district, city, or homeowners association to require the use of electric landscaping equipment. To demonstrate GHG reductions would require enforceable mechanisms. For example, the California Electrical Code requires outdoor receptacle outlet(s) to be installed at an accessible level for all new residences⁹⁷; this can enable the use of electric landscaping equipment but does not ensure its use.

5.4 Other Thresholds

As described in Section 1, this report is not intended to replace SMAQMD's existing thresholds or suggested GHG reduction guidance for stationary source emissions or construction emissions. Those thresholds were adopted by the Board with substantial evidence and documented through staff reports.⁹⁸

5.5 GHG Reductions from BMPs

The BMPs were developed to show consistency with the State's climate goals as applicable to new developments in Sacramento County, as described in Sections 3 and 4. The BMPs are expected to reduce GHG emissions as follows:

⁹⁷ California Building Standards Commission. 2019 Title 24, Part 3 California Electrical Code, Sections 210.52(E)

⁹⁸ SMAQMD. 2020. CEQA Guidance and Tools. Available at: <http://www.airquality.org/businesses/ceqa-land-use-planning/ceqa-guidance-tools>.

BMP 1: The reduction in natural gas emissions is approximately 257,000 MT, based on the difference between the 2015 natural gas emissions and the 2030 business-as-usual natural gas emissions summarized in Table A-7. As described in Table A-7, the business-as-usual increase in emissions between the 2015 and 2030 inventories would be solely due to population and employment growth, and therefore is the amount reduced if the growth excludes natural gas. This does not include any additional reductions that would result if renovations or building retrofits reduce natural gas use from existing buildings.

BMP 2: Additional EV infrastructure is necessary to achieve the State's EV goals. The California Energy Commission and National Renewable Energy Laboratory project that far more chargers are needed than currently on-track to be installed to meet the State's 2025 targets; even more will be needed to meet targets for 2030 and beyond.⁹⁹ In addition, the 2020 SACOG MTP/SCS assumes zero emission vehicle infrastructure higher in the SACOG region than the State's overall projections in order to meet the SCS target reduction.¹⁰⁰ On an operational per-mile basis, EVs will reduce emissions by approximately 89% compared to internal combustion engine vehicles at around 211 grams of CO₂e per mile, based on the electricity grid composition and passenger fleet fuel economy expected in 2030; this is shown in **Table A-10**. In later years, as the grid becomes cleaner, this benefit will increase.

BMP 3: The GHG emissions reduction due to the 15% VMT reduction is projected to be approximately 662,000 MT CO₂e, based on the difference in EMFAC2017 projected fuel use and fuel use to meet the State goals as shown in Table A-4.

⁹⁹ National Renewable Energy Laboratory. 2018. California Plug-in Electric Vehicle Infrastructure Projections: 2017-2025. California Energy Commission Publication CEC-60-2018-001. Available at: <https://www.nrel.gov/docs/fy18osti/70893.pdf>.

6. LONGER-TERM GHG TARGETS

After 2030, SB 100 (De León, 2018) requires statewide 100% carbon-free electricity by 2045. In addition, Governor Brown's Executive Order B-55-18 (2018) targets all other sectors of the economy (including transportation, building heating and cooling, industry, etc.) by setting a policy goal of statewide carbon neutrality by 2045.

Achieving statewide carbon neutrality will require systemic changes in how energy is produced and consumed through all sectors of the economy. Because the mix of technologies, strategies, and policy choices the state will ultimately choose to implement to achieve the 2045 goal is not readily ascertainable at this time, any accounting of future GHG emissions from an individual development project cannot yet reflect the scope and scale of reductions that may occur as the state transitions toward new regulations designed to achieve the new long-term goals. Furthermore, in absence of a state plan to achieve these long-term goals, it is difficult to identify the "fair share" of reductions to be applied at the local or project level. Therefore, in order to evaluate the significance of a project with buildout beyond 2030, the project would be required to show that the SMAQMD 2030 targets and BMPs are met, and also qualitatively describe consistency with statewide carbon neutrality by 2045.

A number of studies have been conducted to identify pathways to achieving the statewide goal of reducing GHG emissions to 80% below 1990 levels by 2050, which was established in Governor Schwarzenegger's 2005 Executive Order S-3-05 and preceded the 2045 statewide carbon neutrality goal.^{101,102,103,104,105,106,107} In general, these studies have similar conclusions: deep cuts in GHG emissions can be achieved with substantial changes in electricity production, transportation fuels, and industrial processes. Meeting the 2050 goal (and by extension, the 2045 goal) would require:

-

- ¹⁰⁷ CARB. 2017. 2017 Scoping Plan Appendix C: Vibrant Communities and Landscapes and Potential State-Level Strategies to Advance Sustainable, Equitable Communities and Reduce Vehicle Miles of Travel. Available at: https://ww3.arb.ca.gov/cc/scopingplan/2030sp_appc_vmt_final.pdf. Accessed: March 2020.

- Electricity production that relies on much more renewable energy, plus other carbon-free sources.
- The reduction in petroleum-based fuels for transportation, including a combination of the electrification of transportation to reduce GHG emissions with increased energy efficiency that comes from electric motors and reduced fossil fuel use due to the decarbonized electricity supply and the use of hydrogen fuels.
- The electrification of industrial process heating that is currently provided by fossil fuels.
- Land use strategies that ensure future growth and development occurs in infill locations or locations with existing infrastructure, minimizes vehicles miles traveled, prioritizes active transportation and transit, and preserves natural and working lands, in addition to landscape-scale forest conservation and soil carbon sequestration.
- Reductions in non-energy, non-CO₂ GHGs including reductions in F-gases; solid waste source reduction, diversion, composting, and recycling; and agricultural policies, such as the reduction of methane emissions from dairy cows and manure.
- The use of technologies that have not yet been established or proven.

Thus at a minimum, for purposes of evaluating consistency with 2045 statewide carbon neutrality, a project would need to eliminate natural gas completely or require all pre-wiring necessary so that the building is ready for a future retrofit to all-electric, and in regions with relatively high VMT per capita (e.g., suburban and greenfield developments) to provide sufficient electrical capacity such that 100% of project vehicles have the potential to be zero-emission vehicles. Additionally, the project would be required to qualitatively show that it is not otherwise impeding the 2045 statewide carbon neutrality goal.

	% of HFC Emissions from Residential & Commercial Sector ²	78%
Population in 2030 ³	Sacramento County	1,758,565
	Statewide	43,631,295
	% of Statewide	4.0%
Sacramento Residential & Commercial Percentage of Statewide		0.7%

Notes:

¹ Data from CARB SLCP Strategy, Table 1, 2030 Emissions Reduction Target. Available at: <https://ww2.arb.ca.gov/resources/documents/final-short-lived-climate-pollutant-reduction-strategy-march-2017>. Accessed: September 2019. Assumes residential and commercial sectors are primarily associated with HFC emissions, not methane or anthropogenic black carbon emissions.

² The residential and commercial sectors are assumed to include 78% of HFC emissions based on the categories of commercial refrigeration (37%), residential refrigeration (20%), transportation refrigeration (10%), residential aerosols (5%), and a portion of the foam emissions (6%). 35% of foam emissions are assumed to be associated with the residential and commercial portions of emissions, based on Table 8 of CARB. 2015. California's High Global Warming Potential Gases Emission Inventory: Methodology and Technical Support Document. Available at: https://ww3.arb.ca.gov/cc/inventory/slcp/doc/hfc_inventory_tsd_20160411.pdf. Accessed: September 2019.

³ Data from CA Department of Finance, Total Estimated and Projected Population for California and Counties: July 1, 2010 to July 1, 2060 in 1-year Increments. Available at: http://www.dof.ca.gov/Forecasting/Demographics/Projections/documents/P1_County_1yr_interim.xlsx. Accessed: September 2019.

Abbreviations:

CARB - California Air Resources Board

GWP - Global Warming Potential

HFC - hydrofluorocarbon

SLCP - Short-Lived Climate Pollutants

**Table A-7
Natural Gas Emissions Budget for New Developments
Greenhouse Gas CEQA Thresholds Update
Sacramento County, California**

Location	Type	Residential & Commercial Natural Gas
Building Energy Emissions from Unincorporated SCCAP BAU	2015 Emissions (MT CO ₂ e) ¹	685,662
	2030 Emissions (MT CO ₂ e) ²	844,454
	Change, 2015-2030	23%
Sacramento County	2015 use (million therms) ³	163
	2015 Emissions (MT CO ₂ e) ⁴	1,109,800
	2030 BAU Emissions (MT CO ₂ e) ⁵	1,366,818
	2030 Sector Target (MT CO ₂ e)	548,714
	2030 Remaining for New Development⁶	0

Notes:

- ¹ 2015 emissions from the Sacramento County Communitywide CAP (SCCCAP) technical memo #1, Table 6, for the residential and commercial sectors. 2015 emissions are 33% of the total 2015 emissions from the "Residential Energy" and "Commercial/Industrial Energy" as presented in the SCCCAP. Available at: http://www.per.saccounty.net/PlansandProjectsIn-Progress/Documents/Climate%20Action%20Plan/2015%20Greenhouse%20Gas%20Emissions%20Inventory%20and%20Forecasts_Rev.pdf
- ² Because the SCCCAP Business-as-Usual projection does not incorporate changes in the electricity intensity factor over time, the increase in emissions between the 2015 and 2030 inventories is solely due to population and employment growth. Therefore the same proportion of total emissions (33%) described in footnote #1 is applied to the 2030 BAU "Residential Energy" and "Commercial/Industrial Energy" emissions from the SCCCAP to derive the 2030 emissions from residential and commercial natural gas combustion.
- ³ Data from the CEC for 2015 for total natural gas use for Sacramento County, multiplied by 58% to represent residential and commercial sector natural gas use (consistent with Table A2). Available at: <https://ecdms.energy.ca.gov/gasbycounty.aspx>.
- ⁴ Emissions based on PG&E and Climate Registry Emission Factors for natural gas provided in SCCAP Table 5 and IPCC Fourth Assessment Report Global Warming Potentials.
- ⁵ The percent change is assumed to be similar for Unincorporated Sacramento County (as shown in the SCCCAP) and the rest of the County.
- ⁶ As shown in Table 1, the sector target for Sacramento County Residential and Commercial GHG emissions is lower than the 2030 BAU projection and lower than the 2015 historical emissions. Therefore, there is no emissions budget available for new developments to produce natural gas emissions.

Abbreviations:

BAU - Business as Usual

CO₂e - carbon dioxide equivalence

SCCAP - Sacramento County Communitywide CAP

CEC - California Energy Commission

IPCC - Intergovernmental Panel on Climate Change

CEQA - California Environmental Quality Act

2042	92.0%	45	46
2043	94.7%	30	31
2044	97.3%	15	16
2045	100%	0	2

Notes:

- ¹ Total CO₂ intensity factors from The Climate Registry. Available at: <https://www.theclimateregistry.org/our-members/cris-public-reports/>. Accessed: September, 2019. For 2018, data provided by SMUD.
- ² Percent of total energy from eligible renewables is from the SMUD 2016, 2017, and 2018 Power Content Labels.
- ³ This average uses the most recent three years of data.
- ⁴ The emissions metric presented here is calculated based on the total CO₂ intensity factor divided by the percent of energy delivered from non-RPS-eligible or non-renewable sources. The intensity factor for total energy delivered is estimated by multiplying the percentage of energy delivered from non-RPS-eligible or non-renewable energy by the CO₂ emissions per total non-renewable energy metric calculated above. The estimate provided here assumes that renewable energy sources do not result in any CO₂ emissions. If newer information becomes available that results in a substantial change to the long-term assumed CO₂ intensity per non-RPS energy, this table should be updated.
- ⁵ Emission factors presented here are consistent with the requirements of SB 100: 33% RPS by 2020, 44% RPS by 2024, 50% RPS by 2026, 52% RPS by 2027, 60% RPS by 2030, and 100% carbon-free electricity for 2045. Available at: https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=20170180SB100. Factors are interpolated for intervening (non-**bolded**) years.
- ⁶ Global Warming Potentials (GWP) are based on the IPCC Fourth Assessment Report. CH₄ and N₂O emission factors are from the eGRID2016 total output emission rates for California, and are conservatively assumed not to change from these estimates. Available at: https://www.epa.gov/sites/production/files/2018-02/documents/egrid2016_summarytables.pdf, Table 3. As more renewable energy is integrated into the electricity grid, these intensity factors will also decrease.

	Total (Water Heater, Conventional Heat, & Cooking)^{7,8}	4,650	2,925	2,071	2,278	3,538

Notes

- Commercial energy consumption by end-use is provided from the California Commercial End Use Survey for Sacramento Metropolitan Utility District (SMUD) for All Commercial Gas and Electric fuel types. For projects that do not fit the generic commercial definition, this same methodology and reference can be used by the project applicant to determine the electricity use for more specific building types.
- This demonstrates that the majority of natural gas use in commercial buildings in the SMUD region (93%) is accounted for by these three appliance groups. Due to differences in efficiency between electric and natural gas appliances, the relative amount of energy used for each appliance group may vary if applied to electricity consumption.
- For commercial projects that comply with BMP 1, the electricity use rates should be increased by this total per ksf. For projects that do not comply with BMP 1 and instead commit to one or two of the appliance groups to be electric, the electricity use can be increased by just the rate shown for the relevant appliance groups, and the CalEEMod default natural gas use rate can be decreased by the percent of natural gas from the appliance groups shown above.
- Residential energy consumption data is provided per appliance type by the California Energy Commission (CEC) 2009 Residential Appliance Saturation Study. The CEC began an updated survey in 2019, but results are not yet available as of March, 2020.

**Table A-9
Increases in Electricity Use to Replace Natural Gas
Greenhouse Gas CEQA Thresholds Update
Sacramento County, California**

5. Natural Gas Energy Consumption estimates are presented only for homes with natural gas billing data. Due to variability in saturation rates of other natural gas appliances (e.g., spa heaters, auxiliary heating, gas dryers), these totals are assumed to sum to 100% for use in this methodology. If the applicants only electrify certain appliances and therefore use these percentages to calculate reductions from CalEEMod defaults, this is assumed to be a reasonable representation because the current Title 24 Building Energy Efficiency Standards are expected to reduce natural gas use more than what is reflected in the CalEEMod defaults.
6. Solar Water Heater data should be interpreted with caution given limited data due to low statewide saturation rates of residential solar water heater appliances.
7. For residential projects that comply with BMP 1, the electricity use rates should be increased by this total per DU. For projects that do not comply with BMP 1 and instead commit to one or two of the appliance groups to be electric, the electricity use can be increased by just the rate shown for the relevant appliance groups and the natural gas use can be reduced by the percent of natural gas from the appliance groups shown above. Heat pumps are more efficient than conventional electric heating, so projects that plan to use heat pumps can use the heat pump values instead of the conventional heat values.
8. Space heating and water heating are included in the Title 24 electricity and Title 24 natural gas energy usage categories of CalEEMod, while cooking and appliances are included in the non-title 24 electricity and natural gas energy usage categories.

Abbreviations

DU - Dwelling Unit
EF - Energy Factor

kBTU - thousand British Thermal Units
ksf - thousand square feet

kWh - kilowatt-hour

**APPENDIX B
EV REGS AND COSTS**

Appendix B Table 1. Electric Vehicle Infrastructure Requirements as of September, 2019.**CalGreen Background**

- The California Building Energy Efficiency Standards Title 24 Part 11 ("CalGreen" Green Building Code) is a statewide building code with mandatory measures that apply to all new construction and additions or alterations of buildings in the state.
- The first CalGreen code was adopted in 2008, and it is updated approximately every 3 years to incorporate additional feasible measures with input from stakeholders including designers, architects, builders, property owners, businesses, the government and its agencies.
- The CalGreen code contains provisions on planning and design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and environmental quality.
- The California Building Standards Commission, Department of Housing and Community Development, Division of the State Architect, all Office of Statewide Health Planning and Development all have specific scopes responsible for code adoption and enforcement.

Electric Vehicle Charging Infrastructure Definitions

*CalGreen does not currently require installation of electric vehicle (EV) chargers but does require **EV Capable spaces** as described in the table below, to avoid costly retrofits.*

EV supply equipment (EVSE, "chargers") require a dedicated circuit for each EVSE unit on the electrical panel; sufficient electrical capacity from the utility connection to the electrical panel; and sufficient electrical capacity at the panel.¹

-EV Capable: "Installation of "raceway" (the enclosed conduit that forms the physical pathway for electrical wiring to protect it from damage) and adequate panel capacity to accommodate future installation of a dedicated branch circuit and charging station(s)."

If 1 space is required:

The raceway shall be capable of accommodating a 208/240-volt dedicated branch circuit, not less than trade size 1", shall originate at a service panel or subpanel serving the area, shall terminate in close proximity to the proposed location of the charging equipment and into a listed suitable cabinet, box, enclosure, or equivalent. The service panel or subpanel shall have sufficient capacity to accommodate a minimum 40-ampere dedicated branch circuit for the future installation of the EVSE.

If multiple spaces are required:

Plan design shall be based upon 40-ampere minimum branch circuits. Electrical calculations shall substantiate the design of the electrical system, to include the rating of equipment and any on-site distribution transformers and have sufficient capacity to simultaneously charge all required EVs at its full rated amperage. The service panel or subpanel(s) shall have sufficient capacity to accommodate the required number of dedicated branch circuit(s) for the future installation of the EVSE.

-EV Ready: "Installation of dedicated branch circuit(s), circuit breakers, and other electrical components, including a receptacle or blank cover needed to support future installation of one or more charging stations"²

-Chargers: The physical device that the EV plugs into, e.g., devices from ChargePoint, AeroVironment, Blink, others.

2019 CalGreen Mandatory Measures (Title 24, Part 11), Effective 1/1/2020

Land Use Type	Requirements for New Construction	Ref
1-2 family dwelling units and townhouses with attached garages	EV Capable for every dwelling unit	3
Multifamily dwelling units with residential parking available	EV Capable for 10% of total parking spaces	4
Hotels and motels	EV Capable, # spaces depending on number of parking spaces: 0-9 spaces: 0 EV spaces 10-25: 1 26-50: 2 51-75: 4 76-100: 5 101-150: 7 151-200: 10 201+: 6 percent of total (rounded up)	5
Nonresidential	EV Capable, # spaces depending on number of parking spaces: 0-9 spaces: 0 EV spaces 10-25: 1 26-50: 2 51-75: 4 76-100: 5 101-150: 7 151-200: 10 201+: 6 percent of total (rounded up)	6

Appendix B Table 2. Potential Upcoming Requirements

CalGreen Proposed and Voluntary Standards

-CalGreen contains voluntary "Tier 1" and "Tier 2" standards that are not mandatory statewide but could be required by a City or County. These are 'reach' standards that can be adopted by local jurisdictions and may be incorporated as mandatory standards in future code cycles.

- Sacramento County does not currently require compliance with the voluntary standards, but the air district (SMAQMD), utility (SMUD), and Sacramento Area Council of Governments (SACOG) recently recommended that Sacramento County should require compliance with Tier 1 or Tier 2 CalGreen standards (see table below).¹

Electric Vehicle Charging Infrastructure Definitions

CalGreen does not currently require installation of electric vehicle (EV) chargers, but proposed and Tier 1 or Tier 2 measures would require additional EV Capable or EV Ready spaces, as shown below.

EV supply equipment (EVSE, "chargers") require a dedicated circuit for each EVSE unit on the electrical panel; sufficient electrical capacity from the utility connection to the electrical panel; and sufficient electrical capacity at the panel.²

-EV Capable: "Installation of "raceway" (the enclosed conduit that forms the physical pathway for electrical wiring to protect it from damage) and adequate panel capacity to accommodate future installation of a dedicated branch circuit and charging station(s)."

If 1 space is required:

The raceway shall be capable of accommodating a 208/240-volt dedicated branch circuit, not less than trade size 1", shall originate at a service panel or subpanel serving the area, shall terminate in close proximity to the proposed location of the charging equipment and into a listed suitable cabinet, box, enclosure, or equivalent. The service panel or subpanel shall have sufficient capacity to accommodate a minimum 40-ampere dedicated branch circuit for the future installation of the EVSE.

If multiple spaces are required:

Plan design shall be based upon 40-ampere minimum branch circuits. Electrical calculations shall substantiate the design of the electrical system, to include the rating of equipment and any on-site distribution transformers and have sufficient capacity to simultaneously charge all required EVs at its full rated amperage. The service panel or subpanel(s) shall have sufficient capacity to accommodate the required number of dedicated branch circuit(s) for the future installation of the EVSE.¹

-EV Ready: "Installation of dedicated branch circuit(s), circuit breakers, and other electrical components, including a receptacle or blank cover needed to support future installation of one or more charging stations"³

-Chargers: The physical device that the EV plugs into, e.g., devices from ChargePoint, AeroVironment, Blink, others.

Appendix B Table 3. Estimated Costs for EV Ready and EV Supply Equipment

Type	Stage of Infrastructure ^{a,b,c}	
	EV Full Wiring ("EV Ready")	EV Supply Equipment ("Chargers") ^d
Single Family Residential	~\$250/home ¹	\$500-\$2,000 per Level 2 charge point (before rebates)
Commercial/Multifamily, Surface Parking	~\$760-\$830/space ^{2,3}	
Commercial/Multifamily, Enclosed Garage	~\$280/space ² , ~10% of total electrical work cost for large parking lots ³	

Notes:

- ^a -EV Capable: "Installation of "raceway" (the enclosed conduit that forms the physical pathway for electrical wiring to protect it from damage) and adequate panel capacity to accommodate future installation of a dedicated branch circuit and charging station(s)." Required as noted in Table 1, so costs are not shown.
- EV Ready: "Installation of dedicated branch circuit(s), circuit breakers, and other electrical components, including a receptacle or blank cover needed to support future installation of one or more charging stations" ²
- Chargers: The physical device that the EV plugs into, e.g., devices from ChargePoint, AeroVironment, Blink, others.
- ^b EV supply equipment require a dedicated circuit for each EVSE unit on the electrical panel; sufficient electrical capacity from the utility connection to the electrical panel; and sufficient electrical capacity at the panel. ⁴
- ^c 2019 CalGreen mandatory measures include EV capacity, to avoid more costly retrofitting as EV adoption increases. EV full wiring is still voluntary as of September, 2019. ³
- ^d SMUD has rebates to cover most of the cost of charging equipment in single-family homes, multifamily homes, and workplaces. ⁵

Attachment U
SMAQMD, Guide to Air Quality
Assessment in Sacramento
County, Chapter 6: Greenhouse
Gas Emissions

6 GREENHOUSE GAS EMISSIONS

6.1 INTRODUCTION

The California Environmental Quality Act (CEQA) requires that lead agencies consider the environmental effects of projects they are considering for approval. Greenhouse gas (GHG) emissions adversely affect the environment by contributing, on a cumulative basis, to global climate change. In turn, global climate change will increase sea levels, which can inundate low-lying areas; affect rain and snow fall, leading to changes in water supply; exacerbate the intensity of storms and other extreme weather, endangering human life and infrastructure; and increasing temperatures, leading to adverse effects on public health, agriculture, habitats, and biological and other resources. Thus, GHG emissions require consideration in CEQA documents.

Climate change is a global problem. GHGs are global pollutants, unlike criteria pollutants and toxic air contaminants, which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about 1 day), GHGs have long atmospheric lifetimes (1 year to several thousand years). GHGs persist in the atmosphere for time periods long enough to cause them to be dispersed around the globe, and they cause global effects. The atmospheric concentration of GHGs determines the intensity of global warming, with current levels already leading to dangerous increases in global temperatures, accompanied by sea level rise, severe weather, and other environmental impacts. The continued increase in atmospheric GHG concentrations will only worsen the severity and intensity of climate change, locking in perhaps irrevocable environmental changes. Therefore, from the standpoint of CEQA, GHG impacts to global climate change are inherently cumulative.

Prominent GHGs of primary concern from land use development projects include carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O). Other GHGs such as hydrofluorocarbons (HFC), chlorofluorocarbons, and sulfur hexafluoride are of less concern because construction and operational activities associated with land use development projects are not likely to generate substantial quantities of these GHGs. HFCs are primarily used in air-conditioning and refrigeration systems and are getting increased attention with the passage of [SB 1383](#). SB 1838 requires a 40 percent reduction of HFC emissions from 2013 levels by 2030. A discussion of measures to reduce HFCs is included in the California Air Resources Board's [Short-Lived Climate Pollutant Reduction Strategy](#) (March 2017). Other pollutants being addressed by the *Short-Lived Climate Pollutant Reduction Strategy* include methane and black carbon, which can be reduced by diverting organic material from landfills, reducing residential wood burning, and reducing diesel fuel combustion.

Land use development projects typically include the following sources of GHG emissions:

- Construction activities that result in exhaust emissions of GHGs from fuel combustion for mobile heavy-duty diesel- and gasoline-powered equipment, portable auxiliary equipment, material delivery trucks, and worker commuter trips;
- Motor vehicle trips generated by the particular land use (i.e. vehicles arriving and leaving the project site), including those by residents, shoppers, workers, and vendors;
- Onsite fuel combustion for space and water heating, landscape maintenance equipment, and fireplaces/stoves; and
- Offsite emissions at utility providers associated with the project's demand for electricity, water conveyance, and wastewater processing.

Generally, the District agrees that GHG emissions are best analyzed and mitigated at the program level; however, since not all jurisdictions in Sacramento County have conducted program level GHG analyses, such as a GHG reduction plan or climate action plan, the District offers the guidance contained in this chapter for addressing the GHG emissions associated with individual development projects. Please refer to [Chapter 9, Program Level Analysis of Plans](#), for recommendations for assessing and mitigating GHG emissions-related impacts at the program level.

The guidance presented in this chapter takes into consideration the following bodies of work produced by other agencies and organizations in the state:

- California Air Pollution Control Officers Association's (CAPCOA) white paper titled [CEQA & Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act](#) (January 2008);
- California Air Resources Board's (ARB) [Climate Change Scoping Plan](#) (December 2008, re-approved August 24, 2011);
- ARB's [First Update to the Climate Change Scoping Plan](#) (May 2014);
- ARB's [California's 2017 Climate Change Scoping Plan, The strategy for achieving California's 2030 greenhouse gas target](#) (November 2017);
- Governor's Office of Planning and Research's (OPR) technical advisory, [CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act Review](#) (June 2008);
- The California Natural Resources Agency's [CEQA Guidelines](#);
- California Air Pollution Control Officers Association's (CAPCOA) white paper titled [Model Policies for Greenhouse Gases in General Plans](#) (June 2009); and

- California Air Pollution Control Officers Association's (CAPCOA) [Quantifying Greenhouse Gas Mitigation Measures](#) (August 2010).

In November 2008, Governor Arnold Schwarzenegger issued [Executive Order S-13-08](#) to enhance the state's management of climate impacts from sea level rise, increased temperatures, shifting precipitation, and extreme weather events. The Executive Order directs the state agencies to request that the National Academy of Sciences convene an independent panel to complete the first California Sea Level Rise Assessment Report. The agencies involved in the project include the California Resources Agency; the Department of Water Resources; the California Coastal Commission; the California Ocean Protection Council; California State Parks; and the California Energy Commission (CEC). The Executive Order directed OPR to provide state land-use planning guidance related to sea level rise and other climate change impacts. In addition, SB 379, approved in 2015, asked that local governments address their vulnerabilities to climate impacts and adaptation strategies in their general plans or their local hazard mitigation plans. Therefore, **the District recommends that lead agencies address the impacts of climate change on a proposed project and its ability to adapt to these changes in CEQA documents.** It is anticipated that guidance on addressing this issue will be provided by the state agencies identified above and not the District. OPR's [website](#) contains resources and links related to adaptation. Additional resources include [Cal-Adapt](#), the [Safeguarding California and Climate Change Adaptation Policy](#), and [California's Fourth Climate Change Assessment](#). The Sacramento Area Council of Governments (SACOG) 2016 update to the [2035 Metropolitan Transportation Plan and Sustainable Communities Strategy](#) (MTP/SCS) included a climate adaptation action plan providing an overview of climate vulnerabilities for the region and establishing strategies to help the region's transportation system adapt to climate change impacts. The [2020 MTP/SCS](#) continues to provide resiliency policies.

The District acknowledges that the warming trends associated with climate change in the Sacramento region are expected to result in more episodes of unhealthy levels of ground-level ozone which will adversely affect residents and workers of proposed projects, among other impacts. Nevertheless, the primary focus of this chapter is to provide guidance about evaluating whether the GHG emissions associated with a proposed project will be responsible for making a cumulatively considerable contribution to global climate change.

REGULATORY SETTING

In September 2006, Governor Arnold Schwarzenegger signed [Assembly Bill \(AB\) 32](#), the California Global Warming Solutions Act of 2006. AB 32 established regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and a cap on statewide GHG emissions. AB 32 required that statewide GHG emissions be reduced to 1990 levels by 2020. AB 32 also included guidance to institute emission reductions in an economically efficient manner and conditions to ensure that businesses and consumers are not unfairly affected by the

reductions. AB 32 demonstrated California's commitment to reducing GHG emissions without intent to limit population or economic growth. On April 29, 2015, Governor Edmund Brown Jr. issued [Executive Order B-30-15](#). Executive Order B-30-15 required greenhouse gas emissions in California be reduced by 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by 2050. On September 8, 2016, Governor Brown signed Senate Bill 32 (SB 32) into law which codified the mandate to reduce GHG emissions by 40 percent below 1990 levels by 2030.

CEQA requires lead agencies to identify the potentially significant effects on the environment of projects they intend to carry out or approve, and to mitigate significant effects whenever it is feasible to do so. Although AB 32 did not amend CEQA, it identifies the myriad environmental problems in California caused by global warming ([Health and Safety Code, Section 38501\(a\)](#)).

[Senate Bill \(SB\) 97](#), enacted in 2007, amended the CEQA statute to establish that GHG emissions and their effects are a prominent environmental issue that require analysis and identification of feasible mitigation under CEQA. GHG emissions were incorporated into the CEQA Guidelines on March 18, 2010.

In June of 2008, OPR published a technical advisory entitled [CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act Review](#). OPR recommends that the lead agencies under CEQA make a good-faith effort, based on available information, to estimate the quantity of GHG emissions that will be generated by a proposed project, including the emissions associated with vehicular traffic, energy consumption, water usage, and construction activities, to determine whether the emissions have the potential to result in a cumulative impact and to mitigate the impacts where feasible. In that document, OPR acknowledged that "perhaps the most difficult part of the climate change analysis will be the determination of significance," and noted that "OPR has asked the California Air Resources Board (ARB) technical staff to recommend a method for setting thresholds which will encourage consistency and uniformity in the CEQA analysis of GHG emissions throughout the state." To date, ARB has not adopted thresholds.

In December 2008, ARB adopted its [Climate Change Scoping Plan \(Scoping Plan\)](#), which is the State's plan to achieve GHG reductions in California required by AB 32. The *Scoping Plan* includes ARB-recommended GHG reductions for each emission sector of the state's GHG inventory. The largest proposed GHG reductions recommended are from improving emission standards for light-duty vehicles, implementation of the Low-Carbon Fuel Standard, employing energy efficiency measures in buildings and appliances, the widespread development of combined heat and power systems, and applying a renewable portfolio standard for electricity production. ARB has not determined what statewide reduction in GHG emissions shall be achieved from changes in local government (municipal) operations; however, the *Scoping Plan* does state that land use planning and urban growth decisions will play an important role in the state's GHG reductions because

local governments have primary authority to plan, zone, approve, and permit how land is developed to accommodate population growth and the changing needs of their jurisdictions. ARB further acknowledges that decisions on how land is used will have large impacts on the GHG emissions that will result from the transportation, housing, industry, forestry, water, agriculture, electricity, and natural gas emission sectors. The *Scoping Plan* was re-approved by the ARB on August 24, 2011, after ARB updated its Functional Equivalent Document. ARB adopted the [First Update to the Climate Change Scoping Plan](#) on May 22, 2014. The update reports on the progress made towards meeting the 2020 GHG reduction goals; lays groundwork for longer term reduction goals; and discusses opportunities to leverage funds to drive additional GHG reductions. In December 2017, ARB adopted [California's 2017 Climate Change Scoping Plan, the strategy for achieving California's 2030 greenhouse gas target](#), setting the path towards the ultimate reduction goal of 2050.

A comprehensive discussion of regulatory actions taken by federal and state agencies related to GHG is included in the District's [Greenhouse Gas Thresholds in Sacramento County](#) document supporting updated thresholds of significance, released March 4, 2020.

Regional GHG reduction targets are aligned with regional transportation planning efforts and land use and housing allocations through SB 375, signed into law in September 2008. SB 375 requires Metropolitan Planning Organizations (MPOs) to adopt a Sustainable Communities Strategy (SCS) or Alternative Planning Strategy (APS), which will prescribe land use allocations in that MPO's Regional Transportation Plan (RTP). On April 19, 2012, SACOG adopted its 2035 Metropolitan Transportation Plan and associated SCS (MTP/SCS), the first plan to meet the requirements of SB 375. Updated MTP/SCSs were adopted by SACOG on February 18, 2016 and November 18, 2019.

With the passage of Senate Bill 743 in 2013, the Governor's Office of Planning and Research (OPR) amended the State CEQA Guidelines providing alternative criteria to level of service (LOS) for evaluating transportation impacts. The goal of the new criteria is to promote the reduction of GHG, the development of multimodal transportation networks, and a diversity of land uses. OPR provides [documents](#) to evaluate vehicle miles traveled (VMT) as the alternative to LOS. Local jurisdictions must implement SB 743 by July 1, 2020 or do additional transportation analysis on a project by project basis.

The 2017 Climate Change Scoping Plan notes that SB 375 efforts, if fully implemented, do not provide enough light-duty transportation sector reductions for the state to meet the 2050 GHG targets. As such, land use and transportation projects consistent with the MTP/SCS may still need additional GHG reductions to be consistent with state climate change goals. In January 2019, ARB released the [California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals](#), which provides additional information on

what level of statewide VMT reduction would promote achievement of statewide GHG emissions reduction targets.

6.2 ANALYSIS EXPECTATIONS

The District recommends that CEQA analyses addressing the potential impacts of project-generated GHG emissions include the following:

- A summary of the current state of the science with respect to GHGs and climate change. [U.S. Global Change Research Program](#), [NASA](#), [California Climate Change Assessments](#), and [OEHHA's Indicators of Climate Change in California](#) provide good resources;
- A description of the existing environmental conditions or setting, without the project, which constitutes the baseline physical conditions for determining the project's impact;
- A discussion of the existing regulatory environment pertaining to GHGs;
- Identification of the thresholds of significance applicable to the proposed project. The District provides [recommended thresholds](#), including required Best Management Practices for operational emissions, for agencies without adopted GHG reduction plans (climate action plans) or their own adopted thresholds and for projects that are inconsistent with an agency's adopted GHG reduction plan;
- A discussion of the GHG emission sources associated with the project's construction and operational activities;
- Discussion of whether the project's size qualifies it to be analyzed using the District's construction screening level for GHG emissions, discussed in Section 6.3.1;
- If the analysis cannot be completed using the District's construction screening level, a quantification of the annual mass emissions of GHGs that will be generated by project construction, and the input parameters and assumptions used to estimate these values;
- Identification of the earliest year in which operational emissions of GHGs are anticipated to commence;
- Discussion of whether the project's scope and size qualify it to be analyzed using the District's [Operational Screening Levels table](#) (which lists sizes of land uses not expected to exceed 1,100 metric tons of CO₂e per year), including implementation of required tier 1 Best Management Practices;
- If the analysis cannot be completed using the District's operational screening levels table, including implementation of required tier 1 Best

Management Practices, a quantification of the annual mass emissions of GHGs that will be generated by project operations, and the input parameters and assumptions used to estimate these values, including implementation of required tier 2 Best Management Practices;

- A discussion of whether project construction- and operations-related GHG emissions will exceed the established significance thresholds and the resulting determination of whether the construction and operational GHG emissions, without mitigation, will represent a cumulatively considerable contribution to the significant cumulative impact;
- A discussion of feasible construction mitigation necessary to reduce impacts and make a determination whether the mitigation will be sufficient to reduce the project's construction GHG contribution to the significant cumulative impact to a less than considerable level;
- A discussion of operational mitigation, including implementation of required tier 1 and tier 2 operational Best Management Practices (or equivalent on-site or off-site mitigation) necessary to reduce impacts and make a determination whether the mitigation will be sufficient to reduce the project's operational GHG contribution to the significant cumulative impact to a less than considerable level; and
- With state-wide GHG reduction targets established in 2030 and 2050, and carbon free electricity targeted in 2045, analysts are advised to include a discussion of how the project will be consistent with these targets.

6.3 METHODOLOGIES

The evaluation of GHG emissions considers the following questions regarding Greenhouse Gas Emissions from the Environmental Checklist Form, [Appendix G of the State CEQA Guidelines](#):

- VIII.a. Will the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
- VIII.b. Will the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

The State CEQA Guidelines [Section 15064.4](#) states that a lead agency must make a good faith effort, based on available information, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. The guidelines give the lead agency the discretion to select the most appropriate tools based on substantial evidence. The District's recommendations on appropriate methodology and tools for analyzing GHG emissions are provided in the following sections. Additionally, the District created an [applicability flow chart](#) to assist lead agencies

and project proponents with properly evaluating operational GHG emissions, thresholds, and best management practices.

6.3.1 ASSESSING MASS EMISSIONS

LAND USE DEVELOPMENT PROJECTS

Screening

The District assumes that projects described in CEQA's categorical and statutory exemption provisions ([Articles 18 and 19 of the California Code of Regulations, Title 14](#)) will not interfere with achieving emission reductions from new projects subject to CEQA. The District also assumes that GHG emissions from residential and commercial projects that are described in the categorical exemption language appear to be relatively small from a GHG perspective and may be considered less-than-cumulatively considerable.

For projects within the District's jurisdiction not described in CEQA's categorical and statutory exemption provisions, the District has developed screening levels to help lead agencies analyze operational and construction GHG emissions. The [GHG Operational Screening Levels table](#) shows the size of development (by land use type) at which 1,100 metric tons of GHG per year would not be exceeded. If a project is less than or equal to 1,100 metric tons of GHG per year and implements the District's tier 1 operational GHG Best Management Practices (noted in Section 6.4.1), the District's operational GHG threshold of significance would not be exceeded. In addition, the District has determined that projects below the GHG Operational Screening Levels would not exceed the District's construction GHG threshold of significance if the project meets the parameters in Chapter 3, Section 3.3.1 for the construction NOx screening level.

Therefore, operational and construction emissions from projects that are smaller than the land use sizes in the Operational Screening Levels table, implement the District's tier 1 operational GHG Best Management Practices, and also meet the parameters outlined in Chapter 3, Section 3.3.1 regarding construction may be considered less-than-cumulatively considerable.

[CEQA Guidelines Section 15183.5](#) includes the provision for tiering and streamlining the analysis of GHG emissions in CEQA documents. Under this provision, lead agencies may analyze and mitigate the effects of GHG emissions at a programmatic level, such as in a general plan, a long range development plan, or a separate plan to reduce GHG emissions such as a Climate Action Plan developed by a local jurisdiction, or a sustainable communities strategy developed by the metropolitan planning organization. Later project-specific CEQA documents may tier and/or incorporate by reference that existing programmatic review if the proposed project is consistent with the applicable regional or local plan that adequately addresses GHG emissions, and that plan has been evaluated pursuant

to CEQA and has a certified or approved environmental document. More guidance on program-level GHG emissions analysis is included in [Chapter 9](#).

Pursuant to CEQA Guidelines Sections [15064\(h\)\(3\)](#) and [15130\(d\)](#), a lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project complies with the requirements in a previously adopted plan or mitigation program under specified circumstances. CEQA Guidelines Section [15183.5\(b\)\(2\)](#) provides additional detail regarding use of an adopted GHG emissions reduction plan with later projects.

Quantification of GHG Emissions

CEQA is a public disclosure law that requires lead agencies to make a good-faith, reasoned effort, based upon available information, to identify the potentially significant direct and indirect environmental impacts - including cumulative impacts - of a proposed project. The District recommends the lead agency quantify the GHG emissions anticipated to be generated by a proposed project that does not meet the requirements of a categorical or statutory exemption, that cannot show consistency with the jurisdiction's adopted climate action plan or GHG reduction plan (if applicable), or that exceeds the screening levels in the [GHG Operational Screening Levels table](#) (projects below the screening levels must also implement required tier 1 Best Management Practices to avoid quantification). Direct and indirect emissions of GHGs from the project, which include construction emissions, area- and mobile-source emissions, and indirect emissions from in-state energy production and water consumption (energy for conveyance, treatment, distribution, and wastewater treatment), must be quantified and disclosed in the CEQA document. Operational calculations must also include vehicle miles traveled per resident and per worker. The annual and total amount of a project's construction related GHG emissions and the operational GHG emissions generated per year over the lifetime of the project should be disclosed separately. The most recent version of the [California Emissions Estimator Model \(CalEEMod\)](#) is the recommended analysis tool to quantify project GHG emissions. Lead agencies should discuss the use of other analysis tools with the District prior to use.

Construction Emissions

District-recommended methodologies for quantifying construction GHG emissions include using [CalEEMod](#) for proposed land use development projects and the [Roadway Construction Emissions Model](#) for proposed projects that are linear in nature.

Please note that sources of construction-related GHG emissions only include exhaust, for which the lead agency can follow the same detailed guidance as described in [Chapter 3, Construction-Generated Criteria Air Pollutant and Precursor Emissions](#) for criteria air pollutants and precursors. CalEEMod output for construction related GHG emissions must be disclosed in the CEQA document and treated as a net increase in emissions.

For linear construction projects such as construction of a new roadway, road widening, roadway overpass, levee, or pipeline, the District recommends the use of the most current version of the Roadway Construction Emissions Model. This model is a spreadsheet-based tool that uses basic project information (e.g., total construction months, project type, total project area) to estimate a construction schedule and quantify GHG emissions from heavy-duty construction equipment, haul trucks, and worker commute trips associated with linear construction projects. Lead agencies should refer to Chapter 3 for guidance on using the Roadway Construction Emissions Model.

Operational Emissions

Operational GHG emissions from a project should be calculated and reported for the first full year of operation in annual metric tons of carbon dioxide equivalents (CO₂e). Vehicle miles traveled per resident and per worker should also be calculated for comparison to tier 2 Best Management Practices, if applicable. Direct and indirect emissions from the project must be estimated using the most current version of [CalEEMod](#) in accordance with the CalEEMod User's Guide and the District's [User Tips](#). Section 5 of the District's [Greenhouse Gas Thresholds for Sacramento County](#) describes methods to modify CalEEMod inputs for operational emissions calculations (electricity, natural gas, and trip generation rate adjustments). The District encourages the use of project-specific information whenever possible.

If project emissions exceed the District's GHG operational screening levels table, the project would then apply the District's tier 1 and tier 2 Best Management Practices to reduce GHG emissions from the project. The Best Management Practices are fully described in Section 6.4, Mitigation.

STATIONARY-SOURCE FACILITIES

An emissions unit consists of a single emission source with an identified emission point, such as a stack, at a facility. Facilities can have multiple emission units located on-site and sometimes the facility as a whole is referred to as a "stationary source." Stationary sources are typically associated with industrial processes. Examples include boilers, heaters, flares, cement plants, and other types of combustion equipment.

AB 32 required ARB to adopt regulations that require the monitoring and annual reporting of GHG emissions from the sources that "contribute the most to statewide emissions", and account for the GHG emissions from all electricity consumed in California, including transmission and distribution line losses from electricity generated within the state or "imported from outside the state." Pursuant to AB 32, ARB adopted the [Greenhouse Gas Mandatory Reporting Regulation](#) in December 2007. The regulations require certain stationary sources, including, but not limited to, cement plants, petroleum refineries, and operators, retail providers and marketers involved in electric generation within California or the import or export of electricity across California borders, to comply with

monitoring and reporting guidelines associated with their GHG emissions. The rule also applies to operators of other facilities in California that emit greater than or equal to 25,000 metric tons CO₂/year from stationary combustion sources.

GHG Emissions Reporting Tool

The [California Electronic Greenhouse Gas Reporting Tool](#), or Cal e-GGRT, is a web-based annual reporting tool managed by ARB. The tool facilitates tracking and reporting of annual data required under the ARB Mandatory Reporting Regulation. It provides for the assignment of reporting personnel, set-up of source inventory information, and annual reporting of emissions and other data in a manner that directly addresses the requirements of the regulation. Additional elements of the same tool provide for tracking and certification of emission reports and data verification by third-party verifiers. Reporters subject to California's [Greenhouse Gas Mandatory Reporting Regulation](#) must submit their data to ARB using Cal e-GGRT. The Reporting Tool can be used to disclose a stationary source's GHG emissions in a CEQA document.

Manual Estimation

Stationary source GHG emissions may be estimated manually. District staff should be consulted to ensure the emission factors and calculation methods are appropriate for CEQA and permitting purposes.

6.3.2 DETERMINING LEVEL OF SIGNIFICANCE

LAND USE DEVELOPMENT PROJECTS

AB 32 demonstrated California's commitment to reducing GHG emissions and the state's associated contribution to climate change, without intent to limit population or economic growth within the state. To meet AB 32 goals, California must reduce GHG emissions to 1990 levels by 2020. To meet the goals of [Executive Order B-30-15](#), California must reduce GHG emissions 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by 2050. On September 8, 2016, Governor Brown signed Senate Bill 32 (SB 32) into law which codified the mandate to reduce emissions by 40 percent below 1990 levels by 2030. The District recognizes that although there is no known level of emissions that determines if a single project will substantially impact the environment, a threshold must be set to trigger review and to assess the need for mitigation.

Lead agencies shall compare the project's estimated GHG emissions to the [District's recommended thresholds of significance](#):

- Construction phase of all project types -1,100 metric tons of CO₂e per year.
- Stationary source operational emissions - 10,000 metric tons of CO₂e per year.

- Land development project operational emissions are reviewed in the context of consistency with ARB's 2017 Climate Change Scoping Plan (which pertains to the second GHG-related question from appendix G).

If a project's emissions exceed the thresholds of significance for construction or stationary source emissions, then the project emissions may have a cumulatively considerable contribution to a significant cumulative environmental impact, answering Appendix G's first GHG-related question on whether the project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.

For projects that exceed the District's thresholds of significance, lead agencies shall implement all feasible mitigation to reduce GHG emissions, discussed in Section 6.4, Mitigation.

The second GHG-related question in Appendix G asks if the project will conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs. In order to answer this question, project emissions should be evaluated with respect to consistency with the following plans and policies, if applicable, that have been adopted to reduce GHG emissions:

- A jurisdiction's qualified climate action plan or GHG reduction plan.
- The Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS).
- ARB's 2017 Climate Change Scoping Plan (including State climate goals beyond 2030).

In April 2020, the District adopted an update to the land development project operational GHG threshold, which requires a project to demonstrate consistency with ARB's 2017 Climate Change Scoping Plan. The District's technical support document, [Greenhouse Gas Thresholds for Sacramento County](#), identified operational measures that should be applied to a project to demonstrate consistency. The measures target GHG emissions inventory areas where State measures did not fully achieve reductions, allowing for local supportive measures. These measures, known as tier 1 and tier 2 Best Management Practices are discussed in Section 6.4, Mitigation. The District's [applicability flow chart](#) is a good reference to ensure the required best management practices are included in the project.

Construction Emissions

Lead agencies shall estimate and report a land use development or stationary source project's construction GHG emissions for each year of construction. Lead agencies shall compare the project's annual construction GHG emissions to the District's 1,100 metric ton per year threshold of significance. If the threshold is exceeded, then the project may have a cumulatively considerable contribution to

a significant cumulative environmental impact, and all feasible mitigation is required.

Operational Emissions

Lead agencies shall estimate and report a project's annual operational GHG emissions in the first year of full operation (or if various phases, for each phase of operation) for projects that cannot screen out by comparing to the District's operational screening levels table (equivalent to 1,100 metric tons of CO₂e per year), including implementation of tier 1 Best Management Practices. If the project emissions exceed the screening level, or the project fails to implement tier 1 Best Management Practices, the project may have a cumulatively considerable contribution to a significant cumulative environmental impact, and all feasible mitigation is required. Projects exceeding the screening level, must implement tier 1 and tier 2 Best Management Practices, or provide equivalent on-site or off-site mitigation measures.

For purposes of evaluating a project's consistency with the 2045 statewide carbon neutrality goal, a project would need to eliminate natural gas completely (BMP 1) or require all pre-wiring necessary so that the buildings are ready for a future retrofit to all-electric. Additionally, for a project located in an area with relatively high vehicle miles traveled per capita (resident and worker) the project would need to provide sufficient electrical capacity that 100% of project vehicles have the potential to be zero emission vehicles. Qualitatively, the project would be required to show that it is not otherwise impeding the 2045 statewide carbon neutrality goal.

STATIONARY SOURCE FACILITIES

Lead agencies shall compare the stationary source project's annual direct operational GHG emissions to the District's 10,000 metric ton per year threshold of significance for stationary sources. If the project's annual direct GHG emissions will exceed the District's threshold of significance, then the project may have a cumulatively considerable contribution to a significant cumulative environmental impact.

Stationary source GHG emissions shall also be evaluated in the context of the applicable regulatory environment that is in place under the mandates of AB 32, SB 32, ARB's Climate Change Scoping Plan and Executive Order B-30-15.

6.4 MITIGATION

The State CEQA Guidelines [Section 15126.4\(c\)](#) requires lead agencies to consider feasible means of mitigating the significant effects of GHG emissions, supported by substantial evidence and subject to monitoring and reporting. Mitigation measures may include, but are not limited to:

1. Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency's decision;

2. Reductions in emissions resulting from a project through implementation of project features, project design, or other measures, such as those described in CEQA Guidelines [Appendix F - Energy Conservation](#);
3. Off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions;
4. Measures that sequester greenhouse gases; and
5. In the case of the adoption of a plan, such as a general plan, long range development plan, or GHG reduction plan, mitigation may include the identification of specific measures that may be implemented on a project-by-project basis. Mitigation may also include the incorporation of specific measures or policies found in an adopted ordinance or regulation that reduces the cumulative effect of emissions.

GHG mitigation measures could also be included in a Climate Action Plan or similar plan-level document adopted by a lead agency.

The lead agency must impose all mitigation measures that are necessary to reduce GHG emissions to a less-than-cumulatively considerable level. CEQA does not require mitigation measures that are infeasible for specific legal, economic, technological, or other reasons. A lead agency is not responsible for wholly eliminating all GHG emissions from a project; the CEQA standard is to mitigate to a level that is "less than significant" or, in the case of cumulative impacts, less than cumulatively considerable.

For every GHG emission reduction measure included in a CEQA document, the District recommends that the text shall be as detailed as possible and shall clearly identify who is responsible for implementation, funding, monitoring, enforcement, and any required maintenance activities. The lead agency shall also explain why the measure will be effective in reducing emissions and why each measure is considered to be feasible. In the case that GHG emission reduction measures relate directly or indirectly to policies in the local jurisdiction's General Plan, the District encourages the explanation of these relationships also be included.

If, after the identification of all feasible mitigation measures, a project is still deemed to have a cumulatively considerable contribution to a significant cumulative environmental impact, the lead agency can approve a project, but must adopt a Statement of Overriding Consideration to explain why further mitigation measures are not feasible, and why approval of a project with significant unavoidable impacts is warranted.

6.4.1 REDUCING MASS EMISSIONS FROM LAND USE DEVELOPMENT PROJECTS

When a lead agency does not have a previously approved community-wide GHG Reduction Plan or Climate Action Plan from which it can tier subsequent CEQA analyses for land use development projects, the project GHG emissions exceed the

threshold of significance for construction emissions, and/or the project size exceeds the operational land use screening levels table, which are equivalent to 1,100 metric tons of CO₂e per year, the District recommends the project proponent include all feasible measures to reduce GHG emissions.

Construction Emissions

The District provides [Recommended Measures](#) for Reducing GHG emissions from construction activities. These measures are best management practices, and some do not produce easily quantifiable GHG emission reductions. Other options for reducing GHG emissions from construction activities include obtaining emission reduction offsets or amortizing the construction emissions along with the operational emissions prior to applying mitigation.

Lead agencies may decide to amortize the level of short-term construction emissions over the expected (long-term) operational life of a project. Operational life of a building can be estimated to be 40 years for new residential and 25 years for conventional commercial. These estimates are derived from the State of California Executive Order D-16-00 and the US Green Building Council's October 2003 report on [The Costs and Financial Benefits of Green Buildings](#). The US Green Building Council's report provides longer operational life estimates for LEED certified buildings. Other operational life estimates can be used if justification is provided.

Operational Emissions

All projects must implement tier 1 Best Management Practices to demonstrate consistency with the Climate Change Scoping Plan. After implementation of tier 1 Best Management Practices, project emissions are compared to the operational land use screening levels table (equivalent to 1,100 metric tons of CO₂e per year). If a project's operational emissions are less than or equal to 1,100 metric tons of CO₂e per year after implementation of tier 1 Best Management Practices, the project will result in a less than cumulatively considerable contribution. Tier 1 Best Management Practices (fully described in [Greenhouse Gas Thresholds for Sacramento County](#)) include:

- BMP 1 - no natural gas: projects shall be designed and constructed without natural gas infrastructure.
- BMP 2 - electric vehicle (EV) ready: projects shall meet the current CalGreen Tier 2 standards, except all EV capable spaces shall be instead EV ready.

Project's that do not implement the tier 1 Best Management Practices must conduct additional calculations to determine excess emissions and provide measures either on-site or off-site to provide equivalent mitigation. Failure to implement tier 1 Best Management Practices may also require additional

environmental review, especially if a Statement of Overriding Consideration is needed.

If project emissions exceed the land use screening levels table (equivalent to 1,100 metric tons of CO₂e per year) after implementation of tier 1 Best Management Practices, the project is required to implement tier 2 Best Management Practices (fully described in [Greenhouse Gas Thresholds for Sacramento County](#)). Tier 2 Best Management Practices consists of BMP 3 - reductions in vehicle miles traveled (VMT) that meet the following requirements (or equivalent local agency's adopted SB 743 targets):

- Residential projects must achieve a 15% reduction in VMT per resident compared to existing average VMT per capita in the county.
- Office projects must achieve a 15% reduction in VMT per worker compared to existing average VMT per capita for the county.
- Retail projects must achieve no net increase in total VMT.

If the project meets the de minimis criteria for VMT in the Office of Planning and Research's SB 743 [Technical Advisory on Evaluating Transportation Impacts in CEQA](#), document the qualifying criteria to satisfy the BMP3 requirement.

Projects that do not meet tier 2 Best Management Practices (BMP 3) are required to implement additional measures to further reduce VMT to achieve the target. The District's [Recommended Guidance for Land Use Emissions Reductions](#) (District Guidance) provides a description of the most current feasible mitigation measures to reduce a project's operational GHG emissions. The District Guidance provides detailed information on how to utilize CalEEMod to select the most appropriate mitigation measures for the project and quantify GHG mitigation measures selected. All of the measures in the District Guidance include information about the reductions that might be achieved by each measure. The measures and reductions have been substantiated through research identified by a comprehensive literature review including the California Air Pollution Control Officers Association's [Quantifying Greenhouse Gas Mitigation Measures](#) document. Lead agencies and project proponents can also research and develop additional measures, in consultation with the District, that have reductions that are both quantifiable and substantiated. Potential alternative measures include use of natural refrigerants, sequestration, installation of vehicle charging stations, solar water heaters (to reduce electricity use), or offsite mitigation, including offsets, if on-site reduction measures are not sufficient to meet reduction targets. Offsite mitigation measures are required to demonstrate with substantial evidence that the project, credit, or registry being used provides GHG offsets that are real, permanent, quantifiable, verifiable, enforceable, and additional. Alternative measures are discussed further in Section 5 of the District's [Greenhouse Gas Thresholds for Sacramento County](#).

To assist in documenting, quantifying, and monitoring the mitigation measures selected by the project proponent, the District has prescribed that the selected GHG mitigation measures be explained in the context of a project-specific GHG Reduction Plan. The GHG Reduction Plan can be a standalone document or incorporated into the environmental document. During the environmental review process, and before certification of the CEQA environmental document by the lead agency, the District independently verifies the benefits of the selected measures in the GHG Reduction Plan with a letter. The GHG Reduction Plan shall then be referenced in the CEQA document as a GHG mitigation measure, appended to the document, and referenced as a condition of approval by the lead agency.

6.4.2 REDUCING EMISSIONS FROM STATIONARY SOURCES

Mitigation measures for reducing GHG emissions from stationary-source facilities shall be developed on a case-by-case basis in consultation with the District's permitting staff. Area- and mobile-source emissions shall be mitigated in the same way as land use development projects, as discussed in Section 6.4.1. Additional offsets could be implemented, including, but not limited to, the purchase of verified emission reduction credits, to ensure that a facility's GHG emissions are reduced to a less-than-cumulatively considerable level.

Attachment V
SMAQMD, Resolution No. 2020
– 009, Update to the
Recommended Greenhouse
Gas Emissions Thresholds of
Significance

RESOLUTION NO. 2020 – 009

Adopted by the Sacramento Metropolitan Air Quality Management District

UPDATE TO THE RECOMMENDED GREENHOUSE GAS EMISSIONS THRESHOLDS OF SIGNIFICANCE**BACKGROUND:**

- A. Section 15064.7 of the California Environmental Quality Act (CEQA) Guidelines encourages public agencies to develop and publish thresholds of significance to use in the determination of the significance of environmental effects, and states that thresholds of significance adopted for general use as part of the agency's environmental review process must be adopted by ordinance, resolution, rule or regulation; developed through a public review process; and supported by substantial evidence.
- B. On October 23, 2014, the Sacramento Metropolitan Air Quality Management District Board of Directors adopted Recommended Greenhouse Gas Emissions Thresholds of Significance (Resolution 2014-028) for land development project operational phase emissions, construction phase emissions, and stationary source emissions.
- C. Since the adoption of the Recommended Greenhouse Gas Emissions Thresholds of Significance in 2014, changes in State law and guidance documents along with updated CEQA case law resulted in the need to review the Recommended Greenhouse Gas Emissions Thresholds of Significance and prepare needed updates. Current local data was available to update the land development project operational phase emissions threshold.
- D. The Sacramento Metropolitan Air Quality Management District provides substantial evidence supporting the update to the recommended greenhouse gas emissions thresholds of significance in a document entitled *Greenhouse Gas Thresholds for Sacramento County*, final version dated March 4, 2020.
- E. The Sacramento Metropolitan Air Quality Management District conducted outreach on the thresholds update via public workshops January 9 and December 9, 2019. Staff coordinated with local lead agencies and the North State Building Industry Association in one-on-one meetings. Comments by stakeholders were considered and incorporated as needed into *Greenhouse Gas Thresholds for Sacramento County* document.
- F. The updated recommended greenhouse gas emissions thresholds of significance do not apply to a project that is exempt from CEQA; complies with the lead agency's adopted climate action plan or greenhouse gas emission reduction plan in accordance with CEQA Guidelines Section 15183.5; or utilizes the lead agency's own adopted thresholds of significance based on substantial evidence.

BASED ON THE FACTS SET FORTH IN THE BACKGROUND, THE BOARD OF DIRECTORS RESOLVES AS FOLLOWS:

- Section 1. The development and adoption of the update to the recommended greenhouse gas emissions thresholds of significance meets the requirements of CEQA Guidelines Section 15064.7.
- Section 2. The construction phase and stationary source project thresholds of significance remain in place and are unchanged.
- Section 3. The recommended land development project operational phase greenhouse gas emissions threshold of significance is demonstrating consistency with *California's 2017 Climate Change Scoping Plan*.
- Section 4. A project within the jurisdiction of the Sacramento Metropolitan Air Quality Management District shall demonstrate consistency with *California's 2017 Climate Change Scoping Plan* by implementing the following best management practices (BMP).

Tier 1 required for all projects to avoid conflicting with long-term state goals:

BMP 1: No natural gas. Projects shall be designed and constructed without natural gas infrastructure.

BMP 2: Electric vehicle (EV) ready. Projects shall meet the current CalGreen Tier 2 standards, except all EV capable spaces shall instead be EV ready.

Tier 2 required for large projects or inefficient projects that do not screen out of further requirements:

BMP 3: Residential projects shall achieve a 15% reduction in vehicle miles traveled per resident, and office projects shall achieve a 15% reduction in vehicle miles traveled per worker compared to existing average vehicle miles traveled for the county or for the city if a more local target has been established to implement Public Resources Code Section 21099 regarding vehicle miles traveled and the Governor's Office of Planning and Research's December 2018 *Technical Advisory On Evaluating Transportation Impacts in CEQA*. Retail projects shall achieve a no net increase in total vehicle miles traveled, as required to show consistency with the *Technical Advisory*.

If a project cannot incorporate the required BMPs, other on-site reductions or offsite reduction projects would be required to mitigate the emissions. If offsite mitigation is utilized, the project, credit, or registry must demonstrate with substantial evidence that the offset is real, permanent, quantifiable, verifiable, enforceable, and additional.

Section 5. The recommended thresholds of significance are effective immediately upon adoption.

ON A MOTION by Director Hansen, seconded by Director Harris, the foregoing resolution was passed and adopted by the Board of Directors of the Sacramento Metropolitan Air Quality Management District on March 26, 2020, by the following vote:

Ayes: Carr, Frost, Guerra, Kennedy, Lampson, Ly, Nottoli and Terry.

Noes: Daniels and Gaylord.

Abstain:

Absent: Peters and Serna.

ABOUT VERRA

Verra supports climate action and sustainable development through the development and management of standards, tools and programs that credibly, transparently and robustly assess environmental and social impacts, and drive funding for sustaining and scaling up these benefits. As a mission-driven, non-profit (NGO) organization, Verra works in any arena where we see a need for clear standards, a role for market-driven mechanisms and an opportunity to achieve environmental and social good.

Verra manages a number of global standards frameworks designed to drive finance towards activities that mitigate climate change and promote sustainable development, including the [Verified Carbon Standard \(VCS\) Program](#) and its [Jurisdictional and Nested REDD+ framework \(JNR\)](#), the [Verra California Offset Project Registry \(OPR\)](#), the [Climate, Community & Biodiversity \(CCB\) Standards](#) and the [Sustainable Development Verified Impact Standard \(SD VISta\)](#). Verra is also developing new standards frameworks, including [LandScale](#), which will promote and measure sustainability outcomes across landscapes. Finally, Verra is one of the implementing partners of the [Initiative for Climate Action Transparency \(ICAT\)](#), which helps countries assess the impacts of their climate actions and supports greater transparency, effectiveness, trust and ambition in climate policies worldwide.

1 INTRODUCTION

The Verified Carbon Standard (VCS) Program provides a global program and standard for GHG emission reduction and removal projects and programs. It uses as its core the requirements set out in *ISO 14064-2:2006*, *ISO 14064-3:2006* and *ISO 14065:2013*. The *VCS Program Guide* (this document) is the overarching program document and provides the rules and requirements governing the VCS Program, and describes the constituent parts of the program such as the project and program registration process, the Verra registry system, the methodology approval process, and the accreditation requirements for validation/verification bodies.

1.1 Version

VCS Program editions are labeled with a version number and program documents are correspondingly version controlled. *VCS Version 4* is the fourth working version of the VCS, having been preceded by *VCS Version 1* (the initial version), *VCS 2007* and *VCS 2007.1* (which were two releases of the same version, but with the latter version incorporating the agriculture, forestry and other land use (AFOLU) specifications), and *VCS Version 3*.

VCS Version 4 was released on 19 September 2019 and becomes the applicable version with immediate effect, except where grace periods were set out for particular requirements.

VCS Version 4 is comprised of all the program documents labeled v4.x, where x is a running number starting at zero. Individual program documents may be updated from time-to-time, as developments require, and their version numbers will be incremented using the v4.x format. Such updated documents still form part of version 4 and the VCS Program edition should be referred to as *VCS Version 4* regardless of the version numbers of the individual program documents. Where documents are updated, an appendix to the document will clearly state the updates made and their effective date. VCS Program stakeholders will be informed of the updates and the updates will also be catalogued on the Verra website. Readers shall ensure that they are using the most current version of this and all other program documents.

Note that errata documents may also be issued on a periodic basis to correct typographical errors in text, equations or figures in VCS Program documents or methodologies. In addition, clarification documents may be issued to provide additional guidance on the VCS Program rules or methodological requirements. Errata and clarification documents are posted to the Verra website alongside the relevant program document or methodology, and are effective on their issuance date. Project proponents and validation/verification bodies shall apply and interpret the VCS Program rules and methodological requirements consistent with any errata and clarifications. Errata and clarifications will be incorporated into the next issued version of the relevant program document or methodology.

New versions of the VCS Program will be issued on a periodic basis when major edition updates are required. Development of new versions of the program will include public stakeholder consultation and will be announced on the Verra website and to VCS Program stakeholders.

The VCS Program documents for previous versions of the VCS Program are available on the Verra website and these should be referred to for the rules and requirements under such previous versions of the VCS Program.

Note that projects, programs and verified carbon units (VCUs) are not labeled in the Verra registry with a specific version of the VCS Program (i.e., projects are not “Version 3 projects” or “Version 4 projects”, and likewise with VCUs). The VCS Program documentation is merely labeled with a version in order to provide version control over the program documents.

1.2 Language

The operating language of the VCS Program is English. The VCS Program documents may be translated into other languages to facilitate local use. However, the English versions of VCS Program documents, and the interpretation of same, shall take precedence over any other language translations.

1.3 Definitions

Definitions as set out in the VCS Program document *Program Definitions, ISO 14064-2:2006, ISO 14064-3:2006 and ISO 14065:2013* shall apply to all VCS Program documentation. Note that defined terms in the VCS Program documents, in common with ISO convention, are used without capital first letters.

2 OVERVIEW OF THE VCS PROGRAM

2.1 Program Objectives

The VCS Program establishes the rules and requirements that operationalize the *VCS Standard* to enable the validation of GHG projects and programs, and the verification of GHG emission reductions and removals that can be used both in voluntary and compliance markets. The VCS Program aims to:

- 1) Establish clear rules and procedures to enable the successful development of GHG projects and programs, and the creation of high quality GHG credits;
- 2) Create a trusted and fungible GHG credit, the VCU;
- 3) Stimulate innovation in GHG mitigation technologies and measures as well as procedures for validation, verification and registration, all within a context of quality, credibility and transparency;
- 4) Provide a secure registry system for all VCUs that offers assurance against double counting and provides transparency to the public;
- 5) Demonstrate workable frameworks and offer lessons that can be incorporated into other GHG programs and climate change regulation;
- 6) Provide oversight to ensure that investors, buyers and the market recognizes VCUs as being real, additional and permanent; and
- 7) Link carbon markets worldwide through a coherent and robust framework.

2.2 Program History

The Climate Group, the International Emissions Trading Association and the World Business Council for Sustainable Development are the partner organizations that founded the VCS Program. The World Economic Forum also partnered in the development of the VCS Program for part of the process. *VCS Version 1* was released on 28 March 2006 as both a consultation document and a standard for use by the market. *VCS Version 2* was released in October 2006 as a consultation document and did not replace *VCS Version 1* as the applicable version. After two years of work, two rounds of public consultation and the work of the 19-member steering committee¹ and seven technical working groups, *VCS 2007* was released on 19 November 2007. *VCS 2007.1*, which incorporated requirements for agriculture, forestry and other land use projects, was released on 18 November 2008. *VCS Version 3* was issued on 8 March 2011. *VCS Version 4* was released on 19 September 2019.

¹ The members of the steering committee were Jan-Willem Bode, Derik Broekhoff, Mike Burnett, Robert Dornau, Steve Drummond, Mitchell Feierstein, Yoshito Izumi, Mark Kenber, Adam Kirkman, Andrei Marcu, Erin Meezan, Ken Newcombe, Mark Proegler, Robert Routliffe, Richard Samans, Marc Stuart, Einar Telnes, Bill Townsend and Diane Wittenberg.

2.3 Program Scope

The VCS Program provides the standard and framework for independent validation of projects and programs, and verification of GHG emission reductions and removals, based on *ISO 14064-2:2006* and *ISO 14064-3:2006*. The scope of the VCS Program covers all those activities related to the generation of GHG emission reductions and removals, including jurisdictional programs and nested REDD+ projects. The scope does not include carbon footprint assessments or carbon neutrality claims.

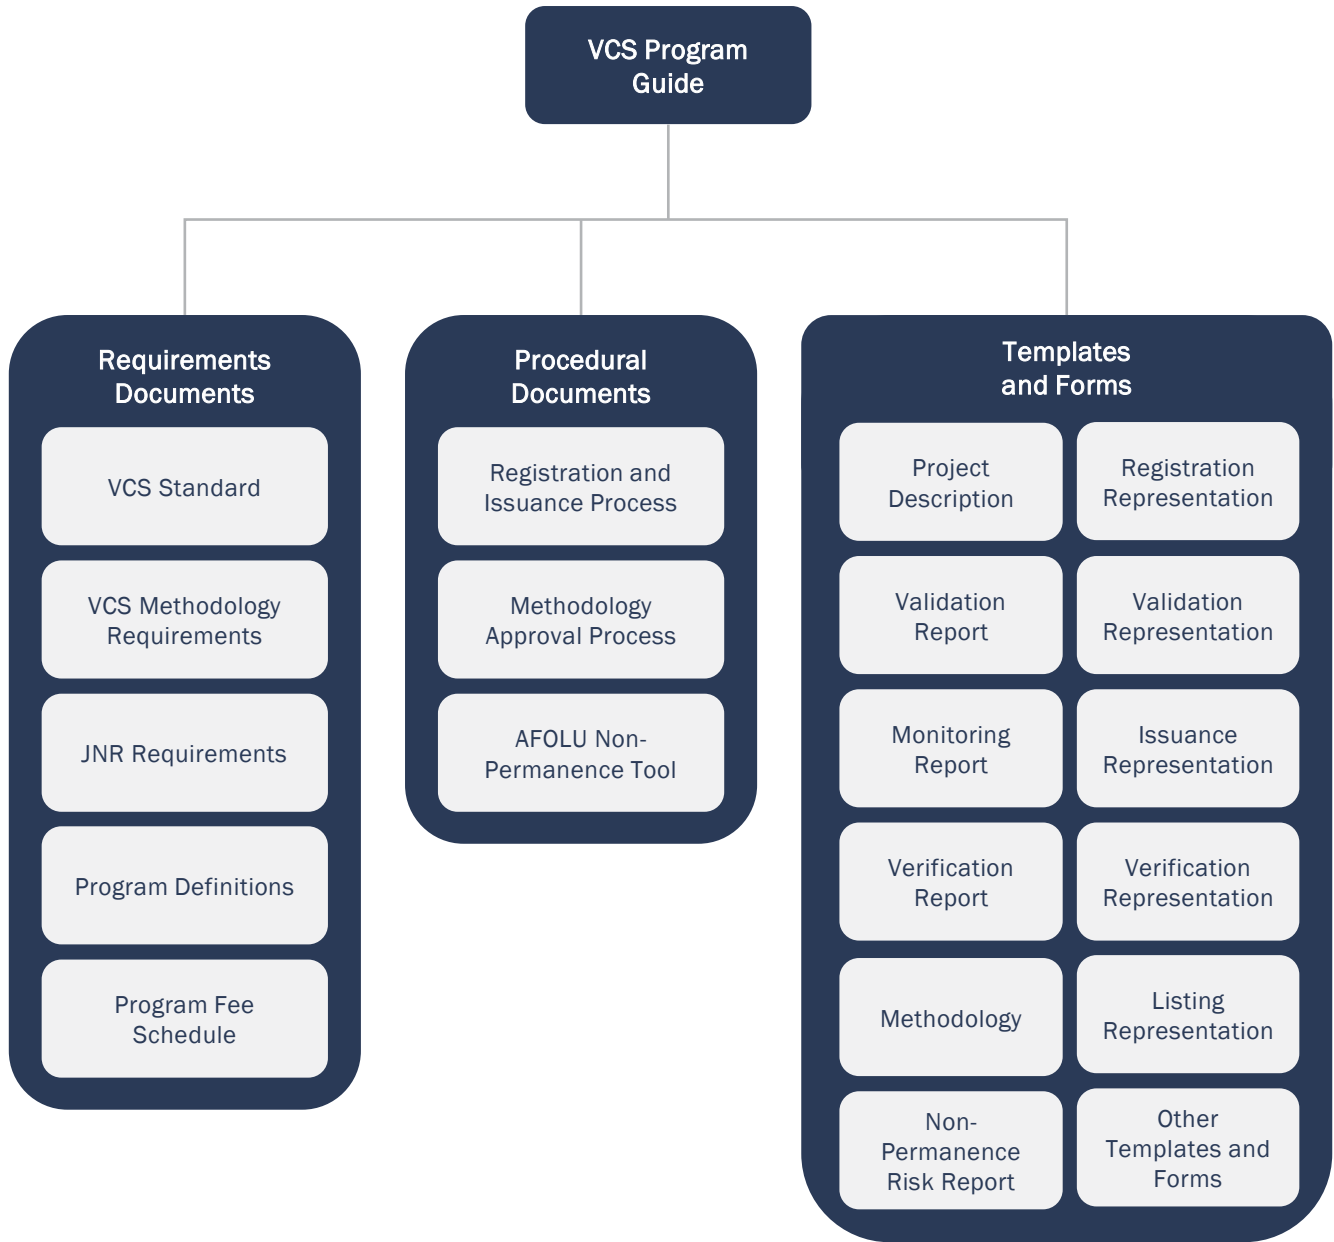

Participation is voluntary and based on objective criteria. The VCS Program is not discriminatory to project proponents, jurisdictional proponents, methodology element developers, validation/verification bodies, or VCU buyers, sellers or brokers.

2.4 Program Documents

The rules and requirements for the VCS Program are set out in the program documents. Projects, programs and methodologies shall meet with all the applicable rules and requirements set out in these documents.

The structure of the program documents is summarized in Diagram 1. The *VCS Program Guide* is the overarching program document, providing the rules and requirements governing the VCS Program and further describing the constituent parts of the program such as the project and program registration process, the Verra registry system, the methodology approval process, and the accreditation requirements for validation/verification bodies. Complementing the *VCS Program Guide* are requirements documents, procedural documents and templates and forms. Verra may issue new documents, as developments in the VCS Program require, and the complete and current list of the program documents is available on the Verra website.

Diagram 1: Program Documents

Attachment: WLC Responses to Appeal_9JUNE2020_Part 2 (4074 : World Logistics Center)

In addition to the *VCS Program Guide*, the program documents currently include the following:

- 1) Requirements Documents
 - a) *VCS Standard*. Provides the requirements for developing projects and for the validation and verification process.
 - b) *Methodology Requirements*. Provides the requirements for developing new methodology elements.

- c) *JNR Requirements*. Provides further requirements for developing jurisdictional REDD+ programs and nested REDD+ projects.
- d) *Program Definitions*. Provides the definitions for terms used in the VCS Program documents.
- e) *Program Fee Schedule*. Provides the fees related to the various parts of the VCS Program.

2) Procedural Documents

- a) *Registration and Issuance Process*. Provides the procedures and rules for registering projects and issuing VCUs.
- b) *JNR Registration and Issuance Process*. Provides the procedures and rules for registering jurisdictional baselines and jurisdictional REDD+ programs, as well as projects nested in jurisdictional programs and standalone projects operating under Scenario 1.
- c) *JNR Validation and Verification Process*. Provides the process and requirements for the validation and verification of jurisdictional baselines and jurisdictional REDD+ programs.
- d) *Methodology Approval Process*. Provides the procedures and rules for approval of VCS Program methodology elements.
- e) *AFOLU Non-Permanence Risk Tool*. Provides the procedure for conducting non-permanence risk analysis and buffer determination for AFOLU projects.

3) Templates and Forms

- a) *VCS Program Templates*. Templates for project descriptions, validation reports, monitoring reports, verification reports and methodologies.
- b) *Representations Templates*. Templates for deeds of representation made by project proponents and validation/verification bodies.
- c) *Forms*. Forms such as for submitting methodology elements under the methodology approval process and for applying to be an AFOLU expert.

The following are normative (referenced) documents for the VCS Program:

- 1) *ISO 14064-2:2006*, Greenhouse gases – Part 2: Specification with guidance at the project level for quantification, monitoring and reporting of greenhouse gas emission reductions or removal enhancements, ISO, 2006.
- 2) *ISO 14064-3:2006*, Greenhouse gases – Part 3: Specification with guidance for the validation and verification of greenhouse gas assertions, ISO 2006.
- 3) *ISO 14065:2013*, Greenhouse gases – Requirements for greenhouse gas validation and verification bodies for use in accreditation or other forms of recognition, BSI, 2007.
- 4) *The GHG Protocol for Project Accounting* (Chapter 7, guidance related to additionality and common practice), WRI, 2005.

The four standards above are part of the requirements of the VCS Program and their requirements shall be met either by the project proponent (*ISO 14064-2:2006*) or validation/verification body (*ISO 14064-3:2006* and *ISO 14065:2013*). Where there is any conflict between VCS Program documentation and the above normative references, the VCS Program documentation shall take precedence.

The program documents are also complemented by a number of guidance documents. These guidance documents do not set out VCS Program rules and requirements, but they provide additional information to assist with the interpretation of the rules and requirements. It is strongly encouraged that such guidance is followed.

2.5 Roles and Responsibilities

2.5.1 Project and Jurisdictional Proponents

Project and jurisdictional proponents are the entities with overall control and responsibility for projects or programs. A project may have one project or jurisdictional proponent, or there may be a number of project or jurisdictional proponents who collectively have overall control and responsibility for a project or program. Project and jurisdictional proponents establish and operate projects and programs in accordance with the VCS Program rules. They are responsible for providing the project or program description, monitoring report and supporting documentation (including evidence of project ownership or program ownership) to facilitate validation and verification.

Project and jurisdictional proponents sign unilateral representations with respect to their projects or programs and VCUs, and these are made available on the Verra registry. Project proponents assume limited liability for replacement of excess VCUs, as set out in Section 4.2.

Note – In order to aid the readability of the VCS Program documentation, the documents use project and jurisdictional proponent in the singular. For projects and programs with multiple project or jurisdictional proponents, “project proponents” or “jurisdictional proponents” should be substituted in place of “project proponent” or “jurisdictional proponent”, as appropriate.

2.5.2 Methodology Element Developers

Methodology element developers are entities that develop methodologies, methodology revisions, modules and tools that are subject to the methodology approval process.

2.5.3 Validation/Verification Bodies

Validation/verification bodies are accredited to:

- 1) Validate projects and verify GHG emission reductions and removals.
- 2) Assess methodology elements under the methodology approval process.

Validation/verification bodies are only eligible to carry out work for the sectoral scopes for validation and verification for which they hold accreditation and must sign the required agreement with Verra before they can perform validation or verification in connection with the VCS Program. The list of validation/verification bodies is available on the Verra website.

2.5.4 Verra Registry

The Verra registry is responsible for ensuring that all required project and program documents have been submitted to Verra; issuing and maintaining accounts of VCUs for accountholders; ensuring the seamless flow of VCUs throughout the entire Verra registry system; tracking and reporting the deposit/withdrawal of buffer credits to/from the centrally managed AFOLU pooled buffer account and jurisdictional pooled buffer account; and maintaining custody and records of VCU legal ownership.

2.5.5 VCU Buyers, Sellers and Brokers

Buyers, sellers and brokers are companies, organizations or individuals who transact VCUs or facilitate the transaction of VCUs.

2.5.6 Verra

The VCS Program is managed by Verra, which is an independent, non-profit organization incorporated under the laws of the District of Columbia in the United States. Verra is responsible for managing, overseeing and developing the program. It maintains an impartial position in the market and does not develop projects, programs or methodologies, nor does it provide validation, verification or consulting services.

One of Verra's roles is in respect of overseeing and ensuring the integrity of projects, programs and VCUs in the Verra registry system. Verra conducts reviews of project and program registration and VCU issuance requests. Verra is also responsible for overseeing the validation/verification bodies operating under the VCS Program. Where Verra identifies shortcomings in a validation/verification body's performance, it may provide feedback and require the validation/verification body to address non-conformities.

Verra reserves the right not to register projects and programs, or issue VCUs where it deems that they are not in compliance with the VCS Program rules or may otherwise impact the integrity of the VCS Program or the functioning of the broader carbon market, and to delist projects, programs and VCUs where it deems that they have not been registered or issued in accordance with the VCS Program rules. Verra also reserves the right to take action against validation/verification bodies in accordance with the provisions set out in the agreements signed with Verra. The rights and obligations for validation/verification bodies are set out in such agreements.

Verra is also responsible for managing the methodology approval process, and it reserves the right to not accept methodology elements into the process, not approve methodology elements, or review and update, put on hold or withdraw approved methodology elements where it deems that they are not in compliance with the VCS Program rules, would sanction politically or ethically contentious project activities, or may otherwise impact the integrity of the VCS Program or the functioning of the broader

carbon market.

Verra may convene steering committees, advisory committees or working groups to support its work in specific areas. These groups draw in expertise from outside the organization to develop and support specific elements of the VCS Program. A full list of steering committees and working groups is available on the Verra website.

3 VCS PROGRAM CRITERIA FOR GHG PROJECTS AND PROGRAMS

All projects and programs shall meet the requirements set out in the VCS *Version 4* program documents.

GHG emission reductions and removals verified under the VCS Program and issued as VCUs shall meet the following principles:

Real

All GHG emission reductions and removals and the projects or programs that generate them must be proven to have genuinely taken place.

Measurable

All GHG emission reductions and removals must be quantifiable using recognized measurement tools (including adjustments for uncertainty and leakage) against a credible emissions baseline.

Permanent

Where GHG emission reductions or removals are generated by projects or programs that carry a risk of reversibility, adequate safeguards must be in place to ensure that the risk of reversal is minimized and that, should any reversal occur, a mechanism is in place that guarantees the reductions or removals will be replaced or compensated.

Additional

GHG emission reductions and removals must be additional to what would have happened under a business-as-usual scenario if the project had not been carried out.

Independently Audited

All GHG emission reductions and removals must be verified to a reasonable level of assurance by an accredited validation/verification body with the expertise necessary in both the country and sector in which the project is taking place.

Unique

Each VCU must be unique and must only be associated with a single GHG emission reduction or removal activity. There must be no double counting, or double claiming of the environmental benefit, in respect of the GHG emission reductions or removals.

Transparent

There must be sufficient and appropriate public disclosure of GHG-related information to allow intended users to make decisions with reasonable confidence.

Conservative

Conservative assumptions, values and procedures must be used to ensure that the GHG emission reductions or removals are not over-estimated.

4 VERRA REGISTRY

The Verra registry provides the public interface to all project, program and VCU information. VCU serial numbers are generated by the registry, which ensures uniqueness of projects, programs and VCUs. In addition, the Verra registry provides full transparency on project and program documentation, together with information on project and jurisdictional proponents, VCU issuance and retirement, the AFOLU pooled buffer account and the jurisdictional pooled buffer account.

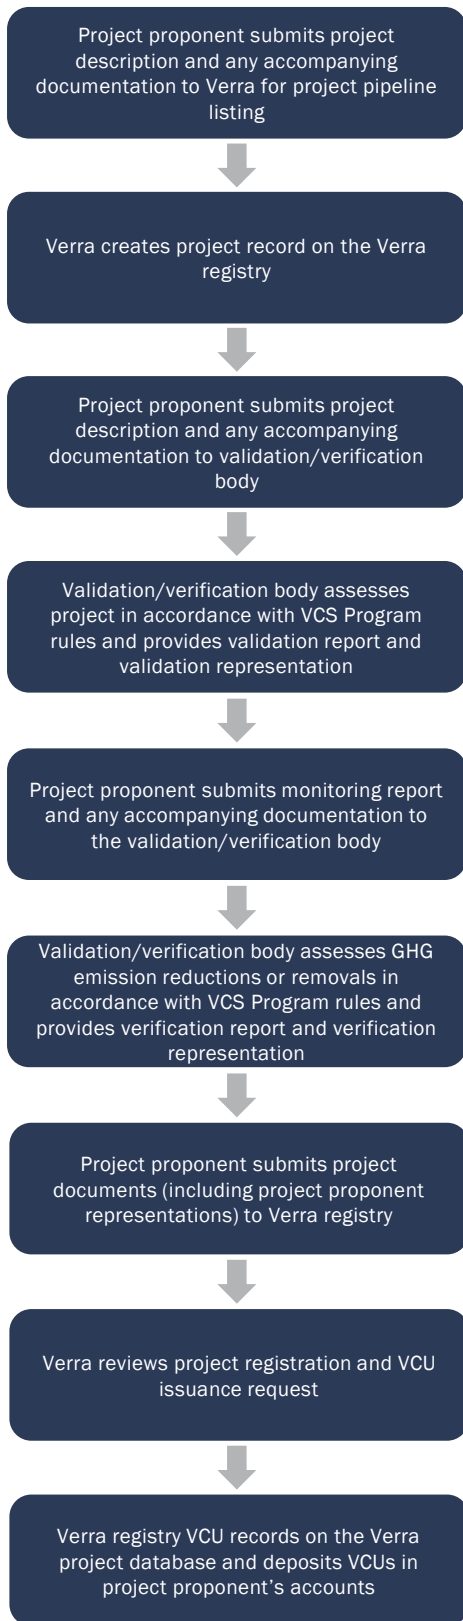

The AFOLU pooled buffer account holds non-tradable buffer credits to cover the non-permanence risk associated with AFOLU projects. It is a single account that holds the buffer credits for all projects. The account is subject to a periodic reconciliation, as set out in the VCS Program document *VCS Standard*. Likewise, the jurisdictional pooled buffer account holds the non-tradable buffer credits to cover the non-permanence risk associated with jurisdictional REDD+ programs and nested projects.

The Verra registry provides accountholder services and is the entry point into the registry system for project and jurisdictional proponents, and VCU buyers and sellers. Such market participants open an account with the Verra registry and project and program registration and VCU issuance is initiated with the Verra registry.

The Verra registry is responsible for ensuring that projects and programs are registered and VCUs are issued in accordance with the VCS Program rules; providing services for holding, transferring and retiring VCUs; managing AFOLU and jurisdictional buffer credits; and providing custodial services for VCUs and maintaining records of VCU legal ownership.

Project and jurisdictional proponents (or other eligible entities, as set out in the VCS Program documents *Registration and Issuance Process* and *JNR Registration and Issuance Process*) request listing and registration of projects and programs, and VCU issuance, with the Verra registry. Diagram 2 outlines the project life cycle and registration process, which is similar to the program life cycle and registration process. Once the project or program has been validated and the GHG emission reductions or removals verified, the project or jurisdictional proponent submits the relevant documents to the Verra registry. Verra conducts a completeness review of the documents, and may conduct a further accuracy review to assess compliance with the VCS Program rules. Where it is determined that the project or program complies with the VCS Program rules, Verra uploads the documents to the public Verra registry and issues VCUs into the project or jurisdictional proponent's account. Note that validation and verification may be undertaken simultaneously, with registration and issuance of the VCUs occurring at the same time, or validation may occur before verification, with registration occurring before any subsequent issuance of VCUs.

Diagram 2: Project Life Cycle and Registration Process

The process and detailed rules and requirements for project pipeline listing, program listing, project and program registration, and VCU issuance are set out in the VCS Program documents *Registration and Issuance Process* and *JNR Registration and Issuance Process*.

4.1 VCS Program Fees

Verra charges fees to cover administration costs, at the rates set out in the VCS Program document *Program Fee Schedule*.

4.2 VCU Liability And Statute Of Limitations

Registered projects and issued VCUs are subject to review by Verra, as set out in the VCS Program document *Registration and Issuance Process*. Project proponents are responsible for compensating for excess VCU issuance where Verra deems, acting reasonably, that there has been a material erroneous issuance of VCUs in respect of a project, as a result of the fraudulent conduct, negligence, intentional act, recklessness, misrepresentation or mistake of the project proponent. A statute of limitations applies, whereby Verra can only require such compensation in relation to any verification completed after 8 April 2014 and up to the later of:

- 1) 6 years after the date of issuance of the relevant VCU; or
- 2) 12 months after the date upon which any second verification report with respect to the relevant VCU is accepted on the Verra registry.²

²The relevant VCU will be issued following acceptance of a verification report for a project. For some types of AFOLU projects in particular, verification cycles may be longer than 6 years. In this regard, if the second verification report shows a VCU has been erroneously issued, Verra will have an additional 12 months to deal with that issue. Note also that where a VCU is erroneously issued from the last verification report of a project, Section 4.2(1) applies.

5 VCS PROGRAM ACCREDITATION

Validation/verification bodies are eligible to provide validation and verification services under the VCS Program if they have signed the required agreement with Verra and are:

- 1) Accredited under a VCS-approved GHG program³; or
- 2) Accredited under *ISO 14065:2013* for scope VCS by an accreditation body that is a member of the International Accreditation Forum;

The validation/verification body shall hold such accreditation or approval for validation or verification (as applicable) for the sectoral scope(s) applicable to the methodology applied to the project. Where the methodology falls under more than one sectoral scope, the validation/verification body shall hold accreditation or approval for validation or verification (as applicable) for all relevant sectoral scopes.

Where the validation/verification body holds accreditation or approval for the verification for the relevant sectoral scope(s) but does not hold accreditation or approval for validation, it may validate project description deviations and inclusion of new project activity instances in grouped projects at the time of verification, under the following circumstances:

- 1) It holds accreditation or approval for validation in at least one other sectoral scope.
- 2) It has completed validation of at least five projects under the VCS Program or an approved GHG program, and such projects have been registered under the relevant program.
- 3) The validation activity does not entail the validation of a project description deviation that impacts the applicability of the methodology, additionality or the appropriateness of the baseline scenario (see the *VCS Standard* for further information on such deviations).

Validation/verification bodies are also eligible to conduct assessments (validation) of methodology elements under the methodology approval process. The validation/verification body shall hold accreditation for validation for the sectoral scope(s) applicable to the methodology. Where the methodology falls under more than one sectoral scope, the validation/verification body shall hold accreditation for validation for all relevant sectoral scopes.

To apply to become an approved validation/verification body with the VCS Program, organizations must complete a *Verra Validation/Verification Body Application Form* and submit the signed application, along with any supporting evidence (as required by the application) to secretariat@verra.org.

A list of validation/verification bodies approved to undertake validation and verification services under the VCS Program is available on the Verra website.

³ Note that accreditation under an approved GHG program shall be recognized only until such time as Verra determines that a sufficient number of validation/verification bodies are accredited under other recognized accreditation pathways, or two years from the date of release of VCS Version 4, whichever is earlier. After such date, all validation/verification bodies must be accredited through another approved accreditation pathway.

6 METHODOLOGY APPROVAL PROCESS

The methodology approval process is the process by which methodologies, methodology revisions, modules and tools (including additionality tools, performance benchmarks and technology benchmarks), are approved under the VCS Program. Such methodology elements are subject to review by Verra, a global stakeholder consultation hosted on the Verra website and independent assessment by one validation/verification body, before final approval by Verra.

The full rules and requirements for methodology elements with respect to the methodology approval process are set out in the VCS Program document *Methodology Approval Process*.

6.1 Review of Approved VCS Methodology Elements

Verra may periodically review methodology elements approved under the VCS Program to ensure they continue to reflect best practice and scientific consensus. This includes ensuring that methodology elements approved under the program are consistent with any new requirements issued by Verra and that methodology elements have appropriate criteria and procedures for addressing all VCS Program requirements and are consistent with emerging best practice and scientific consensus. As a result, Verra may need to update, put on hold or withdraw a methodology element. The procedure through which Verra may review approved VCS Program methodology elements and take appropriate action is set out in the VCS Program document *Methodology Approval Process*.

6.2 Compensation for Methodology Developers

Methodology developers are eligible to receive compensation for methodologies approved under the VCS Program.

Compensation will be paid according to the number of VCUs issued to projects using the methodology or a revision of the methodology, at the rate and in accordance with the payment terms set out in the VCS Program document *Program Fee Schedule*. Compensation is payable with respect to VCUs issued on or after 15 June 2010. Methodology developers may elect not to receive compensation by notifying Verra at any time.

Where Verra sanctions the consolidation of a number of methodologies, the compensation due to the developer of the consolidated methodology and the underlying methodologies respectively will be determined on a case-by-case basis by Verra.

Where an eligible methodology is withdrawn or put on hold, compensation remains payable in respect of continuing issuance of VCUs to registered projects that have applied the methodology or a revision of the methodology.

Only methodologies developed under the VCS Program methodology approval process are eligible for the compensation mechanism. Developers of methodology revisions, modules and tools are not compensated under the mechanism.

Note – Project proponents pay the same VCU issuance levy regardless of the methodology applied to the project. Verra pays any compensation to the methodology developer out of the VCU issuance levy it receives.

7 LINKING TO OTHER GHG PROGRAMS

To recognize work that has gone into developing other credible GHG programs, the VCS Program has a process for approving GHG programs that meet VCS Program criteria. A GHG program shall demonstrate compliance with VCS Program principles and requirements through a gap analysis and the Verra Board will make the final decision on whether to approve the GHG program. Approval of a GHG program under the VCS Program has three implications:

- 1) GHG credits under the approved GHG program may be cancelled and issued as VCUs (converted into VCUs).
- 2) Validation/verification bodies under the approved GHG program are approved for validation and verification under the VCS Program (for the corresponding sectoral scopes for validation and verification respectively, and provided they have signed the required agreement with Verra).
- 3) Methodology elements under the approved GHG program may be used for developing projects under the VCS Program.

The list of approved GHG programs is available on the Verra website, together with any specific conditions or further clarifications with respect to the scope of approval.

7.1 Gap Analysis Methodology and Process

The approval of other GHG programs is based on the principle of full compatibility with the VCS Program. A gap analysis process is applied on a case-by-case basis to determine the other GHG program's compliance with VCS Program principles and requirements and to assess whether the GHG emission reductions or removals issued under the GHG Program are fully compatible with VCUs issued under the VCS Program.

Any party may initiate a gap analysis of another GHG program with the VCS Program. All relevant documentation in relation to the GHG program shall be provided to Verra, with appropriate authorization secured.

The onus is on the GHG program to demonstrate that it meets the VCS Program criteria. The costs of the assessment are borne by the GHG program or whoever initiates the gap analysis.

Based on the gap analysis report, the Verra Board will make a decision on whether to approve the full GHG program or elements of the program.

7.2 Review of VCS Program-Approved GHG Programs

Approved GHG programs are reviewed periodically by Verra. Any changes made by an approved GHG program which may affect its compatibility with the VCS Program shall be communicated immediately to Verra. In the event that it is considered that the changes lead to non-conformity with the VCS Program, the Verra Board may decide to suspend or terminate its recognition of the approved GHG program. Any projects approved under the GHG program prior to such Verra Board decision will not be affected by the suspension or termination.

8 COMPLAINTS AND APPEALS PROCEDURE

Project proponents, validation/verification bodies, methodology element developers and other stakeholders (including interested stakeholders) may submit enquiries to Verra at any time. In addition, the VCS Program provides a complaints and appeals procedure as set out in the *Verra Appeals, Complaints and Conduct Policy* available on the Verra website.

1 | Introduction

The *VCS Standard* provides a global standard for GHG emission reduction and removal projects and programs. It uses as its core the requirements set out in *ISO 14064-2:2006*, *ISO 14064-3:2006* and *ISO 14065:2007*. The two principal documents of the program are the *VCS Program Guide* and the *VCS Standard*. The *VCS Program Guide* describes the rules and requirements governing the VCS Program and further describes the constituent parts of the program such as the project and program registration process, the VCS registry system, the methodology approval process and the accreditation requirements for validation/verification bodies. The *VCS Standard* provides the requirements for developing projects, programs and methodologies, as well as the requirements for validation, monitoring and verification of projects, programs and GHG emission reductions and removals. The *VCS Standard* is supported by other documents that provide further requirements specific to agriculture, forestry and other land use (AFOLU), ozone-depleting substances projects and methodologies, and jurisdictional programs and nested REDD+ projects. The *VCS Program Guide* should be read before using the *VCS Standard*.

The VCSA recognizes the kind agreement of the International Organization for Standardization (ISO, www.iso.org) to allow inclusion of critical clauses of *ISO 14064-2:2006* and *ISO 14064-3:2006* in the VCS documentation to facilitate comprehension. In particular, the sections in this document on project and methodology requirements include text drawn from *ISO 14064-2:2006* clause 5 and *ISO 14064-3:2006* clause 4.9, amended where necessary to fit the context of the VCS Program.

1.1 VERSION

All information about version control under the VCS Program is contained in the *VCS Program Guide*.

This document will be updated from time-to-time and readers shall ensure that they are using the most current version of the document. Where external documents are referenced, such as the *IPCC 2006 Guidelines for National GHG Inventories*, and such documents are updated, the most recent version of the document shall be used.

2 | VCS Program Specific Issues

2.1 SCOPE OF VCS PROGRAM

2.1.1 The scope of the VCS Program includes:

- 1) The six Kyoto Protocol greenhouse gases.
- 2) Ozone-depleting substances as set out in VCS document *ODS Requirements*.

- 3) Project activities supported by a methodology approved under the VCS Program through the methodology approval process.
- 4) Project activities supported by a methodology approved under a VCS approved GHG program, unless explicitly excluded under the terms of VCS approval.
- 5) Jurisdictional REDD+ programs and nested REDD+ projects as set out in VCS document *JNR Requirements*.

The scope of the VCS Program excludes:

- 1) Projects that can reasonably be assumed to have generated GHG emissions primarily for the purpose of their subsequent reduction, removal or destruction.
- 2) Projects that reduce hydrofluorocarbon-23 (HFC-23) emissions.

2.2 LANGUAGE

- 2.2.1** The operating language of the VCS Program is English. The project and program description, validation report, monitoring report, verification report and all other documentation (including all and any appendices) required under the VCS Program shall be in English.

2.3 TIMING OF CREDITING

- 2.3.1** VCUs shall not be issued under the VCS Program for GHG emission reductions or removals that have not been verified.
- 2.3.2** Project activities are eligible for immediate crediting of future avoided emissions under the conditions set out below, which shall be addressed at the level of the methodology:
- 1) The project immediately avoids future streams of GHG emissions as a result of an upfront intervention that permanently precludes further emissions from the source. VCUs shall be issued only after such an intervention has occurred and the GHG emission reductions have been verified. Examples of such activities include projects that destroy chlorofluorocarbons recovered from refrigeration equipment thereby immediately precluding their future release into the atmosphere, and composting projects that divert organic waste from landfill sites thereby immediately precluding future methane emissions. A REDD project would not qualify for immediate crediting because future streams of GHG emissions are not permanently precluded.
 - 2) The physical processes that would generate GHG emissions in the absence of an intervention are well-understood, stable and quantifiable. Models used to simulate such processes shall meet the requirements set out in Section 4.1.6. Any default factors associated with input parameters shall meet the requirements set out in Section 4.1.7.
 - 3) VCUs may be issued only for GHG emissions avoided over a ten year period, even if such GHG emissions are likely to have continued over a longer period of time under the baseline scenario. For example, a composting project that diverts organic waste from a landfill site

would be eligible for crediting (in relation to a specific amount of composted organic waste) for the GHG emissions that would have occurred at the landfill site over a ten year period, and any emissions that would have occurred beyond the ten year period (in relation to the specific amount of composted organic waste) are not eligible. Note that in this particular example the ten year rule applies to the specific amount of composted organic waste and the usual rules on duration of the project and project crediting period still apply.

2.4 PRINCIPLES

- 2.4.1** The application of principles is fundamental in ensuring that GHG-related information is a true and fair account. The principles below shall provide the basis for, and shall guide the application of, the VCS rules and requirements.

Principles taken from ISO 14064-2:2006, clause 3.

Relevance

Select the GHG sources, GHG sinks, GHG reservoirs, data and methodologies appropriate to the needs of the intended user.

Completeness

Include all relevant GHG emissions and removals. Include all relevant information to support criteria and procedures.

Consistency

Enable meaningful comparisons in GHG-related information.

Accuracy

Reduce bias and uncertainties as far as is practical.

Transparency

Disclose sufficient and appropriate GHG-related information to allow intended users to make decisions with reasonable confidence.

Conservativeness

Use conservative assumptions, values and procedures to ensure that net GHG emission reductions or removals are not overestimated.

Note – Accuracy should be pursued as far as possible, but the hypothetical nature of baselines, the high cost of monitoring of some types of GHG emissions and removals, and other limitations make accuracy difficult to attain in many cases. In these cases, conservativeness may serve as a moderator to accuracy in order to maintain the credibility of project and program GHG quantification.

3 | Project Requirements

3.1 GENERAL REQUIREMENTS

- 3.1.1** Projects shall meet all applicable rules and requirements set out under the VCS Program, including this document. Projects shall be guided by the principles set out in Section 2.4.1.
- 3.1.2** Agriculture, forestry and other land use projects shall meet the rules and requirements set out in VCS document *AFOLU Requirements*. Ozone-depleting substances projects shall meet the rules and requirements set out in VCS document *ODS Requirements*.
- 3.1.3** Projects shall apply methodologies eligible under the VCS Program. Methodologies shall be applied in full, including the full application of any tools or modules referred to by a methodology, noting the exception set out in Section 3.14.1. The list of methodologies and their validity periods is available on the VCS website.
- 3.1.4** Where projects apply methodologies that permit the project proponent its own choice of model (see VCS document *Program Definitions* for definition of model), such model shall meet with the requirements set out in Section 4.1.6(2)-(6) and it shall be demonstrated at validation that the model is appropriate to the project circumstances (i.e., use of the model will lead to an appropriate quantification of GHG emission reductions or removals).
- 3.1.5** Where projects apply methodologies that permit the project proponent its own choice of third party default factor or standard to ascertain GHG emission data and any supporting data for establishing baseline scenarios and demonstrating additionality, such default factor or standard shall meet with the requirements set out in Section 4.1.7(1).
- 3.1.6** Projects shall preferentially apply methodologies that use performance methods (see Section 4.1.11 for further information on performance methods) where a methodology is applicable to the project that uses a performance method for determining both additionality and the crediting baseline (i.e., a project shall not apply a methodology that uses a project method where such a performance method is applicable to the project). Methodologies approved under the VCS Program that use performance methods provide a list of similar methodologies that use project methods (that were approved under the VCS Program or an approved GHG program at the time the performance method was developed). Such lists are not necessarily exhaustive but can serve as the starting point for determining whether a performance method is applicable to the project. Following the approval of a methodology that uses a performance method, projects may use any applicable pre-existing methodology that uses a project method for a six-month grace period.
- 3.1.7** Where projects apply methodologies from approved GHG programs, they shall comply with any specified capacity limits (see VCS document *Program Definitions* for definition of capacity limit) and any other relevant requirements set out with respect to the application of the methodology

and/or tools referenced by the methodology under those programs. Where the rules and requirements under an approved GHG program conflict with the rules and requirements of the VCS Program, the rules and requirements of the VCS Program shall take precedence.

- 3.1.8** Where the VCSA issues new requirements relating to projects, registered projects do not need to adhere to the new requirements for the remainder of their project crediting periods (i.e., such projects remain eligible to issue VCUs through to the end of their project crediting period without revalidation against the new requirements). The new requirements shall be adhered to at project crediting period renewal, as set out in Section 3.8.5.

3.2 MULTIPLE PROJECT ACTIVITIES

- 3.2.1** Projects may include multiple project activities where the methodology applied to the project allows more than one project activity and/or where projects apply more than one methodology.
- 3.2.2** Where more than one methodology has been applied to a project with multiple project activities, the following applies:
- 1) Each project activity shall be specified separately in the project description, referencing the relevant methodology.
 - 2) All criteria and procedures set out in the applied methodologies in relation to applicability conditions, demonstration of additionality, determination of baseline scenario and GHG emission reduction and removal quantification shall be applied separately to each project activity, noting the following:
 - a) A single set of criteria and procedures for the demonstration of additionality may be applied where the applied methodologies reference the same additionality tool and/or procedures, and where separate demonstration of additionality for each project activity is not practicable. For example, separate demonstration of additionality may not be practicable in project activities that are implemented at a single facility and therefore represent a single investment. The onus is upon the project proponent to demonstrate to the validation/verification body that separate demonstration of additionality is not practicable, failing which separate demonstration of additionality shall be provided. Where a methodology specifies requirements for demonstrating additionality in addition to those specified in the referenced additionality tool and/or procedures, such requirements shall be adhered to.
 - b) The criteria and procedures for identifying the baseline scenario may be combined where the relevant methodologies or the referenced additionality tool and/or procedures specify criteria and procedures for combining baseline scenarios.
 - 3) The criteria and procedures relating to all other aspects of the methodologies may be combined.
 - 4) Where AFOLU projects are required to undertake non-permanence risk assessment and buffer withholding determination, this shall be done separately for each project activity.

Note – Where a single methodology is applicable to more than one project activity and where the methodology does not provide clear procedures for the application of more than one project activity, the above requirements shall be adhered to.

3.3 MULTIPLE INSTANCES OF PROJECT ACTIVITIES

- 3.3.1 Projects may include more than one project activity instance, such as a wind power project that includes a number of wind turbines. Inclusion of further project activity instances subsequent to initial validation of a non-grouped project is not permitted (see Section 3.4 for information on grouped projects). The baseline determination and additionality demonstration for all project activity instances shall be combined (e.g., multiple wind turbines shall be assessed in combination rather than individually).
- 3.3.2 Where a project includes multiple project activity instances from multiple project activities, the project activity instances from each project activity shall be assessed in accordance with Section 3.2.
- 3.3.3 Non-grouped projects with multiple project activity instances shall not exceed any capacity limits to which a project activity is subject.

3.4 GROUPED PROJECTS

- 3.4.1 Grouped projects are projects structured to allow the expansion of a project activity subsequent to project validation. Validation is based upon the initial project activity instances identified in the project description. The project description sets out the geographic areas within which new project activity instances may be developed and the eligibility criteria for their inclusion. New instances meeting these pre-established criteria may then be added to the project subsequent to project validation, as set out in the sections below. These sections provide the requirements for all grouped projects, which are further expanded upon in VCS document *AFOLU Requirements*. VCS methodologies may also provide additional specifications for grouped projects.

Note – Project activity and project activity instance both have the specific meanings that are set out in VCS document *Program Definitions*.

Baseline Scenario and Additionality

- 3.4.2 Grouped projects shall have one or more clearly defined geographic areas within which project activity instances may be developed. Such geographic areas shall be defined using geodetic polygons as set out in Section 3.10 below.
- 3.4.3 Determination of baseline scenario and demonstration of additionality are based upon the initial project activity instances. The initial project activity instances are those that are included in the project description at validation and shall include all project activity instances currently implemented on the issue date of the project description. The initial project activity instances may also include any planned instances of the project activity that have been planned and developed

to a sufficient level of detail to enable their assessment at validation. Geographic areas with no initial project activity instances shall not be included in the project unless it can be demonstrated that such areas are subject to the same (or at least as conservative) baseline scenario and rationale for the demonstration of additionality as a geographic area that does include initial project activity instances.

- 3.4.4** As with non-grouped projects, grouped projects may incorporate multiple project activities (see Section 3.2 for more information on multiple project activities). Where a grouped project includes multiple project activities, the project description shall designate which project activities may occur in each geographic area.
- 3.4.5** The baseline scenario for a project activity shall be determined for each designated geographic area, in accordance with the methodology applied to the project. Where a single baseline scenario cannot be determined for a project activity over the entirety of a geographic area, the geographic area shall be redefined or divided such that a single baseline scenario can be determined for the revised geographic area or areas.
- 3.4.6** The additionality of the initial project activity instances shall be demonstrated for each designated geographic area, in accordance with the methodology applied to the project. Where the additionality of the initial project activity instances within a particular geographic area cannot be demonstrated for the entirety of that geographic area, the geographic area shall be redefined or divided such that the additionality of the instances occurring in the revised geographic area or areas can be demonstrated.
- 3.4.7** Where factors relevant to the determination of the baseline scenario or demonstration of additionality require assessment across a given area, the area shall be, at a minimum, the grouped project geographic area. Examples of such factors include, inter alia, common practice; laws, statutes, regulatory frameworks or policies relevant to demonstration of regulatory surplus; determination of regional grid emission factors; and historical deforestation and degradation rates.

Capacity Limits

- 3.4.8** Where a capacity limit applies to a project activity included in the project, no project activity instance shall exceed such limit. Further, no single cluster of project activity instances shall exceed the capacity limit, determined as follows:
- 1) Each project activity instance that exceeds one percent of the capacity limit shall be identified.
 - 2) Such instances shall be divided into clusters, whereby each cluster is comprised of any system of instances such that each instance is within one kilometer of at least one other instance in the cluster. Instances that are not within one kilometer of any other instance shall not be assigned to clusters.
 - 3) None of the clusters shall exceed the capacity limit and no further project activity instances

shall be added to the project that would cause any of the clusters to exceed the capacity limit.

Eligibility Criteria

3.4.9 Grouped projects shall include one or more sets of eligibility criteria for the inclusion of new project activity instances. At least one set of eligibility criteria for the inclusion of new project activity instances shall be provided for each combination of project activity and geographic area specified in the project description. A set of eligibility criteria shall ensure that new project activity instances:

- 1) Meet the applicability conditions set out in the methodology applied to the project.
- 2) Use the technologies or measures specified in the project description.
- 3) Apply the technologies or measures in the same manner as specified in the project description.
- 4) Are subject to the baseline scenario determined in the project description for the specified project activity and geographic area.
- 5) Have characteristics with respect to additionality that are consistent with the initial instances for the specified project activity and geographic area. For example, the new project activity instances have financial, technical and/or other parameters (such as the size/scale of the instances) consistent with the initial instances, or face the same investment, technological and/or other barriers as the initial instances.

Note – Where grouped projects include multiple baseline scenarios or demonstrations of additionality, such projects will require at least one set of eligibility criteria for each combination of baseline scenario and demonstration of additionality specified in the project description.

Inclusion of New Project Activity Instances

3.4.10 Grouped projects provide for the inclusion of new project activity instances subsequent to the initial validation of the project. New project activity instances shall:

- 1) Occur within one of the designated geographic areas specified in the project description.
- 2) Comply with at least one complete set of eligibility criteria for the inclusion of new project activity instances. Partial compliance with multiple sets of eligibility criteria is insufficient.
- 3) Be included in the monitoring report with sufficient technical, financial, geographic and other relevant information to demonstrate compliance with the applicable set of eligibility criteria and enable sampling by the validation/verification body.
- 4) Be validated at the time of verification against the applicable set of eligibility criteria.
- 5) Have evidence of project ownership, in respect of each project activity instance, held by the project proponent from the respective start date of each project activity instance (i.e., the date upon which the project activity instance began reducing or removing GHG emissions).
- 6) Have a start date that is the same as or later than the grouped project start date.

- 7) Be eligible for crediting from the start date of the instance through to the end of the project crediting period (only). Note that where a new project activity instance starts in a previous verification period, no credit may be claimed for GHG emission reductions or removals generated during a previous verification period (as set out in Section 3.16.7) and new instances are eligible for crediting from the start of the next verification period.

Where inclusion of a new project activity instance necessitates the addition of a new project proponent to the project, such instances shall be included in the grouped project within two years of the project activity instance start date or, where the project activity is an AFOLU activity, within five years of the project activity instance start date. The procedure for adding new project proponents is set out in VCS document *Registration and Issuance Process*.

Project Description for Grouped Projects

3.4.11 A grouped project shall be described in a single project description, which shall contain the following (in addition to the content required for non-grouped projects):

- 1) A delineation of the geographic area(s) within which all project activity instances shall occur. Such area(s) shall be defined by geodetic polygons as set out in Section 3.10 below.
- 2) One or more determinations of the baseline for the project activity in accordance with the requirements of the methodology applied to the project.
- 3) One or more demonstrations of additionality for the project activity in accordance with the requirements of the methodology applied to the project.
- 4) One or more sets of eligibility criteria for the inclusion of new project activity instances at subsequent verification events.
- 5) A description of the central GHG information system and controls associated with the project and its monitoring.

Note – Where the project includes more than one project activity, the above requirements shall be addressed separately for each project activity, except for the delineation of geographic areas and the description of the central GHG information system and controls, which shall be addressed for the project as a whole.

3.5 METHODOLOGY DEVIATIONS

3.5.1 Deviations from the applied methodology are permitted where they represent a deviation from the criteria and procedures relating to monitoring or measurement set out in the methodology (i.e., deviations are permitted where they relate to data and parameters available at validation, data and parameters monitored, or the monitoring plan). Methodology deviations shall not negatively impact the conservativeness of the quantification of GHG emission reductions or removals, except where they result in increased accuracy of such quantification. Deviations relating to any other part of the methodology shall not be permitted.

- 3.5.2** Methodology deviations shall be permitted at validation or verification and their consequences shall be reported in the validation or verification report, as applicable, and all subsequent verification reports. Methodology deviations are not considered to be precedent setting.

3.6 PROJECT DESCRIPTION DEVIATIONS

- 3.6.1** Deviations from the project description are permitted at verification. The procedures for documenting the deviation depend on whether the deviation impacts the applicability of the methodology, additionality or the appropriateness of the baseline scenario. Interpretation of whether the deviation impacts any of these shall be determined consistent with the CDM *Guidelines on assessment of different types of changes from the project activity as described in the registered PDD*, mutatis mutandis. The procedures are as follows:

- 1) Where the deviation impacts the applicability of the methodology, additionality or the appropriateness of the baseline scenario, the deviation shall be described and justified in a revised version of the project description. This shall include a description of when the changes occurred, the reasons for the changes and how the changes impact the applicability of the methodology, additionality and/or the appropriateness of the baseline scenario. An example of such a deviation is a change in project capacity where a different baseline scenario would be more plausible, the applied methodology would no longer be applicable, or there would be a significant impact on the investment analysis used by the project to demonstrate additionality. Other examples include changes to the project that might have similar impacts such as the addition of new carbon pools or new types of project activities.
- 2) Where the deviation does not impact the applicability of the methodology, additionality or the appropriateness of the baseline scenario, and the project remains in compliance with the applied methodology, the deviation shall be described and justified in the monitoring report. This shall include a description of when the changes occurred and the reasons for the changes. The deviation shall also be described in all subsequent monitoring reports. Examples of such deviations include changes in the procedures for measurement and monitoring, or project design changes that do not have an impact on the applicability of the methodology, additionality or the appropriateness of the baseline scenario.

Note that project proponents may apply project description deviations for the purpose of switching to the latest version of the methodology, or switching to a different methodology. For example, a project proponent may want to switch to the latest version of a methodology where such version includes additional types of carbon pools or project activities.

- 3.6.2** The deviation shall be assessed by a validation/verification body and the process, findings and conclusions shall be reported in the verification report. The assessment shall determine whether the deviation is appropriately described and justified, and whether the project remains in compliance with the VCS rules. The deviation shall also be reported on in all subsequent verification reports. Project description deviations are not considered to be precedent setting.

- 3.6.3** The validation/verification body assessing the project description deviation shall be accredited for the validation, recognizing that assessment of project description deviations is a validation activity, as further set out in the *VCS Program Guide*.

3.7 PROJECT START DATE

- 3.7.1** The project start date is the date on which the project began generating GHG emission reductions or removals (see VCS document *AFOLU Requirements* for further specification for AFOLU projects). The rules and requirements on project start date, as well as validation and verification dates, are set out in the sections below. For projects registered under an approved GHG program which are seeking registration with the VCS Program, further specification with respect to the validation deadline is set out in Sections 3.11.10 and 3.11.11.

Note – The rules and requirements in relation to project start date (as well as validation and verification dates) under VCS Version 1 are different from *VCS 2007, 2007.1* and *VCS Version 3*, and are provided in VCS document *Registration and Issuance Process*.

Non-AFOLU

- 3.7.2** Non-AFOLU projects shall complete validation within two years of the project start date. Additional time is granted for non-AFOLU projects to complete validation where they are applying a new VCS methodology. Specifically, projects using a new VCS methodology and completing validation within two years of the approval of the methodology by the VCSA may complete validation within four years of the project start date. Note that *new VCS methodology* in this context refers to both newly issued VCS methodologies and newly issued VCS revisions to approved GHG program methodologies. The grace period does not apply in relation to any subsequent versions of such new methodologies and new methodology revisions that may be issued.

AFOLU

- 3.7.3** AFOLU projects with a project start date on or after 8 March 2008 shall complete validation within five years of the project start date.
- 3.7.4** AFOLU projects with a project start date on or after 1 January 2002 and before 8 March 2008 shall complete validation before 8 March 2013.
- 3.7.5** For AFOLU projects with a project start date before 1 January 2002, the following applies:
- 1) Validation and verification shall be completed by 1 October 2011. However, additional time is granted for AFOLU projects with a project start date before 1 January 2002 to complete validation and verification where they are applying a new VCS methodology. Specifically, projects using a new VCS methodology shall complete validation and verification within one year of the approval of the methodology, and no later than 1 October 2012. *New VCS methodology* in this context has the same meaning as set out in Section 3.7.2.

- 2) It shall be demonstrated that the project was designed and implemented as a GHG project from its inception. Evidence may include minutes and/or notes related to Board decisions to undertake the project as a GHG project, or other evidence of real actions to undertake the project as a GHG project such as relevant contracts with consultants, documentation related to the sale of GHG credits or contracts with validation/verification bodies.
- 3) It shall be demonstrated that the project, prior to 1 January 2002, applied an externally reviewed methodology and engaged independent carbon expert(s) to assess and quantify the project's baseline scenario and net GHG emissions reductions or removals.

Standardized Methods

- 3.7.6** Notwithstanding the requirements set out in Sections 3.7.1 – 3.7.5 above, projects applying a standardized method for determining additionality shall initiate the project pipeline listing process set out in VCS document *Registration and Issuance Process* within the project validation timelines set out above. Validation may be completed any time thereafter. For example, a non-AFOLU project applying a standardized method for determining additionality shall initiate the project pipeline listing process within two years of the project start date, and may complete validation any time thereafter.

3.8 PROJECT CREDITING PERIOD

- 3.8.1** For non-AFOLU projects and ALM projects focusing exclusively on reducing N₂O, CH₄ and/or fossil-derived CO₂ emissions, the project crediting period shall be a maximum of ten years which may be renewed at most twice. For all other AFOLU projects other than such ALM projects, the project crediting period shall be a minimum of 20 years up to a maximum of 100 years, which may be renewed at most four times with a total project crediting period not to exceed 100 years. Where projects fail to renew the project crediting period, the project crediting period shall end and the project shall be ineligible for further crediting.
- 3.8.2** The earliest project crediting period start date for AFOLU projects shall be 1 January 2002.
- 3.8.3** Projects registered under other GHG programs are not eligible for VCU issuance beyond the end of the total project crediting period under those programs. For example, a CDM project with a seven year twice renewable project crediting period is not eligible for VCU issuance beyond the end of those 21 years. Where projects have been registered under more than one other GHG program, they are not eligible for VCU issuance after the date that is the earliest end date of all applicable project crediting periods.

Note – Since the total project crediting period under the Joint Implementation (JI) program is not defined *ex-ante*, the total project crediting period shall be deemed as 21 years for non-AFOLU JI projects and as 60 years for AFOLU JI projects¹.

¹ Consistent with the UNFCCC's other project-based mechanism, CDM.

3.8.4 Project crediting periods under the VCS Program shall be renewed as set out in Section 3.8.5.

Renewal of Project Crediting Period

3.8.5 The following shall apply with respect to the renewal of the project crediting period under the VCS Program:

- 1) A full reassessment of additionality is not required when renewing the project crediting period. However, regulatory surplus shall be demonstrated in accordance with Section 4.6.3 and the project description shall be updated accordingly.
- 2) The validity of the original baseline scenario shall be demonstrated, or where invalid a new baseline scenario shall be determined, when renewing the project crediting period, as follows:
 - a) The validity of the original baseline scenario shall be assessed. Such assessment shall include an evaluation of the impact of new relevant national and/or sectoral policies and circumstances on the validity of the baseline scenario.
 - b) Where it is determined that the original baseline scenario is still valid, the GHG emissions associated with the original baseline scenario shall be reassessed using the latest version of the *CDM Tool to assess the validity of the original/ current baseline and to update the baseline at the renewal of a crediting period*.
 - c) Where it is determined that the original baseline scenario is no longer valid, the current baseline scenario shall be established in accordance with the VCS rules.
 - d) The project description, containing updated information with respect to the baseline, the estimated GHG emission reductions or removals and the monitoring plan, shall be submitted for validation. Such updates shall be based upon the latest approved version of the methodology or its replacement. Where the project does not meet the requirements of the latest approved version of the methodology or its replacement, the project proponent shall select another applicable approved methodology (which may be a new methodology or methodology revision it has had approved via the methodology approval process), or shall apply a methodology deviation (where a methodology deviation is appropriate). Failing this, the project shall not be eligible for renewal of its project crediting period.
- 3) The updated project description shall be validated in accordance with the VCS rules. In addition, the project shall be validated against the (current) scope of the VCS. Such validation report shall be issued after the end of the (previous) project crediting period but within two years after the end of the (previous) project crediting period.

Additional time is granted for projects to complete such validation where they are switching to a new VCS methodology (*new VCS methodology* in this context has the same meaning as set out in Section 3.7.2) when renewing the project crediting period. Specifically, projects switching to a new VCS methodology and completing such validation within one year of the approval of the methodology by the VCSA may complete such validation within three years of the end of the (previous) project crediting period.

Note – The project crediting period under *VCS Version 1* shall be deemed as 10 years, and

commences at the specific project crediting period start date. Note also, *VCS Version 1* allowed an earlier project start date than subsequent versions and such projects remain eligible for project crediting period renewal under *VCS Version 3*.

3.9 PROJECT SCALE

3.9.1 Projects are categorized by size according to their estimated average annual GHG emission reductions or removals, as set out below, and materiality requirements for validation and verification differ accordingly, as set out in Section 5.3.1:

- 1) Projects: Less than or equal to 300,000 tonnes of CO₂e per year.
- 2) Large projects: Greater than 300,000 tonnes of CO₂e per year.

3.9.2 Where applying a methodology with scale and/or capacity limits, it shall be demonstrated that the project is not a fragmented part of a larger project or activity that would otherwise exceed such limits. The project shall be considered a fragmented part of a larger project if within one kilometer of the project boundary there exists another project where:

- 1) The project proponents for both projects are the same.
- 2) The sectoral scope and project activity for both projects are the same.
- 3) The other project has been registered under the VCS or another GHG program within the previous two years.

3.10 PROJECT LOCATION

3.10.1 Project location shall be specified in the project description as follows:

- 1) Project location for non-AFOLU projects shall be specified by a single geodetic coordinate. Where there are multiple project activity instances (see Section 3.3 for more information on multiple project activities), the following applies:
 - a) Where it is reasonable to do so, a geodetic coordinate shall be provided for each instance and provided in a KML file; or
 - b) Where there are a large number project activity instances (e.g., cookstoves or energy efficient light bulbs), at least one geodetic coordinate shall be provided, together with sufficient additional geographic information (with respect to the location of the instances) to enable sampling by the validation/verification body.
- 2) Project location for grouped projects shall be specified using geodetic polygons to delineate the project's geographic area or areas (see Section 3.4.2 for further information on geographic areas for grouped projects) and provided in a KML file.
- 3) Project location for AFOLU projects shall be specified using geodetic polygons to delineate the geographic area of each AFOLU project activity and provided in a KML file.

3.11 OWNERSHIP AND OTHER PROGRAMS

Project and Program Ownership

3.11.1 The project description shall be accompanied by one or more of the following types of evidence establishing project ownership accorded to the project proponent(s), or program ownership accorded to the jurisdictional proponent(s), as the case may be (see VCS document *Program Definitions* for definitions of project ownership and program ownership). To aid the readability of this section, the term project ownership is used below, but should be substituted by the term program ownership, as appropriate:

- 1) Project ownership arising or granted under statute, regulation or decree by a competent authority.
- 2) Project ownership arising under law.
- 3) Project ownership arising by virtue of a statutory, property or contractual right in the plant, equipment or process that generates GHG emission reductions and/or removals (where the project proponent has not been divested of such project ownership).
- 4) Project ownership arising by virtue of a statutory, property or contractual right in the land, vegetation or conservational or management process that generates GHG emission reductions and/or removals (where the project proponent has not been divested of such project ownership).
- 5) An enforceable and irrevocable agreement with the holder of the statutory, property or contractual right in the plant, equipment or process that generates GHG emission reductions and/or removals which vests project ownership in the project proponent.
- 6) An enforceable and irrevocable agreement with the holder of the statutory, property or contractual right in the land, vegetation or conservational or management process that generates GHG emission reductions or removals which vests project ownership in the project proponent.
- 7) Project ownership arising from the implementation² or enforcement of laws, statutes or regulatory frameworks that require activities be undertaken or incentivize activities that generate GHG emission reductions or removals.

Emission Trading Programs and Other Binding Limits

3.11.2 Where projects reduce GHG emissions from activities that are included in an emissions trading program or any other mechanism that includes GHG allowance trading, evidence shall be provided that the GHG emission reductions or removals generated by the project have not and

² Implemented in the context of this paragraph means enacted or introduced, consistent with use of the term under the CDM rules on so-called Type E+ and Type E- policies.

will not be otherwise counted or used under the program or mechanism. Such evidence may include:

- 1) A letter from the program operator, designated national authority or other relevant regulatory authority that emissions allowances (or other GHG credits used in the program) equivalent to the reductions or removals generated by the project have been cancelled from the program or national cap, as applicable.
- 2) Evidence of the purchase and cancellation of GHG allowances equivalent to the GHG emissions reductions or removals generated by the project related to the program or national cap.
- 3) Evidence from the program operator, designated national authority or other relevant regulatory authority stating that the specific GHG emission reductions or removals generated by the project or type of project are not within the scope of the program or national cap.

Other Forms of Environmental Credit

3.11.3 Projects may generate other forms of GHG-related environmental credits, such as renewable energy certificates (RECs), though GHG emission reductions and removals presented for VCU issuance shall not also be recognized as another form of GHG-related environmental credit. The requirements set out in Sections 3.11.4 and 3.11.5 below assist the VCS registry administrator in confirming that this requirement has been met at the point of the issuance request (i.e., the registry administrator uses the information disclosed in the project documents to perform its checks).

Therefore, project proponents interested in issuing (sequentially) both VCUs and another GHG-related environmental credit should consider which periods of time they wish to issue one credit or the other. Project proponents should also investigate whether such other GHG-related environmental credits can be cancelled from the relevant program, in case such credits have already been issued for periods where the project proponent wishes to issue VCUs. Note that additional requirements regarding evidence that no double issuance has occurred are set out in VCS document *Registration and Issuance Process*.

3.11.4 Where projects have sought or received another form of GHG-related environmental credit, the following information shall be provided to the validation/verification body:

- 1) Name and contact information of the relevant environmental credit program.
- 2) Details of the project as registered under the environmental credit program (e.g., project title and identification number as listed under the program).
- 3) Monitoring periods for which GHG-related environmental credits were sought or received under the environmental credit program.
- 4) Details of all GHG-related environmental credits sought or received under the environmental credit program (e.g., volumes and serial numbers).

3.11.5 Where projects are eligible to participate under one or more programs to create another form of GHG-related environmental credit, but are not currently doing so, a list of such programs shall be provided to the validation/verification body.

Note - The requirements set out in Section 3.11.4 above and this Section 3.11.5 do not apply to non-GHG related environmental credits, such as water or biodiversity credits.

Participation Under Other GHG Programs

3.11.6 Projects may be registered under both the VCS Program and either an approved GHG program or a GHG program that is not an approved GHG program. The rules and requirements set out in the sections below apply.

General Requirements

3.11.7 Project proponents shall not claim credit for the same GHG emission reduction or removal under the VCS Program and another GHG program. Projects issuing GHG credits under both the VCS Program and another GHG program shall also comply with the rules and requirements set out in VCS document *Registration and Issuance Process*.

3.11.8 Projects registered under other GHG programs are not eligible for VCU issuance beyond the end of the total project crediting period under those programs (see Section 3.8.3 for further information).

3.11.9 For projects registered under the CDM as a Program of Activities (PoA), each Component Project Activity (CPA) shall be registered with the VCS Program as a separate project accompanied by its associated Program of Activities Design Document. Each such project shall be validated in accordance with Section 3.11.10(1) below. The project start date for such projects is the date on which the first activity under the Program of Activities began reducing or removing GHG emissions. Where the project start date is before 8 March 2011, validation shall be completed within four years of the project start date; otherwise, validation shall be completed within two years of the project start date (in this case, validation refers to validation of the first CPA under the associated PoA).

Approved GHG Programs

3.11.10 The following applies with respect to projects registered under an approved GHG program which are seeking registration with the VCS Program:

- 1) For projects registered under the CDM, the cover page and sections 1.1, 1.2, 1.3, 1.5, 1.6, 1.7, 1.9, 1.10, 1.12.1, 1.12.2, 1.12.3, 1.12.4, 1.13 and 2.6 of the *VCS Project Description Template* shall be completed. A validation/verification body shall undertake a validation of same, which shall be accompanied by a validation representation, to provide a gap validation for the project's compliance with the VCS rules.
- 2) For projects registered under the JI program, a new *VCS Project Description Template* shall

- be completed (applying a methodology eligible under the VCS Program). A validation/verification body shall undertake a full validation of same in accordance with the VCS rules. The validation report shall be accompanied by a validation representation.
- 3) For projects registered under the Climate Action Reserve, the cover page and sections 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.7, 1.9, 1.10, 1.12.1, 1.12.2, 1.12.3, 1.12.4, 1.13, 2.6, 5.1, 5.2, 5.3 and 5.4 of the *VCS Project Description Template* shall be completed. A validation/verification body shall undertake a validation of same, which shall be accompanied by a validation representation, to provide a gap validation for the project's compliance with VCS rules.
 - 4) The approved GHG program validation (or verification, where the approved GHG program does not have a validation step) or VCS validation shall be completed within the relevant validation deadline as set out in Section 3.7. Validation (or verification) is deemed to have been completed when the validation (or verification) report that is submitted to the relevant program to request registration has been issued.
 - 5) AFOLU projects shall comply with the additional requirements set out in VCS document *AFOLU Requirements*.

Other GHG Programs

3.11.11 Non-AFOLU projects registered under a GHG program that is not an approved GHG program may also register with the VCS Program where a validation or verification report has been issued under such program (by an entity approved under the program to issue such reports). For such projects, the following applies:

- 1) The project start date shall be on or after 19 November 2007.
- 2) A new *VCS Project Description Template* shall be completed (using a methodology eligible under the VCS Program) and a validation/verification body shall undertake a full validation of same in accordance with the VCS rules. The validation report shall be accompanied by a validation representation.

The validation or verification that is submitted to request registration under the other GHG program shall be completed within the relevant validation deadline set out in Section 3.7. Validation or verification is deemed to have been completed when the validation or verification report that is submitted to the other GHG program to request registration has been issued.

Projects Rejected by Other GHG Programs

3.11.12 Projects rejected by other GHG programs due to procedural or eligibility requirements can be considered under the VCS Program, but the following conditions shall be met:

- 1) The project description (where the other GHG program has rejected the project before VCS validation) or monitoring report (where the other GHG program has rejected the project after VCS validation) shall clearly state all GHG programs to which the project has applied for registration and the reason(s) for rejection. Such information shall not be deemed as

commercially sensitive information.

- 2) The validation/verification body shall be provided with the rejection document(s), including any additional explanations.
- 3) The project shall be validated against the VCS rules. For projects where the other GHG program has rejected the project after VCS validation, this means a complete revalidation of the project against the VCS rules.

3.12 PROJECT BOUNDARY

- 3.12.1** The project boundary shall be described (using diagrams, as required) and GHG sources, sinks and reservoirs shall be identified and assessed in accordance with the methodology applied to the project. The project shall justify not selecting any relevant GHG source, sink and reservoirs.

3.13 BASELINE SCENARIO

- 3.13.1** The baseline scenario for the project shall be determined in accordance with the requirements set out in the methodology applied to the project, and the choice of baseline scenario shall be justified.
- 3.13.2** Equivalence in type and level of activity of products or services provided by the project and the baseline scenario shall be demonstrated and, where appropriate, any significant differences between the project and the baseline scenario shall be explained.
- 3.13.3** In developing the baseline scenario, assumptions, values and procedures shall be selected that help ensure that net GHG emission reductions and removals are not overestimated.

3.14 ADDITIONALITY

- 3.14.1** Additionality shall be demonstrated and assessed in accordance with the requirements set out in the methodology applied to the project, noting the following exceptions:
- 1) Where a VCS module using an activity method (see Section 4.1.11 for further information on activity methods) is applicable to the project, additionality may be demonstrated using the module in substitution of the additionality requirements set out in the methodology. For example, if a module uses an activity method (i.e., positive list) to deem a project activity additional, the project proponent does not have to follow the additionality requirements in the methodology applied to the project and may instead demonstrate additionality by demonstrating that it meets the applicability conditions and any other criteria of the activity method. Note that only modules may be used in this way. Where a methodology contains an activity method for additionality, the additionality procedures may not be applied in conjunction with a different methodology.
 - 2) Where the applied methodology was developed under an approved GHG program and uses an activity method or other simplified procedure for demonstrating additionality, the project proponent shall demonstrate to the validation/verification body that the simplified procedure is

appropriate to apply to the project considering the project characteristics, including the context in which the project activity takes place. For example, where a project is developed in the United States and applies a CDM methodology which uses a simplified procedure for demonstrating additionality, the project proponent shall demonstrate to the validation/verification body that the simplified procedure is appropriate to apply given that the simplified procedure was originally developed for application in a developing country context. Failing this demonstration, the project proponent shall not use the simplified procedure for demonstrating additionality, and shall instead use an appropriate additionality assessment method in substitution.

3.15 QUANTIFICATION OF GHG EMISSION REDUCTIONS AND REMOVALS

- 3.15.1** GHG emissions and/or removals shall be estimated for each GHG source, sink and/or reservoir relevant for the project (including leakage) and the baseline scenario.
- 3.15.2** The net GHG emission reductions and removals generated by the project shall be quantified.
- 3.15.3** Metric tonnes shall be used as the unit of measure and the quantity of each type of GHG shall be converted to tonnes of CO₂e. The six Kyoto Protocol greenhouse gases and ozone-depleting substances shall be converted using 100 year global warming potentials derived from the IPCC's *Fourth Assessment Report*.

3.16 MONITORING

Data and Parameters

- 3.16.1** Data and parameters used for the quantification of GHG emission reductions and/or removals shall be provided in accordance with the methodology.
- 3.16.2** Quality management procedures to manage data and information shall be applied and established. Where applicable, procedures to account for uncertainty in data and parameters shall be applied in accordance with the requirements set out in the methodology.

Monitoring Plan

- 3.16.3** The project proponent shall establish a GHG information system for obtaining, recording, compiling and analyzing data and information important for quantifying and reporting GHG emissions and/or removals relevant for the project (including leakage) and baseline scenario.
- 3.16.4** A monitoring plan for the project that includes roles and responsibilities shall be established.
- 3.16.5** Where measurement and monitoring equipment is used, the project proponent shall ensure the equipment is calibrated according to the equipment's specifications and/or relevant national or international standards.

Monitoring Report

- 3.16.6** The monitoring report describes all the data and information related to the monitoring of GHG emission reductions or removals. The project proponent shall use the *VCS Monitoring Report Template*, *VCS Joint Project Description & Monitoring Report Template*, *VCS & CCB Monitoring Report Template* or *VCS+SOCIALCARBON Monitoring Report Template*, as appropriate, and adhere to all instructional text within the template.
- 3.16.7** The verification period of the monitoring report shall be a distinct time period that does not overlap with previous verification periods. Projects shall not be eligible for crediting of GHG emission reductions generated in previous verification periods. In addition, verification periods shall be contiguous with no time gaps between verification periods.
- 3.16.8** Where a monitoring report and associated verification report divide a verification period into vintages, separate VCU issuance records in accordance with vintage periods may be issued, as set out in VCS document *Registration and Issuance Process*.

3.17 SAFEGUARDS

No Net Harm

- 3.17.1** The project proponent shall identify potential negative environmental and socio-economic impacts, and shall take steps to mitigate them. Additional certification standards may be applied to demonstrate social and environmental benefits beyond GHG emission reductions or removals.

Note that VCUs may be labelled with additional standards and certifications on the VCS project database where both the VCS and another standard are applied. The VCS website provides the list of standards that are accepted as VCU labels and the procedure for attaining such VCU labels.

Local Stakeholder Consultation

- 3.17.2** The project proponent shall conduct a local stakeholder consultation prior to validation as a way to inform the design of the project and maximize participation from stakeholders. Such consultations allow stakeholders to evaluate impacts, raise concerns about potential negative impacts and provide input on the project design.
- 3.17.3** The project proponent shall establish mechanisms for ongoing communication with local stakeholders to allow stakeholders to raise concerns about potential negative impacts during project implementation.
- 3.17.4** The project proponent shall take due account of all and any input received during the local stakeholder consultation and through ongoing communications, which means it will need to either update the project design or justify why updates are not appropriate. The project proponent shall

demonstrate to the validation/verification body what action it has taken in respect of the local stakeholder consultation as part of validation, and in respect of ongoing communications as part of each subsequent verification.

Public Comment Period

- 3.17.5** All VCS projects are subject to a 30-day public comment period. The date on which the project is listed on the project pipeline marks the beginning of the project's 30-day public comment period (see VCS document *Registration and Issuance Process* for more information on the VCS project pipeline).
- 3.17.6** Projects shall remain on the project pipeline for the entirety of their 30-day public comment period.
- 3.17.7** Any comments shall be submitted to the VCSA at secretariat@v-c-s.org and respondents shall provide their name, organization, country and email address. At the end of the public comment period, the VCSA provides all and any comments received to the project proponent.
- 3.17.8** The project proponent shall take due account of any and all comments received during the consultation, which means it will need to either update the project design or demonstrate the insignificance or irrelevance of the comment. It shall demonstrate to the validation/verification body what action it has taken.

3.18 RECORDS AND INFORMATION

Records Relating to the Project

- 3.18.1** The project proponent shall ensure that all documents and records are kept in a secure and retrievable manner for at least two years after the end of the project crediting period.

Information for the Validation/Verification Body

- 3.18.2** For validation, the project proponent shall make available to the validation/verification body the project description, evidence of project ownership and any requested supporting information and data needed to support statements and data in the project description and evidence of project ownership.
- 3.18.3** For verification, the project proponent shall make available to the validation/verification body the project description, validation report, monitoring report applicable to the monitoring period and any requested supporting information and data needed to evidence statements and data in the monitoring report.

3.19 PROJECT DESCRIPTION

- 3.19.1** The project description describes the project's GHG emission reduction or removal activities. The project proponent shall use the *VCS Project Description Template*, *VCS Joint Project Description & Monitoring Report Template*, *VCS & CCB Project Description Template*, *VCS+SOCIALCARBON Project Description Template* or approved GHG program project description template where the project is registered under an approved GHG program, as appropriate, and adhere to all instructional text within the template.
- 3.19.2** All information in the project documents shall be presumed to be available for public review, though commercially sensitive information may be protected, as set out in VCS document *Registration and Issuance Process*, where it can be demonstrated that such information is commercially sensitive. The validation/verification body shall check that any information designated by the project proponent as commercially sensitive meets the VCS Program definition of commercially sensitive information. Information in the project documents related to the determination of the baseline scenario, demonstration of additionality, and estimation and monitoring of GHG emission reductions and removals shall not be considered to be commercially sensitive and shall be provided in the public versions of the project documents.

4 | Methodology Requirements

4.1 GENERAL REQUIREMENTS

General

- 4.1.1** The list of methodologies approved under the VCS Program, together with their respective validity periods, is available on the VCS website. All new methodologies applying for approval under the VCS Program shall use the *VCS Methodology Template*, comply with the requirements set out in this Section 4 and any other applicable requirements set out in the VCS rules, and be approved via the methodology approval process. AFOLU methodologies shall meet the rules and requirements set out in VCS document *AFOLU Requirements*. Ozone-depleting substances methodologies shall meet the rules and requirements set out in VCS document *ODS Requirements*.
- 4.1.2** Methodologies shall be informed by a comparative assessment of the project and its alternatives in order to identify the baseline scenario. Such an analysis shall include, at a minimum, a comparative assessment of the implementation barriers and net benefits faced by the project and its alternatives.
- 4.1.3** Methodologies may employ a modular approach in which a framework document provides the structure of the methodology and separate modules and/or tools are used to perform specific

methodological tasks. Such methodologies shall use the *VCS Methodology Template* for the framework document and the *VCS Module Template* for the modules and tools. The framework document shall clearly state how the modules and/or tools are to be used within the context of the methodology.

- 4.1.4** Methodology elements shall be guided by the principles set out in Section 2.4.1. They shall clearly state the assumptions, parameters and procedures that have significant uncertainty, and describe how such uncertainty shall be addressed. Where applicable, methodology elements shall provide a means to estimate a 90 or 95 percent confidence interval. Where a methodology applies a 90 percent confidence interval and the width of the confidence interval exceeds 20 percent of the estimated value or where a methodology applies a 95 percent confidence interval and the width of the confidence interval exceeds 30 percent of the estimated value, an appropriate confidence deduction shall be applied. Methods used for estimating uncertainty shall be based on recognized statistical approaches such as those described in the *IPCC Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories*. Confidence deductions shall be applied using conservative factors such as those specified in the CDM Meth Panel guidance on addressing uncertainty in its Thirty Second Meeting Report, Annex 14.
- 4.1.5** New methodologies shall not be developed where an existing methodology could reasonably be revised (i.e., developed as a methodology revision) to meet the objective of the proposed methodology, as set out in VCS document *Methodology Approval Process*.
- 4.1.6** Where methodologies mandate the use of specific models to simulate processes that generate GHG emissions (i.e., the project proponent is not permitted to use other models), the following applies, given the note below:
- 1) Models shall be publicly available, though not necessarily free of charge, from a reputable and recognized source (e.g., the model developer's website, IPCC or government agency).
 - 2) Model parameters shall be determined based upon studies by appropriately qualified experts that identify the parameters as important drivers of the model output variable(s).
 - 3) Models shall have been appropriately reviewed and tested (e.g., ground-truthed using empirical data or results compared against results of similar models) by a recognized, competent organization, or an appropriate peer review group.
 - 4) All plausible sources of model uncertainty, such as structural uncertainty or parameter uncertainty, shall be assessed using recognized statistical approaches such as those described in *2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 1, Chapter 3*.
 - 5) Models shall have comprehensive and appropriate requirements for estimating uncertainty in keeping with IPCC or other appropriate guidance, and the model shall be calibrated by parameters such as geographic location and local climate data.

- 6) Models shall apply conservative factors to discount for model uncertainty (in accordance with the requirements set out in Section 4.1.4), and shall use conservative assumptions and parameters that are likely to underestimate, rather than overestimate, the GHG emission reductions or removals.

Note – The criteria set out in (2)-(6) above are targeted at more complex models. For simple models, certain of these criteria may not be appropriate, or necessary to the integrity of the methodology. Such criteria may be disregarded, though the onus is upon the methodology developer to demonstrate that they are not appropriate or necessary.

- 4.1.7** Where methodologies use default factors and standards to ascertain GHG emission data and any supporting data for establishing baseline scenarios and demonstrating additionality, the following applies:

- 1) Where the methodology uses third party default factors and/or standards, such default factors and standards shall meet with the requirements for data set out in Section 4.5.6, *mutatis mutandis*.
- 2) Where the methodology itself establishes a default factor, the following applies:
 - a) The data used to establish the default factor shall comply with the requirements for data set out in Section 4.5.6, *mutatis mutandis*.
 - b) The methodology shall describe in detail the study or other method used to establish the default factor.
 - c) The methodology developer shall identify default factors which may become out of date (i.e., those default factors that do not represent physical constants or otherwise would not be expected to change significantly over time). Such default factors are subject to periodic re-assessment, as set out in VCS document *Methodology Approval Process*.
- 3) Where methodologies allow project proponents to establish a project-specific factor, the methodology shall provide a procedure for establishing such factors.

Note – Methodologies may use deemed savings factors which, as set out in the definition of deemed savings factor, are a specific type of default factor.

- 4.1.8** Where proxies are used, it shall be demonstrated that they are strongly correlated with the value of interest and that they can serve as an equivalent or better method (e.g., in terms of reliability, consistency or practicality) to determine the value of interest than direct measurement of the value itself.

- 4.1.9** Methodologies shall use a standardized method (i.e., performance method or activity method) or a project method to determine additionality and/or the crediting baseline, and shall state which type of method is used for each. A project method is a methodological approach that uses a project-specific approach for the determination of additionality and/or crediting baseline. Standardized methods are further described in Section 4.1.11 and additional guidance is available in VCS document *Guidance for Standardized Methods*. This guidance document

provides additional information to aid the interpretation of the VCS rules on standardized methods and should be read before developing or assessing such methods. Although the guidance document does not form part of the VCS rules, interpretation of the rules shall be consistent with the guidance document.

- 4.1.10** Methodologies may use any combination of project, performance or activity methods for determining additionality and the crediting baseline. However, methodologies shall provide only one method (i.e., a project method or performance method) for determining the crediting baseline (i.e., methodologies shall not provide the option of using either a project method or a performance method for the crediting baseline).

Standardized Methods

- 4.1.11** Standardized methods are methodological approaches that standardize the determination of additionality and/or the crediting baseline for a given class of project activity, with the objective of streamlining the development and assessment process for individual projects. Additionality and/or the crediting baseline are determined for the class of project activity, and qualifying conditions and criteria are set out in the methodology. Individual projects need only meet the conditions and apply the pre-defined criteria set out in the standardized method, obviating the need for each project to determine additionality and/or the crediting baseline via project-specific approaches and analyses.

The VCS defines two types of standardized methods:

- 1) Performance methods: These methods establish performance benchmark metrics for determining additionality and/or the crediting baseline. Projects that meet or exceed a pre-determined level of the metric may be deemed as additional and a pre-determined level of the metric may serve as the crediting baseline.
- 2) Activity methods: These methods pre-determine additionality for given classes of project activities using a positive list. Projects that implement activities on the positive list are automatically deemed as additional and do not otherwise need to demonstrate additionality. One of three options (namely, activity penetration, financial viability or revenue streams) is used to qualify the project activity for the positive list, as set out in Section 4.6.9.

Note – There is some overlap between performance and activity methods with respect to concepts, objectives and outcomes, and methodologies may use any combination of methods (performance, activity, and project) for determining additionality and the crediting baseline as set out in Section 4.1.10. However, both performance and activity methods are sufficiently distinct, and this document sets out the rules and requirements for each method separately.

- 4.1.12** Methodologies shall include sufficient information and evidence to allow the reader to reach the same assessment conclusion on the appropriateness and rigor of the standardized method reached by the two validation/verification bodies in the methodology approval process, noting that the confidentiality of proprietary data may be protected as set out in Section 4.5.6(5). To aid the

readability and clarity of methodologies, such information and evidence may be included in appendices to methodology documents rather than in the body of the documents themselves. Following their initial approval, methodologies are subject to periodic re-assessment, as set out in VCS document *Methodology Approval Process*.

Performance Methods

- 4.1.13** All new performance methods shall be prepared using the *VCS Methodology Template*. A performance method is an integral part of a methodology and therefore it cannot be developed and approved as a separate module that is then applied by projects in conjunction with other methodologies.
- 4.1.14** The methodology may use a performance method for determining additionality only, for determining additionality and the crediting baseline, or for determining the crediting baseline only. The level of the performance benchmark metric for determining additionality and for the crediting baseline may be the same, or each may be different. Where they are different, the level for determining additionality shall be more stringent than the level of the crediting baseline.
- 4.1.15** Where the methodology uses a performance method for determining both additionality and the crediting baseline, the methodology shall list all methodologies that use a project method for determining the crediting baseline that are applicable to similar project activities and are approved under the VCS Program or an approved GHG program. The purpose of this requirement is to facilitate the transition to standardized methods, as further set out in Section 3.1.6.
- 4.1.16** The performance benchmark metric shall be specified in terms of tonnes of CO₂e per unit of output (i.e., GHG emissions per unit of product or service), tonnes of CO₂e per unit of input (e.g., GHG emissions per unit of input per unit of land area) or as a sequestration metric (e.g., carbon stock per unit of land area), as appropriate to the project activity applicable under the methodology. This may represent tonnes of CO₂e reduced or tonnes of CO₂e sequestered. An input metric shall only be used where an output metric is not practicable (e.g., the corresponding output metric is subject to influences outside the control of the project proponent) and leakage shall be addressed. The unit shall be unambiguously defined to allow a consistent comparison of project performance with the performance benchmark. The *GHG Protocol for Project Accounting*, Chapter 7 (WRI-WBCSD) provides some examples of products and services that may serve as candidates for performance benchmark metrics. Note that proxies for the performance benchmark metric may be used for determining additionality, as set out in Section 4.6.7.
- 4.1.17** It is recognized that an overly stringent level for the performance benchmark metric used for additionality may exclude additional projects (false negatives) while an overly lenient level may allow in non-additional projects (false positives). Similarly, an overly stringent level of the performance benchmark metric used for the crediting baseline may result in too little incentive for project proponents while an overly lenient level may allow the crediting of non-additional GHG emission reductions and removals. In order to address these considerations, the following shall apply with respect to setting the level(s) of the performance benchmark metric:

- 1) The methodology shall provide a description and analysis of the current distribution of performance within the sector as such performance relates to the applicability of the methodology or each performance benchmark (see Section 4.3.5 for further information on applicability of methodologies and performance benchmarks). The methodology shall also provide an overview of the technologies and/or measures available for improving performance within the sector, though an exhaustive list is not required recognizing that performance methods may be somewhat agnostic with respect to the technologies and/or measures implemented by projects.
- 2) The methodology shall discuss and evaluate the tradeoff between false negatives and false positives and shall describe objectively and transparently the evidence used (including reference to primary and secondary data sources), experts consulted, assumptions made, and analysis (including numerical analysis) and process undertaken in determining the selected level(s) of the performance benchmark metric (noting that expert consultation is a key part of this process, as set out below). The selected level(s) shall not systematically overestimate GHG emission reductions or removals.
- 3) The process of determining the level(s) of the performance benchmark metric shall include and be informed by an expert consultation process, undertaken by the methodology developer as follows:
 - a) The objective of the expert consultation shall be to engage and solicit input from technical experts on the appropriateness of the proposed level(s) of the performance benchmark metric to ensuring environmental integrity and provision of sufficient financial incentive to potential projects. Technical experts are persons who have specific knowledge or expertise relevant to the methodology and performance benchmark metric.
 - b) The methodology developer shall ensure that a representative group of experts participates in the consultation, including, but not limited to, representation from industry, environmental non-governmental organizations, and government or other regulatory bodies. Where a diverse range of views can be expected with regard to the appropriate level of the performance benchmark metric, experts representing the range of views shall participate in the consultation. Participation by experts shall be pro-actively sought and facilitated. Consultation that does not involve a representative group of experts shall be deemed insufficient.
 - c) Experts shall be provided, under appropriate confidentiality agreements (as necessary), with sufficient background and technical information about the methodology and its context to allow meaningful participation in the consultation. The consultation process shall use meetings, conference calls and other appropriate methods to allow all experts to provide comments and exchange views in an open, fair and transparent manner.
 - d) A report on the expert consultation process and outcome shall be prepared and submitted to the VCSA when the methodology is submitted under the methodology approval process. This may be included as an annex to the methodology, to be removed from any final approved version of the methodology. The report shall provide a summary of expert views, and shall demonstrate how the above requirements have been met and

how expert views were taken due account of (i.e., how expert views have affected the final level(s) of the performance benchmark metric in the draft methodology).

Note that expert consultation only needs to be undertaken by the methodology developer with respect to the level of the performance benchmark metric, since the methodology is also subject to public stakeholder consultation as part of the VCS methodology approval process.

4.1.18 Where there is heterogeneity of performance (measured in terms of the performance benchmark metric) that may be practicably achieved by individual projects, multiple benchmarks or correction factors may be required. Multiple benchmarks or correction factors shall be established under the following circumstances:

- 1) The project activity includes technologies and/or measures which may be implemented at both greenfield and brownfield sites and the performance (measured in terms of the performance benchmark metric) that may be practicably achieved at each is substantially different.
- 2) The methodology encompasses both larger and smaller scale project activities and the performance (measured in terms of the performance benchmark metric) that may be practicably achieved in each case is substantially different.
- 3) Any other circumstances related to the baseline scenario or project activity, such as plant age, raw material quality and climatic circumstances, that lead to heterogeneity of performance (measured in terms of the performance benchmark metric) that may be practicably achieved by individual projects.

Activity Methods

4.1.19 The activity method shall be prepared using the *VCS Module Template*, or, where a new methodology is being developed, may be written directly into the methodology (i.e., a positive list may be prepared and approved as a standalone additionality test that may be used in conjunction with applicable methodologies, or may be prepared as a direct part of a new methodology, in which case it may not be used in conjunction with other methodologies). To aid the readability of this document, it is assumed that the activity method is being written directly into the methodology, so readers should take references to *methodology* to mean *methodology or module*, as appropriate.

4.1.20 The activity method shall set out, using the specification of the project activity under the applicability conditions, a positive list of project activities that are deemed as additional under the activity method (see Section 4.3 for further information on providing specification of project activities). All such project activities are deemed as additional under the activity method.

4.2 METHODOLOGY REVISIONS

General

- 4.2.1** Methodology revisions are appropriate where a project activity is broadly similar to the project activities eligible under an existing methodology and such project activity can be included through reasonable changes to that methodology. Methodology revisions are also appropriate where an existing methodology can be materially improved. Materially improving a methodology involves comparing the existing and proposed methodologies so as to show that the changes will deliver material improvements that will result in greater accuracy of measurement of GHG emissions reductions or removals, improved conservatism and/or reduced transaction costs.
- 4.2.2** Methodology revisions shall be prepared using the *VCS Methodology Template* and shall be managed via the methodology approval process. They may be prepared and submitted to the methodology approval process by the developer of the original methodology or any other entity.
- 4.2.3** The VCS Program distinguishes between revisions to VCS methodologies and revisions to approved GHG program methodologies. The requirements for the development and assessment of each are set out in VCS document *Methodology Approval Process*.

Standardized Methods

- 4.2.4** Standardized methods approved under the VCS Program shall be periodically reviewed and may require revision, as set out in VCS document *Methodology Approval Process*.

Activity Methods

- 4.2.5** Where an activity method uses the activity penetration option and the level of activity penetration has risen (since initial approval) to exceed the five-percent threshold level, the activity method may not be revised to use the financial viability or revenue streams options.

4.3 APPLICABILITY CONDITIONS

General

- 4.3.1** The methodology shall use applicability conditions to specify the project activities to which it applies and shall establish criteria that describe the conditions under which the methodology can (and cannot, if appropriate) be applied. Any applicability conditions set out in tools or modules used by the methodology shall also apply.

Standardized Methods

- 4.3.2** Precise specification of the project activity is required to provide a carefully targeted standardized method with an appropriate level of aggregation with respect to the project activity. The

applicability conditions shall be specified accordingly and shall cause to be excluded from the methodology, to the extent practicable, those classes of project activities that it can be reasonably assumed will be implemented without the intervention created by the carbon market. For example, the methodology may exclude facilities larger than a specific size or capacity, constructed before a given date or that have regular access to lower cost fuels than most facilities. The methodology shall demonstrate how the applicability conditions achieve such objective with respect to free-riders.

Performance Methods

- 4.3.3** The applicability conditions shall limit the applicability of the methodology to project activities whose performance can be described in terms of the performance benchmark metric set out in the methodology.
- 4.3.4** Where the methodology uses a performance method for determining additionality, the applicability conditions shall ensure that the project implements technologies and/or measures that cause substantial performance improvement relative to the crediting baseline and what is achievable within the sector, and the methodology shall explicitly specify such technologies and/or measures (or examples thereof). Note that the implementation date of such technologies and/or measures is the project start date and the VCS rules with respect to project start date apply (i.e., implementation will need to have occurred within timeframes permitted under the VCS rules on project start date). Activities that have not implemented any such technologies and/or measures, or that have implemented them on a date that is earlier than that permitted under the VCS rules on project start date, shall be excluded from the methodology.
- 4.3.5** The applicability conditions shall establish the scope of validity of the methodology, and where multiple benchmarks are established, each performance benchmark, including the geographic scope. In establishing the scope of validity of the methodology or each performance benchmark, the methodology shall clearly demonstrate that there is similarity across the sub-areas of the geographic scope in factors such as socio-economic conditions, climatic conditions, energy prices, raw material availability and electricity grid emission factors, as such factors relate to the baseline scenario and additionality, noting that variation is permitted where correction factors address such variation as set out in Section 4.1.18.
- It may be necessary to stratify and establish multiple performance benchmarks, or to limit the applicability of the methodology, to comply with this requirement.
- 4.3.6** The applicability of the methodology or a performance benchmark shall be limited to the geographic area for which data are available, or it shall be demonstrated that data from one geographic area are representative of another or that it is conservative to apply data from one geographic area to another. Representativeness shall be determined in terms of the similarity of the geographic areas considering such factors as those set out in Section 4.3.5 above. Likewise, it shall be determined that it is conservative to apply data from one geographic area by considering the same factors. In determining whether two areas are sufficiently similar, or that it is

conservative, to allow data to apply from one area to another, only factors related to the baseline scenario and additionality need to be considered.

Activity Methods

- 4.3.7** The applicability conditions specify the project activity and they shall therefore serve as the specification of the positive list (i.e., all project activities that satisfy the applicability conditions are deemed as additional).
- 4.3.8** The methodology shall clearly specify the project activity in terms of a technology or measure and its context of application. A technology or measure encompasses the plant, equipment, process, management and conservation measure or other practice that directly or indirectly generates GHG emission reductions and/or removals. The context of application refers to the conditions or circumstances under which such technology or measure may be implemented.
- 4.3.9** The applicability conditions shall establish the scope of validity of the methodology, including the geographic scope. In establishing the scope of validity of the methodology, the methodology shall clearly demonstrate that there is similarity across the sub-areas of the geographic scope in factors such as socio-economic conditions, climatic conditions, energy prices, raw material availability and electricity grid emission factors, as such factors relate to the baseline scenario and additionality, It may be necessary to limit the applicability of the methodology to comply with this requirement.
- 4.3.10** Where the activity method is set out as a separate module (i.e., is not an integrated part of a methodology), the activity method may be applied to any methodology eligible under the VCS Program that permits the project activity specified in the module (see Section 3.14.1 for further details).

4.4 PROJECT BOUNDARY

General

- 4.4.1** The methodology shall establish criteria and procedures for describing the project boundary and identifying and assessing GHG sources, sinks and reservoirs relevant to the project and baseline scenarios. Justification for GHG sources, sinks and reservoirs included or excluded shall be provided.
- 4.4.2** In identifying GHG sources, sinks and reservoirs relevant to the project, the methodology shall set out criteria and procedures for identifying and assessing GHG sources, sinks and reservoirs that are controlled by the project proponent, related to the project or affected by the project (i.e., leakage).
- 4.4.3** In identifying GHG sources, sinks and reservoirs relevant to the baseline scenario, the methodology shall:

- 1) Set out criteria and procedures used for identifying the GHG sources, sinks and reservoirs relevant for the project.
- 2) Where necessary, explain and apply additional criteria for identifying relevant baseline GHG sources, sinks and reservoirs.
- 3) Compare the GHG sources, sinks and reservoirs identified for the project with those identified in the baseline scenario, to ensure equivalency and consistency.

Standardized Methods

4.4.4 (No specific requirements)

4.5 BASELINE SCENARIO

General

4.5.1 Methodologies using a project method shall establish criteria and procedures for identifying alternative baseline scenarios and determining the most plausible scenario, taking into account the following:

- 1) The identified GHG sources, sinks and reservoirs.
- 2) Existing and alternative project types, activities and technologies providing equivalent type and level of activity of products or services to the project.
- 3) Data availability, reliability and limitations.
- 4) Other relevant information concerning present or future conditions, such as legislative, technical, economic, socio-cultural, environmental, geographic, site-specific and temporal assumptions or projections.

4.5.2 Methodologies using a standardized method for determining the crediting baseline shall describe (taking into account the factors set out Section 4.5.1 above), as far as is possible, the technologies or measures that represent the most plausible baseline scenario or the aggregated baseline scenario (see Section 4.5.4 for further information on aggregate baseline scenarios), though it is recognized that it may not be possible to specify precisely all technologies or measures given that the baseline may represent a variety of different technologies and measures.

Standardized Methods

4.5.3 Standardized methods shall be developed with the objective of predicting, as accurately as is practicable, the most plausible baseline scenario or aggregated baseline scenario. Notwithstanding this principle, it is recognized that standardized methods cannot perfectly capture the precise baseline behavior for all proposed projects eligible under a standardized method.

Performance Methods

- 4.5.4** The methodology shall identify alternative baseline scenarios and determine either the most plausible baseline scenario or an aggregate baseline scenario for the project activity. Aggregate baseline scenarios shall be determined by combining likely scenarios on a probabilistic (i.e., likelihood) basis.
- 4.5.5** The performance benchmark shall be established based upon available technologies and/or current practices, and trends, within the sector. Where the analysis of trends shows a clear trend of improvement in the baseline scenario over time, the performance benchmark shall take account of the trend. This means that where the performance benchmark does not use a dataset that is updated at least annually, an autonomous improvement factor shall be used that provides a performance benchmark that tightens annually. Notwithstanding this requirement, methodologies may allow projects to use the level of the performance benchmark metric available at project validation for the duration of their project crediting periods (see also Section 4.5.7 below). Where the analysis of trends shows a trend of increasing GHG emissions or decreasing GHG removals in the baseline scenario over time, the performance benchmark shall not consider such trend.
- 4.5.6** Appropriate data sources for developing performance methods include economic and engineering analyses and models, peer-reviewed scientific literature, case studies, empirical data, and common practice data. The data and dataset derived from such data sources shall meet the requirements below. The *CDM Guidelines for quality assurance and quality control of data used in the establishment of standardized baselines* also provides useful related guidance.
- 1) Data collected directly from primary sources shall comply with relevant and appropriate standards, where available, for data collection and analysis, and be audited at an appropriate frequency by an appropriately qualified, independent organization.
 - 2) Data collected from secondary sources shall be available from a recognized, credible source and must be reviewed for publication by an appropriately qualified, independent organization or appropriate peer review group, or be published by a government agency.
 - 3) Data shall be from a time period that accurately reflects available technologies and/or current practice, and trends, within the sector. Selection of the appropriate temporal range shall be determined based on the guidance provided in the *GHG Protocol for Project Accounting*, Chapter 7 (WRI-WBCSD).
 - 4) Where sampling is applied in data collection, the requirements set out in Section 4.1.4 shall be adhered to. The methodology developer shall demonstrate that sampling results provide an unbiased and reliable estimate of the true mean value (i.e., the sampling does not systematically underestimate or overestimate the true mean value).
 - 5) Data shall be publicly available or made publicly available. Proprietary data (e.g., data pertaining to individual facilities) may be aggregated, and therefore not made publicly available, where there are demonstrable confidentiality considerations. However, sufficient data shall be publicly available to provide transparency and credibility to the dataset.

- 6) All data shall be made available, under appropriate confidentiality agreements as necessary, to the VCSA and each of the validation/verification bodies assessing the proposed performance benchmark methodology, to allow them to reproduce the determination of the performance benchmark. Data shall be presented in a manner that enables them to independently assess the presented data.
- 7) Data shall be appropriate to the methodology's geographic scope and the project activities applicable under it.
- 8) All reasonable efforts shall be undertaken to collect sufficient data and the use of expert judgment as a substitute for data shall only be permitted where it can be demonstrated that there is a paucity of data. Expert judgment may be applied in interpreting data. Where expert judgment is used, good practice methods for eliciting expert judgment shall be used (e.g., *IPCC 2006 Guidelines for National GHG Inventories*).
- 9) Where data must be maintained in a central repository on an on-going basis (e.g., in a database that holds sector data for use by project proponents in establishing specific performance benchmarks for their projects), there shall be clear and robust custody arrangements for the data and defined roles and responsibilities with respect to the central repository.

Where such data requirements set out above cannot be met, a performance method shall not be applied except as set out in Section 4.3.5.

4.5.7 The dataset may be documented and contained within the methodology, or may be maintained in a separate repository that is referenced by the methodology. Datasets documented and contained within methodologies are static datasets, where all projects use the level of the performance benchmark metric specified in the methodology (noting that autonomous improvement factors may be used, as set out in Section 4.5.5 above). The following applies with respect to datasets maintained in a separate repository:

- 1) The dataset may be static or dynamic (i.e., may or may not be periodically updated).
- 2) The methodology shall establish criteria and procedures for use of the dataset and for establishing specific performance benchmarks for individual projects.
- 3) The methodology may specify that projects use the level of the performance benchmark metric available at project validation for the duration of their project crediting periods, or may specify that projects use an updated level of the performance benchmark metric at each verification event. The frequency that data is updated within the dataset shall be determined by the methodology developer.
- 4) It shall be demonstrated that procedures are in place to maintain the dataset in accordance with the applicable requirements set out for data and datasets in Section 4.5.6 above.

Activity Methods

- 4.5.8** There are no specific requirements for activity methods, noting that methodologies using an activity method may use a project or performance method for determining the crediting baseline, as set out in Section 4.1.10.

4.6 ADDITIONALITY

General

- 4.6.1** The methodology shall establish a procedure for the demonstration and assessment of additionality based upon the requirements set out below. Note that such requirements are for methodology development, and projects shall demonstrate and assess additionality in accordance with the requirements set out in the applied methodology.
- 4.6.2** Methodologies shall use a project method, performance method and/or activity method to determine additionality. The high level specifications and procedural steps for each approach are set out in Sections 4.6.3 to 4.6.9 below. New methodologies developed under the VCS shall meet this requirement by doing one of the following:
- 1) Referencing and requiring the use of an appropriate additionality tool that has been approved under the VCS or an approved GHG program;
 - 2) Developing a full and detailed procedure for demonstrating and assessing additionality directly within the methodology; or
 - 3) Developing a full and detailed procedure for demonstrating and assessing additionality in a separate tool, which shall be approved via the methodology approval process, and referencing and requiring the use of such new tool in the methodology.

Note - Reference in a methodology to the VCS requirements on additionality is insufficient. The VCS requirements are high level requirements and do not represent a full and detailed procedure for the demonstration of additionality. The only exception to this is with respect to regulatory surplus (i.e., methodologies may directly reference the VCS requirements on regulatory surplus and do not need to further develop a procedure for demonstrating and assessing regulatory surplus).

Project Method

4.6.3 Step 1: Regulatory Surplus

The project shall not be mandated by any law, statute or other regulatory framework, or for UNFCCC non-Annex I countries, any systematically enforced law, statute or other regulatory framework. For UNFCCC non-Annex I countries, laws, statutes, regulatory frameworks or policies

implemented³ since 11 November 2001 that give comparative advantage to less emissions-intensive technologies or activities relative to more emissions-intensive technologies or activities need not be taken into account. For all countries, laws, statutes, regulatory frameworks or policies implemented since 11 December 1997 that give comparative advantage to more emissions-intensive technologies or activities relative to less emissions-intensive technologies or activities shall not be taken into account.

4.6.4 Step 2: Implementation Barriers

The project shall face one or more distinct barrier(s) compared with barriers faced by alternatives to the project:

- 1) Investment barrier: Project faces capital or investment return constraints that can be overcome by the additional revenues associated with the sale of GHG credits.
- 2) Technological barriers: Project faces technology-related barriers to its implementation.
- 3) Institutional barriers: Project faces financial (other than identified in investment barrier above), organizational, cultural or social barriers that the VCU revenue stream can help overcome.

4.6.5 Step 3: Common Practice

The project shall not be common practice, determined as follows:

- 1) Project type shall not be common practice in sector/region, compared with projects that have received no carbon finance.
- 2) Where it is common practice, the project proponent shall identify barriers faced compared with existing projects.
- 3) Demonstration that the project is not common practice shall be based on guidance provided in *The GHG Protocol for Project Accounting*, Chapter 7 (WRI-WBCSD).

Performance Method

4.6.6 Step 1: Regulatory Surplus

The project activity shall meet with the requirements on regulatory surplus set out under the project method in Section 4.6.3.

4.6.7 Step 2: Performance Benchmark

The GHG emissions generated (or carbon sequestered) per unit of output, unit of input or sequestration metric by the project shall be below (or above, for sequestration) the prescribed

³ Implemented in the context of this paragraph means enacted or introduced, consistent with use of the term under the CDM rules on so-called Type E+ and Type E- policies.

performance benchmark metric or proxy for such metric (see Section 4.1.16 for specification of the metric). Proxy metrics or conditions may be specified where it can be demonstrated that they are strongly correlated with the performance benchmark metric and that they can serve as an equivalent or better method (e.g., in terms of reliability, consistency or practicality) to determine whether performance is achieved to a level at least equivalent to that of the performance benchmark metric.

GHG emissions generated (or carbon sequestered) may be above (or below, for sequestration) the prescribed performance benchmark metric or proxy for such metric for a given verification period, though the project shall not be granted credit for such verification periods.

Activity Method

4.6.8 Step 1: Regulatory Surplus:

The project activity shall meet with the requirements on regulatory surplus set out under the project method in Section 4.6.3.

4.6.9 Step 2: Positive List:

The methodology shall apply one or more of the following three options:

1) Option A: Activity Penetration

The methodology shall demonstrate that the project activity has achieved a low level of penetration relative to its maximum adoption potential, as follows:

- a) The methodology shall demonstrate that the project activity has achieved a low level of penetration relative to its maximum adoption potential, determined using the following equation:

$$AP_y = OA_y / MAP_y$$

Where:

- AP_y = Activity penetration of the project activity in year y (percentage)
- OA_y = Observed adoption of the project activity in year y (e.g., total number of instances installed at a given date in year y, or amount of energy supplied in year y)
- MAP_y = Maximum adoption potential of the project activity in year y (e.g., total number of instances that potentially could have been installed at a given date in year y, or the amount of energy that potentially could have been supplied in year y)

The maximum adoption potential is the total adoption of a project activity that could currently be achieved given current resource availability, technological capability, level of service, implementation potential, total demand, market access and other relevant factors

within the methodology's applicable geographically defined market. Maximum adoption potential does not consider market price, cost of adoption, consumer education, cultural or behavioral barriers, and laws, statutes, regulatory frameworks or policies.

Maximum adoption potential is constrained by numerous factors each imposing their own limitations on the total adoption of a project activity. The following list provides further specification with respect to factors that do, and do not, need to be considered in determining maximum adoption potential:

- i) Resource availability is the limitation imposed by the supply of raw materials or energy resources to the activity.
- ii) Technological capability is the limitation imposed by the technical efficiency of the project activity.
- iii) Level of service is the limitation imposed by the technical reliability or quality of the service provided by the project activity relative to its alternatives.
- iv) Implementation potential is the limitation imposed by the availability of appropriate locations for implementing the project activity.
- v) Total demand is the limitation imposed by demand for the product or service provided by, or associated with, the project activity and all relevant alternative sources of the product or service.
- vi) Market access is the limitation imposed by current infrastructure and the degree to which the outputs of project activity can be practically supplied to the market.
- vii) Market price is the limitation imposed by the current price achievable for outputs from the project activity. Cost of adoption is the limitation imposed by the cost of switching to the project activity from an alternative activity. Consumer education is the public knowledge or awareness of the activity and its benefits. Behavioral or cultural barriers are limitations resulting from social or cultural inertia with respect to the adoption of the project activity.

Data used in determining the level of activity penetration shall meet the requirements for data set out for performance benchmarks in Section 4.5.6, *mutatis mutandis*.

- b) The level of penetration of the project activity shall be no higher than five percent.
 - c) Where the project activity has been commercially available in any area of the applicable geographic scope for less than three years (i.e., it uses a new technology or measure), it shall be demonstrated that the project activity faces barriers to its uptake. Such barriers shall be demonstrated in accordance with Step 3 (barrier analysis) of the latest version of the CDM *Tool for the demonstration and assessment of additionality*.
- 2) Option B: Financial Viability

The methodology shall demonstrate that the project activity is less financially or economically attractive than the alternatives to the project activity using the procedures for investment analysis set out in the CDM *Tool for the demonstration and assessment of additionality*. This

requires that Steps 1, 2 and 4 of such tool are followed. The analysis shall be conducted for the class of project activities to which the methodology is applicable, and the following also applies:

- a) Sub-step 1a. Other realistic and credible alternative scenarios shall be taken to mean the full range of alternatives to the class of project activity that are found and are operational in the applicable geographic scope.
- b) Sub-step 1b. Where the methodology is applicable to more than one country, the mandatory applicable legal and regulatory requirements of all countries shall be examined.
- c) Sub-step 2b and Sub-step 2c. The following applies:
 - i) The full range of circumstances which can influence the project activity shall be considered, and either average circumstances or the circumstances that lead to the most cost effective outcome shall be assumed (e.g., if the observed wind resource in the geographic scope of the methodology leads to plant load factors for wind turbines of between 25 and 30 percent, an average of these figures can be used, or 30 percent may be assumed).
 - ii) Likewise, the full range of cost and/or revenue estimates for the project activity shall be considered, and either average estimates or the estimates that lead to the most cost effective outcome shall be assumed.
 - iii) The full range of circumstances related to the baseline alternatives shall be considered, and either average circumstances or the circumstances that lead to the most cost effective outcome shall be assumed. Only observed or realistic circumstances shall be included (e.g., in a country where cement plants are all located close to harbors or large rivers with a view to easy access to transport, it would not be realistic to assume cement plants would be located in remote areas without easy access to transport).
 - iv) Likewise, the full range of cost and/or revenue estimates for the baseline alternatives shall be considered, and either average estimates or estimates pertaining to the most likely baseline alternative shall be assumed. Where estimates pertaining to the most likely baseline alternative are used, it shall be substantiated that such baseline alternative is the most likely among the alternatives.
- d) Sub-step 2b, Option III. Company internal benchmarks may not be used.
- e) Sub-step 2d. Where average circumstances or estimates have been used in Sub-step 2b and/or Sub-step 2c (i.e., calculations have been based upon a range of circumstances or estimates, see above), a sensitivity analysis shall be undertaken. The objective of the sensitivity analysis is to test whether the conclusion regarding the financial/economic attractiveness of the class of project activity is robust to reasonable variations in the critical assumptions, and where it does not demonstrate conclusively that the (entire class of) project activity is additional, the project activity shall not qualify for the positive

list under this Option B. Where the most cost effective, and therefore most conservative, circumstances or estimates have been used, a sensitivity analysis is not required.

- f) Step 2 (General). Where there are multiple circumstances and estimates that must be aggregated in order to calculate output figures, the method of aggregation shall account for the correlations between each circumstance and estimate.
 - g) Step 4 (Common practice analysis). It shall be demonstrated that the project activity is not common practice using the full procedures for common practice analysis set out in the CDM *Tool for the demonstration and assessment of additionality*.
- 3) Option C: Revenue Streams

The methodology shall demonstrate that the project activity does not have any significant sources of revenue other than revenue from the sale of GHG credits, as follows:

- a) The project activity's gross annual revenue (including cost savings) excluding from the sale of GHG credits shall not exceed five percent of capital expenditure (see VCS document *Program Definitions* for definition of capital expenditure). All capital expenditures incurred during the project crediting period shall be accounted for and where the project activity involves capital expenditure subsequent to year zero, an appropriate discount rate shall be applied.
- b) It shall be demonstrated that the project activity is not common practice using the full procedures for common practice analysis set out in the CDM *Tool for the demonstration and assessment of additionality*.

4.7 QUANTIFICATION OF GHG EMISSION REDUCTIONS AND REMOVALS

General

- 4.7.1** The methodology shall establish criteria and procedures for quantifying GHG emissions and/or removals, and/or carbon stocks, for the selected GHG sources, sinks and/or reservoirs, separately for the project (including leakage) and baseline scenarios.
- 4.7.2** The methodology shall establish criteria and procedures for quantifying net GHG emission reductions and removals generated by the project, which shall be quantified as the difference between the GHG emissions and/or removals, and/or as the difference between carbon stocks, from GHG sources, sinks and reservoirs relevant for the project and those relevant for the baseline scenario. Where appropriate, net GHG emission reductions and removals, and net change in carbon stocks, shall be quantified separately for the project and the baseline scenarios for each relevant GHG and its corresponding GHG sources, sinks and/or reservoirs.

Performance Methods

- 4.7.3** In any given verification period, the methodology may result in the project's GHG emission reductions or removals being quantified as negative. This is permitted and the project shall be granted no credit in such periods.

Activity Methods

- 4.7.4** (No specific requirements)

4.8 MONITORING

General

- 4.8.1** The methodology shall describe the data and parameters to be reported, including sources of data and units of measurement.
- 4.8.2** When highly uncertain data and information are relied upon, conservative values shall be selected that ensure that the quantification does not lead to an overestimation of net GHG emission reductions or removals.
- 4.8.3** Metric tonnes shall be used as the unit of measure and the quantity of each type of GHG shall be converted to tonnes of CO₂e consistent with the requirements set out in Section 3.15.3 above.
- 4.8.4** The methodology shall establish criteria and procedures for monitoring, which shall cover the following:
- 1) Purpose of monitoring.
 - 2) Monitoring procedures, including estimation, modeling, measurement or calculation approaches.
 - 3) Procedures for managing data quality.
 - 4) Monitoring frequency and measurement procedures.

Standardized Methods

- 4.8.5** (No specific requirements)

5 | Validation and Verification Requirements

5.1 INTRODUCTION

- 5.1.1** Validation is the independent assessment of the project by a validation/verification body that determines whether the project complies with the VCS rules. Verification is the periodic ex-post independent assessment by a validation/verification body of the GHG emission reductions and removals that have occurred as a result of the project during the monitoring period, conducted in accordance with the VCS rules.
- 5.1.2** Validation and verification is a risk-based process and shall be carried out in conformance with *ISO 14064-3:2006* and *ISO 14065:2007*. Additional requirements with respect to validation and verification are set out in this Section 5 and shall be adhered to.
- 5.1.3** The validation/verification body shall select samples of data and information to be validated or verified to provide a reasonable level of assurance and to meet the materiality requirements of the specific project.

5.2 GENERAL REQUIREMENTS

- 5.2.1** The project shall be validated and GHG emission reductions or removals verified by a validation/verification body that meets with the eligibility requirements set out in the *VCS Program Guide*.
- 5.2.2** Validation and verification of the project may be undertaken by the same validation/verification body, noting the rules on rotation of validation/verification bodies set out in Section 5.3.12 below. Validation may occur before the first verification or at the same time as the first verification.
- 5.2.3** The project shall be listed on the project pipeline before the opening meeting between the validation/verification body and the project proponent (such opening meeting representing the beginning of the validation process). The validation/verification body is responsible for checking that the project is listed on the project pipeline and shall not conduct the opening meeting or otherwise begin validation until such time as the project is listed.
- 5.2.4** Where the project applies a methodology from an approved GHG program that does not have an independent validation step, the VCS rules still require validation of the project.
- 5.2.5** Validation/verification bodies are expected to follow the guidance provided in the *VCS Validation and Verification Manual* when validating or verifying projects and conducting methodology assessments under the VCS Program.

5.3 VALIDATION AND VERIFICATION PROCESS

General Requirements

- 5.3.1** In addition to the requirements set out in *ISO 14064-3:2006*, the following shall apply:
- 1) The level of assurance shall be reasonable, with respect to material errors, omissions and misrepresentations, for both validation and verification.
 - 2) The criteria for validation shall be the *VCS Version 3*, or approved GHG program where the validation is performed under an approved GHG program (as in cases of participation under the VCS Program and an approved GHG program). The criteria for verification shall be the *VCS Version 3* (regardless of the VCS version or GHG program under which the project was validated). This means the validation or verification shall ensure conformance of the project with the VCS rules, or rules and requirements of the approved GHG program, as applicable.
 - 3) The objective of validation or verification shall be in conformance with the VCS rules and the methodology applied to the project.
 - 4) The threshold for materiality with respect to the aggregate of errors, omissions and misrepresentations relative to the total reported GHG emission reductions and/or removals shall be five percent for projects and one percent for large projects.
- 5.3.2** Where the project does not fully comply with the methodology, the validation/verification body shall determine whether this represents a methodology deviation or a methodology revision (in accordance with the specifications for each), and the case shall be handled accordingly.
- 5.3.3** Where the project applies a revision to an approved GHG program methodology and the version of the (underlying) methodology referenced by the methodology revision is no longer current, the validation/verification body shall determine whether material changes have occurred to the underlying methodology that affect the integrity of the methodology revision. Where such material changes have occurred, the project shall not be approved.
- 5.3.4** Where the project does not meet the criteria for validation or verification, the validation/verification body shall produce a negative validation conclusion and provide the validation, or verification, report and project description, or monitoring report to the VCSA. The project shall be ineligible for registration until such time as corrective action is taken and the (same) validation/verification body has provided a positive validation or verification.

Competence

- 5.3.5** The validation/verification body and validation and verification team shall meet the competence requirements set out in *ISO 14065:2007*, *mutatis mutandis*.

Validation and Verification Reporting

- 5.3.6** The validation report describes the validation process, any findings raised during validation and their resolutions, and the conclusions reached by the validation/verification body. The validation/verification body shall use the *VCS Validation Report Template*, *VCS Joint Validation & Verification Report Template*, *VCS & CCB Validation Report Template*, *VCS+SOCIALCARBON Validation Report Template* or approved GHG program validation report template where the project is registered under an approved GHG program, as appropriate, and adhere to all instructional text within the template. The validation report shall be accompanied by a validation representation, which shall be prepared using the *VCS Validation Deed of Representation Template*.
- 5.3.7** The verification report describes the verification process, any findings raised during verification and their resolutions, and the conclusions reached by the validation/verification body. The validation/verification body shall use the *VCS Verification Report Template*, *VCS Joint Validation & Verification Report Template*, *VCS & CCB Verification Report Template* or *VCS+SOCIALCARBON Verification Report Template*, as appropriate, and adhere to all instructional text within the template. The verification report shall be accompanied by a verification representation, which shall be prepared using the *VCS Verification Deed of Representation Template*.

Validation and Verification Statement

- 5.3.8** The validation report and the verification report shall contain a validation statement and a verification statement, respectively.
- 5.3.9** Validation and verification statements shall:
- 1) Describe the level of assurance of the validation or verification.
 - 2) Describe the objectives, scope and criteria of the validation or verification.
 - 3) Describe whether the data and information supporting the GHG assertion were hypothetical, projected and/or historical in nature.
 - 4) Include the validation/verification body's conclusion on the GHG assertion, including any qualifications or limitations.
- 5.3.10** The verification statement shall state the volume of GHG emission reductions or removals generated during the monitoring period that have been verified.

Records of Validation and Verification

- 5.3.11** The validation/verification body shall keep all documents and records in a secure and retrievable manner for at least two years after the end of the project crediting period, even where they do not conduct verification for the whole project crediting period.

Rotation of Validation/Verification Bodies

5.3.12 Rotation of validation/verification bodies is required in respect of validation and verification, as follows:

- 1) Validation (including project crediting period renewal validation) and the first verification of a project (in a given project crediting period) may be undertaken by the same validation/verification body. However, the subsequent verification shall be undertaken by a different validation/verification body. For example, if validation and verification were undertaken at the same time, the subsequent verification would have to be undertaken by a different validation/verification body. If validation were undertaken first (i.e., separately), the first verification could be undertaken by the same validation/verification body, but the subsequent verification would have to be undertaken by a different validation/verification body.

Note – The gap validation of a project registered under an approved GHG program may be disregarded when assessing adherence to these requirements.

- 2) A validation/verification body may not verify more than six consecutive years of a project's GHG emission reductions or removals. The validation/verification body may undertake further verification for the project only when at least three years of the project's GHG emission reductions or removals have been verified by a different validation/verification body. Additionally, where a validation/verification body verifies the final six consecutive years of a project crediting period, the project crediting period renewal validation shall be undertaken by a different validation/verification body. Notwithstanding these rules, where AFOLU projects have verification periods longer than six years, a validation/verification body is permitted to verify more than six consecutive years of a project's GHG emission reductions or removals, and the subsequent verification shall be undertaken by a different validation/verification body.

Note – Validations and verifications performed under other GHG programs shall be counted when assessing adherence to these requirements.

Validation and Verification Requirements for Grouped Projects

5.3.13 Validation and verification of grouped projects shall assess conformance of the project with the requirements for grouped projects set out in the VCS rules.

5.3.14 New project activity instances shall be validated, based on the information reported in the monitoring report, against the applicable set of eligibility criteria. The validation/verification body shall specify which instances meet the eligibility criteria for inclusion in the project. Such validation may be reported in the verification report or a separate validation report.

5.3.15 Where, due to the number of project activity instances, it is unreasonable to undertake an individual assessment of each initial or new instance, the validation/verification body shall document and explain the sampling methods employed for the validation of such instances. Such sampling methods shall be statistically sound. The number of instances included in the project,

eligible for monitoring and generation of VCUs shall be proportional to the percentage of sampled instances found to be in compliance by the validation/verification body.

- 5.3.16** The verification report for grouped projects shall document and explain the sampling methods employed by the validation/verification body for the verification of GHG emission reductions or removals generated by the project. Such methods shall be statistically sound. Any subsequent changes to the sampling method(s) required as a result of the verification findings shall be documented.

APPENDIX 1: DOCUMENT HISTORY

Version	Date	Comment
v3.0	8 Mar 2011	Initial version released under <i>VCS Version 3</i>
v3.1	15 Jul 2011	<p>Main updates (all effective on issue date):</p> <ol style="list-style-type: none"> 1) Clarified the language for the validation deadline of AFOLU projects. 2) Provided an extension of the validation/verification deadline for AFOLU projects with a start date before 1 January 2002. 3) Incorporated requirements for projects registered sequentially under the VCS Program and a GHG program that is not an approved GHG program. 4) Updated requirements for estimating uncertainty in methodologies. 5) Clarified the rules on grace period granted to projects using new methodologies.
v3.2	1 Feb 2012	<p>Main updates (all effective on issue date, unless otherwise stated):</p> <ol style="list-style-type: none"> 1) Included requirements for standardized methods (Sections 3.1.6, 3.14.1 and 4). 2) Updated rules on double counting to focus on double selling and monetizing, and not double claiming (Section 3.11.2). 3) Expanded requirements and procedures for AFOLU projects registering and issuing credits under the VCS Program and an approved GHG program (Section 3.11). 4) Amended additionality rules on regulatory surplus such that the exception for Type E- policies and systematically enforced law is granted to non-Annex I countries only (Section 4.6.3). Effective from 1 August 2012. 5) Clarified that new requirements released by the VCSCA do not impact registered projects (Section 3.1.8). 6) Replaced the term <i>proof of title</i> with <i>evidence of right of use</i> (Sections 3.4.10, 3.11.1, 3.18.2 and 3.19.2).
v3.3	4 Oct 2012	<p>Main updates (all effective on issue date, unless otherwise stated):</p> <ol style="list-style-type: none"> 1) Included reference to jurisdictional programs and nested REDD+ projects (Sections 1 and 2.1). 2) Clarified that the most recent version of external documents shall be used where referenced (Section 1.1). 3) Introduced rules for the use of models, default factors and proxies (Sections 2.3.2, 3.1.4, 3.1.5, 4.1.6, 4.1.7 and 4.1.8). 4) Clarified that the size/scale of project activity instances for grouped projects may need to be considered in establishing eligibility criteria for the inclusion of instances (Section 3.4.9). 5) Added new type of right of use for JNR (Sections 3.4.10 and 3.11.1). 6) Clarified requirements for methodology deviations (Section 3.5.1). 7) Introduced rules on project description deviations, replacing rules on monitoring plan deviations and switching methodologies (Section 3.6). 8) Clarified that the project crediting period under <i>VCS Version 1</i> is deemed as 10 years (Section 3.8.5). 9) Changed the thresholds for project scale so that projects with emission reductions or removals greater than 300,000 tonnes CO₂e per year are considered large and the

		<p>materiality threshold is one percent for large projects. (Sections 3.9 and 5.3.1).</p> <p>10) Clarified that the consultation undertaken on the level of performance benchmark metrics is an expert consultation rather than a general stakeholder consultation (i.e., the purpose is to engage technical experts in the process) (Section 4.1.17).</p> <p>11) Added QA/QC guidance for standardized methods data (Section 4.5.6).</p> <p>12) Clarified that proxy metrics or conditions may serve as an <i>equivalent</i> method to determine whether performance is achieved to a level at least equivalent to that of the performance benchmark metric (Section 4.6.7).</p> <p>13) Clarified that the difference in carbon stock between the baseline and project scenarios may be used to quantify the emission reductions from pools (Sections 4.7.1 and 4.7.2).</p> <p>14) Removed monitoring section requirements for standards and factors (previously Section 4.8.2).</p> <p>15) Specified rules on rotation of VVBs (Sections 5.2.2 and 5.3.12). Effective immediately, unless evidence of contracting for verification prior to 4 October 2012 is provided.</p> <p>16) Added new requirement that listing on the project pipeline is required before validation can begin (Section 5.2.3). Effective from 4 April 2013.</p> <p>17) Included reference to the <i>VCS Validation and Verification Manual</i> (Section 5.2.5).</p> <p>18) Revised language on validation report conclusions (Section 5.3.4).</p>
v3.4	8 Oct 2013	<p>Main updates (all effective on issue date):</p> <p>1) Clarified that readers <i>shall</i> use the most current version of this document (Section 1.1).</p> <p>2) Clarified that verification periods cannot overlap (Sections 3.4.10 and 3.16.7).</p> <p>3) Removed reference to JNR-specific right of use for grouped projects (previously Section 3.4.10(7)).</p> <p>4) Extended validation grace period for projects applying a new VCS methodology, including at project crediting period renewal (Sections 3.7.2 and 3.8.5(3)).</p> <p>5) Added requirements on debundling (Section 3.9.2).</p> <p>6) Added new requirements with respect to other forms of GHG-related environmental credits (Sections 3.11.3 and 3.11.5).</p> <p>7) Removed duplication of reporting requirements between the monitoring report, project description, validation report, and verification report and their respective templates (Sections 3.16.6, 3.19.1, 5.3.6 and 5.3.7).</p> <p>8) Removed language on validation/verification body liability (Section 5.2.5).</p> <p>9) Revised VCSA actions for projects not meeting criteria for validation and verification (Section 5.3.4).</p> <p>10) Clarified validation/verification body rotation requirements in respect of project crediting period renewals (Section 5.3.12).</p> <p>11) Expanded the document to be applicable to JNR, and made other minor edits and clarifications to text and grammar (throughout).</p>
v3.5	25 Mar 2015	<p>Main updates (all effective on issue date, unless otherwise stated):</p> <p>1) Incorporated 9 January 2014 exclusion of HFC-23 from the scope of the VCS Program (Section 2.1.1).</p>

		<ol style="list-style-type: none"> 2) Clarified language with respect to projects registered under other GHG programs which are seeking registration with the VCS Program (Sections 3.7.1, 3.11.9, 3.11.10, 3.11.10(1), 3.11.10(3), 3.11.11, 3.19.1, 5.3.6). 3) Specified the total project crediting period for projects registered under the JI Program which are seeking registration with the VCS Program (Section 3.8.3). 4) Incorporated 30 October 2014 clarification with respect to GHG-related environmental credits (Section 3.11.3). 5) Updated reference to <i>CPA</i> to be consistent with latest version of <i>Glossary of CDM Terms</i> (Section 3.11.9). 6) Added requirements and procedures for projects registered under the Joint Implementation program to also register with the VCS Program (Section 3.11.10(2)).
v3.6	19 Oct 2016	<p>Main updates (all effective on issue date, unless otherwise stated):</p> <ol style="list-style-type: none"> 1) Replaced term <i>right of use</i> with <i>project ownership</i> (Sections 3.4.10(5), 3.11.1, 3.18.2) 2) Incorporated 23 September 2015 standalone update removing validation deadline for projects applying a standardized method for determining additionality into document text (Section 3.7.6) 3) Incorporated 24 February 2016 clarification with respect to introduction of joint templates into document text (Sections 3.16.6, 3.19.1, 5.3.6, 5.3.7) 4) Introduced requirements for assessment of no net harm (Section 3.17.1). Effective immediately, unless evidence of contracting for validation prior to 19 April 2017 is provided. 5) Introduced requirements for conducting local stakeholder consultations (Sections 3.17.2-3.17.4). Effective immediately, unless evidence of contracting for validation prior to 19 April 2017 is provided. 6) Introduced requirements for public comment periods for projects (Sections 3.17.5-3.17.8). Effective from 19 April 2017.
v3.7	21 Jun 2017	<p>Main updates (all effective on issue date, unless otherwise stated):</p> <ol style="list-style-type: none"> 1) Introduced new requirement that new project activity instances added to grouped projects shall have a start date that is equal to or later than the grouped project start date (Section 3.4.10(6)) 2) Clarified that the project crediting period shall not be renewed until the end of the previous crediting period (Section 3.8.5(3)) 3) Updated CDM gap validation process and introduced new Climate Action Reserve gap validation process (Section 3.11.10(1, 3)) 4) Introduced new requirements for projects applying an approved GHG program methodology which uses an activity method or other simplified procedure for demonstrating additionality (Section 3.14.1) 5) Updated required source of global warming potentials from the IPCC's <i>Second Assessment Report</i> to the IPCC's <i>Fourth Assessment Report</i> (Sections 3.15.3 and 4.8.3). Projects may optionally transition to the updated global warming potentials immediately via a project description deviation. Projects shall transition to the updated global warming potentials at their project crediting period renewal. 6) Added reference to joint VCS, VCS & CCB and VCS+SOCIALCARBON templates (Sections 3.16.6, 3.19.1, 5.3.6, 5.3.7)

		<ul style="list-style-type: none">7) Clarified that project verification periods must be contiguous (Section 3.16.7)8) Clarified that any validation and verification activities performed under other GHG programs shall be counted when assessing compliance with VVB rotation requirements (Section 5.3.12)9) Removed requirement that a validation representation must be submitted where verification includes the validation of new project activity instances of a grouped project (formerly Section 5.3.14)

1 | Introduction

1.1 OVERVIEW

Independent third-party validation and verification plays a vital role in upholding the integrity and quality of greenhouse gas (GHG) emission reductions and removals achieved by VCS projects.

Validation/verification bodies (VVBs) have three main roles under the VCS Program: to validate projects, verify GHG emission reductions and removals, and assess methodology elements under the methodology approval process.

VVBs are eligible to provide validation and verification services under the VCS Program if they are accredited under a VCS-approved GHG program, accredited under *ISO 14065* for scope VCS by an accreditation body that is a member of the International Accreditation Forum, or approved under the VCS temporary accreditation program. The detailed accreditation requirements for VVBs are set out in the *VCS Program Guide*. The VVB annual fee is set out in the *Program Fee Schedule*.

The objective of the *Validation and Verification Manual* is to provide guidance to increase the consistency, quality and transparency of validation and verification of projects under the VCS Program and to provide guidance on assessing methodologies under the VCS methodology approval process. The manual is intended to be used in combination with the VCS Program documents that set out the VCS rules and *ISO 14064-3* which sets out program-neutral requirements for validation and verification. The manual was developed with the support of a working group.¹

The manual does not contain VCS requirements but rather provides further clarification on VCS rules and, in some instances, clarifications on the application of *ISO 14064-3* requirements on validation and verification as they relate to the VCS Program. In addition, the manual does not address *ISO 14065* or other VVB accreditation-specific topics, nor does it offer methodology-specific or sectoral scope-specific guidance (although various project types are discussed as examples). VVBs must refer directly to the applied methodology when conducting project validation or verification.

While VVBs are the primary intended users of this manual, the guidance presented in this manual is also considered useful for project proponents and methodology developers.

¹ The working group comprised of representatives from VVBs and the American National Standards Institute (ANSI). Working group members were Ann Bowles, Tod Delaney, Todd Frank, Jared Nunery, Rainer Winter and Siddharth Yadav.

VCS GUIDANCE

This document shall be updated from time-to-time and readers should ensure they are using the most current version of the document.

1.2 KEY REQUIREMENTS AND REFERENCES

The VCS Program provides the standard and framework for independent validation of projects and methodologies as well as verification of GHG emission reductions and removals, based on *ISO 14064-2* and *ISO 14064-3*. The key requirements of the VCS Program are described in the following documents:

- *VCS Program Guide*
- *VCS Standard*
- *AFOLU Requirements*
- *ODS Requirements*
- *Jurisdictional and Nested REDD+ (JNR) Requirements*
- *Program Definitions*

Other procedural requirements are described in the following documents:

- *Registration and Issuance Process*
- *Methodology Approval Process*
- *AFOLU Non-Permanence Risk Tool*

These documents are available on the VCS website and are updated periodically when VCSA releases program updates. New requirements are effective immediately upon release, though, where appropriate, a grace period may be provided to allow stakeholders sufficient time to transition to the new requirements. VVBs must refer directly to the VCS website for full information on program updates. Further information specifically for VVBs will be made available on the VVB Portal (a password-protected informational website for VVBs).

1.3 DEFINITIONS

Definitions and acronyms that apply to the VCS Program are set out in the VCS document *Program Definitions*.

1.4 SEEKING CLARIFICATIONS FROM VCSA

VVBs that need clarification directly from VCSA can access the VVB Portal via the VCS website. The portal lists responses to common VVB questions. If no responses are provided to the particular question, VVBs are encouraged to submit their questions directly to VCSA at secretariat@v-c-s.org.

For responses to proprietary or commercially sensitive questions, VVBs may contact a VCSA program officer directly. Where VVBs use clarifications provided by VCSA staff or clarifications provided in this manual as a basis for interpreting VCS rules, they must also provide a direct reference to the VCS requirement set out in the VCS Program documents to which the clarification applies. Clarifications provided by VCSA staff or in this manual are not decisions and should not be misinterpreted as approvals or consultations of specific project activities.

1.5 OVERARCHING VALIDATION AND VERIFICATION PRINCIPLES

Overarching principles are useful for helping VVBs understand the overall goals of the VCS Program and *ISO 14064* requirements. The principles serve as guidance for VVBs where project- or methodology-specific requirements are not fully prescriptive.

While *ISO 14064-3* principles do not constitute auditable criteria, VCS principles form mandatory criteria that the VVBs must consider when validating or verifying projects, or conducting methodology assessments. For example, where a project does not use data and methods that enable meaningful comparisons of GHG related information, the VVB must note it as a non-conformance with the VCS principle of consistency.

In some cases, VVBs may need to use professional judgment in applying the VCS principles. For instance, the principles of accuracy and conservativeness are interrelated and often the principle of conservativeness serves as a moderator to the principle of accuracy. The accuracy principle implies that VVBs must assess whether uncertainties with respect to GHG measurements, estimates or calculations have been reduced as much as is practical and measurement and estimation methods are used in a manner that avoids bias. The conservativeness principle implies that assumptions, values and procedures used in the project or methodology do not result in an overestimation in the quantification of net GHG emission reductions and removals. Therefore, where the data or procedures associated with the project or methodology have uncertainties, VVBs must apply the conservativeness principle.

Keep in mind

The VCS Program principles are:

- Relevance
- Completeness
- Consistency
- Accuracy
- Transparency
- Conservativeness

Explanations of these principles are set out in the *VCS Standard*.

2 | Elements of Validation and Verification Plans

When a VVB is approached to conduct a validation or verification, the VVB and its client must come to agreement on the objectives, scope, criteria, level of assurance and materiality of the validation or verification assessment. These five elements form the basis for validation or verification plans and associated sampling plans. Such agreements must recognize VCSA as one of the primary intended users of project descriptions, monitoring reports and resulting validation and verification reports.

Prior to finalizing an agreement, a VVB is required to follow the steps included in *ISO 14064-3*. The various steps include determining risks to team member impartiality and determining whether the VVB can assemble a team with competencies and resources appropriate for completing the scope of work.

2.1 OBJECTIVES

Overview

The first step in conducting a validation or verification is to establish the objectives and identify the GHG assertion to be assessed as part of a validation or verification. Assessment of these assertions against the requirements of the VCS Program, the applied methodology and *ISO 14064-2* is the core objective for any project validation or verification. The objectives may vary depending on whether the engagement is a validation or verification. The scope, criteria, level of assurance, and materiality of the validation and verification assessment should also inform the objectives.

Key Elements

2.1.1 Validation Objectives

Validation involves the assessment of a project description wherein VVBs must assess the following:

- Project conformance to VCS rules;
- Project conformance to the applied methodology, including the procedure for the demonstration of additionality specified in the methodology; and
- Likelihood that methods and procedures set out in the project description will generate verifiable GHG data and information when implemented.

VVBs should review the guidance provided in Annex A.2.3.3 of *ISO 14064-3* with respect to establishing validation objectives.

2.1.2 Verification Objectives

Verification is conducted once project implementation has commenced. It is the ex-post assessment of the monitored GHG data and information. During verification, VVBs must evaluate the monitoring report and assess the following:

- The extent to which methods and procedures, including monitoring procedures, have been implemented in accordance with the validated project description. This includes ensuring conformance with the monitoring plan.
- The extent to which GHG emission reductions and removals reported in the monitoring report are materially accurate.

VVBs should review the guidance provided in Annex A.2.3.4 of *ISO 14064-3* with respect to establishing project verification objectives.

2.2 SCOPE AND CRITERIA

Overview

The scope of a validation or verification helps place physical and temporal boundaries on the GHG data and information that must be assessed. Criteria are the set of requirements against which the project is evaluated.

Key Elements

In determining the scope of the assessment, VVBs must take into account the physical boundaries, sites or facilities of the project and the temporal boundaries (ie, the years when GHG emission reductions and removals are quantified). For validation, the temporal boundaries are determined by VCS project crediting period requirements set out in the *VCS Standard*. For verification, the temporal boundaries are determined by the length of the monitoring period.

The mandatory requirements of the VCS Program and *ISO 14064-2* guide the criteria against which the validation or verification is conducted. The methodology applied to the project also informs the criteria for validation and verification; therefore, it is essential that VVBs thoroughly understand a methodology prior to undertaking an assessment. Where projects apply methodologies from other approved GHG program such as the Clean Development Mechanism (CDM) or Climate Action Reserve (CAR), VVBs should refer to any guidance provided by such programs with regard to the application of the methodology. Some of the key validation and verification criteria are discussed further in Section 3.

VVBs are not expected to document every criterion that will apply to the validation or verification engagement. Instead, it is sufficient to indicate the relevant documents containing the criteria such as the *VCS Standard*, *ISO 14064-2* and the applied GHG methodology.

2.3 MATERIALITY

Overview

Materiality, as applied to GHG projects, is the concept that errors, omissions or misrepresentations, individually or in aggregate, can affect the GHG assertion and therefore affect the decisions of the intended users. The materiality threshold is non-negotiable between the project proponent and the VVB and must be informed by the VCS rules on materiality thresholds with respect to project scale.

Key Elements

Materiality has both qualitative and quantitative aspects. When assessing qualitative materiality, VVBs must determine whether the project conforms to VCS rules and methodology requirements. Certain qualitative discrepancies such as a discrepancy with respect to ownership or applicability criteria must always be noted as a material non-conformance. In other cases, qualitative discrepancies will be less definite and may ultimately manifest themselves as quantitative discrepancies. When considering less definite qualitative discrepancies, VVBs should use their professional judgment to determine the issues that immediately need to be identified as material and which require further investigation through sampling and testing.

When assessing quantitative materiality of data errors, omissions or misrepresentations, VVBs must assess materiality with respect to the aggregate estimate of GHG emission reductions and removals set out in the project description or monitoring report. Uncertainties inherent in an approved GHG methodology are not to be considered.

The materiality threshold varies depending on the amount of the project's GHG emission reductions and removals, as set out in the *VCS Standard*. The materiality threshold applies equally to validation and verification. While all material errors, omissions and misrepresentations must be addressed for a project to receive a positive validation or verification opinion, if non-material errors are found in the project documents, VVBs should ensure that such errors are addressed by the project proponent where practicable.

EXAMPLE – Qualitative Material Discrepancy

Qualitative discrepancies that are material:

- An improved forest management (IFM) methodology requires that the evaluation of the baseline scenarios include, at minimum, historical practice baseline scenarios based on the project proponent's previous and current forest management activities, and common practice baseline scenarios based on evidence of comparable forest management for similar property types and situations in the region. While the project description provides a detailed analysis of historical practices, the VVB finds that the identification of common practice baseline scenarios is based on national data that does not differentiate between different kinds of forest management scenarios. The VVB must consider this as a material discrepancy.
- A project applies a meter calibration schedule that differs from what is set out in the validated project description. The VVB must consider this as a material discrepancy.

Qualitative discrepancy that may not be material:

- Gaps in procedures for quality management of data need not be a material discrepancy unless the VVB determines that such weaknesses in the data management procedures could result in quantitative discrepancies.

2.4 LEVEL OF ASSURANCE

Overview

The VCS Program requires a reasonable level of assurance in validation and verification that GHG assertions are free of material errors, omissions and misrepresentations. This is non-negotiable between the project proponent and the VVB.

Key Elements

In a reasonable level of assurance engagement, the VVB must test a sufficient amount of data to ensure with confidence that no material errors are present. The amount of testing to be conducted is determined based on the outcome of a risk assessment (see Section 3.3.1.1).

3 | Project Validation and Verification Process

VCS Program documents provide detailed rules and requirements that VVBs must refer to when conducting project validations or verifications. This section provides further guidance on some of the key areas of validation and verification.

3.1 PRE-VALIDATION ASSESSMENT

VVBs are encouraged to conduct an assessment prior to undertaking project validation to ensure the project is eligible under the VCS Program. The pre-assessment should, at minimum, focus on the following:

- VVBs must confirm that the validation can be completed within the relevant validation deadline, relative to the project start date (ie, the date the project starts generating emission reductions and removals). The project start date is fixed and cannot be adjusted to ensure that validation deadline is met.
- VVBs must confirm that the project applies a methodology eligible under the VCS Program. Eligible methodologies include VCS methodologies and methodologies approved under CDM and CAR. The project must be validated against a valid version of the applied methodology. Note the relevant methodology grace periods on the GHG program website.
- In the case of AFOLU projects, VVBs must confirm that the project is in conformance with the eligibility requirements for AFOLU projects set out in VCS document *AFOLU Requirements*. For example, project activities that convert native ecosystems are not eligible under the VCS Program.

Keep in mind

VVBs conducting a pre-validation assessment must confirm whether the project has applied a valid version of the methodology. VCS, CDM and CAR methodologies are updated periodically. In such cases, projects applying the previous version of the methodology must issue a validation report by the deadline posted on the methodology page of the VCS, CDM or CAR website.

- Where the project has registered and issued credits under the CDM, VVBs must check the issuance date of the validation report used to request CDM registration to determine whether the project complies with VCS rules on validation deadlines.

3.2 KEY VALIDATION AND VERIFICATION REQUIREMENTS

VVBs must assess the project's conformance with all VCS Program requirements as well as the requirements of the applied methodology. This section provides guidance on some of the main requirements that need to be assessed, highlighting common issues and challenges faced by VVBs.

3.2.1 Project ownership

Overview

Under the VCS Program, a project is only eligible where the project proponent can demonstrate project ownership. Project ownership is the legal right to control and operate the project activities.

Key Elements

VVBs are not expected to provide an opinion on the legal ownership of GHG emission reductions and removals, but VVBs must assess project ownership with a reasonable level of assurance. VVBs must assess whether the project proponent can claim project ownership based on the evidence provided by the project proponent. Such evidence may include a contractual right such as legal title to the plant or equipment that generates GHG emission reductions and removals or a legally binding agreement such as a long-term lease for the management of lands. VVBs should refer directly to the *VCS Standard* for a list of acceptable forms of evidence of project ownership.

While the level of due diligence required to evaluate evidence of project ownership varies depending on the project, VVBs must, at minimum, assess whether the project proponent has provided sufficient evidence to demonstrate the authenticity of the documentation presented to demonstrate project ownership. VVBs must also assess the regulatory or jurisdictional framework within which the project is being implemented to determine that there is no conflict with the project proponent's claims at a *prima facie* level.² VVBs are encouraged to solicit external expertise when evaluating a project in a geographic jurisdiction or sector where knowledge or expertise is limited.

² *Prima facie* implies sufficient evidence to establish a fact or raise a presumption unless disproved or rebutted and is generally understood to be a flexible evidentiary standard that may at first appear sufficient.

EXAMPLE – Project ownership

A company develops a REDD project on forest land owned by the state government. The company has a long-term lease for the management of the forest and provides the VVB with the lease as evidence of project ownership.

The VVB reviews the jurisdiction's regulatory framework and finds that state law recognizes customary land rights of indigenous peoples and local communities who reside in state-owned forests. The law transfers rights to the natural resource benefits accruing from the forests to local residents. The VVB notes that the state law raises a conflict with respect to the project proponent's claim to project ownership, and the VVB requires that the project proponent provide further evidence to demonstrate that project ownership is undisputed.

In response, the project proponent submits legal documentation that includes a benefits-sharing agreement established with a community residing in one section of the forest. The documentation has the approval from the appropriate government authorities and the traditional authority customarily recognized by the community. However, the project proponent is unable to provide a similar agreement with a community residing in another section of the forest and therefore redefines the project area to limit it only to the area where a benefits-sharing agreement has been secured.

The VVB concludes that the legal documentation provides *prima facie* evidence that the project proponent has secured project ownership, which now encompasses a smaller area.

3.2.2 Methodology Applicability

Overview

All methodologies include specific conditions that a project applying the methodology must meet in order to be eligible. VVBs must assess whether the project proponent has met these applicability conditions.

Key Elements

Project proponents are expected to detail how their project meets all applicability conditions. VVBs are required to assess the project against each of these applicability conditions to confirm that methodology requirements are satisfied. Applicability conditions may include restrictions with respect to the nature of the technology or measure used in the project, geographic conditions, baseline conditions and eligible carbon pools. Failure to conform to any applicability conditions must be viewed as a material discrepancy.

3.2.3 Baseline Scenario

Overview

The baseline scenario is a hypothetical reference case that most likely represents what would have occurred in the absence of the GHG project. Given its hypothetical nature, baseline scenarios can carry significant uncertainty and are a common source of material error.

Key Elements

VVBs must assess whether the baseline scenario selection procedure complies with the procedure set out in the methodology. Often the procedures for identifying the baseline scenario are combined with the procedures for demonstrating additionality. For example, many CDM methodologies require the use of the baseline assessment procedures set out in the CDM methodological tool *Combined tool to identify the baseline scenario and demonstrate additionality*.

Methodologies may use one of two approaches in the procedures for determining the baseline scenario: a project method or a standardized method.

Keep in mind

VVBs should consider the following when assessing a project method for identifying the baseline scenario:

- Have all methodology requirements been met?
- Has a complete set of baseline alternatives been identified, within a justified geographic and temporal boundary relevant for the project?
- Are all alternative baseline scenarios functionally equivalent to the project? (This may not apply for AFOLU projects)
- Has objective evidence been provided to support the barriers assessment? Has the VVB sampled and tested this evidence?
- Where two or more alternative baseline scenarios seem equally likely, has the conservativeness principle been applied to select the scenario that will result in the fewest GHG emission reductions and removals?

3.2.3.1 Project Method

A project method is a methodological approach that uses a project-specific approach for determining the baseline scenario. Viable alternative baseline scenarios are assessed against one or more barriers to implementation such as investment, technological and institutional barriers. The assessment of baseline scenarios should therefore focus on the identification of the most plausible baseline scenario (ie, a scenario that faces the fewest barriers to implementation). For example, in a retrofit project that involves upgrading equipment, VVBs must consider whether the continued use of existing equipment would have been a plausible baseline scenario if the equipment was reaching the end of its useful life.

3.2.3.2 Standardized Method

A standardized method is a methodological approach that standardizes elements of additionality and/or the crediting baseline for a given class of project activity. Performance methods establish a baseline scenario and baseline emissions that are reflective of all viable alternative scenarios and emissions for a given class of project activity. Performance benchmark metrics are based upon baseline emissions, which can serve as the basis for determining additionality as well as the benchmark for the crediting baseline. For example, a performance method for a cement methodology could establish a performance benchmark metric expressed in terms of a given level of GHG emissions generated per tonne of cement or clinker produced (such level would represent the top performance within the sector).

EXAMPLE – Baseline Scenario

A REDD project in Brazil is seeking to avoid planned conversion of forested land to agricultural land. The project proponent is the owner of the project lands. Prior to project implementation, the project proponent sold portions of the lands for development into sugar cane plantations.

The applied VCS REDD methodology uses a project method (ie, a project-specific approach) for the selection of the baseline and prescribes specific procedures that must be undertaken to select the baseline, beginning with the identification of the agent of planned deforestation.

The specific entity that would undertake future deforestation is unknown, but potential classes of deforestation agents were considered as required by the methodology. The project proponent demonstrated that the only deforestation activities undertaken in the project vicinity were agricultural conversion to sugar cane, citrus or corn plantations. Based on the project proponent's history of selling land to sugar cane plantation owners, this baseline scenario was selected as the most likely.

However, the VVB identified two material discrepancies:

- The project proponent did not consider the impact of different (soil) strata within the project area, as required by the methodology. The VVB determined that soil types differed between the north and south portions of the project area. Sugar cane suitability may vary by soil type.
- The project proponent did not compare the selected baseline scenario against an appropriate geographic area with similar socio-economic economic and ecological conditions, as set out in VT0001 (the applied additionality tool). The process did not consider the prevalence of conversion to each crop type on local lands not formerly owned by the project proponent.

As a result, the project proponent revised the assessment as follows:

- The south portion of the project area, where the soil was determined to be too poor to sustain agriculture, was deemed unlikely to face deforestation and removed from the project area.
- A review of recent conversion activities on local areas of similar soil type found an equal distribution of all crop scenarios. Citrus plantations, (which support high carbon stocks when compared to sugar cane or corn plantations, were considered the most conservative baseline scenario for the remainder of the project area.

Further guidance on how a project method or standardized method is identified and assessed is provided in Section 5.2.4.

3.2.3.3 AFOLU-Specific Guidelines

Assessing the baseline scenario in an AFOLU project can be particularly challenging due to the variety of specific requirements within each methodology.

Some questions VVBs should consider when assessing alternative land use scenarios and whether these scenarios are realistic and credible include:

- Do the land use scenarios include the continuation of pre-project land use, the proposed project activity and an alternative land use within the project boundary?
- Do the land use scenarios include the observed land use activities in surrounding geographical areas with similar socio-economic and ecological conditions?
- Do the land use scenarios include activities that occurred within the proposed project activity boundary in the past 20 years?
- Is the identification of a realistic and credible land use scenario based on analysis of land use records, field surveys and interviews? Project proponents must justify the baseline scenario, and claims of alternative land uses, by providing sufficient evidence such as reports on geospatial planning, legal requirements and economic feasibility studies.

3.2.4 Additionality

Overview

Additionality is the concept that credited GHG emission reductions and removals must exceed (ie, be additional to) what would have been achieved under the business-as-usual scenario, and credited reductions and removals must be attributable to the intervention of the carbon market.

Specific requirements and criteria for demonstrating additionality are specified in methodologies. VVBs must assess project additionality against these criteria in full. Methodologies may reference additionality tools from the VCS or approved GHG programs such as CDM. When a methodology references a tool such as the CDM *Combined tool to identify the baseline scenario and demonstrate additionality*, VVBs need to assess additionality in accordance with the tool. VVBs must take account of relevant guidance issued in respect of the tool except where such guidance conflicts with VCS rules. For example, when projects apply the CDM tools for additionality, VVBs must refer to the decisions and guidelines issued by the CDM Executive Board on assessment of barriers, investment analysis and common practice analysis, though they can disregard the CDM requirement for prior consideration of carbon finance (the latter being addressed by the VCS requirement to have projects validated within fixed times of the project start date).

VVBs should note that VCS requirements on additionality set out in the *Methodology Requirements* section of the *VCS Standard* are high-level requirements not to be used by projects for the demonstration and assessment of additionality. Rather, the requirements provide the basis for methodologies to develop fully elaborated procedures for the demonstration and assessment of additionality.

Key Elements

The *VCS Standard* identifies two main approaches for demonstrating additionality. Both approaches require a regulatory surplus analysis step followed by the option of a project-specific approach or one of two standardized approaches (ie, a project method, or a performance method or activity method).

3.2.4.1 Regulatory Surplus

To be additional, a project must not be mandated by any law, statute or other regulatory framework or, for projects in non-Annex I countries, any *systematically enforced* law, statute or other regulatory framework. *Systematically enforced* means that projects required by law may still be eligible if the project proponent

EXAMPLE – Additionality

An IFM project undertaken in Rwanda has demonstrated additionality through the use of the *VCS Tool for the Demonstration and Assessment of Additionality in VCS AFOLU Project Activities* in accordance with the methodology. In conducting its assessment, the validation team reviewed the following:

Step 1: Identification of alternative land use scenarios to the proposed project activity

All identified alternative land use scenarios were deemed credible and legal.

Step 2: Investment analysis

The project proponent elected to use a simple cost analysis. However, the VVB deemed a simple cost analysis as inappropriate because the project proponent was expecting revenue from ecotourism in the project areas. The project proponent subsequently performed an investment comparison analysis using the IRR as a financial indicator. The results of the analysis indicated a five percent IRR for the project in the absence of carbon finance. Other alternatives suggested IRRs as high as 20 percent. No sensitivity analysis was conducted, which the VVB noted as a clarification request. The sensitivity analysis, which was later conducted, found the conclusions to be robust.

Step 4: Common practice analysis

The project proponent indicated that forest lands in Rwanda are typically over-logged, providing statistics related to the rate of logging as supporting evidence. The VVB indicated that this was insufficient to demonstrate that the project was not common practice, as it did not address the prevalence of sustainable forest management initiatives (relative to other alternatives) found across the country. In response, the project proponent provided statistics regarding the number of sustainably managed forests in the country. This evidence indicated that only 20 percent of forests were sustainably managed and that these forests were government owned. No examples of sustainable forest management on private lands were found by the project proponent. The VVB agreed that the project activities are not common practice.

can demonstrate that applicable laws are not enforced and non-compliance is widespread (provided the methodology does not state otherwise). VCS rules also allow certain laws and regulations to be disregarded that give comparative advantage to more emission intensive technologies or less emission intensive technologies. Known as Type E+ and E- policies, these rules ensure carbon finance does not create perverse incentives that stymie the implementation of local laws and regulations that would seek to contribute towards climate change mitigation.

3.2.4.2 Project Method

The project method requires that each project individually demonstrate that the project would not have been feasible in the absence of the intervention of the carbon market.

The project method involves a barriers analysis step and a common practice analysis step. The barrier analysis and common practice analysis is discussed in greater detail in Section 5.2.4.

Where projects apply an investment analysis as part of the project-based demonstration of additionality, VVBs should consider the following:

- Has an appropriate method for analysis been applied? For example, a wind energy project will generate revenue beyond the sale of VCUs. The use of a simple cost-benefit analysis is not likely to be appropriate to the project context. Rather, a more detailed investment analysis would be required.
- Are the applied financial or economic indicators such as internal rate of return (IRR) or net present value (NPV) suitable for the project type and investment decision, and supported with objective evidence?
- Has uncertainty been adequately addressed in the analysis?
- How sensitive is the final result to changes in key assumptions and data?

In assessing the results of a common practice analysis step, VVBs must pay close attention to the following:

- Are the geographic and temporal boundaries appropriate? Various factors may change and influence alternative choices across geographic areas. The rate that technologies and practices evolve in the region or sector must also be considered.
- Is the justified common practice threshold appropriate? The prevalence of a project depends on the number of project alternatives, among other factors. The *GHG Protocol for Project Accounting* suggests applying a lower common practice threshold where several alternatives exist.

- Does the project activity qualify to be considered as a first-of-its-kind technology? A common practice analysis may not be required for emerging technologies. However, VVBs must assess whether the project activity meets the definition of *first-of-its-kind*. VVBs are encouraged to refer to CDM guidance to determine if the project activity qualifies as *first-of-its-kind*.

3.2.4.3 Standardized Method

Standardized methods allow for more streamlined assessment of additionality than project-specific approaches. Standardized methods pre-determine additionality for a given class of project activity. Qualifying conditions and criteria are set out within the methodology. Rather than each project undertaking project-specific barriers and common practice assessments, projects are compared against clearly specified conditions and parameters pre-defined in the methodology. Further guidance on standardized approaches to additionality is set out in Section 5.2.4.

3.2.5 Ex-ante Quantification of Emission Reductions

Overview

VVBs must include an assessment of whether the GHG emission reductions and removals estimated in the project description will be achieved by implementing the project activity.

Key Elements

Providing assurance on future projections of GHG emission reductions and removals is inherently challenging. Various factors may influence the reductions ultimately achieved. In the assessment of GHG emission reduction and removal quantification, VVBs must, at minimum, review the following:

- Methodology equations: Where methodologies provide different options and procedures for quantifying baseline and project emissions, VVBs must confirm whether proper justification has been provided based on the choice of the baseline scenario, context of the project activity and other evidence provided. VVBs must also confirm whether correct equations have been used, reflecting the relevant methodological choices.

Keep in Mind

Some projects have inherent uncertainty that cannot be resolved prior to project implementation. Examples include scientific uncertainty related to the use of models in the quantification or uncertainty surrounding weather patterns in solar and wind projects. Any such uncertainties must be transparently identified in the project's assertion of ex-ante GHG emission reductions and removals.

- **Data and parameters:** Where data and parameters are determined at validation (ie, not monitored during the project crediting period), VVBs must assess all data sources, assumptions and calculations to verify that they are correct and applicable to the project. Where models are used to estimate GHG emission reductions and removals, VVBs must assess whether the model has been transparently and appropriately parameterized and calibrated for the project context. For example, where a project applies a model to estimate changes in soil carbon, and the model requires the use of a project-specific soil carbon decay rate, the VVB must determine the appropriateness of the data provided and its suitability to the given agro-ecological zone. In some cases, VVBs may need to review relevant peer-reviewed literature to ascertain the validity of the data or parameters provided by the project proponent.

EXAMPLE – Ex-ante quantification of GHG emission reductions

An off-grid, run-of-river hydroelectric project is being developed in Indonesia where the baseline scenario is the use of diesel generators. The methodology allows for determining the baseline based on the energy consumption of the technology in use in the absence of the project activity.

Baseline emissions are calculated, as follows:

$$BE_{CO_2,y} = EBL,y * EF_{CO_2}$$

Where:

$BE_{CO_2,y}$	= Emissions in the baseline in year y; tCO ₂ e
EBL,y	= Annual energy baseline in year y; MWh
EF_{CO_2}	= Fuel emission factor; tCO ₂ e/MWh

A default value of 0.8kg CO₂e/KWh is used for diesel generation units. The annual energy baseline consumption is estimated to be 600KWh. In assessing the ex-ante emission reduction estimates, the VVB focused on the proposed annual energy baseline. Public data indicated that the average household electricity consumption was 350KWh per year. As a result, the project proponent prepared and justified a conservatively low forecast of annual energy consumption in the project description.

- **Uncertainty:** VVBs must account for any uncertainty associated with measurement. VVBs must also consider other sources of uncertainty such as uncertain future project activity or performance levels. For example, where a project uses a model to estimate forest regrowth, local climate variability can influence forest regrowth patterns.
- **Conservativeness:** Where VVBs find uncertainty associated with a project's data and parameters, the conservativeness principle should be applied to adjust estimates of GHG emission reductions and removals and, where appropriate, manage the risk of associated uncertainty.

3.2.6 Leakage

Overview

Many GHG projects, whether related to energy, industrial processes or AFOLU, have the potential to result in leakage (ie, the increase of GHG emissions outside the project boundary as a result of the project). VVBs must include an assessment of leakage emissions within the same country as the project if such emissions are measurable. Each methodology sets out processes to calculate leakage emissions.

Key Elements

Effects from leakage on all carbon sources, sinks and reservoirs need to be assessed, and significant effects must be considered when calculating net GHG emission reductions or removals. Accounting for positive leakage (emission reductions that occur outside the project area as a beneficial spill-over effect from implementing the project activity) is not allowed.

VVBs must approach leakage quantification in the same manner as baseline and project quantification, assessing all data sources, assumptions and calculations to verify accuracy and applicability.

Keep in Mind

When a project includes timber harvesting, as in IFM and some REDD and ARR projects, market leakage can be calculated using a discount factor as set out in the *AFOLU Requirements*. When validating a market leakage discount factor, VVBs need to be aware that project proponents are incentivized to select the lowest discount factor possible to maximize net emission reductions or removals claimed by the project.

EXAMPLE – Leakage

A REDD project is developed in Kenya in accordance with a VCS methodology for avoided mosaic deforestation in dryland forests. The project implements a variety of leakage mitigation activities that intend to provide economic alternatives to slash-and-burn agricultural practices. The methodology quantifies activity-shifting leakage using a cumulative model of combined deforestation or degradation and observations from a leakage area during each monitoring period.

With no historical leakage observations, no data on participation in leakage mitigation activities, and no certainty as to the extent that leakage mitigation activities will be implemented during the life of the project, estimating an ex-ante leakage rate is highly uncertain. At validation, the VVB randomly selected and visited a leakage area used in the model and confirmed that the primary agents of deforestation had access to the leakage area. In addition, the VVB examined the topographic characteristics, ownership structure, soil productivity and access points of selected leakage areas and identified a material discrepancy: five plots in the leakage area did not have landscape configurations comparable to the project area. The project proponent was required to select different plots.

For non-AFOLU projects that reference CDM tools for calculating leakage, such as from fossil fuel combustion, electricity consumption or transportation, VVBs must ensure that the procedures and criteria specified in the tools have been applied appropriately.

For AFOLU projects, VVBs must assess if the project has accounted for any leakage considered to be significant (ie, greater than the *de minimis* threshold of five percent of total GHG emission reductions and removals) for three types of leakage: market leakage, activity-shifting leakage and ecological leakage. Further guidance on the three types of leakage in AFOLU projects is provided in Section 5.2.6.

For REDD and IFM projects, VVBs must carefully examine all assumptions prior to validating the leakage rate. At each verification event, VVBs must visit leakage mitigation zones (eg, the leakage belt in REDD projects) and, where applicable, inspect the management plans and/or land-use designations of all lands owned by the project proponent to ensure affected lands have not materially changed as a result of the project leakage.

3.2.7 Monitoring Plan

Overview

A monitoring plan includes details about monitoring parameters, schedules and process. The plan must describe the entire system employed by a project proponent for obtaining, recording, compiling and analyzing GHG data and information, as well as descriptions of the roles and responsibilities of those involved. Monitoring plans must be assessed by VVBs to ensure that the GHG emission reductions and removals generated by a project will be measurable and verifiable.

Key Elements

VVBs must confirm that a project's monitoring plan conforms to requirements set out in the applied methodology. In addition, VVBs must assess the relevant data quality management procedures for generating verifiable GHG data and avoiding material errors in reported GHG emission reductions and removals.

Keep in mind

For AFOLU projects that require field measurements to monitor changes in carbon stocks, VVBs must assess whether the project's sampling approach is appropriately documented and in accordance with the guidelines established by the methodology. VVBs must consider whether the monitoring plan includes target precision levels, sample site locations, stratification, number of plots per strata, types of plots used, frequency of measurement and appropriate quality control checks such as a field protocol or standard operating procedures for data collection.

VVBs should consider the following:

- Data monitoring, calibration or other similar procedures need to be consistently performed, according to validated methods.
- Recognized areas of data uncertainty and risks for material error need to be adequately managed through data controls and quality assurance checks.
- Record-keeping practices need to result in the generation of sufficient levels of documentary evidence to support assessment against all relevant criteria.
- Controls and procedures need to be in place to avoid intentional or unintentional alteration or destruction of data.
- Controls need to be in place to ensure participating staff are sufficiently qualified.
- The project proponent needs to demonstrate sufficient management oversight and accountability for the conduct of monitoring procedures.

Discrepancies between a project's monitoring plan and the monitoring requirements in the applied methodology must be cited as a material discrepancy.

3.2.8 Methodology deviations

Overview

Methodology requirements may be impracticable in some specific project circumstances. The VCS Program permits deviations from the applied methodology where they pertain to the criteria and procedures relating to monitoring and measurement. Deviations relating to any other part of the methodology are not permitted and require a methodology revision.

Key Elements

The limited scope of permissible methodology deviations implies that VVBs should be cautious when assessing the validity of proposed deviations. VVBs must ensure that methodology deviations do not negatively affect the conservativeness of the quantification of GHG emissions reductions or removals, except where the deviations result in greater accuracy. VVBs must also note that past methodology deviations are not precedent setting (ie, approval of a particular deviation does not grant approval of the similar deviations in the future).

In most cases, VVBs should be able to recognize whether a methodology deviation relates only to the procedures relating to monitoring and measurement. However, given the interconnected nature of many methodologies, VVBs should be aware that such deviations may have implications on other provisions of

the methodology (eg, equations for quantification) and must assess this possibility when evaluating a proposed deviation.

EXAMPLE – Methodology deviation

A methodology requires the use of a default factor to calculate project emissions and no options are provided for developing an alternative factor. At validation, the project proponent proposes the use of an alternative, peer-reviewed, region-specific factor as a methodology deviation. The project proponent also proposes a new quantification approach that alters the equation for calculating baseline emissions. The VVB rejects the proposed deviation to the quantification approach, citing the fact that the proposed deviation is not specific to the “procedures relating to monitoring and measurement”. However, given that the default factor is a parameter available at validation, the VVB determines that the proposed deviation is allowed. The VVB finds that while use of a regional default factor may result in less conservative quantification of GHG emission reductions or removals, it increases accuracy.

The same methodology requires the use of particular measurement equipment to monitor methane emissions in the project scenario. At validation, the project proponent proposes an alternative model of monitoring equipment due to the particular model specified in the methodology no longer being sold in the market. The project proponent demonstrates that the alternative monitoring equipment does not negatively impact the conservativeness of the quantification of GHG emission reductions or removals.

The project proponent documents the use of a regional default factor and more modern measurement equipment in the project description as methodology deviations. The VVB also documents in the validation report that the deviations are appropriately described and justified, and that the project remains in compliance with VCS rules. The VVB issues a positive validation. At the subsequent verification, the VVB will take note of the methodology deviations when reporting on the implementation of the project activity.

3.2.9 Project Description Deviations

Overview

Projects may be implemented differently from the validated project description, or the project may change over time. Further, project proponents may want to switch to use the latest version of a methodology or a different methodology altogether, recognizing the development and evolution of methodologies. In such cases, the VCS Program allows project description deviations at the time of verification.

Key Elements

Where a project description deviation is proposed, VVBs must first ascertain whether the deviation impacts the applicability of the methodology, additionality or the appropriateness of the baseline scenario. Guidance on these three types of impacts is set out in the CDM *Guidelines on assessment of different types of changes from the project activity as described in the registered PDD*. Determination of whether the deviation impacts any of these three elements must be consistent with the CDM guidance and apply the following conditions:

- Where the deviation impacts applicability of the methodology, additionality or appropriateness of the baseline scenario, the project proponent must describe and justify the deviation in a revised version of the project description. The requirement for a revised project description is in recognition of the deviation being a substantial change to the project.
- Where the deviation does not impact the applicability of the methodology, additionality or the appropriateness of the baseline scenario, and the project remains in compliance with the applied methodology, the project proponent must describe and justify the deviation in the monitoring report. The deviation is documented in the monitoring report in recognition of the deviation being a more limited change to the project.

VVBs are required to assess whether the deviation is appropriately described and justified. VVBs are further required to determine whether the project remains in compliance with VCS rules. The findings and conclusions must be reported in the verification report and the deviation must also be reported on in all subsequent verification reports. Where the assessment results in a negative conclusion, the verification report, and either the monitoring report or revised project description, must be provided to the VCSA, as set out in the *VCS Standard*.

VVBs must have experience of project validation, recognizing that assessment of project description deviations is a validation activity. If the VVB is not accredited or approved for validation for the applicable sectoral scope, it may still proceed if the following conditions are met:

- It holds accreditation for validation in at least one (other) sectoral scope.
- It has completed validation of at least five projects under the VCS Program or an approved GHG program, and such projects have been registered under the relevant program.
- The project description deviation does not impact the applicability of the methodology, additionality or the appropriateness of the baseline scenario (see the *VCS Standard* for further information on such deviations).

Note also that past project description deviations are not precedent setting (ie, each deviation must be assessed upon its merits and approval of similar deviations does not provide a sufficient basis for approval).

EXAMPLE – Project description deviation

A registered REDD project is undergoing inventory field work in preparation for the initial verification. While processing the inventory data, the project proponent realizes their GIS technician committed a processing error that resulted in incorrect mapping of the project area, leading to an omission of five percent of the project area. At verification, the project proponent proposes, through a project description deviation, expanding the project area to include the forests mistakenly excluded from the project area. The project proponent documents that the expansion would not have an impact on the applicability of the methodology, appropriateness of the baseline scenario nor additionality of the project. The VVB, determines that, consistent with the *CDM Guidelines on assessment of different types of changes from the project activity as described in the registered PDD*, the addition of project activity sites may impact the validity of the investment analysis or barrier analysis as validated in the project description. The VVB requests that the project proponent describe and justify the deviation in a revised version of the project description.

A registered ARR project undergoes a change in management that results in modifications to various silviculture techniques. The project proponent now conducts re-planting, fertilization and other management approaches in a manner unlike how it was reported in the project description. The project proponent describes the new techniques in the monitoring report and justifies that the deviation does not have an impact on the applicability of the methodology, additionality or the appropriateness of the baseline scenario.

When assessing these deviations, the VVBs conclude in each verification report that the deviations are appropriately described and justified, and that the projects remain in compliance with VCS rules. At the subsequent verification, the VVBs will take note of the deviation when reporting on the implementation of the project activity.

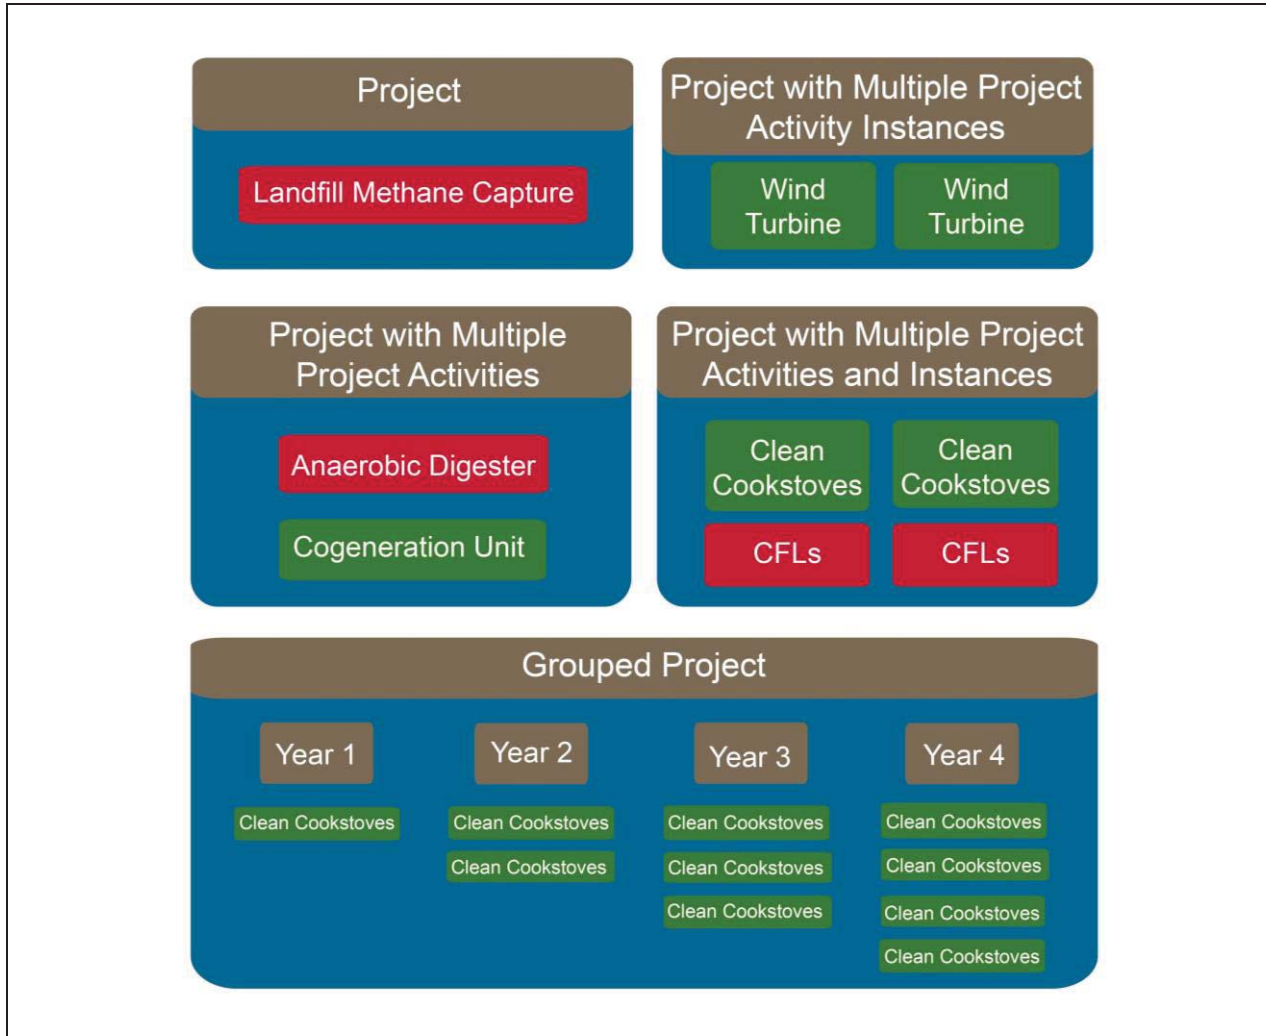

3.2.10 Projects with Multiple Project Activities or Multiple Project Activity Instances

Overview

Under the VCS rules, project proponents can combine multiple project activities or multiple project activity instances within one project. Project activity refers to the set of technologies or measures that generate GHG emission reductions and removals set out in a given methodology. Project activity instance refers to

an individual unit of a project activity. For example, if the project activity is the implementation of efficient cookstoves, each individual cookstove represents a project activity instance. Diagram 1 below provides a schematic overview of the five project configurations that are allowable under the VCS Program.

Diagram 1: Project Configurations Allowable Under VCS Rules

Key Elements

Projects with multiple instances of project activities or multiple project activities need only one project description and a single validation is undertaken.

For projects with multiple instances, the demonstration and assessment of baseline and additionality is combined, because multiple project activity instances are undertaken as part of the same investment decision.

A project with multiple project activities refers to the implementation of different types of project activities and can entail the application of a combination of methodologies. VVBs must perform the assessment of baseline and additionality separately for each project activity, except where these can be integrated by using the same tool and/or procedures for each activity (eg, generation of electricity from methane captured in an anaerobic digester). In addition, VVBs must consider

whether the project proponent has provided sufficient evidence to establish the impracticality of a separate demonstration of additionality. For example, multiple additionality assessments are unnecessary where a project proponent implements different project activities at a single facility such as the installation of an anaerobic manure digester and electricity generation system on a farm. However, where a project

Keep in Mind

VVBs should consider whether multiple project activity instances are simply separate projects.

For example, where instances are geographically distant, baseline and additionality characteristics for these instances may be quite different, given that common practice, local laws and other characteristics may vary. VVBs should assess whether aggregated baseline and additionality assessments would yield the same outcome as an individual assessment of each instance.

EXAMPLE – Projects with multiple instances of project activities

Deciding whether baseline identification and additionality demonstration can be performed jointly or separately depends on the circumstances of the project activity instances. The following two examples require different approaches:

1. A wind energy project with total capacity of 12.5 MW comprises ten wind turbine generators of varying capacities. All the wind turbines are located in the state of Karnataka, India and were commissioned between 2010 and 2012. The electricity generated is sold to the state electricity supply company on the basis of power purchase agreements. Based on the baseline scenario and additionality assessment, the VVB concludes that the project activity conforms to the VCS definition of a project with multiple instances. The baseline identification and additionality demonstration for the ten wind turbines can be performed jointly.
2. A landfill gas project captures methane for electricity production at three different landfill sites, located in the states of Colorado, Virginia and Texas in the United States. Different local regulations apply at each site, and waste management practices also differ. The VVB concludes that the identification of the baseline and demonstration of additionality cannot be done jointly for the three landfills, and each site would need to be considered as a separate project.

includes implementation of energy efficiency retrofits on one site and implementation of fuel switch on another site, the VVB should assess whether both project activities emanate from a single investment decision.

3.2.11 Grouped Projects

Overview

VCS rules for grouped projects allow for the expansion of project activities over time and over a geographically dispersed area. New project activity instances can be added to the project over time (ie, following initial project validation) within predefined geographic areas, provided they meet the set of eligibility criteria set out in the project description. The new instances are validated at the time of verification.

In keeping with the intent of the CDM rules on Program of Activities (PoA), the VCS rules on grouped projects are intended for programmatic initiatives that are typically managed by a central coordinating entity. The rules are designed to facilitate the scaling up of project activities where the GHG emission reductions generated by each project activity instance are small. Examples of activities well suited to the grouped project approach include solar home systems, installation of efficient lighting and installation of clean cookstoves.

Key Elements

VVBs should focus on the following key elements when validating grouped projects:

- Geographic areas: VVBs must ensure that the project description clearly identifies the geographic areas within which new instances may be added. Geographic areas must be defined using geodetic polygons and provided in a KML file. Such geographic areas need not be contiguous and may be large or small, noting the grouped project requirements for additionality and baseline assessments of the geographic area.
- Identification of baseline scenario and demonstration of additionality: The assessment of baseline scenario and additionality is based upon the initial instances included within each geographic area. VVBs must ensure that, for each project activity, a single baseline scenario exists for each geographic area. VVBs must also ensure for each project activity that additionality is demonstrated across the entirety of each geographic area. Failing this, VVBs must require that the geographic areas are redefined such that the requirements are met. As with projects with multiple instances, project activity instances within a grouped project should be part of the same investment decision if they are to be included in a single project.
- Eligibility criteria: VVBs must ensure that an appropriate set of eligibility criteria are established for each combination of project activity and geographic area. The criteria are

used to validate new project activity instances, essentially serving as a checklist to determine whether the instances share the same attributes as the initial set of validated project activities instances. For example, eligibility criteria for grouped projects implementing CFLs may state that new instances must be installed in grid-connected households and the CFLs must be at least 30 percent more expensive compared to conventional incandescent bulbs. In general, VVBs must ensure that the eligibility criteria are developed sufficiently that such determinations could be made when validating new instances. Eligibility criteria must also conform to any restrictions set out in the methodologies applied.

- **Monitoring and GHG information system:** VVBs must ensure that the project has an appropriate monitoring plan that includes a sampling plan to collect data from all project activity instances and information systems, allowing for centralized data collection. VVBs must ensure the sampling plan is able to generate statistically significant results.
- **Methodology:** Grouped projects can apply methodologies other than those designed specifically for grouped projects. When reviewing the methodology and the project's application of it, VVBs must be mindful of any capacity limits applicable to the methodology. VVBs need only ensure that project activity instances and clusters adhere to such capacity limits; the grouped project as a whole may exceed the capacity limit.

3.2.12 Assessing Non-Permanence Risk

Overview

AFOLU project proponents must complete a self-assessment of the potential transient and permanent losses to their project's carbon stocks over a 100-year period. The VCS *AFOLU Non-Permanence Risk Tool* generates risk ratings that are applied to the net change in the project's carbon stocks, thereby determining the number of credits that the project proponent deposits into the reserve of non-tradable credits, the AFOLU pooled buffer account. At verification, VVBs must assess the project's non-permanence risk based upon the project's *Non-Permanence Risk Report*.

Key Elements

The non-permanence risk rating only needs to be assessed for projects with GHG emission sources or sinks that can be reversed. GHG project activities are not subject to buffer withholding if they do not store carbon in biomass or carbon pools, such as projects that reduce N₂O, CH₄ or fossil-derived CO₂.

Risk factors are classified into three categories: internal risks, external risks and natural risks. The risk tool assesses internal risk further by evaluating sub-categories: project management, financial viability, community engagement and project longevity.

VCS GUIDANCE

When assessing the non-permanence risk report for AFOLU projects, VVBs must refer to the most recent version of the risk tool and assess whether the project meets the risk threshold identified for each risk category and the project as a whole.

In assessing risk factors, VVBs should pay particular attention to the following:

- When assessing internal risk, VVBs must evaluate the risk that project activities will not be continued in the future. VVBs should note that the project proponent does not have to provide evidence of project ownership for the entire project longevity. Rather, the project proponent must demonstrate it can obtain and maintain project ownership for the entire project crediting period. For example, evidence of project ownership for a 10-year period is acceptable if project ownership is renewable at the end of 10 years.
- For all AFOLU project types, the entire project longevity must be covered by management and financial plans that demonstrate the intention to continue the management practices. The project longevity risk rating is determined by whether the project proponent has a legal agreement or requirement to continue the management practice. A legal agreement or requirement must be in place to continue the management practice. A legal agreement to protect land, such as national designation as a protected area, is insufficient to demonstrate that a management practice will continue for the

Keep in Mind

If a project proponent is aware that part of the project area has comparatively greater risks, the project area can be stratified for the purpose of the risk analysis. The VVB would assess the non-permanence risk for each stratified project area. The risk rating would then apply to the net change in the project's carbon stocks of the respective stratified area.

EXAMPLE – Assessing Non-Permanence Risk

A wetlands rewetting and conservation (WRC) project in Malaysia began implementing activities to conserve an undrained peatland in 2005. The project was verified in 2011. In preparing a non-permanence risk assessment, the project proponent evaluated the project's financial viability and opportunity cost based on, among various factors, previously secured funding and alternative land uses developed prior to the project start date.

However, a major donor discontinued funding for the project in 2010. Meanwhile, growing oil palm demand led to a significant increase in the land value of the project's surrounding areas, compared to the 2005 land value. The project's opportunity cost increased with respect to its main alternative land use, which the project proponent identified as draining peatland for oil palm production.

Upon verifying the non-permanence risk assessment, the VVB noted a non-conformance that the project proponent did not correctly apply the risk tool. The project proponent improperly estimated the cumulative cash flow breakeven point and the net present value (NPV) based on data and information from the project start date and not information from the date of the current assessment.

The project proponent revised the risk assessment for both financial viability and opportunity cost and estimated risk based on the most recent data available from the date of the assessment.

length of the project.

- Projects with longevities of less than 30 years are not permitted under the VCS, and VVBs in such cases must fail the risk assessment.
- While risk is assessed over a 100-year period from the start of the current monitoring period, the analysis should be based on data and assumptions that accurately reflect current conditions, not past or future circumstances, when determining all risks, including the opportunity costs and financial viability.
- When assessing the cumulative cash flow breakeven point, VVBs must evaluate whether recurring capital expenditures have been accounted for in the breakeven analysis.

3.3 KEY ELEMENTS OF THE VALIDATION AND VERIFICATION PROCESS

3.3.1 Sampling, Validation and Verification Plans

Overview

Sampling plans and associated validation or verification plans describe the planned validation or verification activities and schedules. These plans also address what data and information will be sampled and how it will be tested. A robust sampling plan is critical in ensuring the robustness of the validation or verification.

Key Elements

In developing sampling, plans, VVBs must consider the objectives, scope, criteria, materiality and level of assurance for the proposed validation or verification assessment.

3.3.1.1 Sampling Plans

A sampling plan should describe: risks of material error, types of data and information to be assessed, methods to be used to assess the data and information, and the amount of each type of data or information to be assessed.

To determine each of these, a VVB must first conduct a risk assessment to identify areas that may potentially result in material discrepancy.

Risk assessments must follow the guidelines set out in Annex A.2.4.6 of *ISO 14064-3* and include, at minimum, reviews of the following:

Keep in Mind

Sampling applies to both quantitative and qualitative data and information. Qualitative information (eg, procedures or applicability) is particularly relevant for validation. Quantitative data (eg, monitored results) is a principal focus at verification.

- **Background information:** Contextual information is provided to help readers understand the nature, scale and complexity of the project.
- **Potential sources of material error:** Potential sources of material error will differ for validation and verification, reflecting the different objectives as set out in Section 2.1.
- **GHG information system controls:** Controls are needed to avoid or correct errors (ie, control risk) for each source of potential material error. Consideration should be given to the full data chain of custody for all relevant data types, considering potential risks of error at each step in the chain.
- **Residual risks:** Any areas of risk not adequately addressed by the control systems should be identified for inclusion in the sampling plan. *ISO 14064-3* identifies a range of testing methods that can be employed alone or in combination to assess a particular residual risk.

Keep in Mind

Data and information vary in reliability. *ISO 14064-3* delineates three general types of evidence in order of decreasing reliability:

- **Physical:** directly observable such as witnessing a meter calibration.
- **Documentary:** written or electronic records, logs, data or procedures.
- **Testimonial:** verbal information gathered through interviews.

For less reliable sources of evidence, cross-checking should be used.

Given that physically observed data is considered most reliable, and that VVBs are required to provide a reasonable level of assurance, site visits must be included in validation and verification plans.

3.3.1.2 Data Testing Methods and Determining Representative Samples

VVBs may employ several testing methods, including, *inter alia*: simple random sampling, stratified random sampling, systematic sampling, cluster sampling and multi-stage sampling.

Choice of testing method (or combination of methods) will depend on the data in question and the nature and extent of risks identified. VVBs should apply their professional judgment in determining the most appropriate method. VVBs are encouraged to use the following resources as guidance:

- *Standard for Sampling and Surveys for CDM Project Activities and Programme of Activities (PoAs);*
- *IPCC 2006 Guidelines for National Greenhouse Gas Inventories;*
- *IPCC 2003 Good Practice Guidelines for Land Use, Land-Use Change and Forestry.*

Multiple cross-checking methods are advisable where data is less reliable. VVBs must also determine the amount of data required for the assessment (eg, how many data points or records) by selected methods. Data samples must be representative of the whole data set and reflect the risk assessment.

3.3.1.3 Validation and Verification Plans

VVBs must prepare validation and verification plans that describe the schedule of validation or verification activities, documents to be reviewed, locations to be visited, validation or verification team duties, and associated logistical details and arrangements.

Design of the validation or verification plan must be informed by the sampling plan.

EXAMPLE – Sampling and Verification Plan

A gas-to-biomass fuel switching project using a methodology for fuel switch from fossil fuels to biomass residues for thermal power is undergoing its first verification. During the risk assessment portion of sampling plan development, the VVB identified baseline emissions from fossil fuel combustion for heat generation ($BE_{HG,y}$) as a key emission source with potential for material error. The equation used to calculate $BE_{HG,y}$ is as follows:

$$BE_{HG,y} = \frac{HG_{PJ,biomass,y} \times EF_{FF,CO_2,y}}{\eta_{heatFF}}$$

Where:

$BE_{HG,y}$	=	Baseline emissions from fossil fuel combustion for heat generation in the heat generation equipment (tCO ₂ e/yr)
$HG_{PJ,biomass,y}$	=	Heat generated with incremental biomass residues used as a result of the project activity during the year y (GH/yr)
$EF_{FF,CO_2,y}$	=	CO ₂ emission factor of the fossil fuel type displaced by biomass residues (tCO ₂ e/GJ)
η_{heatFF}	=	Average net efficiency of the heat generation equipment if fired with fossil fuels in the baseline (ratio)

Below is a simplified summary of related details on the sampling plan. In developing the verification plan, the VVB ensured that the site visit was scheduled to correspond with a scheduled calibration event, sufficient time was allocated to perform the planned data sampling and testing, and appropriate verification team members were assigned to specific tasks.

Potential Discrepancy	Reporting Risk	Control Risk	Planned Sampling and Testing
$HG_{PJ,biomass,y}$	Meter Calibration	Medium (use of non-accredited firm)	Physically observe calibration firm conducting calibration Review all calibration logs Interview calibration technicians
	Data entry and storage in spreadsheet	Very low (automated data acquisition and uploading; validated previously)	Trace back limited sample data to raw data High level review of dataset to ensure continuity of data over reporting period
$EF_{FF,CO_2,y}$	Data entry and storage in spreadsheet	Medium (manual entry to spreadsheet)	Review spreadsheet to confirm that validated values are used
$\eta_{heat,FF}$			
$BE_{HG,y}$	Spreadsheet used for calculations	Low-Medium (good access controls, validated previously)	Recalculate a limited sample of daily results

3.3.1.4 Updating Sampling, Validation and Verification Plans

As data are sampled and tested, VVBs will likely need to change the initial risk assessments. VVBs must update sampling, validation and verification plans in an iterative manner according to increases or decreases in the perceived level of risk. Some situations may necessitate extending the validation or verification schedule or number of sites visited. Adjustments, while potentially inconvenient and involving some cost, are necessary to ensure that a reasonable level of assurance can be provided.

3.3.2 Resolution of Material Discrepancies and Clarification Requests

Overview

Resolution of identified actual or potential material discrepancies is an important part of finalizing a validation or a verification. All identified discrepancies and areas for clarification must be clearly communicated to the project proponent, addressed and transparently documented.

Key Elements

Validation and verification almost always result in the identification of areas requiring further clarification and discrepancies that must be addressed. VVBs must clearly document the following:

- Clarification requests (CLs): Project reporting lacks transparency and further information is needed to determine if a material discrepancy is present.
- Corrective action requests (CARs): The VVB has identified a material discrepancy or non-conformance that the project proponent must address.

When issuing CLs and CARs to project proponents, the following guidelines apply:

- VVBs must be careful not to offer consulting advice when issuing CARs such as how to address noted deficiencies. Otherwise, the independence of the VVB is called into question.
- The VCS validation and verification reporting templates require that VVBs document the process used to resolve material discrepancies (not just the discrepancies themselves).
- VVBs must document all identified CLs and CARs and summarize the CLs and CARs in the validation or verification report.
- All CLs and CARs need to be fully resolved prior to issuance of a positive validation or verification statement. In the case of validation, it is unacceptable for VVBs to leave material discrepancies unresolved (eg, deficiencies in a project's data management system), which a verifier may need to ensure is addressed at a later date.

3.4 COMMON TECHNICALLY CHALLENGING AREAS

During validation and verification, common areas of technical challenge arise across a wide variety of projects and methodologies. This section identifies some common issues and provides related guidance.

3.4.1 Complete Identification of GHG Sources, Sinks and Reservoirs

Overview

A key component of assessing project and baseline emissions is the complete identification of relevant GHG sources, sinks and reservoirs. While the methodology identifies the relevant types of GHG sources, sinks and reservoirs, the project proponent must determine the specific sources, sinks and reservoirs present and ultimately quantified for a given project.

Key Elements

Identification of a complete set of relevant GHG sources, sinks and reservoirs can be challenging, especially for large or complex project sites, or where the project involves multiple sites. For many projects, this can be a potential source of material error.

During validation, VVBs must first assess the project proponent's process for identifying relevant emission sources (eg, how systematic was the process and who was involved in carrying it out?) to identify the associated control risk. The sampling plan could then be developed accordingly. In addition to review of engineering drawings and interviews with key staff, careful attention during site tours (if the facility has already been constructed) can be effective in confirming identified GHG sources, sinks and reservoirs.

During verification, the verification team must not only visit all relevant sites but also sample an adequate number of sites based on a risk assessment.

In both validation and verification, the assessment team will need sufficient technical experience related to the methodology and project technology. Deficiencies in this area have in the past led VVBs to overlook material discrepancies.

3.4.2 Calibration

Overview

Calibration of monitoring equipment is critical in ensuring accurate reporting of results. This is a common problem area for projects. Calibration is frequently conducted incorrectly or at inappropriate times. The result is often a material impact on the reported emission quantifications.

Key Elements

Calibration problems can often be traced to poor calibration procedures, including communication of calibration schedules and associated record keeping. Problems are also common when unqualified or inexperienced technicians are employed.

Calibration is an issue for both validation and verification. During validation, VVBs must focus on ensuring that calibration plans meet the requirements specified in the applied methodology and/or by the equipment manufacturer. Calibration schedules need to be clearly presented and communicated to relevant staff. It should also be clear how verifiable records of calibration will be generated.

During verification, attention must be placed on reviewing objective evidence, demonstrating that calibration was performed according to plan. Depending on assessed risk and project type, the use of cross-referenced data and information is recommended. Best practice examples include timing a site visit to align with a calibration event, reviewing calibration logs and/or interviewing the individual(s) conducting the calibration (which often involves outside service providers).

Determining minimum required experience or qualifications for a calibration technician or organization can be challenging. Ideally, the project uses calibration organizations accredited to relevant standards. Other non-accredited organizations may also perform calibrations if permitted by an equipment manufacturer's specifications and the relevant methodology. Ultimately, VVBs must assess whether calibration practices follow current good practice as required by Clause 5.10 of *ISO 14064-2* and meet any requirements

EXAMPLE – Calibration

A landfill gas destruction project in the United States has developed a VCS project using a consolidated methodology for landfill gas project activities. In order to minimize the risk of calibration drift in gas flow meters, the project proponent established a quarterly field check schedule.

During verification, the VVB discovered that planned quarterly checks were missed, and only single checks at the beginning and end of the annual reporting period were conducted. The final check showed that the calibration had drifted significantly, over-reporting gas flows by 10 percent. The monitoring report was based on unadjusted meter readings.

The VVB cited two material discrepancies:

1. Material error of up to 10%: To resolve this issue, the project proponent conservatively assumed that the meter over-reported flows by 10% for the entire monitoring period.
As a result, the proponent discounted measured flows (and thus reductions) for the entire year by 9.1 percent [$10 \div (100 + 10)$].
2. Non-conformance with the validated monitoring plan: To resolve this issue, the project proponent submitted a project description deviation applicable to the reporting period, justifying the conservativeness of the alternative approach. The project proponent also identified why the scheduled checks were missed and enhanced associated monitoring and quality assurance procedures accordingly.

specified in the methodology. To avoid significant challenges during verification, it is important that these procedures are carefully scrutinized during validation.

3.4.3 Emission Factors, Measurement Abbreviations and Conversion Factors

Overview

Emission factors, conversion factors and measurement abbreviations, while often taken for granted, are all common areas where material errors may be introduced into the quantification of GHG reductions and removals.

Key Elements

Accuracy is contingent on proper use of the factors and assumptions embedded in GHG calculations. Accuracy likewise relies on proper understanding of any abbreviations or industry-specific language. The following are examples of factors and abbreviations:

- Emission factors (eg, tCO₂e per MWh electricity, tonne CO₂e per m³ natural gas);
- Conversion factors (eg, BTU/m³, g/L, kg/tonne, GWPs);
- Measurement abbreviations (eg, MMBTU, SCF, kt, Nm³).

VVBs must ensure that factors and abbreviations are appropriate and meet the requirements of the applied methodology. VVBs must ensure the sampling and testing are appropriate for the assessed risk. Spreadsheets can pose significant risks, especially where associated data quality controls are minimal.

Experience from a range of GHG programs indicates that VVBs tend to devote insufficient time to sampling and testing emission factors, conversion factors and measurement abbreviations. Errors often emerge when spot checks are conducted by program administrators.

3.4.4 Models

Overview

Models are powerful tools used to provide GHG data where direct monitoring or simple estimation is not possible or practical. Models can, however, be complex. Results are sensitive to various inputs and key assumptions, making them a common source of material error.

Key Elements

Models can range from simple (eg, expressed as a single equation) to complex (eg, comprised of many equations incorporated into modeling software). Models can estimate emissions directly (eg, a landfill gas

generation model) or indirectly (eg, a forest growth and yield model that estimates changes in amount of woody biomass). There are two broad uses for models:

- Estimating *ex-ante* GHG data in a project description (eg, use of the CDM *Tool to determine methane emissions avoided from disposal of waste at a solid waste disposal site* to estimate *ex-ante* baseline emissions for a landfill gas project).
- Estimating *ex-post* GHG data in a monitoring report (eg, use of a forestry model that meets the requirements of VCS methodology VM0003: *Methodology for Improved Forest Management through Extension of Rotation Age* to estimate *ex-post* carbon stock changes in the baseline).

Given that models are often complex and have inherent uncertainty, VVBs must ensure that applied models apply conservative factors to discount for model uncertainty and use conservative assumptions and parameters that are likely to underestimate, rather than overestimate, the GHG emission reductions or removals. VVBs must also ensure that sufficient empirical testing has been conducted to calibrate the model accurately for the project. For example, where a forest growth and yield model is used to estimate change in carbon stocks, the model may need to be calibrated and/or validated through field measurements and compared against inventory data to ensure the appropriateness of the model for the project. Model results should be subjected to sensitivity analysis, taking into account variation in input parameters. It is also important that the validation or verification team include an expert experienced in the application of the particular model to ensure its correct use.

Keep in Mind

Key questions to consider when reviewing factors and abbreviations include:

- Is the factor appropriate for the project or baseline technology, fuel type, geographic location and time period?
- Are the correct units being used?
- Has there been confusion between CO₂ and CO₂e?
- Has there been confusion between GHGs such as CO₂ and CH₄?
- Have the VVB and project proponent clearly understood the abbreviations?
- Have the abbreviations been used correctly in the calculations?
- Have metric and imperial units been confused?

4 | Project Validation and Verification Reporting

Project validation and verification reporting is central to the transparency of validation and verification processes. Reporting provides a means for VCSA and other stakeholders to better understand VVB findings and supporting rationale. This ultimately increases market confidence in the VCS Program and its projects and VCUs. Reports are also an important tool during subsequent verifications, as they can provide useful inputs to a VVB's risk assessment.

4.1 REPORT TEMPLATES

Overview

The VCS Program ensures consistent VVB reporting by requiring the use of validation and verification report templates. Guidance is contained within each template to assist VVBs in properly documenting processes, findings and conclusions.

Key Elements

When preparing a validation or verification report, VVBs must address, at minimum, the specific items detailed within the VCS templates (*VCS Validation Report Template* and *VCS Verification Report Template*, respectively) and adhere to the structure of the template. However, VVBs can provide additional information. VVBs are encouraged to include additional documentation as annexes to the reports where needed.

The report templates have been developed to ensure both a minimum level of transparency in reporting and consistency in work undertaken by different VVBs. Both templates are structured in a similar manner covering the following key areas:

- **Introduction:** Covers objectives, scope, criteria, level of assurance and project description.
- **Process:** Addresses methods, objectives and criteria, including the sampling plan used to undertake the validation or verification.
- **Findings:** Identifies, discusses and justifies findings in specific areas identified in the templates.

- **Conclusions:** Provides a clear statement of conclusions, addressing specific items identified in the templates.

The verification template also includes a section for reporting on the validation process, findings and conclusions, which VVBs need to complete where a methodology deviation or project description deviation is applied to the project or where new project activity instances are added to a grouped project. In some cases, verification may also include gap validation of a project that is registered sequentially under the VCS and another approved GHG program.

4.2 REPORTING LEVEL OF DETAIL

Overview

A sufficient level of information and detail must be provided in validation and verification reports to allow readers to understand the validation or verification process and draw informed conclusions about the project.

Key Elements

Understanding the appropriate level of detail for reporting is a common challenge for VVBs. Reporting is simplified through various report templates where VVBs are instructed whether to provide more descriptions or more detailed discussion and justification.

All sections of the templates, other than validation or verification findings, require only a description. VVBs must indicate the activities conducted, methods used, criteria applied and other information as appropriate. Descriptions should be succinct, while providing enough detail for the reader to understand what approaches were taken. VVBs are not required to include details on why they pursued a chosen course of action.

In contrast, the validation and verification findings sections of the templates require the identification, discussion and justification of all conclusions. VVBs must not only indicate findings but must also provide details on the following:

- Project proponent assertions;
- Types and amounts of evidence sampled and tested;
- Material and non-material discrepancies identified and how they were addressed; and
- Results of data testing that support the validation or verification conclusions.

VVBs must also ensure that reports contain an itemized breakdown of GHG emission reductions and removals where appropriate. For example, where the net emission reductions and removals is the sum of

emission reductions and removals from changes in soil carbon, changes in both belowground biomass and aboveground biomass, as well as emission reductions and removals from each of the carbon pools must be stated and verified separately.

Where the monitoring report includes vintage breakdowns, the verification report must verify the emission reduction and removal volume for each vintage period specifying the exact start dates and end dates of the vintage period. This is required if VCUs are to be issued according to any vintage period breakdown in the monitoring report.

It is not necessary to provide detailed information such as the results of individual recalculations, notes from interviews and meetings, or detailed observations from site visits. This detailed information should still be retained outside of the validation or verification report in the form of validation and verification records. Such records assist VVBs in demonstrating conformance to *ISO 14064-3* and *ISO 14065* (eg, as part of accreditation assessment and surveillance). VCSA may also request such records as part of program oversight.

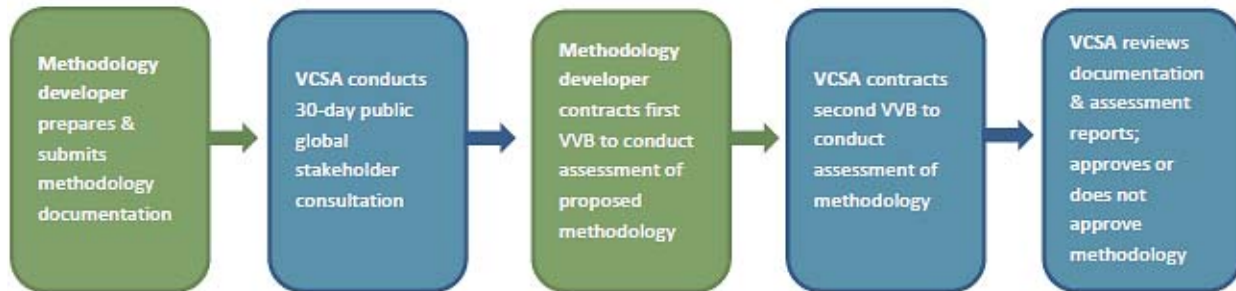

5 | Methodology Assessment

The VCS Program provides a unique, bottom-up approach to methodology development that incentivizes project proponents or other market participants to create new methodological approaches for accounting for GHG emissions reductions or removals in eligible sectoral scopes. Ensuring that VCS methodologies are robust is integral to quality assurance of the VCS Program. This section sets out guidance that VVBs are expected to follow when conducting methodology assessments.

5.1 GUIDANCE ON KEY ELEMENTS OF METHODOLOGY APPROVAL PROCESS

Assessment of new methodologies, methodology revisions, modules and tools are guided by the requirements and procedures set out in VCS document *Methodology Approval Process*. Methodologies submitted to VCS undergo a 30-day public consultation period followed by two independent assessments by qualified VVBs. Where both VVBs approve a methodology, VCSA conducts a final review prior to approving the methodology. Diagram 2 shows the main stages in the methodology approval process.

Diagram 2: Main Stages in the Methodology Approval Process

5.1.1 Key Elements of the Process

The methodology approval process is designed in stages that are sequential. VVBs conducting methodology assessments should bear in mind the following:

- **Initial VCSA review:** VCSA undertakes a review of all methodology elements submitted under the methodology approval process. The purpose of the initial methodology review is to ensure that the methodology documentation has been completed in accordance with VCS rules and is of a sufficient quality to enable its assessment under the VCS methodology approval process. The methodology developer may need to revise the methodology as a result of the preliminary VCSA review. VCSA may not accept methodologies into the process where they are not of the requisite standard or not in compliance with VCS rules. VCSA may also not accept methodologies that sanction politically or ethically contentious project activities or otherwise undermine the integrity of the VCS Program or broader carbon market. VVBs who are contacted to begin first assessment should therefore confirm whether VCSA has already accepted the methodology into the approval process and completed its preliminary review.
- **Public consultation:** Methodologies that have completed the initial VCSA review are posted for a 30-day public comment period. The VCSA will also host a webinar on the methodology during the public comment period.
- **First assessment:** The first assessment report cannot be issued before the public comment period concludes. This allows the methodology developer to take into account any public comments. It also allows the VVB to undertake an assessment of, and to document, how such comments were taken into account.
- **VCSA review:** VCSA reviews the methodology and the associated assessment report once the first assessment has been completed. VCSA may hire external experts as part of this review. Any CLs and CARs emerging from this review will need to be addressed by the developer during second assessment. VCSA may also issue CLs and CARs that the VVB

would need to address if the review indicates that the methodology has not been assessed in accordance with VCS rules. If CLs and CARs issued by VCSA are not satisfactorily addressed by the VVB, VCSA reserves the right to not accept the assessment report.

- Second assessment: The second assessment needs to include a review of the first assessment report and the most recent version of the methodology element. The second assessment report cannot be issued until the first assessment report has been issued. The second assessment must also take account of the findings from VCSA review. Where CARs issued by the first assessor cannot be resolved in a reasonable time frame, second assessment may begin once the draft first assessment report has been issued. The first and second assessors can simultaneously review unresolved CARs. All such CARs must be closed out before the respective VVB can issue the final first and second assessment reports.
- VCSA review: The VCSA review at this stage entails a thorough review of the methodology document and the second assessment report. Any CLs and CARs resulting from the VCSA review need to be addressed in the methodology and the second assessment may also need to be updated as necessary. VCSA may also issue CLs and CARs that the VVB would need to address if the review indicates that the methodology has not been assessed in accordance with VCS rules. If CLs and CARs issued by VCSA are not satisfactorily addressed by the VVB, VCSA reserves the right to not accept the assessment report.
- Reconciliation: Once the second assessment is completed, both VVBs need to approve the same final version of the methodology. The VVB who performed first assessment needs to update the first assessment report statement to take account of changes made to the methodology during second assessment. VVBs conducting a first assessment should therefore consider the time and costs of reviewing the methodology following second assessment.
- Final VCSA review and approval: VCSA undertakes a final review of the methodology when the developer submits the final version of the methodology document along with the final versions of the two assessment reports and a signed methodology approval request form. VCSA may make minor edits and clarifications in the methodology as part of the final review and approval process to ensure that methodologies approved under the VCS are written clearly and apply consistent terminology and formatting.

5.1.2 Role of the VVB

Under the methodology approval process, two VVBs are required to independently assess the methodology. The methodology assessment process is a desk review process that involves a thorough review of all the elements of a methodology as set out under the *Methodology Approval Process*. Methodology assessments typically entail an iterative review where the VVB issues CLs and CARs that must be addressed by the developer until the issues are resolved satisfactorily.

Methodology assessments require background research, document reviews, and interviews with experts and key stakeholders to determine whether criteria and procedures described in the methodology conform with the requirements and principles set out in the *VCS Standard* as well with scientific best practice. VVBs must also carefully evaluate the underlying assumptions and conceptual approaches that are used in methodology and explain whether and how the methodology takes into account relevant scientific and sector specific considerations.

VVBs conducting methodology assessments need to meet the eligibility criteria set out in the *Methodology Approval Process*. VVBs are responsible for assembling competent and qualified teams to undertake methodology assessments. VVBs must consider sector-specific competencies and capabilities of personnel when building assessment teams. VVBs must also ensure teams include an appropriately qualified, independent technical reviewer.

Some VVBs contract external experts as consultants where a methodology requires detailed technical or scientific expertise in a sector for which it does not have in-house expertise. For non-ARR AFOLU methodologies and methodologies that use a standardized methods, at least one of the VVBs must include in its assessment team a VCS-approved expert for the given project type. In many project types, the science or technology within a sector is continually evolving and experts play a key role in ensuring that a methodology reflects scientific best practice.

5.1.3 Role of VCSA

VCSA is responsible for managing the methodology approval process and for providing support and oversight to ensure that approved methodologies are consistent with VCS rules.

Each methodology submitted to the methodology approval process is assigned a program officer who is responsible for facilitating communications across the relevant stakeholders and for conducting a review of the methodology at various stages of the process. VCSA reviews methodologies upon initial submission of the methodology (before the methodology is posted for public consultation), after first assessment and after second assessment.

VCSA is also responsible for overseeing the second assessment. VVBs conducting second assessment sign a contract directly with VCSA (rather than the methodology developer). This agreement clarifies that

the VVBs' client is VCSA and ensures VCSA has the ability to oversee second assessment even while the methodology developer is responsible for financing the assessment. During second assessment, it is important that VVBs inform VCSA of progress related to all relevant milestones. Where milestones are not met in a timely manner, VCSA reserves the right to terminate the agreement and contract an alternative VVB following consultation with the methodology developer.

5.1.4 Effective Communications

Close communications between the methodology developer, the VVBs and VCSA is critical in ensuring that the methodology assessment is completed in a timely, efficient and robust manner. The VCSA program officer managing the methodology can help facilitate communication where appropriate. The program officer can also provide clarifications on VCS procedures and requirements as needed.

5.1.5 Seeking Clarifications from VCSA

If there is a lack of consensus on the methodology element between the methodology developer and VVBs, or between VVBs, either party may request that VCSA provide clarification or facilitate additional discussions between all parties to resolve the issue. While the VVBs are ultimately responsible for assessing the methodology element, the clarifications provided by VCSA may, in certain cases, take precedence over assessment findings of the VVBs.

5.2 KEY ASSESSMENT CRITERIA

Methodologies set out the detailed criteria and procedures that project activities must follow. Detailed requirements for methodologies are set out in the *VCS Standard* and other accompanying program documents such as the *AFOLU Requirements* and *ODS Requirements*.

When conducting a methodology assessment, VVBs need to assess whether the methodology conforms to VCS rules and whether the methodology has appropriate criteria and procedures to ensure conservativeness and scientific integrity.

VVBs must also ensure that methodologies are written in a manner that provides a prescriptive set of criteria and procedures that projects can apply and VVBs can audit against, thereby minimizing the scope for subjective interpretation, or gaming, by project proponents and VVBs using the methodology. This includes the use of precise language and the avoidance of vague terminology. For example, VVBs must ensure the proper use of key words *must*, *should* and *may*. Consistent with best practice, *must* is to be used to indicate a firm requirement, *should* is to be used to indicate a (non-mandatory) recommendation and *may* is to be used to indicate a permissible or allowable option. The term *shall* is reserved for VCS program documents and is generally not appropriate for methodologies.

VCS GUIDANCE

Methodology assessments must focus on whether and how the methodology addresses the components set out in the sections below.

Keep in mind

Methodologies must not restate VCS requirements. For example, VCS requirements on project crediting period should not be included in the methodology. Where necessary, methodologies may make reference to the VCS rules directly to prevent methodologies from becoming outdated, should it be necessary to update a specific VCS requirement. References to specific tools or VCS Program documents must not state specific versions but rather refer to *the most recent version* of the tool or document.

Where methodologies include definitions, VVBs must ensure that the definitions are consistent with VCS definitions. If methodologies contain definitions not included in the *Program Definitions*, or the methodology contains more narrowly defined terms than in the *Program Definitions*, such methodology definitions need to be noted within the methodology element. In addition, VVBs must ensure that terms are used consistently across the methodology.

5.2.1 Applicability

Overview

The applicability conditions set out the criteria for determining which projects are eligible under the methodology. These may include conditions with respect to GHG reduction technologies and measures, or geographic areas under which a methodology is applicable.

Key Elements

VVBs must assess whether the methodology provides a clear and defined specification and/or list of project activities eligible under the methodology. This means that applicability conditions cannot be open ended. For example, a methodology cannot state that a methodology can be applied to “a range of energy efficiency measures” but instead needs to specify the energy efficiency activities or measures that are applicable, such as replacement of incandescent light bulbs with CFLs and LEDs. Modules and tools also need to set clear conditions and parameters under which the module or tool is applicable.

VVBs must bear in mind that applicability conditions must not include criteria and procedures that are addressed in other sections of the methodology. For example, the applicability conditions section cannot state that the project will have no leakage, but the methodology must instead provide a procedure for determining leakage within the leakage section. In addition, conditions specified in tools or modules used by the methodology must not contradict any conditions specified in the applicability conditions section.

VVBs must also bear in mind that a methodology should not create limiting conditions that restrict its use to a single project or proprietary technology or approach.

5.2.2 Project Boundary

Overview

The project boundary in a methodology sets out criteria and procedures for identifying and describing the GHG sources, sinks and reservoirs relevant to the project and baseline scenarios.

Key Elements

VVBs must assess whether the methodology has provided adequate justification for the included and excluded GHG sources, sinks and reservoirs. AFOLU methodologies must adhere to the requirements on relevant carbon pools set out in the *AFOLU Requirements*. VVBs must also assess whether the GHG sources, sinks and reservoirs identified for the project and those identified in the baseline scenario are equivalent and consistent. VVBs must assess whether the project boundary includes, at minimum, all GHG sources, sinks and reservoirs controlled by the project proponent and related to the project.

5.2.3 Baseline scenario

Overview

All methodologies need to establish criteria and procedures for identifying alternative baseline scenarios and determining the most plausible scenario.

Key Elements

The baseline scenario is a reference case for the project activity. VVBs must consider whether the procedures for determining the baseline scenario take into account existing and alternative project types, activities and technologies that provide the same type of quality and quantity of product or service as the project activity. Note that functional equivalence between the baseline scenario and the project scenario may not apply or be appropriate for certain AFOLU project types.

VVBs must assess whether the procedure for identifying the baseline scenario allows for identifying the most *plausible* baseline scenario and determine whether the procedure takes into account relevant information concerning present or future conditions such as political, technical, economic and socio-cultural conditions. For methodologies that use a performance method to establish the crediting baseline, VVBs must assess whether the proposed baseline scenario, or aggregate baseline scenario, would be credible for the whole class of project activity.

The procedure for the identification of baseline scenario may be combined with the procedure for demonstrating additionality where appropriate.

5.2.4 Additionality

Overview

The procedures for demonstrating additionality provide a step-wise approach to demonstrate whether a project activity would have occurred in the absence of the intervention of the carbon market.

Key Elements

VVBs must assess whether the procedure set out in the methodology complies the VCS rules on project methods and standardized methods (ie, performance or activity methods) for additionality.

Note that referencing or restating VCS rules is not sufficient. Rather, methodologies need to apply an appropriate additionality tool that is approved under the VCS or an approved GHG program, or methodologies can develop new, detailed procedures for demonstrating additionality within the methodology or as a separate tool. However, methodologies may reference VCS requirements on regulatory surplus without providing further procedures.

Methodologies can apply one of two approaches for the demonstration and assessment of additionality: the project method or the standardized method. Both methods begin with the regulatory surplus analysis step.

5.2.4.1 Project method

As set out in Section 3.2.4, the project method involves a barriers analysis step and a common practice analysis step.

For the barriers analysis, the types of barriers that may be assessed for a VCS project are:

- **Investment Barriers:** The investment barriers analysis step involves determining if the proposed project activity would have been economically feasible or economically the most attractive option in the absence of revenues from sale of VCU.
- **Technological Barriers:** Technological barriers of various kinds may be present for a project, including a lack of key elements necessary to move the project forward (eg, supporting infrastructure, material inputs or skilled labor) and/or project aspects that increase the risk of technology failure (eg, risk inherent in the complex or unproven nature of a technology).
- **Institutional Barriers:** Institutional barriers include other barriers not reflected above such as organizational, cultural, social or educational barriers.

The final additionality step is the common practice analysis. The project method requires a demonstration and assessment of whether the project activity is common practice in an appropriately-defined sector or region when compared against project alternatives that do not receive carbon finance. The common practice analysis step may also be required where methodologies apply standardized methods.

The criteria and procedures established for demonstrating common practice must be based on guidance provided in the *GHG Protocol for Project Accounting*, Chapter 7 (WRI-WBCSD). The *GHG Protocol* requires that market penetration of a project technology or practice will be assessed by collecting data on all alternative baseline scenarios within a relevant geographic area and calculating a relative market share for each different technology or practice.

5.2.4.2 Standardized Method

The VCS Program allows two types of standardized methods:

- **Performance Methods:** A methodology that uses a performance method establishes a performance benchmark for determining additionality and/or the crediting baseline. Projects that meet or exceed a pre-determined level of the metric may be deemed as additional and a pre-determined level of the metric may serve as the crediting baseline.
- **Activity Methods:** A methodology that applies an activity method establishes the bounds of the project activity that is deemed to be additional. These methods pre-determine additionality for given technologies and measures within given contexts of application using a positive list. Projects that implement activities on the positive list are automatically deemed as additional and do not otherwise need to demonstrate additionality. One of three options (activity penetration, financial viability or revenue streams) is used to qualify the project activity for the positive list.

The assessment of standardized methods requires a very careful review given that standardized methods entail the determination of additionality and/or the crediting baseline for whole classes of project activities. When assessing standardized methods, VVBs should refer to the VCS requirements, described in the *VCS Standard*, as well as the guidance provided in the *Guidance for Standardized Methods*. The guidance document provides information to help with the background and interpretation of standardized methods.

5.2.5 Procedure for Quantification of Net GHG Emission Reductions and Removals

Overview

Methodologies need to establish procedures for quantifying GHG emissions and reductions and removals. As set out in the *VCS Standard*, the procedure must determine baseline emissions, project emissions and emissions associated with leakage.

Key Elements

When assessing quantification procedures, VVBs must determine whether appropriate formulae and calculation methods have been used. The methods must provide a logical and consistent approach to determine the net GHG emission reductions and removals. The assessment must also focus on whether appropriate parameters have been applied in the calculation methods or formulae.

Quantification procedures are subject to uncertainty. VVBs must assess whether the methodology relies on assumptions, parameters and/or procedures with significant uncertainty and whether the methodology has appropriate procedures to address such uncertainty. The *VCS Standard* sets out required confidence intervals and, where the uncertainty exceeds the permitted thresholds, methodologies are required to apply a conservative deduction to address the uncertainty. VVBs are encouraged to review the most recent version of the IPCC report *Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories* when reviewing the uncertainty associated with methodologies.

VVBs must pay particular attention to uncertainty where indirect methods such as models, default factors and proxies are used to estimate GHG emissions reductions and removals, and where direct measurements are not be feasible either due to the nature of the project activity or due to the complexity and cost involved in field-based measurements. While methodologies may pursue a model-based approach to estimate GHG emission reductions and removals, VVBs must assess whether the model is based on publicly available, reputable and recognized sources. Further requirements for the use of models, as well as the use of default factors, standards, and proxies, are provided in the *VCS Standard*.

VVBs may also be required to determine whether a model has been calibrated for use in a given ecological zone. For example, a methodology for reduced deforestation in a semi-arid zone should not use a model that is derived from data from a moist tropical climatic zone. VVBs must assess whether the methodologies that use models include basic requirements for model selection, parameterization, calibration and validation to the local project area. VVBs must also assess whether methodologies include a pathway for calibrating, or refining, the model uncertainty through the use of available data and/or measurements.

5.2.6 Leakage

Overview

Methodologies must specify procedures for estimating leakage in project activities. Specific leakage requirements for various AFOLU project categories are detailed in the *AFOLU Requirements*.

Key Elements

Assessing leakage can be challenging. Complex inter-linkages typically exist between a project activity and the activities outside the project boundary. VVBs must consider whether changes in GHG emissions outside the project boundary are directly attributable to the project.

Where a project results in a change in GHG emissions outside the project boundary, those emissions are considered as leakage. A key question VVBs must consider when assessing leakage is whether the methodology has accounted for potential upstream and downstream emission sources associated with the project activity. For example, in a project activity that uses biomass to generate electricity and the project boundary only includes emission sources within the generation site, upstream emissions that result from the production of biomass should be evaluated. Given that a project activity can have multiple upstream and downstream effects, VVBs should consider the significance of the effect and the extent to which the effects are directly attributable to the project activity. The principle of relevance should be applied in determining what constitutes leakage.

In some methodologies it may be necessary to evaluate and account for lifecycle emissions. Lifecycle emissions are emissions associated with the product life from cradle-to-grave (ie, from raw material extraction through materials processing, manufacture, distribution, use, repair and maintenance, including disposal or recycling). For example, in fuel switch projects where conventional fossil fuels are replaced with biofuels, the seed to tailpipe emissions associate with biofuels, depending on how the biofuel is produced, can be very significant.

In AFOLU methodologies, VVBs must ensure that the methodology has appropriate criteria and procedures for addressing the following types of leakage, as applicable:

- Market leakage: Projects may significantly reduce the production of a commodity, causing a change in the supply and demand equilibrium, resulting in a shift of production elsewhere.
- Activity-shifting leakage: The agent of deforestation and/or degradation may move to an area outside the project boundary and continues activities elsewhere.
- Ecological leakage: Wetlands restoration and conservation (WRC) projects may cause changes in GHG emissions or fluxes of GHG emissions from ecosystems hydrologically connected to the project area.

Criteria and procedures for determining leakage may either be within the methodology or a separate tool. Where appropriate, the methodology may also reference approved tools for the estimation of leakage.

5.2.7 Monitoring

Overview

The methodology must provide the data and parameters to be reported, including sources of data and units of measurement.

Key Elements

In assessing monitoring data and parameters, VVBs must assess whether the default factors and standards used are from a publicly available, reputable and recognized source (eg, IPCC or published government data), peer reviewed, and appropriate for the given source, sink or reservoir. The standards and factors must also reflect current data.

Where methodologies do not provide data values, VVBs must assess whether the methodology establishes appropriate procedures for the project proponent to determine data values.

VVBs must also consider whether the measurement methods prescribed by the methodology are appropriate. For instance, in some case direct measurements of GHG emissions may be feasible (eg, measuring the methane captured in landfills through flow meters); in other cases, indirect measurements of GHG emissions combined with calculations may be more appropriate (eg, calculating carbon stock changes from models). These choices may involve trade-offs between accuracy and uncertainty. If a methodology uses a less accurate method for monitoring a particular GHG source or sink, the VVB must assess whether appropriate procedures are in place to ensure that the estimates are conservative. As set out in the IPCC *Good Practice Guidance and Uncertainty Management*, higher tier methods that involve direct measurement result in more reliable estimates with reduced uncertainty. This implies that methodologies that rely on low-tier approaches, such as the Tier One method of using default emission factors, must ensure that the default factors are conservative to account for uncertainty.

Keep in Mind

VVBs must assess the appropriateness of monitoring and quality assurance procedures set out in the methodology. For example, in an IFM project, a VVB may need to assess whether sufficient clarity on sampling design is provided (ie, plot location, sampling intensity and stratification). In certain methodologies, the procedures may need to provide prescriptive guidance with regard to measurement procedures as well (eg, the minimum diameter at breast height (DBH) of trees to be measured or minimum depth for soil sampling).

VCS GUIDANCE

Where methodologies require the use of remotely sensed data, VVBs must, at minimum, require that internationally-recognized published guidelines are followed for evaluating remotely-sensed data. Guidelines for estimating carbon stock based on forest inventories and remotely sensed data are found in the IPCC *Good Practice Guidelines for LULUCF* and the Global Observation of Forest and Land Cover Dynamics (GOFD-GOLD).

5.3 REPORTING REQUIREMENTS

Methodology assessment reports must clearly describe the process of the assessment as well as the findings from the assessment.

VCSCA provides a template for methodology assessments. The template requires that VVBs provide a description of the assessment, the method and criteria used, and any findings of uncertainties related to the methodology element. For each aspect of the methodology element, VVBs must assess whether and how the criteria and procedures are appropriate, adequate and in compliance with VCS rules. All CLs and CARs as well as the methodology developer's responses need to be documented.

VVBs must ensure that the methodology assessment reports provide a sufficient level of detail to allow VCSCA and other intended readers to understand how the methodology conforms to VCS rules and scientific best practice. For example, where a VVB relies on published peer reviewed studies to evaluate the credibility of a procedure used in a methodology, the methodology assessment report should provide references to the studies.

VCS GUIDANCE

APPENDIX 1: DOCUMENT HISTORY

Version	Date	Comment
v3.0	4 Oct 2012	Initial version released under <i>VCS Version 3</i>
v3.1	8 Oct 2013	Main updates: 1) Updated the methodology deviation and project description deviation examples (Sections 3.2.8, and 3.2.9). 2) Clarified the use of the terms <i>must</i> , <i>should</i> and <i>may</i> in methodologies (Section 5.2).
v3.2	19 Oct 2016	Main updates: 1) Replaced the term <i>right of use</i> with <i>project ownership</i> (throughout)

ABOUT VERRA

Verra supports climate action and sustainable development through the development and management of standards, tools and programs that credibly, transparently and robustly assess environmental and social impacts, and drive funding for sustaining and scaling up these benefits. As a mission-driven, non-profit (NGO) organization, Verra works in any arena where we see a need for clear standards, a role for market-driven mechanisms and an opportunity to achieve environmental and social good.

Verra manages a number of global standards frameworks designed to drive finance towards activities that mitigate climate change and promote sustainable development, including the [Verified Carbon Standard \(VCS\) Program](#) and its [Jurisdictional and Nested REDD+ framework \(JNR\)](#), the [Verra California Offset Project Registry \(OPR\)](#), the [Climate, Community & Biodiversity \(CCB\) Standards](#) and the [Sustainable Development Verified Impact Standard \(SD VISTa\)](#). Verra is also developing new standards frameworks, including [LandScale](#), which will promote and measure sustainability outcomes across landscapes. Finally, Verra is one of the implementing partners of the [Initiative for Climate Action Transparency \(ICAT\)](#), which helps countries assess the impacts of their climate actions and supports greater transparency, effectiveness, trust and ambition in climate policies worldwide.

APPENDIX 2 DOCUMENT HISTORY 62

1 INTRODUCTION

The *VCS Standard* provides a global standard for GHG emission reduction and removal projects and programs. It uses as its core the requirements set out in *ISO 14064-2:2006*, *ISO 14064-3:2006* and *ISO 14065:2013*. The three principal documents of the program are the *VCS Program Guide*, the *VCS Standard*, and the *VCS Methodology Requirements*. The *VCS Program Guide* describes the rules and requirements governing the VCS Program and further describes the constituent parts of the program such as the project and program registration process, the Verra registry system, the methodology approval process and the accreditation requirements for validation/verification bodies. The *VCS Standard* provides the requirements for developing projects and programs, as well as the requirements for validation, monitoring and verification of projects, programs and GHG emission reductions and removals. The *VCS Methodology Requirements* provides the rules and requirements for developing new VCS methodologies. The *VCS Program Guide* should be read before using the *VCS Standard* or the *VCS Methodology Requirements*.

Verra recognizes the kind agreement of the International Organization for Standardization (ISO, www.iso.org) to allow inclusion of critical clauses of *ISO 14064-2:2006* and *ISO 14064-3:2006* in the VCS Program documentation to facilitate comprehension. In particular, the sections in this document on project and methodology requirements include text drawn from *ISO 14064-2:2006* clause 5 and *ISO 14064-3:2006* clause 4.9, amended where necessary to fit the context of the VCS Program.

1.1 Version

All information about version control under the VCS Program is contained in the *VCS Program Guide*.

This document will be updated from time-to-time and readers shall ensure that they are using the most current version of the document. Where external documents are referenced, such as the *IPCC 2006 Guidelines for National GHG Inventories*, and such documents are updated, the most recent version of the document shall be used.

Previous versions of the VCS Program may have included different rules and requirements than those set out in this version. Previous versions of the *VCS Standard* and other VCS Program documents are archived and available on the Verra website.

1.2 Language

The operating language of the VCS Program is English. The project and program description, validation report, monitoring report, verification report and all other documentation (including all and any appendices) required under the VCS Program shall be in English.

2 VCS PROGRAM SPECIFIC ISSUES

2.1 Scope of VCS Program

2.1.1 The scope of the VCS Program includes:

- 1) The six Kyoto Protocol greenhouse gases.
- 2) Ozone-depleting substances.
- 3) Project activities supported by a methodology approved under the VCS Program through the methodology approval process.
- 4) Project activities supported by a methodology approved under a VCS approved GHG program, unless explicitly excluded under the terms of Verra approval.
- 5) Jurisdictional REDD+ programs and nested REDD+ projects as set out in the VCS Program document *Jurisdictional and Nested REDD+ (JNR) Requirements*.

The scope of the VCS Program excludes projects that can reasonably be assumed to have generated GHG emissions primarily for the purpose of their subsequent reduction, removal or destruction. The VCS Program also excludes the following project activities under the circumstances indicated in Table 1, below.

Table 1: Excluded Project Activities

Activity	Non-LDC ¹		LDC	
	Large scale ²	Small scale ²	Large scale	Small scale
Activities that reduce hydrofluorocarbon-23 (HFC-23) emissions	Excluded	Excluded	Excluded	Excluded
Grid-connected electricity generation ³	Excluded	Excluded	Excluded	

¹ Least Developed Country, as designated by the United Nations.

² Small-scale and large-scale designations are as per CDM definitions for same.

³ "Grid-connected electricity generation" means the generation of electricity primarily for delivery to a national or regional grid. Generation of electricity primarily for delivery to a micro-grid (i.e., a localized grid that facilitates the delivery of electricity to discrete and often remote sets of infrastructure that do not otherwise have reliable access to electricity) is not included in this definition, and such project activities are eligible under the scope of the VCS Program.

using hydro power plants/units				
Grid-connected electricity generation using wind, geothermal, or solar power plants/units	Excluded	Excluded		
Utilization of recovered waste heat for, <i>inter alia</i> , combined cycle electricity generation and the provision of heat for residential, commercial or industrial use	Excluded	Excluded		
Generation of electricity and/or thermal energy using biomass. This does not include efficiency improvements in thermal applications (e.g., cook stoves).	Excluded	Excluded		
Generation of electricity and/or thermal energy using fossil fuels, including activities that involve switching from a higher carbon content fuel to a lower carbon content fuel	Excluded	Excluded		
Replacement of electric lighting with more energy efficient electric lighting, such as the replacement of incandescent electrical bulbs with CFLs or LEDs	Excluded			
Installation and/or replacement of electricity transmission lines and/or energy efficient transformers	Excluded			

Attachment: WLC Responses to Appeal_9JUNE2020_Part 2 (4074 : World Logistics Center)

For example, and to illustrate the mechanics of this table, large-scale grid-connected hydroelectric projects are excluded in all cases. However, a small-scale grid-connected hydroelectric project would be eligible where located within an LDC.

2.2 Principles

- 2.2.1 The application of principles is fundamental in ensuring that GHG-related information is a true and fair account. The principles below shall provide the basis for, and shall guide the application of, the VCS Program rules and requirements.

Principles taken from ISO 14064-2:2006, clause 3.

Relevance

Select the GHG sources, GHG sinks, GHG reservoirs, data and methodologies appropriate to the needs of the intended user.

Completeness

Include all relevant GHG emissions and removals. Include all relevant information to support criteria and procedures.

Consistency

Enable meaningful comparisons in GHG-related information.

Accuracy

Reduce bias and uncertainties as far as is practical.

Transparency

Disclose sufficient and appropriate GHG-related information to allow intended users to make decisions with reasonable confidence.

Conservativeness

Use conservative assumptions, values and procedures to ensure that net GHG emission reductions or removals are not overestimated.

Note – Accuracy should be pursued as far as possible, but the hypothetical nature of baselines, the high cost of monitoring of some types of GHG emissions and removals, and other limitations make accuracy difficult to attain in many cases. In these cases, conservativeness may serve as a moderator to accuracy in order to maintain the credibility of project and program GHG quantification.

2.3 Timing of Crediting

- 2.3.1 VCUs shall not be issued under the VCS Program for GHG emission reductions or removals that have not been verified.
- 2.3.2 Project activities are eligible for immediate crediting of future avoided emissions under the conditions set out below, which shall be addressed at the level of the methodology:

- 1) The project immediately avoids future streams of GHG emissions as a result of an upfront intervention that permanently precludes further emissions from the source. VCUs shall be issued only after such an intervention has occurred and the GHG emission reductions have been verified. Examples of such activities include projects that destroy chlorofluorocarbons recovered from refrigeration equipment thereby immediately precluding their future release into the atmosphere, and composting projects that divert organic waste from landfill sites thereby immediately precluding future methane emissions. A REDD project would not qualify for immediate crediting because future streams of GHG emissions are not permanently precluded.
- 2) The physical processes that would generate GHG emissions in the absence of an intervention are well-understood, stable and quantifiable. Models used to simulate such processes shall meet the requirements for such models set out in the VCS Program document *VCS Methodology Requirements*. Any default factors associated with input parameters shall meet the requirements set out for such default factors in the VCS Program document *VCS Methodology Requirements*.
- 3) VCUs may be issued only for GHG emissions avoided over a ten-year period, even if such GHG emissions are likely to have continued over a longer period of time under the baseline scenario. For example, a composting project that diverts organic waste from a landfill site would be eligible for crediting (in relation to a specific amount of composted organic waste) for the GHG emissions that would have occurred at the landfill site over a ten-year period, and any emissions that would have occurred beyond the ten year period (in relation to the specific amount of composted organic waste) are not eligible. Note that in this particular example the ten-year rule applies to the specific amount of composted organic waste and the usual rules on duration of the project and project crediting period still apply.

2.3.3 ODS projects are eligible for immediate crediting of future avoided emissions and methodology elements may use such a crediting model.

Note – Crediting of ODS projects shall still be in relation to the baseline scenario. In many cases, methodology elements will credit projects for all of the ODS destroyed by the project (minus any project emissions and leakage). However, it is possible that projects could destroy ODS from existing stockpiles and only a portion of the ODS would have been emitted under the baseline scenario. For example, if the baseline scenario includes use of the ODS to service existing equipment and a certain proportion of such ODS would be recovered and destroyed at the end of that equipment’s life (whether voluntarily or due to regulation), then the volume of credits granted to the project shall reflect this.

2.4 AFOLU Non-Permanence Risk and Pooled Buffer Account

2.4.1 Non-permanence risk in Agriculture, Forestry, and Other Land Use (AFOLU) projects is addressed through the use of a project risk analysis, using the *AFOLU Non-Permanence Risk Tool*, which determines a number of credits to be deposited in the AFOLU pooled buffer account. The pooled buffer account holds non-tradable buffer credits to cover the non-permanence risk associated with AFOLU projects. It is a single account that holds the buffer

credits for all projects.

Buffer credits are cancelled to cover carbon known, or believed, to be lost. As such, the VCU already issued to projects that subsequently fail are not cancelled and do not have to be “paid back”. All VCUs issued to AFOLU projects (as with all projects) are permanent. The VCS approach provides atmospheric integrity because the AFOLU pooled buffer account will always maintain an adequate surplus to cover unanticipated losses from individual project failures and the net GHG benefits across the entire pool of AFOLU projects will be greater than the total number of VCUs issued.

The full rules and procedures for AFOLU projects with respect to non-permanence risk are set out in Section 3.2.

- 2.4.2 The AFOLU pooled buffer account is subject to periodic reconciliation. Reconciliation is based on a review of existing AFOLU verification reports and an assessment of project performance. This process will identify the projects that have failed or underperformed and seek to identify their common characteristics. The risk analysis criteria and buffer withholding percentages, set out in the VCS Program document *AFOLU Non-Permanence Risk Tool*, will be adjusted accordingly to ensure that there are always sufficient buffer credits in the AFOLU pooled buffer account to cover project losses. Any changes to the tool will not be retroactive (i.e., they will apply only to future non-permanence risk assessments).
- 2.4.3 Project risk analyses will be subject to periodic review by Verra. This process consists of a review of a sample of AFOLU project risk reports to identify any inconsistencies in the process and application of the *AFOLU Non-Permanence Risk Tool* and assessment of same by validation/verification bodies. The risk analysis criteria and risk ratings set out in the tool may be adjusted, to ensure consistent and accurate application of the tool. Any changes to the tool will not be retroactive (i.e., they will apply only to subsequent non-permanence risk analyses).

2.5 AFOLU Leakage Assessments

- 2.5.1 Project market leakage assessments will be subject to periodic review by Verra. This process consists of a review of a sample of AFOLU projects’ leakage assessments to identify any inconsistencies in the process and application of the leakage requirements in Sections 3.14.7–3.14.9 and the VCS Program document *VCS Methodology Requirements*, and assessment of same by validation/verification bodies. The leakage requirements set out in the *VCS Methodology Requirements* may be adjusted to ensure consistent and accurate application. Any changes to the leakage requirements will not be retroactive (i.e., they will apply only to subsequent leakage assessments).

3 PROJECT REQUIREMENTS

This section sets out the rules and requirements for projects under the VCS Program. Specific requirements for AFOLU and ODS projects are set out throughout this section, as these project types may encounter unique circumstances related to project implementation, monitoring and other matters, which must be addressed.

In order to complete the VCS Program certification process, projects must demonstrate how they meet the rules and requirements set out below. Projects must also demonstrate how they have applied an eligible methodology in full. Projects demonstrate their compliance with the VCS Program rules and the applied methodology through the validation and verification processes, which are defined in Section 4 below. Once projects complete the validation and verification processes, they become eligible to request registration and VCU issuance. Note that the full process for requesting project registration and VCU issuance is set out in the VCS Program document *Registration and Issuance Process*.

3.1 General Requirements

Concept

Establishing a consistent and standardized certification process is critical to ensuring the integrity of VCS projects. Accordingly, certain high-level requirements must be met by all projects, as set out below.

Requirements

- 3.1.1 Projects shall meet all applicable rules and requirements set out under the VCS Program, including this document. Projects shall be guided by the principles set out in Section 2.2.1.
- 3.1.2 Projects shall apply methodologies eligible under the VCS Program. Methodologies shall be applied in full, including the full application of any tools or modules referred to by a methodology, noting the exception set out in Section 3.13.1. The list of methodologies and their validity periods is available on the Verra website.
- 3.1.3 Projects and the implementation of project activities shall not lead to the violation of any applicable law, regardless of whether or not the law is enforced.
- 3.1.4 Where projects apply methodologies that permit the project proponent its own choice of model (see the VCS Program document *Program Definitions* for definition of model), such model shall meet with the requirements set out in the VCS Program document *VCS Methodology Requirements* and it shall be demonstrated at validation that the model is appropriate to the project circumstances (i.e., use of the model will lead to an appropriate quantification of GHG emission reductions or removals).

- 3.1.5 Where projects apply methodologies that permit the project proponent its own choice of third party default factor or standard to ascertain GHG emission data and any supporting data for establishing baseline scenarios and demonstrating additionality, such default factor or standard shall meet with the requirements set out in the VCS Program document *VCS Methodology Requirements*.
- 3.1.6 Projects shall preferentially apply methodologies that use performance methods (see the VCS Program document *VCS Methodology Requirements* for further information on performance methods) where a methodology is applicable to the project that uses a performance method for determining both additionality and the crediting baseline (i.e., a project shall not apply a methodology that uses a project method where such a performance method is applicable to the project). Methodologies approved under the VCS Program that use performance methods provide a list of similar methodologies that use project methods (that were approved under the VCS Program or an approved GHG program at the time the performance method was developed). Such lists are not necessarily exhaustive but can serve as the starting point for determining whether a performance method is applicable to the project. Following the approval of a methodology that uses a performance method, projects may use any applicable pre-existing methodology that uses a project method for a six-month grace period.
- 3.1.7 Where the rules and requirements under an approved GHG program conflict with the rules and requirements of the VCS Program, the rules and requirements of the VCS Program shall take precedence.
- 3.1.8 Where projects apply methodologies from approved GHG programs, they shall comply with any specified capacity limits (see the VCS Program document *Program Definitions* for definition of capacity limit) and any other relevant requirements set out with respect to the application of the methodology and/or tools referenced by the methodology under those programs.
- 3.1.9 Where Verra issues new requirements relating to projects, registered projects do not need to adhere to the new requirements for the remainder of their project crediting periods (i.e., such projects remain eligible to issue VCUs through to the end of their project crediting period without revalidation against the new requirements). The new requirements shall be adhered to at project crediting period renewal, as set out in Section 3.8.9.

3.2 AFOLU-Specific Matters

Concept

AFOLU projects may encounter unique circumstances related to project implementation, monitoring and other matters. This section sets out high-level requirements related to such AFOLU-specific matters. Note that additional AFOLU-specific requirements are also set out throughout this document.

Requirements

General

- 3.2.1 There are currently six AFOLU project categories eligible under the VCS Program, as defined in *Appendix 1 Eligible AFOLU Project Categories* below: afforestation, reforestation and revegetation (ARR), agricultural land management (ALM), improved forest management (IFM), reduced emissions from deforestation and degradation (REDD), avoided conversion of grasslands and shrublands (ACoGS), and wetland restoration and conservation (WRC). Further specification with respect to eligible activities which may be included within methodologies approved under the VCS Program can be found in the VCS Program document *VCS Methodology Requirements*.
- 3.2.2 Where projects are located within a jurisdiction covered by a jurisdictional REDD+ program, project proponents shall follow the requirements in this document and the requirements related to nested projects set out in the VCS Program document *Jurisdictional and Nested REDD+ Requirements*.
- 3.2.3 Where an implementation partner is acting in partnership with the project proponent, the implementation partner shall be identified in the project description. The implementation partner shall identify its roles and responsibilities with respect to the project, including but not limited to, implementation, management and monitoring of the project, over the project crediting period.
- 3.2.4 Activities that convert native ecosystems to generate GHG credits are not eligible under the VCS Program. Evidence shall be provided in the project description that any ARR, ALM, WRC or ACoGS project areas were not cleared of native ecosystems to create GHG credits (e.g., evidence indicating that clearing occurred due to natural disasters such as hurricanes or floods). Such proof is not required where such clearing or conversion took place at least 10 years prior to the proposed project start date. The onus is upon the project proponent to demonstrate this, failing which the project shall not be eligible.
- 3.2.5 Activities that drain native ecosystems or degrade hydrological functions to generate GHG credits are not eligible under the VCS Program. Evidence shall be provided in the project description that any AFOLU project area was not drained or converted to create GHG credits. Such proof is not required where such draining or conversion took place prior to 1 January 2008. The onus is upon the project proponent to demonstrate this, failing which the project shall not be eligible.
- 3.2.6 The project proponent shall demonstrate that project activities that lead to the intended GHG benefit have been implemented during each verification period in accordance with the project design. Where no new project activities have been implemented during a verification period, project proponents shall demonstrate that previously implemented project activities continued to be implemented during the verification period (e.g., forest patrols or improved agricultural practices of community members).

3.2.7 For all IFM, REDD, WRC and ACoGS project types, the project proponent shall, for the duration of the project, reassess the baseline every 10 years and have this validated at the same time as the subsequent verification. Baseline projections for deforestation and/or degradation, land conversion, forest management plans and wetland hydrological changes beyond a 10-year period are not likely to be realistic because rates of change in land-use and/or land or water management practices are subject to many factors that are difficult to predict over the long term, hence the need for periodic reassessment of the baseline. The following shall apply with respect to the baseline reassessment:

- 1) The reassessment will capture changes in the drivers and/or behavior of agents that cause the change in land use, hydrology, sediment supply and/or land or water management practices and changes in carbon stocks, all of which shall then be incorporated into revised estimates of the rates and patterns of land-use change and estimates of baseline emissions.⁴
- 2) The latest approved version of the methodology or its replacement shall be applied at the time of baseline reassessment.
- 3) The project description shall be updated at the time of baseline reassessment following the requirements set out in Section 3.8.9(2)(d).
- 4) Ex-ante baseline projections beyond a 10-year period are not required.

3.2.8 Where ARR, ALM, IFM or REDD project activities occur on wetlands, the project shall adhere to both the respective project category requirements and the WRC requirements, unless the expected emissions from the soil organic carbon pool or change in the soil organic carbon pool in the project scenario is deemed below *de minimis* or can be conservatively excluded as set out in the VCS Program document *VCS Methodology Requirements*, in which case the project shall not be subject to the WRC requirements.

Non-Permanence Risk

3.2.9 Projects shall prepare a non-permanence risk report in accordance with the VCS Program document *AFOLU Non-Permanence Risk Tool* at both validation and verification. In the case of projects that are not validated and verified simultaneously, having their initial risk assessments validated at the time of VCS project validation will assist VCU buyers and sellers by providing a more accurate early indication of the number of VCUs projects are expected to generate. The non-permanence risk report shall be prepared using the *VCS Non-Permanence Risk Report Template*, which may be included as an annex to the project description or monitoring report, as applicable, or provided as a stand-alone document.

⁴ Brown, S., M. Hall, K. Andrasko, F. Ruiz, W. Marzoli, G. Guerrero, O. Masera, A. Dushku, B. DeJong, and J. Cornell, 2007. Baselines for land-use change in the tropics: application to avoided deforestation projects. *Mitigation and Adaptation Strategies for Global Change*, 12 (6):1001-1026.

- 3.2.10 Projects with tree harvesting shall demonstrate that the permanence of their carbon stock is maintained and shall put in place management systems to ensure the carbon against which VCUs are issued is not lost during a final cut with no subsequent replanting or regeneration.
- 3.2.11 WRC projects shall demonstrate that the permanence of their soil carbon stock will be maintained. The maximum quantity of GHG emission reductions that may be claimed by the project is limited to the difference between project and baseline scenario after a 100-year time frame, as further described in the VCS Program document *VCS Methodology Requirements*.
- 3.2.12 Buffer credits shall be deposited in the AFOLU pooled buffer account based upon the non-permanence risk report assessed by the validation/verification body(s). Buffer credits are not VCUs and cannot be traded. The full rules and procedures with respect to the deposit of buffer credits are set out in the VCS Program document *Registration and Issuance Process*.
- 3.2.13 Projects shall perform the non-permanence risk analysis at every verification event because the non-permanence risk rating may change. Projects that demonstrate their longevity, sustainability and ability to mitigate risks are eligible for release of buffer credits from the AFOLU pooled buffer account. The full rules and procedures with respect to the release of buffer credits are set out in the VCS Program document *Registration and Issuance Process*.
- 3.2.14 Assessment of non-permanence risk analyses may be conducted by the same validation/verification body that is conducting validation or verification of the project and at the same time as the validation or verification of the project, as applicable. The rules and requirements for the process of assessment by validation/verification body(s) are set out in Section 4 below.
- 3.2.15 Where an event occurs that is likely to qualify as a loss event (see the VCS Program document *Program Definitions* for definition of loss event), the project proponent shall notify Verra within 30 days of discovering the likely loss event. Where VCUs have been previously issued, a loss event report shall be prepared and submitted to the Verra registry, as follows:
- 1) The loss event report shall be prepared using the *VCS Loss Event Report Template*. It shall include a conservative estimate of the loss of previously verified emission reductions and removals due to losses in carbon stocks from the project, based on monitoring of the full area affected by the loss event.
 - 2) The loss event report shall be accompanied by a loss event representation signed by the project proponent and representing that the loss estimate is true and accurate in all material respects. The template for the loss event representation is available on the Verra website.
 - 3) The loss event report shall be submitted to the Verra registry within two years of the date of discovery of the loss event. Where a loss event report is not submitted within two years of the date of discovery of the loss event, the project shall no longer be eligible to issue VCUs.

- 4) The Verra registry shall put buffer credits from the AFOLU pooled buffer account on hold, in an amount equivalent to the estimated loss stated in the loss event report.

3.2.16 At the verification event subsequent to the loss event, the monitoring report shall restate the loss from the loss event and calculate the net GHG benefit for the monitoring period in accordance with the requirements set out in the methodology applied. In addition, the following applies:

- 1) Where the net GHG benefit of the project, compared to the baseline, for the monitoring period is negative, taking into account project emissions, removals and leakage, a reversal has occurred (see the VCS Program document *Program Definitions* for definition of reversal) and buffer credits equivalent to the reversal shall be cancelled from the AFOLU pooled buffer account, as follows:
 - a) Where the total reversal is less than the number of credits put on hold after the submission of the loss event report, Verra shall cancel buffer credits equivalent to the reversal. Any remaining buffer credits shall be released from their hold status (though remain in the AFOLU pooled buffer account).
 - b) Where the reversal is greater than stated by the loss event report, the full amount of buffer credits put on hold with respect to the submission of the loss event report shall be cancelled, and additional buffer credits from the AFOLU pooled buffer account shall be cancelled to fully account for the reversal.
- 2) Where the net GHG benefit for the monitoring period is positive, taking into account project emissions, removals and leakage (i.e., all losses have been made up over the monitoring period), a reversal has not occurred and buffer credits put on hold after the submission of the loss event report shall be released from their hold status (but shall remain in the AFOLU pooled buffer account).

3.2.17 At a verification event, where a reversal has occurred, the following applies:

- 1) Where the reversal is a catastrophic reversal (see the VCS Program document *Program Definitions* for the definition of catastrophic reversal), the following applies:
 - a) The baseline may be reassessed, including any relevant changes to baseline carbon stocks and, where reassessed, shall be validated at the time of the verification event subsequent to the reversal. Note that allowing baseline revisions after catastrophic reversal supersedes any methodological requirements for a fixed baseline.
 - b) The same geographic boundary shall be maintained. The entire project area, including areas degraded or disturbed by the catastrophic event, shall continue to be a part of project monitoring. GHG credits may not be claimed from any increased rate of sequestration from natural regeneration after a catastrophic reversal until the loss from catastrophic reversals is recovered. At the subsequent VCU issuance, GHG credits from the project equal to the additional number of buffer credits cancelled after the

reversal from the AFOLU pooled buffer account on behalf of the project (i.e., above what has been previously contributed by the project) shall be deposited in the AFOLU pooled buffer account. For example, if the project previously contributed 100 buffer credits and 150 credits were cancelled from the AFOLU pooled buffer account after a reversal, the project would deposit an additional 50 buffer credits (to replenish the pool at large) in addition to the amount required by the risk analysis at the current verification event. Buffer credits deposited to replenish the pool after a reversal (50 in the example above) shall never be eligible for release back to the project, as set out in Section 3.2.12. In addition, buffer credits shall be deposited in the AFOLU pooled buffer account based upon the non-permanence risk analysis determined in accordance with the VCS Program document *AFOLU Non-Permanence Risk Tool*, as assessed by the validation/verification body(s).

- 2) Where the reversal is a non-catastrophic reversal (e.g., due to poor management, removal of a portion of the project area from participation in the project or over-harvesting), the following applies:
 - a) No further VCUs shall be issued to the project until the deficit is remedied. The deficit is equivalent to the full amount of the reversal, including GHG emissions from losses to project and baseline carbon stocks.
 - b) The same geographic boundary shall be maintained. The entire project area, including areas degraded or disturbed by the non-catastrophic event, shall continue to be a part of project monitoring. Projects may not claim GHG credits from any increased rate of sequestration from natural regeneration after a reversal until the loss from catastrophic reversals is recovered.

Note – Notwithstanding the rules set out in (b) above, where a portion of the project area is removed from participation in the project, it is not expected that the project proponent maintain the same geographic boundary of the project, nor is it expected that the area that is removed from the project continue to be monitored.

3.2.18 As set out in the VCS Program document *Registration and Issuance Process*, where projects fail to submit a verification report within five or ten years from the previous verification event, a percentage of buffer credits is put on hold under the conservative assumption that the carbon benefits represented by buffer credits held in the AFOLU pooled buffer account may have been reversed or lost in the field. Where projects fail to submit a verification report within 15 years from the previous verification event, buffer credits are cancelled under the same assumption. The full rules and requirements with respect to the cancellation and holding of buffer credits are set out in the VCS Program document *Registration and Issuance Process*.

3.2.19 The remaining balance of buffer credits is cancelled at the end of the project crediting period.

Long-term Average GHG Benefit

3.2.20 ARR and IFM projects with harvesting activities shall not be issued GHG credits above the long-term average GHG benefit maintained by the project.

3.2.21 Where ARR or IFM projects include harvesting, the loss of carbon due to harvesting shall be included in the quantification of project emissions. The maximum number of GHG credits available to projects shall not exceed the long-term average GHG benefit. The GHG benefit of a project is the difference between the project scenario and the baseline scenario of carbon stocks stored in the selected carbon pools and adjusted for any project emissions of N₂O, CH₄ and fossil-derived CO₂, and leakage emissions. The long-term average GHG benefit shall be calculated using the following procedure:

- 1) Establish the period over which the long-term average GHG benefit shall be calculated, noting the following:
 - a) For ARR or IFM projects undertaking even-aged management, the time period over which the long-term GHG benefit is calculated shall include at minimum one full harvest/cutting cycle, including the last harvest/cut in the cycle. For example, where a project crediting period is 40 years and has a harvest cycle of 12 years, the long-term average GHG benefit will be determined for a period of 48 years.
 - b) For ARR projects under conservation easements with no intention to harvest after the project crediting period, or for selectively-cut IFM projects, the time period over which the long-term average is calculated shall be the length of the project crediting period.
- 2) Determine the expected total GHG benefit of the project for each year of the established time period. For each year, the total GHG benefit is the to-date GHG emission reductions or removals from the project scenario minus baseline scenario.
- 3) Sum the total GHG benefit of each year over the established time period.
- 4) Calculate the average GHG benefit of the project over the established time period.
- 5) Use the following equation to calculate the long-term average GHG benefit:

$$LA = \frac{\sum_{t=0}^n PE_t - BE_t}{n}$$

Where:

- LA = The long-term average GHG benefit
- PE_t = The total to-date GHG emission reductions and removals generated in the project scenario (tCO₂e). Project scenario emission reductions and removals shall also consider project emissions of CO₂, N₂O, CH₄ and leakage.
- BE_t = The total to-date GHG emission reductions and removals projected for the baseline scenario (tCO₂e)

- t = Year
- n = Total number of years in the established time period

6) A project may claim GHG credits during each verification event until the long-term average GHG benefit is reached. Once the total number of GHG credits issued has reached this average, the project can no longer issue further GHG credits. The long-term average GHG benefit shall be calculated at each verification event, meaning the long-term average GHG benefit may change over time based on monitored data. For an example of determining the long-term average GHG benefit, see the Verra website.

Buffer credits are withheld only when GHG credits are issued. the number of buffer credits to withhold is based on the change in carbon stocks only (not the net GHG benefit), as such the buffer credits will be based on the long-term average change in carbon stock. Use the following equation to calculate the long-term average change in carbon stock.

Where:

$$LC = \frac{\sum_{t=0}^n PC_t - BC_t}{n}$$

- LC = The long-term average change in carbon stock
- PC_t = The total to-date carbon stock in the project scenario (tCO_{2e})
- BC_t = The total to-date carbon stock projected for the baseline scenario (tCO_{2e})
- t = Year
- n = Total number of years in the established time period

Note – The VCS Program guidance document AFOLU Guidance: Example for Calculating the Long-Term Average Carbon Stock for ARR Projects with Harvesting, available on the Verra website, provides examples for calculating the long-term average carbon stock for a variety of ARR project scenarios with harvesting. The same examples can be applied to IFM projects with harvesting.

3.3 ODS-Specific Matters

Concept

ODS projects may encounter unique circumstances related to project implementation, avoidance of perverse incentives and other matters. This section sets out high-level requirements related to such ODS-specific matters. Note that additional ODS-specific requirements are also set out throughout this document.

Requirements

Eligible ODS

- 3.3.1 ODS residing in stockpiles or ODS recovered directly from any of the products set out in Section 3.3.2 are eligible. The following ODS controlled by the Montreal Protocol for which the IPCC publishes a global warming potential (100-year time horizon) are eligible:
- 1) Annex A, Group I
 - 2) Annex B, Group I
 - 3) Annex C, Group I
- 3.3.2 The destruction of ODS recovered from the following products are eligible:
- 1) Refrigeration equipment, systems or appliances;
 - 2) Air conditioning equipment, systems or appliances;
 - 3) Fire suppression equipment or systems; and
 - 4) Thermal insulation foams.
- 3.3.3 The destruction of ODS recovered from pre-polymers, aerosol products or other products is not eligible.

ODS Origin

- 3.3.4 Where ODS is recovered from products that have been imported specifically for their disassembly (i.e., the products have not been collected in the host country), the following shall apply:
- 1) The products shall not originate from any country in which any law, statute or other regulatory framework requires the recovery and destruction of the relevant ODS from such products.
 - 2) The project proponent shall provide documentary evidence, such as shipping manifests, bills of lading and evidence of collection of the products in the originating country, to demonstrate the origin of such products.
- 3.3.5 Documentary evidence shall be provided to verify the origin of all ODS destroyed by the project. Evidence may include, inter alia, shipping manifests, bills of lading, other commercial documentation, and addresses of households, commercial premises and other evidence of collection of the products. Such evidence shall be appropriate to the nature and scale of the project.

Destruction Technology

- 3.3.6 The project shall use a destruction technology that meets the screening criteria for destruction technologies set out in the *UNEP April 2002 Report of the Technology and Economic Assessment Panel (TEAP), Volume 3b, Report of the Task Force on Destruction Technologies*⁵, as may be updated from time to time. The report sets out, inter alia, requirements for Destruction and Removal Efficiency (DRE).
- 3.3.7 For concentrated sources (e.g., refrigerants), projects shall use a destruction technology with a minimum verified DRE of 99.99 percent.
- 3.3.8 For dilute sources (i.e., foams), projects shall use a destruction technology with a minimum verified DRE of 95 percent. In addition, a minimum Recovery and Destruction Efficiency (RDE) of 85 percent shall be achieved. RDE describes the proportion of blowing agent (ODS) remaining in the foam immediately prior to decommissioning that is recovered in the overall end-of-life management step, including ultimate destruction. For a full specification of RDE, see the *UNEP May 2005 Report of the Technology and Economic Assessment Panel, Volume 3, Report of the Task Force on Foam End-of-Life Issues*.⁶

Note – The May 2005 TEAP report provides a theoretical model for calculating RDE and methodology elements will need to specify a practical approach for determining RDE, such as those provided in RAL GZ 728 (Quality Assurance and Test Specifications for the Demanufacture of Refrigeration Equipment, 2007), the WEEE Forum standard (Requirements for the Collection, Transportation, Storage, Handling and Treatment of Household Cooling and Freezing Appliances containing CFC, HCFC or HFC, 2007) or another appropriate approach.

3.4 Project Documentation

Concept

In order to complete the project validation process, project proponents shall prepare a project description, which describes the project's GHG emission reduction or removal activities. In order to complete the project verification process, project proponents shall prepare a monitoring report, which describes the data and information related to the monitoring of GHG emission reductions or removals.

⁵ UNEP, 2002, UNEP April 2002 Report of the Technology and Economic Assessment Panel, Volume 3b, Report of the Task Force on Destruction Technologies. (http://ozone.unep.org/teap/Reports/Other_Task_Force/TEAP02V3b.pdf)

⁶ UNEP, 2005, UNEP May 2005 Report of the Technology and Economic Assessment Panel, Volume 3, Report of the Task Force on Foam End-of-Life Issues. (http://ozone.unep.org/teap/Reports/TEAP_Reports/TEAP-May-2005-Vol-2-Forms-End-of-Life.pdf)

Requirements

Project Description

- 3.4.1 The project proponent shall use the *VCS Project Description Template*, an approved combined project description template available on the Verra website or an approved GHG program project description template where the project is registered under an approved GHG program, as appropriate. The project proponent shall adhere to all instructional text within the template.
- 3.4.2 All information in the project description shall be presumed to be available for public review, though commercially sensitive information may be protected, as set out in the VCS Program document *Registration and Issuance Process*, where it can be demonstrated that such information is commercially sensitive. The validation/verification body shall check that any information designated by the project proponent as commercially sensitive meets the VCS Program definition of commercially sensitive information. Information in the project description related to the determination of the baseline scenario, demonstration of additionality, and estimation and monitoring of GHG emission reductions and removals shall not be considered to be commercially sensitive and shall be provided in the public versions of the project description.

Monitoring Report

- 3.4.3 The project proponent shall use the *VCS Monitoring Report Template* or an approved combined monitoring report template available on the Verra website, as appropriate, and adhere to all instructional text within the template.
- 3.4.4 The monitoring period of the monitoring report shall be a distinct time period that does not overlap with previous monitoring periods. Projects shall not be eligible for crediting of GHG emission reductions generated in previous monitoring periods. In addition, monitoring periods shall be contiguous with no time gaps between monitoring periods.
- 3.4.5 Where a monitoring report and associated verification report divide a monitoring period into vintages, separate VCU issuance records in accordance with vintage periods may be issued, as set out in the VCS Program document *Registration and Issuance Process*.

3.5 Project Design

Concept

The VCS Program allows for different approaches to project design. Projects may be designed as a single installation of an activity. Projects may also be designed to include more than one project activity, such as an AFOLU project that includes REDD and ALM components. In addition, projects may be designed to include more than one project activity instance, such as a clean cookstove project that distributes cookstoves to a number of different communities. Finally, projects may be designed as

grouped projects, which are projects structured to allow the expansion of a project activity subsequent to project validation.

Note – Project activity and project activity instance both have the specific meanings that are set out in the VCS Program document Program Definitions.

Requirements

Multiple Project Activities

- 3.5.1 Projects may include multiple project activities where the methodology applied to the project allows more than one project activity and/or where projects apply more than one methodology.
- 3.5.2 Where more than one methodology has been applied to a project with multiple project activities, the following applies:
 - 1) Each project activity shall be specified separately in the project description, referencing the relevant methodology.
 - 2) All criteria and procedures set out in the applied methodologies in relation to applicability conditions, demonstration of additionality, determination of baseline scenario and GHG emission reduction and removal quantification shall be applied separately to each project activity, noting the following:
 - a) A single set of criteria and procedures for the demonstration of additionality may be applied where the applied methodologies reference the same additionality tool and/or procedures, and where separate demonstration of additionality for each project activity is not practicable.

 For example, separate demonstration of additionality may not be practicable in project activities that are implemented at a single facility and therefore represent a single investment. The onus is upon the project proponent to demonstrate to the validation/verification body that separate demonstration of additionality is not practicable, failing which separate demonstration of additionality shall be provided. Where a methodology specifies requirements for demonstrating additionality in addition to those specified in the referenced additionality tool and/or procedures, such requirements shall be adhered to.
 - b) The criteria and procedures for identifying the baseline scenario may be combined where the relevant methodologies or the referenced additionality tool and/or procedures specify criteria and procedures for combining baseline scenarios.
 - 3) The criteria and procedures relating to all other aspects of the methodologies may be combined.
 - 4) Where AFOLU projects are required to undertake non-permanence risk assessment and buffer withholding determination, this shall be done separately for each project activity.

Note – Where a single methodology is applicable to more than one project activity and where the methodology does not provide clear procedures for the application of more than one project activity, the above requirements shall be adhered to.

- 3.5.3 AFOLU projects that include multiple project activities shall comply with the respective project requirements of each included AFOLU category.

For example, projects that combine agroforestry or enrichment planting with community forestry in a single project, where farmers integrate these activities within a single landscape, shall follow an ARR methodology for planting activities and an IFM methodology for community forestry activities (except where the activities have been combined in a single methodology). Similarly, projects that integrate avoided grassland and shrubland conversion and improved grazing practices shall follow an ACoGS methodology for grassland or shrubland protection activities and an ALM methodology for improved grazing practices (except where both activities have been combined into a single methodology). Avoided conversion projects in landscapes that contain both forest and non-forest shall follow a REDD methodology for forested lands and an ACoGS methodology for non-forested lands. For each activity covered by a different methodology, the geographic extent of the area to which the methodology is applied shall be clearly delineated.

Multiple Instances of Project Activities

- 3.5.4 Inclusion of further project activity instances subsequent to initial validation of a non-grouped project is not permitted (see Sections 3.5.8 – 3.5.16 for information on grouped projects).
- 3.5.5 The baseline determination and additionality demonstration for all project activity instances shall be combined (e.g., multiple wind turbines shall be assessed in combination rather than individually).
- 3.5.6 Where a project includes multiple project activity instances from multiple project activities, the project activity instances from each project activity shall be assessed in accordance with Sections 3.5.1 – 3.5.3.
- 3.5.7 Non-grouped projects with multiple project activity instances shall not exceed any capacity limits to which a project activity is subject.

Grouped Projects

Baseline Scenario and Additionality

- 3.5.8 Grouped projects shall have one or more clearly defined geographic areas within which project activity instances may be developed. Such geographic areas shall be defined using geodetic polygons as set out in Section 3.10 below.
- 3.5.9 Determination of baseline scenario and demonstration of additionality are based upon the initial project activity instances. The initial project activity instances are those that are included in the project description at validation and shall include all project activity instances currently implemented on the issue date of the project description. The initial project activity instances

may also include any planned instances of the project activity that have been planned and developed to a sufficient level of detail to enable their assessment at validation. Geographic areas with no initial project activity instances shall not be included in the project unless it can be demonstrated that such areas are subject to the same (or at least as conservative) baseline scenario and rationale for the demonstration of additionality as a geographic area that does include initial project activity instances.

- 3.5.10 As with non-grouped projects, grouped projects may incorporate multiple project activities (see Section 3.5.1 – 3.5.3 for more information on multiple project activities). Where a grouped project includes multiple project activities, the project description shall designate which project activities may occur in each geographic area.
- 3.5.11 The baseline scenario for a project activity shall be determined for each designated geographic area, in accordance with the methodology applied to the project. Where a single baseline scenario cannot be determined for a project activity over the entirety of a geographic area, the geographic area shall be redefined or divided such that a single baseline scenario can be determined for the revised geographic area or areas.
- 3.5.12 The additionality of the initial project activity instances shall be demonstrated for each designated geographic area, in accordance with the methodology applied to the project. Where the additionality of the initial project activity instances within a particular geographic area cannot be demonstrated for the entirety of that geographic area, the geographic area shall be redefined or divided such that the additionality of the instances occurring in the revised geographic area or areas can be demonstrated.
- 3.5.13 Where factors relevant to the determination of the baseline scenario or demonstration of additionality require assessment across a given area, the area shall be, at a minimum, the grouped project geographic area. Examples of such factors include, inter alia, common practice; laws, statutes, regulatory frameworks or policies relevant to demonstration of regulatory surplus; determination of regional grid emission factors; and historical deforestation and degradation rates.

Capacity Limits

- 3.5.14 Where a capacity limit applies to a project activity included in the project, no project activity instance shall exceed such limit. Further, no single cluster of project activity instances shall exceed the capacity limit, determined as follows:
 - 1) Each project activity instance that exceeds one percent of the capacity limit shall be identified.
 - 2) Such instances shall be divided into clusters, whereby each cluster is comprised of any system of instances such that each instance is within one kilometer of at least one other instance in the cluster. Instances that are not within one kilometer of any other instance shall not be assigned to clusters.

- 3) None of the clusters shall exceed the capacity limit and no further project activity instances shall be added to the project that would cause any of the clusters to exceed the capacity limit.

Eligibility Criteria

3.5.15 Grouped projects shall include one or more sets of eligibility criteria for the inclusion of new project activity instances. At least one set of eligibility criteria for the inclusion of new project activity instances shall be provided for each combination of project activity and geographic area specified in the project description. A set of eligibility criteria shall ensure that new project activity instances:

- 1) Meet the applicability conditions set out in the methodology applied to the project.
- 2) Use the technologies or measures specified in the project description.
- 3) Apply the technologies or measures in the same manner as specified in the project description.
- 4) Are subject to the baseline scenario determined in the project description for the specified project activity and geographic area.
- 5) Have characteristics with respect to additionality that are consistent with the initial instances for the specified project activity and geographic area. For example, the new project activity instances have financial, technical and/or other parameters (such as the size/scale of the instances) consistent with the initial instances, or face the same investment, technological and/or other barriers as the initial instances.

Note – Where grouped projects include multiple baseline scenarios or demonstrations of additionality, such projects will require at least one set of eligibility criteria for each combination of baseline scenario and demonstration of additionality specified in the project description.

Inclusion of New Project Activity Instances

3.5.16 Grouped projects provide for the inclusion of new project activity instances subsequent to the initial validation of the project. New project activity instances shall:

- 1) Occur within one of the designated geographic areas specified in the project description.
- 2) Comply with at least one complete set of eligibility criteria for the inclusion of new project activity instances. Partial compliance with multiple sets of eligibility criteria is insufficient.
- 3) Be included in the monitoring report with sufficient technical, financial, geographic and other relevant information to demonstrate compliance with the applicable set of eligibility criteria and enable sampling by the validation/verification body.

- 4) Be validated at the time of verification against the applicable set of eligibility criteria.
- 5) Have evidence of project ownership, in respect of each project activity instance, held by the project proponent from the respective start date of each project activity instance (i.e., the date upon which the project activity instance began reducing or removing GHG emissions).
- 6) Have a start date that is the same as or later than the grouped project start date.
- 7) Be eligible for crediting from the start date of the instance through to the end of the project crediting period (only). Note that where a new project activity instance starts in a previous verification period, no credit may be claimed for GHG emission reductions or removals generated during a previous verification period (as set out in Section 3.4.4) and new instances are eligible for crediting from the start of the next verification period.

Where inclusion of a new project activity instance necessitates the addition of a new project proponent to the project, such instances shall be included in the grouped project within two years of the project activity instance start date or, where the project activity is an AFOLU activity, within five years of the project activity instance start date. The procedure for adding new project proponents is set out in the VCS Program document *Registration and Issuance Process*.

AFOLU Projects

- 3.5.17 AFOLU non-permanence risk analyses, where required, shall be assessed for each geographic area specified in the project description (for requirements related to geographic areas of grouped projects see the VCS Standard). Where risks are relevant to only a portion of each geographic area, the geographic area shall be further divided such that a single total risk rating can be determined for each geographic area. Where a project is divided into more than one geographic area for the purpose of risk analysis, the project's monitoring and verification reports shall list the total risk rating for each area and the corresponding net change in the project's carbon stocks in the same area, and the risk rating for each area applies only to the GHG emissions reductions generated by project activity instances within the area.
- 3.5.18 Activity-shifting, market leakage and ecological leakage assessments, where required, shall be undertaken as set out in Section 3.14.5 – 3.14.15, and the methodology applied, on the initial group of instances of each project activity and reassessed where new instances of the project activity are included in the project.

Project Description for Grouped Projects

- 3.5.19 A grouped project shall be described in a single project description, which shall contain the following (in addition to the content required for non-grouped projects):
- 1) A delineation of the geographic area(s) within which all project activity instances shall occur. Such area(s) shall be defined by geodetic polygons as set out in Section 3.10 below.
 - 2) One or more determinations of the baseline for the project activity in accordance with the requirements of the methodology applied to the project.

- 3) One or more demonstrations of additionality for the project activity in accordance with the requirements of the methodology applied to the project.
- 4) One or more sets of eligibility criteria for the inclusion of new project activity instances at subsequent verification events.
- 5) A description of the central GHG information system and controls associated with the project and its monitoring.

Note – Where the project includes more than one project activity, the above requirements shall be addressed separately for each project activity, except for the delineation of geographic areas and the description of the central GHG information system and controls, which shall be addressed for the project as a whole.

3.6 Ownership

Concept

Project and jurisdictional proponents shall demonstrate that they have the legal right to control and operate project or program activities.

Requirements

3.6.1 The project description shall be accompanied by one or more of the following types of evidence establishing project ownership accorded to the project proponent(s), or program ownership accorded to the jurisdictional proponent(s), as the case may be (see the VCS Program document *Program Definitions* for definitions of project ownership and program ownership). To aid the readability of this section, the term project ownership is used below, but should be substituted by the term program ownership, as appropriate:

- 1) Project ownership arising or granted under statute, regulation or decree by a competent authority.
- 2) Project ownership arising under law.
- 3) Project ownership arising by virtue of a statutory, property or contractual right in the plant, equipment or process that generates GHG emission reductions and/or removals (where the project proponent has not been divested of such project ownership).
- 4) Project ownership arising by virtue of a statutory, property or contractual right in the land, vegetation or conservational or management process that generates GHG emission reductions and/or removals (where the project proponent has not been divested of such project ownership).
- 5) An enforceable and irrevocable agreement with the holder of the statutory, property or contractual right in the plant, equipment or process that generates GHG emission reductions and/or removals which vests project ownership in the project proponent.

- 6) An enforceable and irrevocable agreement with the holder of the statutory, property or contractual right in the land, vegetation or conservational or management process that generates GHG emission reductions or removals which vests project ownership in the project proponent.
- 7) Project ownership arising from the implementation⁷ or enforcement of laws, statutes or regulatory frameworks that require activities be undertaken or incentivize activities that generate GHG emission reductions or removals.

3.7 Project Start Date

Concept

The project start date of a non-AFOLU project is the date on which the project began generating GHG emission reductions or removals. The project start date of an AFOLU project is the date on which activities that led to the generation of GHG emission reductions or removals are implemented (e.g., preparing land for seeding, planting, changing agricultural or forestry practices, rewetting, restoring hydrological functions, or implementing management or protection plans). Projects shall complete validation within specific timeframes from the project start date.

Requirements

Non-AFOLU Projects

- 3.7.1 Non-AFOLU projects shall complete validation within two years of the project start date. Additional time is granted for non-AFOLU projects to complete validation where they are applying a new VCS methodology. Specifically, projects using a new VCS methodology and completing validation within two years of the approval of the methodology by Verra may complete validation within four years of the project start date.
- 3.7.2 Note that new VCS methodology in this context refers to both newly issued VCS methodologies and newly issued VCS revisions to approved GHG program methodologies. The grace period does not apply in relation to any subsequent versions of such new methodologies and new methodology revisions that may be issued.

AFOLU Projects

- 3.7.3 AFOLU projects shall complete validation within five years of the project start date.

⁷ Implemented in the context of this paragraph means enacted or introduced, consistent with use of the term under the CDM rules on so-called Type E+ and Type E- policies.

ODS Projects

3.7.4 ODS projects shall comply with at least one of the following in relation to project start date:

- 1) The project start date shall not be before the Montreal Protocol production phase-out deadline (except for critical/essential uses) for the relevant ODS as it applies to the host country and/or any country from which ODS destroyed by the project is imported (as applicable); or
- 2) The project start date shall not be before the date the host country and/or any country from which ODS destroyed by the project is imported (as applicable) implements the production phase-out, or consumption phase-out where such country does not produce the relevant ODS, of the relevant ODS (critical/essential uses exempted). Such phase-outs shall be implemented in combination with an import ban on the relevant ODS (critical/essential uses exempted). This project start date requirement accounts for countries that phase-out the relevant ODS in advance of their Montreal Protocol production phase-out deadline.

Note – The project can destroy ODS that has not been phased out under either of the two options in above (e.g., if one ODS has contaminated another), but it shall receive no credit for the destruction of such ODS. Note also that the relevant production phase-out deadlines are those of the individual substances and not the substance groups.

Note – The relevant production phase-out deadlines are those of the individual substances and not the substance groups.

3.7.5 Where the project imports ODS, it shall provide documentary evidence, such as shipping manifests and bills of lading, to demonstrate that the ODS originates from a country meeting with the above.

Standardized Methods

3.7.6 Notwithstanding the requirements set out in Sections 3.7.1 – 3.7.5 above, projects applying a standardized method for determining additionality shall initiate the project pipeline listing process set out in the VCS Program document *Registration and Issuance Process* within the project validation timelines set out above. Validation may be completed any time thereafter.

For example, a non-AFOLU project applying a standardized method for determining additionality shall initiate the project pipeline listing process within two years of the project start date, and may complete validation any time thereafter.

Projects Registered with Other GHG Programs

3.7.7 For projects registered under an approved GHG program which are seeking registration with the VCS Program, further specification with respect to the validation deadline is set out in Sections 3.19.5 and 3.19.6.

3.8 Project Crediting Period

Concept

The project crediting period is the time period for which GHG emission reductions or removals generated by the project are eligible for issuance as VCUs. Project crediting periods shall be renewed periodically in order to ensure that changes to a project's baseline scenario and regulatory surplus are taken into consideration throughout the lifetime of the project.

Requirements

Project Crediting Period Length

Non-AFOLU Projects

3.8.1 For non-AFOLU projects, the project crediting period shall be either seven years, twice renewable for a total of 21 years, or ten years fixed.

AFOLU Projects

3.8.2 For ALM projects focusing exclusively on reducing N₂O, CH₄ and/or fossil-derived CO₂ emissions, the project crediting period shall be either seven years, twice renewable for a total of 21 years, or ten years fixed.

3.8.3 For all other AFOLU projects other than such ALM projects described above, the project crediting period shall be a minimum of 20 years up to a maximum of 100 years, which may be renewed at most four times with a total project crediting period not to exceed 100 years.

3.8.4 AFOLU projects shall have a credible and robust plan for managing and implementing the project over the project crediting period.

3.8.5 For ARR or IFM extension of rotation age or low-productive to high-productive projects with harvesting, the length of the project crediting period shall be set to include at least one complete harvest/cutting cycle. In the case of selectively cut IFM projects, where trees are individually selected for harvest, the harvest/cutting cycle is the allowable re-entry period into the harvest area as determined by legal and regulatory requirements, and/or common practice.

3.8.6 The earliest project crediting period start date for AFOLU projects shall be 1 January 2002.

Projects Registered under Other GHG Programs

3.8.7 Projects registered under other GHG programs are not eligible for VCU issuance beyond the end of the total project crediting period under those programs. For example, a CDM project with a seven year twice renewable project crediting period is not eligible for VCU issuance beyond the end of those 21 years. Where projects have been registered under more than one other GHG program, they are not eligible for VCU issuance after the date that is the earliest end date of all applicable project crediting periods.

Note – Since the total project crediting period under the Joint Implementation (JI) program is not defined ex-ante, the total project crediting period shall be deemed as 21 years for non-AFOLU JI projects and as 60 years for AFOLU JI projects⁸.

Renewal of Project Crediting Period

3.8.8 Where projects fail to renew the project crediting period, the project crediting period shall end and the project shall be ineligible for further crediting.

3.8.9 The following shall apply with respect to the renewal of the project crediting period under the VCS Program:

- 1) A full reassessment of additionality is not required when renewing the project crediting period. However, regulatory surplus shall be demonstrated in accordance with the requirements set out in the VCS Program rules and the project description shall be updated accordingly.
- 2) The validity of the original baseline scenario shall be demonstrated, or where invalid a new baseline scenario shall be determined, when renewing the project crediting period, as follows:
 - a) The validity of the original baseline scenario shall be assessed. Such assessment shall include an evaluation of the impact of new relevant national and/or sectoral policies and circumstances on the validity of the baseline scenario.
 - b) Where it is determined that the original baseline scenario is still valid, the GHG emissions associated with the original baseline scenario shall be reassessed using the latest version of the *CDM Tool to assess the validity of the original/current baseline and to update the baseline at the renewal of a crediting period*.
 - c) Where it is determined that the original baseline scenario is no longer valid, the current baseline scenario shall be established in accordance with the VCS Program rules.
 - d) The project description, containing updated information with respect to the baseline, the estimated GHG emission reductions or removals and the monitoring plan, shall be submitted for validation. Such updates shall be based upon the latest approved version of the methodology or its replacement. Where the project does not meet the requirements of the latest approved version of the methodology or its replacement, the project proponent shall select another applicable approved methodology (which may be a new methodology or methodology revision it has had approved via the methodology approval process), or shall apply a methodology deviation (where a methodology deviation is appropriate). Failing this, the project shall not be eligible for renewal of its project crediting period.

⁸ Consistent with the UNFCCC's other project-based mechanism, CDM.

- 3) The updated project description shall be validated in accordance with the VCS Program rules. In addition, the project shall be validated against the (current) scope of the VCS. Such validation report shall be issued after the end of the (previous) project crediting period but within two years after the end of the (previous) project crediting period.

Additional time is granted for projects to complete such validation where they are switching to a new VCS methodology (*new VCS methodology* in this context has the same meaning as set out in Section 3.7.1) when renewing the project crediting period. Specifically, projects switching to a new VCS methodology and completing such validation within one year of the approval of the methodology by Verra may complete such validation within three years of the end of the (previous) project crediting period.

3.9 Project Scale

Concept

Projects are categorized by size according to their estimated average annual GHG emission reductions or removals. Materiality thresholds differ for projects of different sizes.

Requirements

3.9.1 Project size categorizations are as follows:

- 1) *Projects*: Less than or equal to 300,000 tonnes of CO₂e per year.
- 2) *Large projects*: Greater than 300,000 tonnes of CO₂e per year.

3.9.2 Materiality requirements for validation and verification differ according to project size, as set out in Section 4.1.8 below.

3.9.3 Where applying a methodology with scale and/or capacity limits, it shall be demonstrated that the project is not a fragmented part of a larger project or activity that would otherwise exceed such limits. The project shall be considered a fragmented part of a larger project if within one kilometer of the project boundary there exists another project where:

- 1) The project proponents for both projects are the same.
- 2) The sectoral scope and project activity for both projects are the same.
- 3) The other project has been registered under the VCS Program or another GHG program within the previous two years.

3.10 Project Location

Concept

The project location shall be provided in order to accurately describe project characteristics and to demonstrate a project's conformance with other requirements, such as project ownership and regulatory compliance.

Requirements

General

3.10.1 Project location shall be specified in the project description as follows:

- 1) Project location for non-AFOLU projects shall be specified by a single geodetic coordinate.
- 2) Where there are multiple project activity instances (see Sections 3.5.4 – 3.5.7 for more information on multiple project activities), project location shall be specified according to the following:
 - a) Where it is reasonable to do so, a geodetic coordinate shall be provided for each instance and provided in a KML file; or
 - b) Where there are a large number project activity instances (e.g., cookstoves or energy efficient light bulbs), at least one geodetic coordinate shall be provided, together with sufficient additional geographic information (with respect to the location of the instances) to enable sampling by the validation/verification body.
- 3) Project location for grouped projects shall be specified using geodetic polygons to delineate the project's geographic area or areas (see Section 3.5.8 for further information on geographic areas for grouped projects) and provided in a KML file.

AFOLU Projects

3.10.2 The project location for AFOLU projects shall be specified in the project description in terms of its project area. The spatial extent of the project shall be clearly specified to facilitate accurate monitoring, reporting and verification of GHG emission reductions and removals and to demonstrate that the project meets the eligibility criteria of the relevant project category. The description of the project location shall include the following information:

- 1) Name of the project area (e.g., compartment number, allotment number and local name).
- 2) Maps of the project area.
- 3) Geodetic polygons that delineate the geographic area of each AFOLU project activity, provided in a KML file.
- 4) Total size of the project area.
- 5) Details of ownership.

Where the project area is comprised of multiple polygons (parcels), the project location details of each polygon/parcel shall be included in the project description.

3.10.3 The project proponent shall demonstrate control over the entire project area with documentary evidence establishing project ownership, noting the following:

- 1) For non-grouped projects, the entire project area shall be under the control of the project proponent at the time of validation, or shall come to be under the control of the project proponent by the first verification event.
- 2) Where the project proponent does not yet have control over the entire area at validation, the entire project area (that shall be specified in accordance with Section 3.10.2) is to be validated as if it were under control and the project is ready to be implemented.
- 3) Where less than 80 percent of the total proposed area of the project is under current control at validation, the following applies:
 - a) It shall be demonstrated that the result of the additionality test is applicable to the project area at the time of validation and to the entire project area to come under control in the future.
 - b) The monitoring plan shall be designed such that it is flexible enough to deal with changes in the size of the project.
 - c) The project shall be verified within five years of validation. At verification, the size of the project becomes fixed.
 - d) Where the area fixed at verification is smaller than intended at validation, areas that at verification have not come under control of the project shall be considered in the leakage management, mitigation and accounting. This requires the selection, at validation, of a methodology with appropriate leakage methods that may be used in the event the entire area does not come under control of the project.

3.10.4 WRC projects shall demonstrate that:

- 1) There is no hydrological connectivity to adjacent (non-project) areas; or
- 2) It is not possible for hydrologically connected areas to have a negative impact on the hydrology within the project area that could cause a significant increase in GHG emissions; or
- 3) Where projects are hydrologically connected to adjacent areas that may have a negative impact on the hydrology within the project area, projects shall demonstrate that such impacts will not result in a significant increase in GHG emissions, as follows:
 - a) Peatland projects shall establish a buffer zone to ensure that potential negative impacts to the hydrology in the project area, such as causing the water table in the project area to drop or otherwise negatively impacting the hydrology, are mitigated. The buffer zone may be inside or outside the geographic boundary of the project area.

Where it is outside of the project area, the buffer zone shall be adjacent to the project geographic boundary and binding water management agreements with land holders in the buffer zone shall be in place by the time of the first verification. The size and shape of the buffer zone shall be sufficient to avoid such negative impacts on the project area, which may be demonstrated through peer reviewed literature or expert judgment.

- b) All other wetland projects shall establish a buffer zone as set out in Section 3.10.4(3)(a) above, or implement project activities or establish a mitigation plan to ensure that impacts to the hydrology (e.g., interrupted water or sediment supply) do not result in a significant increase in GHG emissions. Emphasis shall be placed on hydrological connectivity that is immediately adjacent to the project area. Coastal wetlands shall consider hydrological connectivity originating from adjacent lands and shall follow the applied methodology with respect to oceanic impacts.

Where a project activity to mitigate impacts from hydrological connectivity causes an increase in GHG emissions in the project area or buffer zone, such emissions shall be included in GHG accounting where above *de minimis*.

3.11 Project Boundary

Concept

The project boundary includes the GHG sources, sinks and reservoirs that are relevant to the project and baseline scenarios. The relevant GHG sources, sinks and reservoirs that shall be included or excluded, or are optional, are set out in the methodology(s) applied by the project.

Requirements

- 3.11.1 The project boundary shall be described (using diagrams, as required) and GHG sources, sinks and reservoirs shall be identified and assessed in accordance with the methodology applied to the project. The project shall justify not selecting any relevant GHG source, sink and reservoir.

3.12 Baseline Scenario

Concept

The baseline scenario represents the activities and GHG emissions that would occur in the absence of the project activity. The baseline scenario shall be accurately determined so that an accurate comparison can be made between the GHG emissions that would have occurred under the baseline scenario and the GHG emission reductions and/or removals that were achieved by project activities.

Requirements

- 3.12.1 The baseline scenario for the project shall be determined in accordance with the requirements set out in the methodology applied to the project, and the choice of baseline scenario shall be justified.
- 3.12.2 Equivalence in type and level of activity of products or services provided by the project and the baseline scenario shall be demonstrated and, where appropriate, any significant differences between the project and the baseline scenario shall be explained.
- 3.12.3 In developing the baseline scenario, assumptions, values and procedures shall be selected that help ensure that net GHG emission reductions and removals are not overestimated.

3.13 Additionality

Concept

A project activity is additional if it can be demonstrated that the activity results in emission reductions or removals that are in excess of what would be achieved under a “business as usual” scenario and the activity would not have occurred in the absence of the incentive provided by the carbon markets. Additionality is an important characteristic of GHG credits, including VCUs, because it indicates that they represent a net environmental benefit and a real reduction of GHG emissions, and can thus be used to offset emissions.

Requirements

3.13.1 Additionality shall be demonstrated and assessed in accordance with the requirements set out in the methodology applied to the project, noting the following exceptions:

- 1) Where a VCS module using an activity method (see the *VCS Methodology Requirements* for further information on activity methods) is applicable to the project, additionality may be demonstrated using the module in substitution of the additionality requirements set out in the methodology.

For example, if a module uses an activity method (i.e., positive list) to deem a project activity additional, the project proponent does not have to follow the additionality requirements in the methodology applied to the project and may instead demonstrate additionality by demonstrating that it meets the applicability conditions and any other criteria of the activity method.

Note that only modules may be used in this way. Where a methodology contains an activity method for additionality, the additionality procedures may not be applied in conjunction with a different methodology.

- 2) Where the applied methodology was developed under an approved GHG program and uses an activity method or other simplified procedure for demonstrating additionality, the project proponent shall demonstrate to the validation/verification body that the simplified procedure is appropriate to apply to the project considering the project characteristics, including the context in which the project activity takes place. Failing this demonstration, the project proponent shall not use the simplified procedure for demonstrating additionality, and shall instead use an appropriate additionality assessment method in substitution.

For example, where a project is developed in the United States and applies a CDM methodology which uses a simplified procedure for demonstrating additionality, the project proponent shall demonstrate to the validation/verification body that the simplified procedure is appropriate to apply given that the simplified procedure was originally developed for application in a developing country context.

ODS Projects

- 3.13.2 The project shall not be mandated by any law, statute or other regulatory framework applying in the host country that was implemented on or before 11 November 2001, or the compliance rate of any such law, statute or other regulatory framework during (part of) the project crediting period shall be below 50 percent.

3.14 Quantification of GHG Emission Reductions and Removals

Concept

GHG emission reductions and removals achieved by projects are the basis for the volume of VCUs that can be issued. GHG emissions reductions and removals shall be quantified in accordance with the applied methodology(s).

Requirements

- 3.14.1 GHG emission and/or removals shall be estimated for each GHG source, sink and/or reservoir relevant for the project (including leakage) and the baseline scenarios.
- 3.14.2 The net GHG emission reductions and removals generated by the project shall be quantified.
- 3.14.3 Metric tonnes shall be used as the unit of measure and the quantity of each type of GHG shall be converted to tonnes of CO₂e.
- 3.14.4 The six Kyoto Protocol greenhouse gases and ozone-depleting substances shall be converted using 100-year global warming potentials derived from the IPCC's *Fourth Assessment Report*.

AFOLU Projects

- 3.14.5 The potential for leakage shall be identified for AFOLU projects, and projects are encouraged to include leakage management zones as part of the overall project design. Leakage management zones can minimize the displacement of land use activities to areas outside the project area by maintaining the production of goods and services, such as agricultural products, within areas under the control of the project proponent or by addressing the socio-economic factors that drive land use change. Activities to mitigate ecological leakage in WRC projects may include the establishment of a leakage management zone inside the project boundary.
- 3.14.6 Activities to mitigate leakage and sustainably reduce deforestation and/or forest or wetland degradation are encouraged and may include the establishment of agricultural intensification practices on non-wetlands, lengthened fallow periods, agroforestry and fast-growing woodlots on degraded land, forest under-story farming, ecotourism and other sustainable livelihood activities, sustainable production of non-timber forest products, and/or sustainable aquaculture. Leakage mitigation activities may be supplemented by providing economic opportunities for local communities that encourage forest or wetland protection, such as employment as protected-area guards, training in sustainable forest use or assisting communities in securing markets for sustainable forest products, such as rattan, vanilla, cacao, coffee and natural medicines, or wetland products, such as rattan, fish and shellfish.
- 3.14.7 Where projects are required to account for leakage, such leakage evaluation shall be documented in the appropriate section of the project description and/or monitoring report, as applicable.
- 3.14.8 Market leakage assessments shall occur per the requirements set out in the applied methodology(s) at validation and verification.
- 3.14.9 Notwithstanding the requirement set out in Section 3.14.8 above, IFM projects may apply the appropriate market leakage discount factor identified in Table 2 to the net change in carbon stock associated with the activity that reduces timber harvest to determine market leakage.

Table 2: Market Leakage Discount Factors

Project Action	Leakage Risk	Market Leakage Discount Factor
IFM activity with no effect or minimal effect on total timber harvest volumes (e.g., RIL with less than 25% reduction)	None	0%
IFM activity that leads to a shift in harvests across time periods but minimal change in total timber harvest over time (e.g., ERA with rotation extension of 5-10 years)	Low	10%
IFM activity that substantially reduces harvest levels permanently (e.g., RIL activity that reduces timber harvest across the project area, or project that halts logging by at least 25%)	Moderate to High	<p>Conditional upon where timber harvest is likely to be shifted, as follows:</p> <ul style="list-style-type: none"> • Where the ratio of merchantable biomass to total biomass is higher within the area to which harvesting is displaced compared to the project area, 20% • Where the ratio of merchantable biomass to total biomass is similar within the area to which harvesting is displaced compared to the project area, 40% • Where the ratio of merchantable biomass to total biomass is lower within the area to which harvesting is displaced compared to the project area, 70% • Where the leakage is out of country, 0%

3.14.10 Leakage occurring outside the host country (international leakage) does not need to be quantified.

3.14.11 Projects shall not account for positive leakage (i.e., where GHG emissions decrease or removals increase outside the project area due to project activities).

3.14.12 Where the applied methodology(s) does not set out a method to determine whether leakage is *de minimis*, projects may use the process set out in the VCS Program document *VCS Methodology Requirements* or the CDM A/R methodological *Tool for testing significance of GHG Emissions in A/R CDM Project Activities*.

3.14.13 Projects may apply optional default leakage deductions at validation under the following circumstances:

- 1) Where the applied methodology requires the quantification of activity-shifting leakage, projects may apply the optional default activity-shifting leakage deduction of 15 percent to the gross GHG emission reductions and/or removals.
- 2) Where the applied methodology requires the quantification of market leakage and where a) timber is a significant⁹ commodity that is driving deforestation and/or degradation in the baseline scenario and b) the project country is not a leading producer or exporter of forest products as defined by the United Nations Food and Agriculture Organization (FAO)¹⁰, projects may apply the optional default market leakage deduction of 10 percent to the gross GHG emission reductions and/or removals.

3.14.14 Projects shall monitor and calculate leakage, per the applied methodology, for all ex-post accounting (i.e., at each verification), and leakage shall be deducted from the total GHG emission reductions and/or removals of the project. Any leakage shall be subtracted from the number of GHG emission reductions and removals eligible to be issued as VCUs.

3.14.15 The number of GHG credits issued to projects is determined by subtracting out the buffer credits from the net GHG emission reductions or removals (including leakage) associated with the project. The buffer credits are calculated by multiplying the non-permanence risk rating (as determined by the *AFOLU Non-Permanence Risk Tool*) times the change in carbon stocks only. The full rules and procedures with respect to assignment of buffer credits are set out in the VCS Program document *Registration and Issuance Process*.

3.15 Monitoring

Concept

The impacts of project activities on relevant emission sources, sinks and reservoirs shall be monitored in order to determine the net GHG benefit. Projects shall be monitored in accordance with the applied methodology(s).

⁹ Defined as contributing to 20 percent or more of baseline emissions.

¹⁰ The FAO releases annual listings of countries that are Major Producers of Forest Products (<http://www.fao.org/forestry/statistics/80938@180723/en/>) and Major Exporters of Forest Products (<http://www.fao.org/forestry/statistics/80938@180724/en/>).

Requirements

Data and Parameters

- 3.15.1 Data and parameters used for the quantification of GHG emission reductions and/or removals shall be provided in accordance with the methodology.
- 3.15.2 Quality management procedures to manage data and information shall be applied and established. Where applicable, procedures to account for uncertainty in data and parameters shall be applied in accordance with the requirements set out in the methodology.

Monitoring Plan

- 3.15.3 The project proponent shall establish a GHG information system for obtaining, recording, compiling and analyzing data and information important for quantifying and reporting GHG emissions and/or removals relevant for the project (including leakage) and baseline scenario.
- 3.15.4 A monitoring plan for the project that includes roles and responsibilities shall be established.
- 3.15.5 Where measurement and monitoring equipment is used, the project proponent shall ensure the equipment is calibrated according to the equipment's specifications and/or relevant national or international standards.

3.16 Safeguards

Concept

Project activities shall not negatively impact the natural environment or local communities. Project proponents shall identify and address any negative environmental and socio-economic impacts of project activities, and shall engage with local stakeholders during the project development and implementation processes.

Requirements

General

No Net Harm

- 3.16.1 The project proponent shall identify potential negative environmental and socio-economic impacts, and shall take steps to mitigate them. Additional certification standards may be applied to demonstrate social and environmental benefits beyond GHG emission reductions or removals.

Note that VCUs may be labeled with additional standards and certifications on the Verra registry where both the VCS Program and another standard are applied. The Verra website provides the list of standards that are accepted as VCU labels and the procedure for attaining such VCU labels.

Local Stakeholder Consultation

- 3.16.2 The project proponent shall conduct a local stakeholder consultation prior to validation as a way to inform the design of the project and maximize participation from stakeholders. Such consultations allow stakeholders to evaluate impacts, raise concerns about potential negative impacts and provide input on the project design.
- 3.16.3 The project proponent shall establish mechanisms for ongoing communication with local stakeholders to allow stakeholders to raise concerns about potential negative impacts during project implementation.
- 3.16.4 The project proponent shall take due account of all and any input received during the local stakeholder consultation and through ongoing communications, which means it will need to either update the project design or justify why updates are not appropriate. The project proponent shall demonstrate to the validation/verification body what action it has taken in respect of the local stakeholder consultation as part of validation, and in respect of ongoing communications as part of each subsequent verification.

Public Comment Period

- 3.16.5 All projects are subject to a 30-day public comment period. The date on which the project is listed on the project pipeline marks the beginning of the project’s 30-day public comment period (see the VCS Program document *Registration and Issuance Process* for more information on the VCS project pipeline).
- 3.16.6 Projects shall remain on the project pipeline for the entirety of their 30-day public comment period.
- 3.16.7 Any comments shall be submitted to Verra at secretariat@verra.org and respondents shall provide their name, organization, country and email address. At the end of the public comment period, Verra provides all and any comments received to the project proponent.
- 3.16.8 The project proponent shall take due account of any and all comments received during the consultation, which means it will need to either update the project design or demonstrate the insignificance or irrelevance of the comment. It shall demonstrate to the validation/verification body what action it has taken.

AFOLU Projects

- 3.16.9 Where AFOLU project activities do not impact local stakeholders, projects are not required to meet the requirements set out in Sections 3.16.11– 3.16.18 below. The project proponent shall provide evidence that project activities do not impact local stakeholders at validation and each verification.

3.16.10 Where AFOLU projects complete a validation or verification to the Climate, Community & Biodiversity (CCB) Program at the same time as a VCS Program validation or verification, they are not required to conduct a separate demonstration of compliance with the requirements set out in this Section 3.16.

Note – Where an AFOLU project has previously certified to the Climate, Community & Biodiversity (CCB) Program, but is completing a VCS Program verification without also completing a CCB Program verification for the same verification period, the project proponent shall demonstrate compliance with the requirements set out in Sections 3.16.11 – 3.16.18 below.

Local Stakeholder Identification and Background

3.16.11 The project proponent shall conduct a thorough assessment of the local stakeholders that will be impacted by the project. The project description shall include information on local stakeholders at the start of the project, including:

- 1) The process(es) used to identify local stakeholders likely impacted by the project and a list of such stakeholders;
- 2) Identification of any legal or customary tenure/access rights to territories and resources, including collective and/or conflicting rights, held by local stakeholders;
- 3) A description of the social, economic and cultural diversity within local stakeholder groups and the differences and interactions between the stakeholder groups;
- 4) Any significant changes in the makeup of local stakeholders over time;
- 5) The expected changes in well-being and other stakeholder characteristics under the baseline scenario, including changes to ecosystem services identified as important to local stakeholders;
- 6) The location of communities, local stakeholders and areas outside the project area that are predicted to be impacted by the project; and
- 7) The location of territories and resources which local stakeholders own or to which they have customary access.

Risks to Local Stakeholders

3.16.12 The project proponent shall identify likely natural and human-induced risks to local stakeholder well-being expected during the project lifetime and outline measures needed to mitigate these risks.

3.16.13 The project proponent shall identify the risks for local stakeholders to participate in the project, including project design and consultation. Risks should include trade-offs with food security, land loss, loss of yields and climate change adaptation. The project shall be designed and implemented to avoid trade-offs and manage the identified risks to local stakeholders.

3.16.14 The project proponent or any other entity involved in project design or implementation shall not be involved in any form of discrimination or sexual harassment.

3.16.15 The management teams involved in the project shall have expertise and prior experience implementing land management and carbon projects with community engagement at the project scale. Where relevant experience is lacking, the project proponent shall either demonstrate how they have partnered with other organizations to support the project or have a recruitment strategy to fill the identified gaps.

Respect for Local Stakeholder Resources

3.16.16 The project proponent shall avoid negative impacts of project implementation and mitigate impacts when unavoidable, including the following:

- 1) The project proponent shall recognize, respect and support local stakeholders' property rights and where feasible, take measures to help secure rights. The project shall not encroach on private, stakeholder or government property or relocate people off their lands without consent. The project may affect property rights if free, prior and informed consent is obtained from those concerned and a transparent agreement is reached that includes provisions for just and fair compensation. In the event there are any ongoing or unresolved conflicts over property rights, usage or resources, the project shall undertake no activity that could exacerbate the conflict or influence the outcome of an unresolved dispute.
- 2) To reduce damage to the ecosystems on which the local stakeholders rely:
 - a) The project shall not introduce any invasive species or allow an invasive species to thrive through project implementation.
 - b) The project shall justify the use of non-native species over native species, explaining the possible adverse effects of non-native species.
 - c) The project shall justify the use of fertilizers, chemical pesticides, biological control agents and other inputs used by the project and their possible adverse effects.

Communication and Consultation

3.16.17 The project proponent shall take all appropriate measures to communicate and consult with local stakeholders in an ongoing process for the life of the project. The project proponent shall communicate:

- 1) The project design and implementation, including the results of monitoring.
- 2) The risks, costs and benefits the project may bring to local stakeholders.
- 3) All relevant laws and regulations covering workers' rights in the host country.
- 4) The process of VCS Program validation and verification and the validation/verification body's site visit.

3.16.18 The project proponent shall develop a grievance redress procedure to address disputes with local stakeholders that may arise during project planning and implementation, including with regard to benefit sharing. The procedure shall include processes for receiving, hearing, responding and attempting to resolve grievances within a reasonable time period, taking into account culturally-appropriate conflict resolution methods. The procedure and documentation of disputes resolved through the procedure shall be made publicly available. The procedure shall have three stages:

- 1) The project proponent shall attempt to amicably resolve all grievances and provide a written response to the grievances in a manner that is culturally appropriate.
- 2) Any grievances that are not resolved by amicable negotiations shall be referred to mediation by a neutral third party.
- 3) Any grievances that are not resolved through mediation shall be referred either to a) arbitration, to the extent allowed by the laws of the relevant jurisdiction or b) competent courts in the relevant jurisdiction, without prejudice to a party’s ability to submit the grievance to a competent supranational adjudicatory body, if any.

3.16.19 All communication and consultation shall be performed in a culturally appropriate manner, including language and gender sensitivity, directly with local stakeholders or their legitimate representatives when appropriate. The results of implementation shall be provided in a timely manner and consultation shall be performed prior to design decisions or implementation to allow stakeholders adequate time to respond to the proposed design or action.

3.17 Methodology Deviations

Concept

Projects may deviate from the procedures set out in methodologies in certain cases, where alternative methods may be more efficient for project-specific circumstances, and where the deviation will achieve the same level of accuracy or is more conservative than what is set out in the methodology.

Requirements

3.17.1 Deviations from the applied methodology are permitted where they represent a deviation from the criteria and procedures relating to monitoring or measurement set out in the methodology (i.e., deviations are permitted where they relate to data and parameters available at validation, data and parameters monitored, or the monitoring plan).

3.17.2 Methodology deviations shall not negatively impact the conservativeness of the quantification of GHG emission reductions or removals, except where they result in increased accuracy of such quantification. Deviations relating to any other part of the methodology shall not be permitted.

3.17.3 Methodology deviations shall be permitted at validation or verification and their consequences shall be reported in the validation or verification report, as applicable, and all subsequent verification reports. Methodology deviations are not considered to be precedent setting.

3.18 Project Description Deviations

Concept

Projects may deviate from the validated project description in certain cases in order to accommodate changing circumstances post-validation. Such deviations shall be described and assessed by a validation/verification body during the next project verification.

Requirements

3.18.1 Deviations from the project description are permitted at verification.

3.18.2 The procedures for documenting a project description deviation depend on whether the deviation impacts the applicability of the methodology, additionality or the appropriateness of the baseline scenario. Interpretation of whether the deviation impacts any of these shall be determined consistent with the *CDM Guidelines on assessment of different types of changes from the project activity as described in the registered PDD*, mutatis mutandis. The procedures are as follows:

- 1) Where the deviation impacts the applicability of the methodology, additionality or the appropriateness of the baseline scenario, the deviation shall be described and justified in a revised version of the project description. This shall include a description of when the changes occurred, the reasons for the changes and how the changes impact the applicability of the methodology, additionality and/or the appropriateness of the baseline scenario.

An example of such a deviation is a change in project capacity where a different baseline scenario would be more plausible, the applied methodology would no longer be applicable, or there would be a significant impact on the investment analysis used by the project to demonstrate additionality. Other examples include changes to the project that might have similar impacts such as the addition of new carbon pools or new types of project activities.

- 2) Where the deviation does not impact the applicability of the methodology, additionality or the appropriateness of the baseline scenario, and the project remains in compliance with the applied methodology, the deviation shall be described and justified in the monitoring report. This shall include a description of when the changes occurred and the reasons for the changes. The deviation shall also be described in all subsequent monitoring reports.

Examples of such deviations include changes in the procedures for measurement and monitoring, or project design changes that do not have an impact on the applicability of the methodology, additionality or the appropriateness of the baseline scenario.

Note that project proponents may apply project description deviations for the purpose of switching to the latest version of the methodology, or switching to a different methodology. For example, a project proponent may want to switch to the latest version of a methodology where such version includes additional types of carbon pools or project activities.

- 3.18.3 The deviation shall be assessed by a validation/verification body and the process, findings and conclusions shall be reported in the verification report. The assessment shall determine whether the deviation is appropriately described and justified, and whether the project remains in compliance with the VCS Program rules. The deviation shall also be reported on in all subsequent verification reports. Project description deviations are not considered to be precedent-setting.
- 3.18.4 The validation/verification body assessing the project description deviation shall be accredited for the validation, recognizing that assessment of project description deviations is a validation activity, as further set out in the VCS Program Guide.

3.19 Participation under Other GHG Programs

Concept

Projects may be registered under both the VCS Program and either an approved GHG program or a GHG program that is not an approved GHG program.

Requirements

General

- 3.19.1 Project proponents shall not claim credit for the same GHG emission reduction or removal under the VCS Program and another GHG program. Projects issuing GHG credits under both the VCS Program and another GHG program shall also comply with the rules and requirements set out in the VCS Program document *Registration and Issuance Process*.
- 3.19.2 Projects registered under other GHG programs are not eligible for VCU issuance beyond the end of the total project crediting period under those programs (see Section 3.8.7 for further information).
- 3.19.3 For projects registered under the CDM as a program of activities (PoA), the following applies:
 - 1) Each component project activity (CPA) shall be registered with the VCS Program as a separate project accompanied by its associated program of activities design document.
 - 2) Each such project shall be validated in accordance with Section 3.19.5(1) below.
 - 3) The project start date for such projects is the date on which the first activity under the program of activities began reducing or removing GHG emissions.

- 4) Validation shall be completed within the relevant project start date deadline, as set out in Section 3.19(in this case, validation refers to validation of the first CPA under the associated PoA).

AFOLU Projects

3.19.4 In addition to the above, AFOLU projects registered under both the VCS Program and another GHG program shall comply with the following:

- 1) All and any (VCS) monitoring and verification reports shall state the total amount of credits (GHG credits and, where applicable, buffer credits) issued under the other GHG program.
- 2) The project shall prepare a non-permanence risk report in accordance with the VCS Program document *AFOLU Non-Permanence Risk Tool* and a validation/verification body shall undertake a full validation of same in accordance with the VCS Program rules. The non-permanence risk analysis shall be based upon the project as a whole, though the buffer withholding shall apply to the net change in carbon stocks for which credits are sought under the VCS Program.
- 3) Where temporary GHG credits (e.g., tCERs or ICERs) have been issued to the project, VCU's may be issued to the project only in accordance with the rules and requirements set out in the VCS Program document *Registration and Issuance Process*.
- 4) Where a loss event or a reversal occurs, the project shall comply with the rules for reporting a loss event and holding/cancelling credits set out in Section 3.2.15 and the VCS Program document *Registration and Issuance Process*. Such reporting, holding and cancelling shall apply to the proportion of credits (GHG credits and buffer credits) granted to date under the VCS Program.

For example, if 50 percent of the total credits (GHG credits and, where applicable, buffer credits) related to the project have been issued under the VCS Program and a loss event results in a reversal of GHG emission reductions or removals achieved, buffer credits would be cancelled to cover 50 percent of the reversal. An example calculation is available on the Verra website.

Approved GHG Programs

3.19.5 The following applies with respect to projects registered under an approved GHG program which are seeking registration with the VCS Program:

- 1) For projects registered under the CDM, the cover page and sections 1.1, 1.2, 1.3, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.12, 1.13, 1.14, 1.15.1, 1.16, 1.17 and 2.6 of the *VCS Project Description Template* shall be completed. A validation/verification body shall undertake a validation of same, which shall be accompanied by a validation representation, to provide a gap validation for the project's compliance with the VCS Program rules.

- 2) For projects registered under the JI program, a new *VCS Project Description Template* shall be completed (applying a methodology eligible under the VCS Program). A validation/verification body shall undertake a full validation of same in accordance with the VCS Program rules. The validation report shall be accompanied by a validation representation.
- 3) For projects registered under the Climate Action Reserve, the cover page and sections 1.1, 1.2, 1.3, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.12, 1.13, 1.15.1, 1.16, 1.17, 2.1, 2.2, 2.3, 2.4 and 3.6 of the *VCS Project Description Template* shall be completed. A validation/verification body shall undertake a validation of same, which shall be accompanied by a validation representation, to provide a gap validation for the project's compliance with VCS Program rules.
- 4) The approved GHG program validation (or verification, where the approved GHG program does not have a validation step) or VCS validation shall be completed within the relevant validation deadline as set out in Section 3.7. Validation (or verification) is deemed to have been completed when the validation (or verification) report that is submitted to the relevant program to request registration has been issued.

Other GHG Programs

3.19.6 Projects registered under a GHG program that is not an approved GHG program may also register with the VCS Program where a validation or verification report has been issued under such program (by an entity approved under the program to issue such reports). For such projects, the following applies:

- 1) The project start date shall be on or after 19 November 2007.
- 2) A new *VCS Project Description Template* shall be completed (using a methodology eligible under the VCS Program) and a validation/verification body shall undertake a full validation of same in accordance with the VCS Program rules. The validation report shall be accompanied by a validation representation.
- 3) The validation or verification that is submitted to request registration under the other GHG program shall be completed within the relevant validation deadline set out in Section 3.7. Validation or verification is deemed to have been completed when the validation or verification report that is submitted to the other GHG program to request registration has been issued.

Projects Rejected by Other GHG Programs

3.19.7 Projects rejected by other GHG programs due to procedural or eligibility requirements can be considered under the VCS Program, but the following conditions shall be met:

- 1) The project description (where the other GHG program has rejected the project before VCS validation) or monitoring report (where the other GHG program has rejected the project after VCS validation) shall clearly state all GHG programs to which the project has applied

- for registration and the reason(s) for rejection. Such information shall not be deemed as commercially sensitive information.
- 2) The validation/verification body shall be provided with the rejection document(s), including any additional explanations.
 - 3) The project shall be validated against the VCS Program rules. For projects where the other GHG program has rejected the project after VCS validation, this means a complete revalidation of the project against the VCS Program rules.

3.20 Other Forms of Credit

Concept

In order to maintain atmospheric integrity, GHG emission reductions/removals that are issued as VCU's cannot also be issued as other types of GHG credits or claimed as other forms of environmental credit. Project proponents shall demonstrate that project emission reductions or removals are not also used under emission trading programs, other mechanisms that include GHG allowance trading, or as other forms of environmental credit.

Requirements

Emission Trading Programs and Other Binding Limits

3.20.1 Where projects reduce GHG emissions from activities that are included in an emissions trading program or any other mechanism that includes GHG allowance trading, evidence shall be provided that the GHG emission reductions or removals generated by the project have not and will not be otherwise counted or used under the program or mechanism. Such evidence may include:

- 1) A letter from the program operator, designated national authority or other relevant regulatory authority that emissions allowances (or other GHG credits used in the program) equivalent to the reductions or removals generated by the project have been cancelled from the program or national cap, as applicable.
- 2) Evidence of the purchase and cancellation of GHG allowances equivalent to the GHG emissions reductions or removals generated by the project related to the program or national cap.
- 3) Evidence from the program operator, designated national authority or other relevant regulatory authority stating that the specific GHG emission reductions or removals generated by the project or type of project are not within the scope of the program or national cap.

Other Forms of Environmental Credit

3.20.2 Projects may generate other forms of GHG-related environmental credits, such as renewable energy certificates (RECs), though GHG emission reductions and removals presented for VCU issuance shall not also be recognized as another form of GHG-related environmental credit. The requirements set out in Sections 3.20.2 and 3.20.3 below assist Verra in confirming that this requirement has been met at the point of the issuance request (i.e., Verra uses the information disclosed in the project documents to perform its checks).

Therefore, project proponents interested in issuing (sequentially) both VCUs and another GHG-related environmental credit should consider which periods of time they wish to issue one credit or the other. Project proponents should also investigate whether such other GHG-related environmental credits can be cancelled from the relevant program, in case such credits have already been issued for periods where the project proponent wishes to issue VCUs. Note that additional requirements regarding evidence that no double issuance has occurred are set out in the VCS Program document *Registration and Issuance Process*.

3.20.3 Where projects have sought or received another form of GHG-related environmental credit, the following information shall be provided to the validation/verification body:

- 1) Name and contact information of the relevant environmental credit program.
- 2) Details of the project as registered under the environmental credit program (e.g., project title and identification number as listed under the program).
- 3) Monitoring periods for which GHG-related environmental credits were sought or received under the environmental credit program.
- 4) Details of all GHG-related environmental credits sought or received under the environmental credit program (e.g., volumes and serial numbers).

3.20.4 Where projects are eligible to participate under one or more programs to create another form of GHG-related environmental credit, but are not currently doing so, a list of such programs shall be provided to the validation/verification body.

Note – The requirements set out in Section 3.20.3 above and this Section 3.20.4 do not apply to non-GHG related environmental credits, such as water or biodiversity credits.

3.21 Records and Information

Concept

The project proponent shall make relevant information available to the validation/verification body during validation and each verification and retain documents and records related to the project for future reference.

Requirements

Records Relating to the Project

3.21.1 The project proponent shall ensure that all documents and records are kept in a secure and retrievable manner for at least two years after the end of the project crediting period.

Information for the Validation/Verification Body

3.21.2 For validation, the project proponent shall make available to the validation/verification body the project description, evidence of project ownership and any requested supporting information and data needed to support statements and data in the project description and evidence of project ownership.

3.21.3 For verification, the project proponent shall make available to the validation/verification body the project description, validation report, monitoring report applicable to the monitoring period and any requested supporting information and data needed to evidence statements and data in the monitoring report.

4 VALIDATION AND VERIFICATION REQUIREMENTS

This section sets out the rules and requirements for validation and verification of projects under the VCS Program. Validation/verification bodies must assess projects' compliance with VCS Program rules and requirements and the applied methodology(s) in accordance with the sections below.

Validation/verification bodies must be approved under the VCS Program, and meet the eligibility criteria set out in the *VCS Program Guide*.

4.1 Introduction and General Requirements

Concept

Validation is the independent assessment of the project by a validation/verification body that determines whether the project complies with the VCS Program rules. Verification is the periodic ex-post independent assessment by a validation/verification body of the GHG emission reductions and removals that have occurred as a result of the project during the monitoring period, conducted in accordance with the VCS Program rules.

Requirements

General

- 4.1.1 Validation and verification is a risk-based process and shall be carried out in conformance with *ISO 14064-3:2006* and *ISO 14065:2013*. Additional requirements with respect to validation and verification are set out in this Section 4 and shall be adhered to.
- 4.1.2 The validation/verification body shall select samples of data and information to be validated or verified to provide a reasonable level of assurance and to meet the materiality requirements of the specific project.
- 4.1.3 The project shall be validated and GHG emission reductions or removals verified by a validation/verification body that meets with the eligibility requirements set out in the *VCS Program Guide*.
- 4.1.4 Validation and verification of the project may be undertaken by the same validation/verification body, noting the rules on rotation of validation/verification bodies set out in Section 4.1.20 below. Validation may occur before the first verification or at the same time as the first verification.

- 4.1.5 The project shall be listed on the project pipeline before the opening meeting between the validation/verification body and the project proponent (such opening meeting representing the beginning of the validation process). The validation/verification body is responsible for checking that the project is listed on the project pipeline and shall not conduct the opening meeting or otherwise begin validation until such time as the project is listed.
- 4.1.6 Where the project applies a methodology from an approved GHG program that does not have an independent validation step, the VCS Program rules still require validation of the project.
- 4.1.7 Validation/verification bodies are expected to follow the guidance provided in the VCS *Validation and Verification Manual* when validating or verifying projects and conducting methodology assessments under the VCS Program.

Validation and Verification Process

- 4.1.8 In addition to the requirements set out in *ISO 14064-3:2006*, the following shall apply:
 - 1) The level of assurance shall be reasonable, with respect to material errors, omissions and misrepresentations, for both validation and verification.
 - 2) The criteria for validation shall be the *VCS Version 4*, or approved GHG program where the validation is performed under an approved GHG program (as in cases of participation under the VCS Program and an approved GHG program). The criteria for verification shall be the *VCS Version 4* (regardless of the VCS version or GHG program under which the project was validated). This means the validation or verification shall ensure conformance of the project with the VCS Program rules, or rules and requirements of the approved GHG program, as applicable.
 - 3) The objective of validation or verification shall be in conformance with the VCS Program rules and the methodology applied to the project.
 - 4) The threshold for materiality with respect to the aggregate of errors, omissions and misrepresentations relative to the total reported GHG emission reductions and/or removals shall be five percent for projects and one percent for large projects.
- 4.1.9 Where the project does not fully comply with the methodology, the validation/verification body shall determine whether this represents a methodology deviation or a methodology revision (in accordance with the specifications for each), and the case shall be handled accordingly.
- 4.1.10 Where the project applies a revision to an approved GHG program methodology and the version of the (underlying) methodology referenced by the methodology revision is no longer current, the validation/verification body shall determine whether material changes have occurred to the underlying methodology that affect the integrity of the methodology revision. Where such material changes have occurred, the project shall not be approved.

4.1.11 Where the project does not meet the criteria for validation or verification, the validation/verification body shall produce a negative validation conclusion and provide the validation or verification report and project description, or monitoring report, to Verra. The project shall be ineligible for registration until such time as corrective action is taken and the (same) validation/verification body has provided a positive validation or verification.

Competence

4.1.12 The validation/verification body and validation and verification team shall meet the competence requirements set out in *ISO 14065:2013*, mutatis mutandis.

Validation and Verification Reporting

4.1.13 The validation report describes the validation process, any findings raised during validation and their resolutions, and the conclusions reached by the validation/verification body. The validation/verification body shall use the *VCS Validation Report Template*, an approved combined validation report template available on the Verra website, or an approved GHG program validation report template where the project is registered under an approved GHG program, as appropriate, and adhere to all instructional text within the template. The validation report shall be accompanied by a validation representation, which shall be prepared using the *VCS Validation Deed of Representation Template*.

4.1.14 The verification report describes the verification process, any findings raised during verification and their resolutions, and the conclusions reached by the validation/verification body. The validation/verification body shall use the *VCS Verification Report Template* or an approved combined verification report template available on the Verra website, and adhere to all instructional text within the template. The verification report shall be accompanied by a verification representation, which shall be prepared using the *VCS Verification Deed of Representation Template*.

4.1.15 Where a monitoring report and associated verification report divide a verification period into vintages, separate VCU issuance records in accordance with vintage periods may be issued, as set out in the VCS Program document *Registration and Issuance Process*.

Validation and Verification Statement

4.1.16 The validation report and the verification report shall contain a validation statement and a verification statement, respectively.

4.1.17 Validation and verification statements shall:

- 1) Describe the level of assurance of the validation or verification.
- 2) Describe the objectives, scope and criteria of the validation or verification.
- 3) Describe whether the data and information supporting the GHG assertion were hypothetical, projected and/or historical in nature.

- 4) Include the validation/verification body’s conclusion on the GHG assertion, including any qualifications or limitations.
- 5) For AFOLU projects, state the version number of the non-permanence risk report or market leakage evaluation documentation upon which the statement is based.

4.1.18 The verification statement shall state the volume of GHG emission reductions or removals generated during the monitoring period that have been verified. For AFOLU projects, the verification statement shall also include the non-permanence risk rating, leakage emissions and number of GHG emission reductions or removals eligible to be issued as VCU.

Records of Validation and Verification

4.1.19 The validation/verification body shall keep all documents and records in a secure and retrievable manner for at least two years after the end of the project crediting period, even where they do not conduct verification for the whole project crediting period.

Rotation of Validation/Verification Bodies

4.1.20 Rotation of validation/verification bodies is required in respect of validation and verification, as follows:

- 1) Validation (including project crediting period renewal validation) and the first verification of a project (in a given project crediting period) may be undertaken by the same validation/verification body. However, the subsequent verification shall be undertaken by a different validation/verification body. For example, if validation and verification were undertaken at the same time, the subsequent verification would have to be undertaken by a different validation/verification body. If validation were undertaken first (i.e., separately), the first verification could be undertaken by the same validation/verification body, but the subsequent verification would have to be undertaken by a different validation/verification body.

Note – The gap validation of a project registered under an approved GHG program may be disregarded when assessing adherence to these requirements.

- 2) A validation/verification body may not verify more than six consecutive years of a project’s GHG emission reductions or removals. The validation/verification body may undertake further verification for the project only when at least three years of the project’s GHG emission reductions or removals have been verified by a different validation/verification body. Additionally, where a validation/verification body verifies the final six consecutive years of a project crediting period, the project crediting period renewal validation shall be undertaken by a different validation/verification body. Notwithstanding these rules, where AFOLU projects have verification periods longer than six years, a validation/verification body is permitted to verify more than six consecutive years of a project’s GHG emission reductions or removals, and the subsequent verification shall be undertaken by a different validation/verification body.

Note – Validations and verifications performed under other GHG programs shall be counted when assessing adherence to these requirements.

Validation and Verification Requirements for Grouped Projects

- 4.1.21 Validation and verification of grouped projects shall assess conformance of the project with the requirements for grouped projects set out in the VCS Program rules.
- 4.1.22 New project activity instances shall be validated, based on the information reported in the monitoring report, against the applicable set of eligibility criteria. The validation/verification body shall specify which instances meet the eligibility criteria for inclusion in the project. Such validation may be reported in the verification report or a separate validation report.
- 4.1.23 Where, due to the number of project activity instances, it is unreasonable to undertake an individual assessment of each initial or new instance, the validation/verification body shall document and explain the sampling methods employed for the validation of such instances. Such sampling methods shall be statistically sound. The number of instances included in the project, eligible for monitoring and generation of VCUs shall be proportional to the percentage of sampled instances found to be in compliance by the validation/verification body.
- 4.1.24 The verification report for grouped projects shall document and explain the sampling methods employed by the validation/verification body for the verification of GHG emission reductions or removals generated by the project. Such methods shall be statistically sound. Any subsequent changes to the sampling method(s) required as a result of the verification findings shall be documented.

Non-Permanence Risk Analysis and Market Leakage Evaluations for AFOLU Projects

- 4.1.25 Non-Permanence risk analysis and market leakage evaluations shall be assessed by the validation/verification body in accordance with the VCS Program rules.
- 4.1.26 The validation/verification body shall assess the risk analysis carried out by the project proponent in accordance with the VCS Program document *AFOLU Non-Permanence Risk Tool*. The project proponent shall respond to all and any of the validation/verification body's findings. As a result of any such findings, the project proponent shall amend the documentation as necessary and update the risk rating accordingly.

APPENDIX 1 ELIGIBLE AFOLU PROJECT CATEGORIES

This appendix defines the types of activities that are included within each AFOLU project category, and is intended to aid project proponents in determining which type of methodology may be applicable to their AFOLU project activity(s). As set out in Section 3.2 above, AFOLU projects must apply a methodology eligible under the VCS Program.

Additional information about the eligible activities and specific GHG sources, sinks and reservoirs that must be included in methodologies developed under the VCS Program for each eligible AFOLU project category is available in the VCS Program document *VCS Methodology Requirements*.

Afforestation, Reforestation and Revegetation (ARR)

A1.1 Eligible ARR activities are those that increase carbon sequestration and/or reduce GHG emissions by establishing, increasing or restoring vegetative cover (forest or non-forest) through the planting, sowing or human-assisted natural regeneration of woody vegetation. Eligible ARR projects may include timber harvesting in their management plan. The project area shall not be cleared of native ecosystems within the 10 year period prior to the project start date, as set out in Section 3.2.4.

Note – Activities which improve forest management practices such as enrichment planting and liberation thinning are categorized as IFM project activities.

Agricultural Land Management (ALM)

A1.2 Eligible ALM activities are those that reduce net GHG emissions on croplands and grasslands by increasing carbon stocks in soils and woody biomass and/or decreasing CO₂, N₂O and/or CH₄ emissions from soils. The project area shall not be cleared of native ecosystems within the 10-year period prior to the project start date. Eligible ALM activities include:

- 1) Improved Cropland Management (ICM): This category includes practices that demonstrably reduce net GHG emissions of cropland systems by increasing soil carbon stocks, reducing soil N₂O emissions, and/or reducing CH₄ emissions.
- 2) Improved Grassland Management (IGM): This category includes practices that demonstrably reduce net GHG emissions of grassland ecosystems by increasing soil carbon stocks, reducing N₂O emissions and/or reducing CH₄ emissions.
- 3) Cropland and Grassland Land-use Conversions (CGLC): This category includes practices that convert cropland to grassland or grassland to cropland and reduce net GHG emissions by increasing carbon stocks, reducing N₂O emissions, and/or reducing CH₄ emissions.

Note – Project activities relating to manure management are eligible under sectoral scope 15 (livestock, enteric fermentation, and manure management), not sectoral scope 14 (AFOLU).

Improved Forest Management (IFM)

- A1.3 Eligible IFM activities are those that increase carbon sequestration and/or reduce GHG emissions on forest lands managed for wood products such as sawtimber, pulpwood and fuelwood by increasing biomass carbon stocks through improving forest management practices. The baseline and project scenarios for the project area shall qualify as forests remaining as forests, such as set out in the *IPCC 2006 Guidelines on National GHG Inventories*, and the project area shall be designated, sanctioned or approved for wood product management by a national or local regulatory body (e.g., as logging concessions or plantations).
- A1.4 Various sanctioned forest management activities may be changed to increase carbon stocks and/or reduce emissions, but only a subset of these activities make a measurable difference to the long-term increase in net GHG emissions compared to the baseline scenario. Eligible IFM activities include:
- 1) Reduced Impact Logging (RIL): This category includes practices that reduce net GHG emissions by switching from conventional logging to RIL during timber harvesting.
 - 2) Logged to Protected Forest (LtPF): This category includes practices that reduce net GHG emissions by converting logged forests to protected forests. By eliminating harvesting for timber, biomass carbon stocks are protected and can increase as the forest re-grows and/or continues to grow. Harvesting of trees to advance conservation purposes (e.g., the removal of diseased trees) may continue in the project scenario.
 - 3) Extended Rotation Age / Cutting Cycle (ERA): This category includes practices that reduce net GHG emissions of evenly aged managed forests by extending the rotation age or cutting cycle and increasing carbon stocks.
 - 4) Low-Productive to High-Productive Forest (LtHP): This category includes practices that increase carbon sequestration by converting low-productivity forests to high-productivity forests. Note - Activities that reduce GHG emissions from unsanctioned forest degradation (e.g., illegal logging) are considered REDD activities. Projects focusing solely on the reduction of forest fires are not eligible under IFM. Activities that degrade wetlands to increase forest production are not eligible.

Reduced Emissions from Deforestation and Degradation (REDD)

- A1.5 Eligible REDD activities are those that reduce net GHG emissions by reducing deforestation and/or degradation of forests. Deforestation is the direct, human-induced conversion of forest land to non-forest land. Degradation is the persistent reduction of canopy cover and/or carbon stocks in a forest due to human activities such as animal grazing, fuelwood extraction, timber removal or other such activities, but which does not result in the conversion of forest to non-

forest land (which would be classified as deforestation), and qualifies as *forests remaining as forests*, such as set out under the *IPCC 2003 Good Practice Guidance*. The project area shall meet an internationally accepted definition of forest, such as those based on UNFCCC host-country thresholds or FAO definitions, and shall qualify as forest for a minimum of 10 years before the project start date. The definition of forest may include mature forests, secondary forests, and degraded forests. Under the VCS Program, secondary forests are considered to be forests that have been cleared and have recovered naturally and that are at least 10-years-old and meet the lower bound of the forest threshold parameters at the start of the project. Forested wetlands, such as floodplain forests, peatland forests and mangrove forests, are also eligible provided they meet the forest definition requirements mentioned above.

- A1.6 Activities covered under the REDD project category are those that are designed to stop planned (designated and sanctioned) deforestation or unplanned (unsanctioned) deforestation and/or degradation. Avoided planned degradation is classified as IFM.
- A1.7 Activities that stop unsanctioned deforestation and/or illegal degradation (such as removal of fuelwood or timber extracted by non-concessionaires) on lands that are legally sanctioned for timber production are eligible as REDD activities. However, activities that reduce or stop logging only, followed by protection, on forest lands legally designated or sanctioned for forestry activities are included within IFM. Projects that include both avoided unplanned deforestation and/or degradation as well as stopping sanctioned logging activities, shall follow the REDD guidelines for the unplanned deforestation and/or degradation and the IFM guidelines for the sanctioned logging activities, and shall follow the requirements set out in Section 3.5.2.
- A1.8 Eligible REDD activities include:
 - 1) Avoiding Planned Deforestation and/or Degradation (APDD): This category includes activities that reduce net GHG emissions by stopping or reducing deforestation or degradation on forest lands that are legally authorized and documented for conversion.
 - 2) Avoiding Unplanned Deforestation and/or Degradation (AUDD): This category includes activities that reduce net GHG emissions by stopping deforestation and/or degradation of degraded to mature forests that would have occurred in any forest configuration.

Avoided Conversion of Grasslands and Shrublands (ACoGS)

- A1.9 Eligible ACoGS activities are those that reduce net GHG emissions by reducing the conversion of grassland and shrubland ecosystems to other land uses with lower carbon densities. Eligible avoided conversion activities include avoiding, at a minimum, the removal/replacement of vegetation and may also include avoiding soil disturbance.
- A1.10 The project area shall be native grasslands (including savanna) and/or shrublands (including chaparral). Non-forested wetlands, including peatlands, are not eligible under ACoGS and are covered under other AFOLU project categories.

A1.11 Activities covered under the ACoGS project category are those that are designed to stop planned (designated and sanctioned) conversion or unplanned (unsanctioned) conversion on public or private lands. This category type only includes avoided conversion of non-forested lands, noting that other management activities on non-forested land may qualify under ALM or ARR project categories.

A1.12 Eligible ACoGS activities include:

- 1) Avoiding Planned Conversion (APC): This category includes activities that reduce net GHG emissions by stopping conversion of grasslands or shrublands that are legally authorized and documented for conversion.
- 2) Avoiding Unplanned Conversion (AUC): This category includes activities that reduce net GHG emissions by stopping unplanned conversion of grasslands or shrublands.

Wetlands Restoration and Conservation (WRC)

A1.13 Eligible WRC activities are those that increase net GHG removals by restoring wetland ecosystems or that reduce GHG emissions by rewetting or avoiding the degradation of wetlands. The project area shall meet an internationally accepted definition of wetland, such as from the IPCC, Ramsar Convention on Wetlands, those established by law or national policy, or those with broad agreement in the peer-reviewed scientific literature for specific countries or types of wetlands. Common wetland types include peatland, salt marsh, tidal freshwater marsh, mangroves, wet floodplain forests, prairie potholes and seagrass meadows. WRC activities may be combined with other AFOLU project categories, as further explained in Section 59.

A1.14 A peatland is an area with a layer of naturally accumulated organic material (peat) at the surface (excluding the plant layer). Common peatland types include peat swamp forest, mire, bog, fen, moor, muskeg and pocosin. Rewetting of drained peatland and the conservation of undrained or partially drained peatland are sub-categories of restoring wetland ecosystems and conservation of intact wetlands, respectively¹¹.

A1.15 Activities that generate net reductions of GHG emissions from wetlands are eligible as WRC projects or combined category projects (such as REDD on peatland). Activities that actively lower the water table depth in wetlands are not eligible. Eligible WRC activities include:

- 1) Restoring Wetland Ecosystems (RWE): This category includes activities that reduce GHG emissions or increase carbon sequestration in a degraded wetland through restoration activities. Such activities include enhancing, creating and/or managing hydrological conditions, sediment supply, salinity characteristics, water quality and/or native plant communities. For the purpose of these requirements, restoration activities are those that

¹¹ These categories existed as rewetting drained peatlands (RDP) and conservation of undrained and partially drained peatlands (CUPP) in the *AFOLU Requirements v3.2*.

result in the reestablishment of ecological processes, functions, and biotic and/or abiotic linkages that lead to persistent, resilient systems integrated within the landscape.

- 2) Conservation of Intact Wetlands (CIW): This category includes activities that reduce GHG emissions by avoiding degradation and/or the conversion of wetlands that are intact or partially altered while still maintaining their natural functions, including hydrological conditions, sediment supply, salinity characteristics, water quality and/or native plant communities.

Wetland degradation or conversion can be planned (designated and sanctioned) or unplanned (unsanctioned). Planned and unplanned degradation or conversion of wetlands can therefore encompass a wide variety of activities such as those listed under REDD while adding a wetland component. Activities covered under the CIW project category are those that are designed to stop or reduce planned or unplanned degradation or conversion in the project area to other land uses. The following CIW activities are eligible:

- a) Avoiding Planned Wetland Degradation (APWD): This activity reduces GHG emissions by avoiding degradation of wetlands, or further degradation in partially drained wetlands that are legally authorized and documented for conversion.
- b) Avoiding Unplanned Wetland Degradation (AUWD): This activity reduces GHG emissions by avoiding unplanned degradation of wetlands, or by avoiding further degradation in partially degraded wetlands.

Note – Activities where drainage is continued or maintained are not eligible. This includes, for example, projects that require the maintenance of drainage channels to maintain the pre-project drainage level on a partially drained peatland (e.g., where periodic deepening may be needed to counteract peat subsidence). Projects that allow selective harvesting that results in a lowering of the water table depth (e.g., by extracting timber using drainage canals) or affects the ability of vegetation to act as a major hydrological regulation device (e.g., extracting trees which support the peat body) are also not eligible. Project activities may include selective harvesting where harvesting does not lower the water table, for example by extracting timber using wooden rails instead of drainage canals.

- A1.16 Activities that generate net GHG emission reductions by combining other AFOLU project activities with wetlands restoration or conservation activities are eligible as WRC combined projects. RWE may be implemented without further conversion of land use or it may be combined with ARR, ALM, IFM, REDD or ACoGS activities, referred to as ARR+RWE, ALM+RWE, IFM+RWE, REDD+RWE or ACoGS+RWE, respectively. CIW may be implemented on non-forest land or combined with IFM, REDD or ACoGS activities, referred to as IFM+CIW, REDD+CIW or ACoGS+CIW, respectively.

Table 3 illustrates the types of WRC activities that may be combined with other AFOLU project categories. The table identifies the applicable AFOLU requirements that shall be followed for combined category projects, based on the condition of the wetland in the baseline scenario, the land use in the baseline scenario and the project activity.

Table 3: Eligible WRC Combined Category Projects

Baseline Scenario		Project Activity	Applicable Guidance
Condition	Land Use		
Degraded wetland (including, drained, impounded, and with interrupted sediment supply)	Non-forest (including aquacultures, grasslands and shrublands)	Restoration of wetlands*	RWE
		Restoration of wetlands* and revegetation or conversion to forest	ARR+RWE
		Restoration of wetlands* and conversion to wetland agriculture (including paludiculture)	ALM+RWE
		Restoration of wetlands* and avoided conversion of grasslands or shrublands	ACoGS+RWE
	Forest	Restoration of wetlands*	RWE
	Forest with deforestation/ degradation	Restoration of wetlands* and avoided deforestation/degradation	REDD+RWE
	Forest managed for wood products	Restoration of wetlands* and improved forest management	IFM+RWE
Non-wetland or open water	Non-forest	Creation of wetland conditions and afforestation, reforestation or revegetation	ARR+RWE
	Open water or impounded wetland	Creation or restoration of conditions for vegetation development and afforestation, reforestation or revegetation	ARR+RWE
Intact wetland	Non-forest (including grasslands and shrublands)	Avoided drainage and/or interrupted sediment supply	CIW
		Avoided conversion to open water or impounded wetland (including excavation to create fish ponds)	CIW
		Avoided drainage and/or interrupted sediment supply and avoided conversion of grasslands and Shrublands	ACoGS+CIW
	Forest	Avoided drainage and/or interrupted sediment supply	CIW

Attachment: WLC Responses to Appeal_9JUNE2020_Part 2 (4074 : World Logistics Center)

		Avoided conversion to open water or impounded wetland	CIW
	Forest with deforestation/ degradation	Avoided drainage and/or interrupted sediment supply and avoided deforestation/degradation	REDD+CIW
		Avoided conversion to open water or impounded wetland and avoided deforestation/degradation	REDD+CIW
	Forest managed for wood products	Avoided drainage and/or interrupted sediment supply and improved forest management	IFM+CIW

* *Restoration of wetlands* includes all the activities set out in Section A1.15.

A1.17 Combined category projects shall use the relevant WRC requirements and the respective AFOLU project category requirements for quantifying GHG emissions/removals, unless the former may be deemed *de minimis* or conservatively excluded.

APPENDIX 2 DOCUMENT HISTORY

Version	Date	Comment
v4.0	Released: 19 Sep 2019	Initial version released under <i>VCS Version 4</i> , with immediate effect except for the following:
	Updated: 9 Mar 2020	<p>For project activities that were eligible under <i>VCS Version 3</i>, but are now excluded from the scope of the VCS Program (Section 2.1):</p> <p>Updated on 9 March 2020 to revise the effective dates for projects registered with an approved GHG Program. New text is shown in red and deleted text is shown in strikethrough, below.</p> <ol style="list-style-type: none"> 1) Registered VCS projects and projects that request registration with the VCS Program on or before 31 December 2019 remain eligible under the VCS Program for the entirety of their crediting periods. 2) Grouped projects registered under the VCS Program shall be prohibited from adding new project activity instances of the newly excluded project types on or after 1 January 2020; verification reports dated on or after 1 January 2020 shall not be accepted where they include the validation of such new project activity instances. 3) Projects registered under an approved GHG program shall only be eligible to complete a gap validation and/or transfer to the VCS Program where the project has applied for registration with the VCS Program approved GHG program on or before 9 March 2020 31 December 2019, unless evidence of contracting for a VCS gap validation prior to 9 March 2020 is provided. 4) GHG credits issued under an approved GHG program shall only be eligible to be converted into VCU's where a conversion request has been submitted the project has applied for registration with the approved GHG program on or before 9 March 2020 31 December 2019, unless evidence of contracting for a CER conversion prior to 9 March 2020 is provided, in which case the conversion must take place on or before 9 April 2020. <p>For projects subject to new crediting period requirements under <i>VCS Version 4</i> (i.e., non-AFOLU projects and ALM projects focusing exclusively on reducing N₂O, CH₄ and/or fossil-derived CO₂ emissions) (Section 3.8):</p> <ol style="list-style-type: none"> 1) Registered projects and projects that complete validation on or before 19 March 2020 remain eligible to apply the crediting period requirements under <i>VCS Version 3</i>. 2) Projects applying a new VCS methodology (i.e., a methodology for which a concept note was submitted to Verra on or before 31 December 2018) shall be granted additional time to apply the crediting period requirements under <i>VCS Version 3</i>. Specifically, projects using a new VCS methodology and completing validation within two years of the approval of the methodology may apply the crediting requirements as set out under <i>VCS Version 3</i>.

VCS Website

Verified Carbon Units (VCUs)

The world's leading voluntary GHG program

The VCS Program

The VCS Program is the world's most widely used voluntary GHG program. Almost 1,600 certified VCS projects have collectively reduced or removed more than 450 million tonnes of carbon and other GHG emissions from the atmosphere.

Individuals and corporations around the world are recognizing the importance of reducing their GHG emissions. As a result, many of them are reducing their carbon footprints through energy efficiency and other measures. Quite often, however, it is not possible for these entities to meet their targets or eliminate their carbon footprint, at least in the near term, with internal reductions alone, and they need a flexible mechanism to achieve these aspirational goals. Enter the carbon markets.

By using the carbon markets, entities can neutralize, or *offset*, their emissions by retiring carbon credits generated by [projects](#) that are reducing GHG emissions elsewhere. Of course, it is critical to ensure, or *verify*, that the emission reductions generated by these projects are actually occurring. This is the work of the VCS Program – to ensure the credibility of emission reduction projects.

Once projects have been certified against the VCS Program's rigorous set of [rules and requirements](#), project developers can be issued tradable GHG credits that we call . Those VCUs can then be sold on the open market and retired by individuals and companies as a means to offset their own emissions. Over time, this flexibility channels financing to clean, innovative businesses and technologies.

Verra's role is to develop and administer the program. We provide oversight to all operational components of the VCS Program and we are responsible for updating the VCS rules such that they ensure the quality of VCUs. The development of the VCS Program is supported by the [VCS Program Advisory Group](#), a multi-stakeholder body that helps ensure that the VCS Program continues to serve its users in an effective and efficient manner and drives practical and robust solutions to mitigate climate change.

How It Works

Projects developed under the VCS Program must follow a rigorous assessment process in order to be certified. VCS projects cover a diverse range of sectors, including renewable energy (such as wind and hydroelectric projects), forestry (including the avoidance of deforestation), and others. Emission reductions certified by our program are eligible to be issued as VCUs, with one VCU representing one metric tonne of greenhouse gas emissions reduced or removed from the atmosphere.

VCS Standard: The VCS Standard lays out the rules and requirements which all projects must follow in order to be certified.

Independent Auditing: All VCS projects are subject to desk and field audits by both qualified [independent third parties](#) and Verra staff to ensure that standards are met and methodologies are properly applied.

Accounting Methodologies: Projects are assessed using a technically sound GHG emission reduction [quantification methodology](#) specific to that project type.

Registry System: The registry system is the central storehouse of data on all registered projects, and tracks the generation, retirement and cancellation of all VCUs. To register with the program, projects must show that they have met all standards and methodological requirements.

While VCS projects typically include a discrete set of activities, governments are now establishing policies and programs to mitigate GHG emissions across entire national or subnational jurisdictions. In the forest sector, these programs (called REDD+ programs) can be accounted for and credited using the world's first jurisdictional-scale framework, the Verra [Jurisdictional and Nested REDD+ \(JNR\)](#) framework. JNR integrates government-led and project-level REDD+ activities and establishes a clear pathway for subnational- and project-level activities to be incorporated within broader REDD+ programs.

Registration and Issuance Process

Attachment: WLC Responses to Appeal_9JUNE2020_Part 2 (4074 : World Logistics Center)

ABOUT VERRA

Verra supports climate action and sustainable development through the development and management of standards, tools and programs that credibly, transparently and robustly assess environmental and social impacts, and drive funding for sustaining and scaling up these benefits. As a mission-driven, non-profit (NGO) organization, Verra works in any arena where we see a need for clear standards, a role for market-driven mechanisms and an opportunity to achieve environmental and social good.

Verra manages a number of global standards frameworks designed to drive finance towards activities that mitigate climate change and promote sustainable development, including the [Verified Carbon Standard \(VCS\) Program](#) and its [Jurisdictional and Nested REDD+ framework \(JNR\)](#), the [Verra California Offset Project Registry \(OPR\)](#), the [Climate, Community & Biodiversity \(CCB\) Standards](#) and the [Sustainable Development Verified Impact Standard \(SD VISta\)](#). Verra is also developing new standards frameworks, including [LandScale](#), which will promote and measure sustainability outcomes across landscapes. Finally, Verra is one of the implementing partners of the [Initiative for Climate Action Transparency \(ICAT\)](#), which helps countries assess the impacts of their climate actions and supports greater transparency, effectiveness, trust and ambition in climate policies worldwide.

1 INTRODUCTION

This document outlines the procedures for listing pipeline projects, registering projects and issuing verified carbon units (VCUs) under the VCS Program. This document is intended for use by project proponents, VCU buyers, VCU sellers and any other entities participating in the VCU market. Note that the *VCS Standard* and its related documents provide the rules and requirements for developing projects, and this document (the *Registration and Issuance Process*) should not be used for such purpose.

Projects may have one or many project proponents, though to aid readability, this document uses project proponent in the singular. For projects with multiple project proponents, *project proponents* should be substituted in place of *project proponent*, as appropriate.

Project proponents interact with the Verra registry to list pipeline projects, register projects and issue VCUs (i.e., project pipeline listing, project registration and VCU issuance are handled by the Verra registry). Verra staff are responsible for undertaking a completeness check on documentation and for ensuring adherence to the VCS Program rules with respect to the pipeline listing process and the project registration process. Verra staff also upload information to the Verra registry.

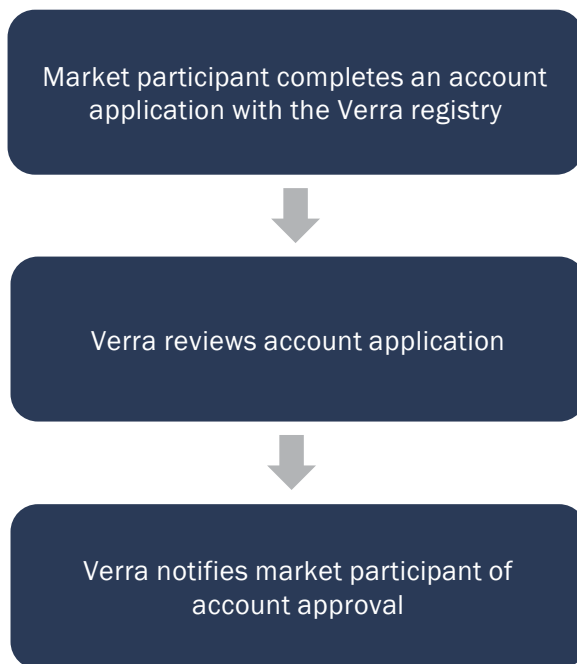

The Verra registry provides the central repository for all information and documentation relating to pipeline and registered projects. The registry is also responsible for ensuring uniqueness of projects, issuing VCU serial numbers and tracking VCU retirement. The registry makes project and VCU information and documentation publicly available and can be accessed via the Verra website. As set out in the VCS Program document *VCS Program Guide*, Verra is responsible for reviewing project documentation and overseeing validation/verification bodies to ensure the integrity of projects and VCUs in the Verra registry system.

This document will be updated from time-to-time and readers shall ensure that they are using the most current version of the document.

2 OPENING A VERRA REGISTRY ACCOUNT

A Verra registry account shall be opened by any market participant who wants to list a pipeline project, register a project and/or issue, trade or retire VCUs as set out in Diagram 1, with the notes that follow providing further details.

Diagram 1: Opening a Verra Registry Account

- 2.1.1 The Verra registry is managed and operated by Verra staff. Further details about the Verra registry system are available in the *VCS Program Guide*.
- 2.1.2 A market participant can apply to open a Verra registry account at any time. For example, a would-be project proponent does not need to have a validated or verified project and a would-be VCU buyer does not need to have entered into a legal agreement to purchase VCUs in order to open a Verra registry account.
- 2.1.3 Market participants can apply to open a Verra registry account through the Verra website. Market participants are also encouraged to contact the Verra registry at any time at registry@verra.org.

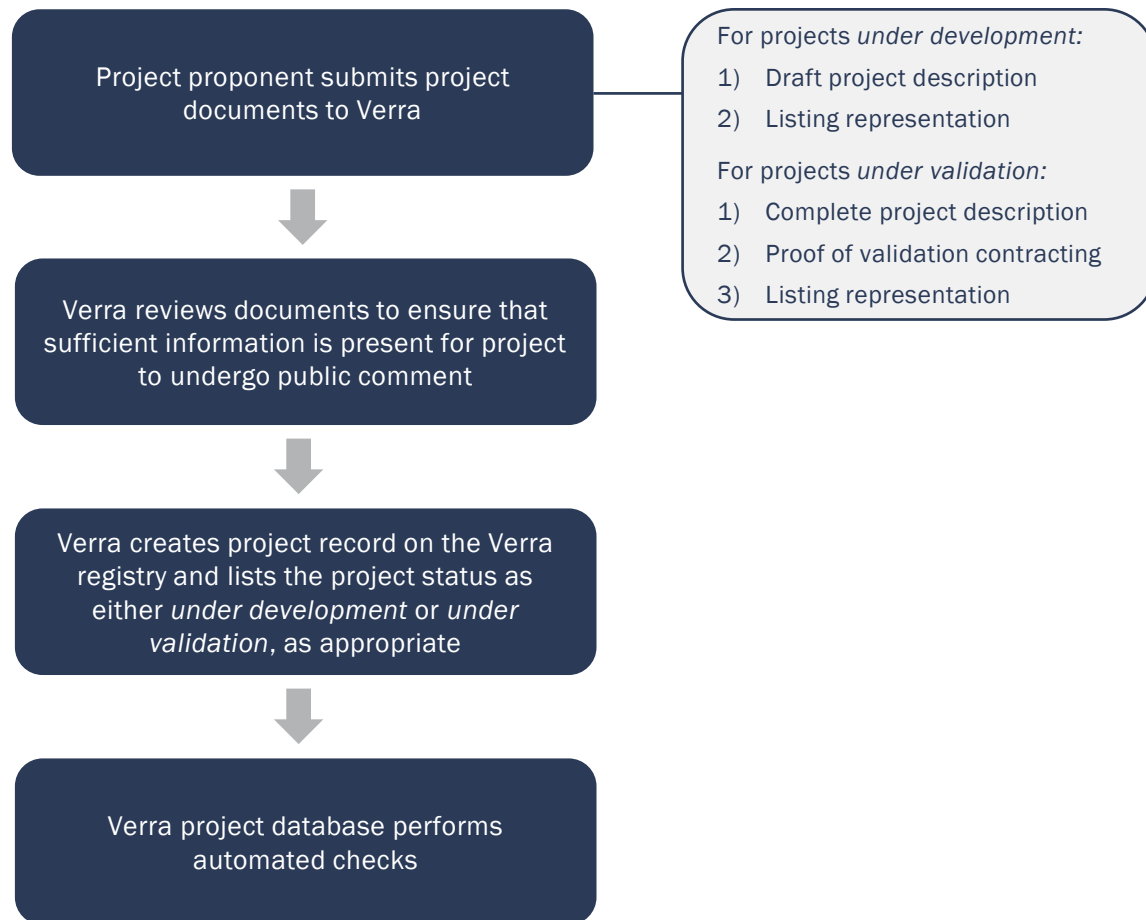

3 PIPELINE LISTING PROCESS

The Verra registry contains a project pipeline which lists projects before they are registered. Projects shall be listed on the project pipeline before the opening meeting between the validation/verification body and the project proponent (such opening meeting representing the beginning of the validation process). The validation/verification body is responsible for checking that the project is listed on the project pipeline and shall not conduct the opening meeting or otherwise begin validation until such time as the project is listed. Note, also, that where a methodology element is put on hold or withdrawn, only projects that have been listed on the project pipeline by the date on which the methodology element is put on hold or withdrawn shall be granted the grace period for using the methodology element (i.e., any projects not listed on the project pipeline by such date shall not be granted the grace period). Project proponents may therefore wish to list their projects at the early stages of project development to ensure that they can take advantage of any grace periods. See the VCS Program document *Methodology Approval Process* for more information on grace periods.

The date on which the project is listed on the project pipeline marks the beginning of that project's 30-day public comment period. Any comments shall be submitted to Verra at secretariat@verra.org and respondents shall provide their name, organization, country and email address. At the end of the public comment period, Verra provides all and any comments received to the project proponent. The project proponent shall address such comments as set out in the *VCS Standard*.

The process for listing a project on the project pipeline is set out in Diagram 2 below, with the notes that follow providing further details.

Diagram 2: Pipeline Listing Process

3.1 Process

- 3.1.1 The only entities that may initiate the pipeline listing process are the project proponent, an entity to which the project proponent has assigned sole right to the GHG emission reductions or removals for the entire project crediting period, an entity who has been authorized by the project proponent(s) to list the project on the project pipeline or the authorized representative of any of these entities. No other entity can initiate the pipeline listing process.
- 3.1.2 Pipeline projects shall be listed as either *under development* or *under validation*. Projects under development are those which have not yet contracted a validation/verification body to perform validation. Projects under validation are those that have contracted a validation/verification body to perform validation (i.e., are ready to begin or have begun the validation process).

- 3.1.3 To list a project as *under development*, the following shall be submitted to the Verra registry:
- 1) A draft project description which shall include (at a minimum) the cover page and drafts of sections 1.1, 1.2, 1.3, 1.5, 1.7, 1.8, 1.9, 1.10, 1.11, 1.12, 1.13, 1.14, 3.1, 3.2, 3.3, 3.4, and 3.5 of the *VCS Project Description Template*. Note that indicative information is sufficient (e.g., the proposed approach for demonstrating additionality or establishing project ownership, rather than the full rationale and evidence that will be submitted for validation); and
 - 2) A listing representation.

- 3.1.4 To list a project as *under validation*, the following shall be submitted to the Verra registry:
- 1) A complete project description (i.e., one with all sections of the *VCS Project Description Template* completed);
 - 2) Proof of contracting of the validation, provided in accordance with Section 4.2.6; and
 - 3) A listing representation.

Note – Pipeline projects may either apply an approved methodology or a methodology that is under development. Where a methodology under development is applied, the project description shall provide a reference for the draft version of the methodology.

- 3.1.5 The project status may be updated from *under development* to *under validation* where the required documentation set out in Section 3.1.4 is submitted (noting that a second listing representation is not required). Verra shall undertake the relevant checks set out in Section 3.1.8.

- 3.1.6 The following applies with respect to the listing representation:
- 1) The Verra website provides the template for the listing representation. The template shall not be altered other than to fill in the project-specific details.
 - 2) The listing representation shall be properly executed as a deed in accordance with applicable local laws and the organization’s own constitutional documents (e.g., signature by directors and requirement of company seals).
 - 3) Where more than one individual or organization can claim rights in respect of the execution of the listing representation, and there exists no other (single) entity which may execute the listing representation, all such individuals and organizations shall execute the listing representation, using the appropriate template available on the Verra website for pipeline projects with multiple project proponents, as applicable. Note that such representations may be executed in any necessary number of counterparts.

- 3.1.7 All project documents may be submitted to the Verra registry in electronic format.

- 3.1.8 Verra shall check the submitted project documents to ensure that:
- 1) The relevant sections of the *VCS Project Description Template* have been completed in accordance with Sections 3.1.3 and 3.1.4.
 - 2) The listing representation has been signed by the relevant responsible parties.
 - 3) Where required, proof of contracting has been properly submitted.
- 3.1.9 Verra reviews the project documents to ensure that sufficient information is present for the project to undergo public comment and may require the project proponent to update project documentation before listing the project on the Verra registry.
- 3.1.10 Verra shall upload all relevant project documentation to the Verra registry. Verra will use the information from the project documents to create the project record in the Verra registry. The status of the project shall be *under development* or *under validation*, as appropriate.
- 3.1.11 Verra shall store the electronic and signed original project documents in its record-keeping system for a minimum period of 12 years from the date the project is listed on the project pipeline.
- 3.1.12 Where a pipeline project successfully completes validation, it may progress to project registration on the Verra registry, following the procedures set out in Section 4.
- 3.1.13 Where a pipeline project does not successfully complete validation within 12 months of its initial listing, Verra shall update the project status to *inactivated*, unless Verra is informed that validation is still being pursued. Likewise, inactivated projects may be reactivated by notifying Verra.
- 3.1.14 Where Verra has reason to believe that false or misleading project information has been submitted, Verra seeks clarification from the project proponent. Where the project proponent cannot satisfactorily justify the information provided for the pipeline project, Verra reserves the right to delist the project.

4 PROJECT REGISTRATION PROCESS

The following steps are required under the VCS Program to register a project and issue VCUs, and these are presented in detail in this Section 4:

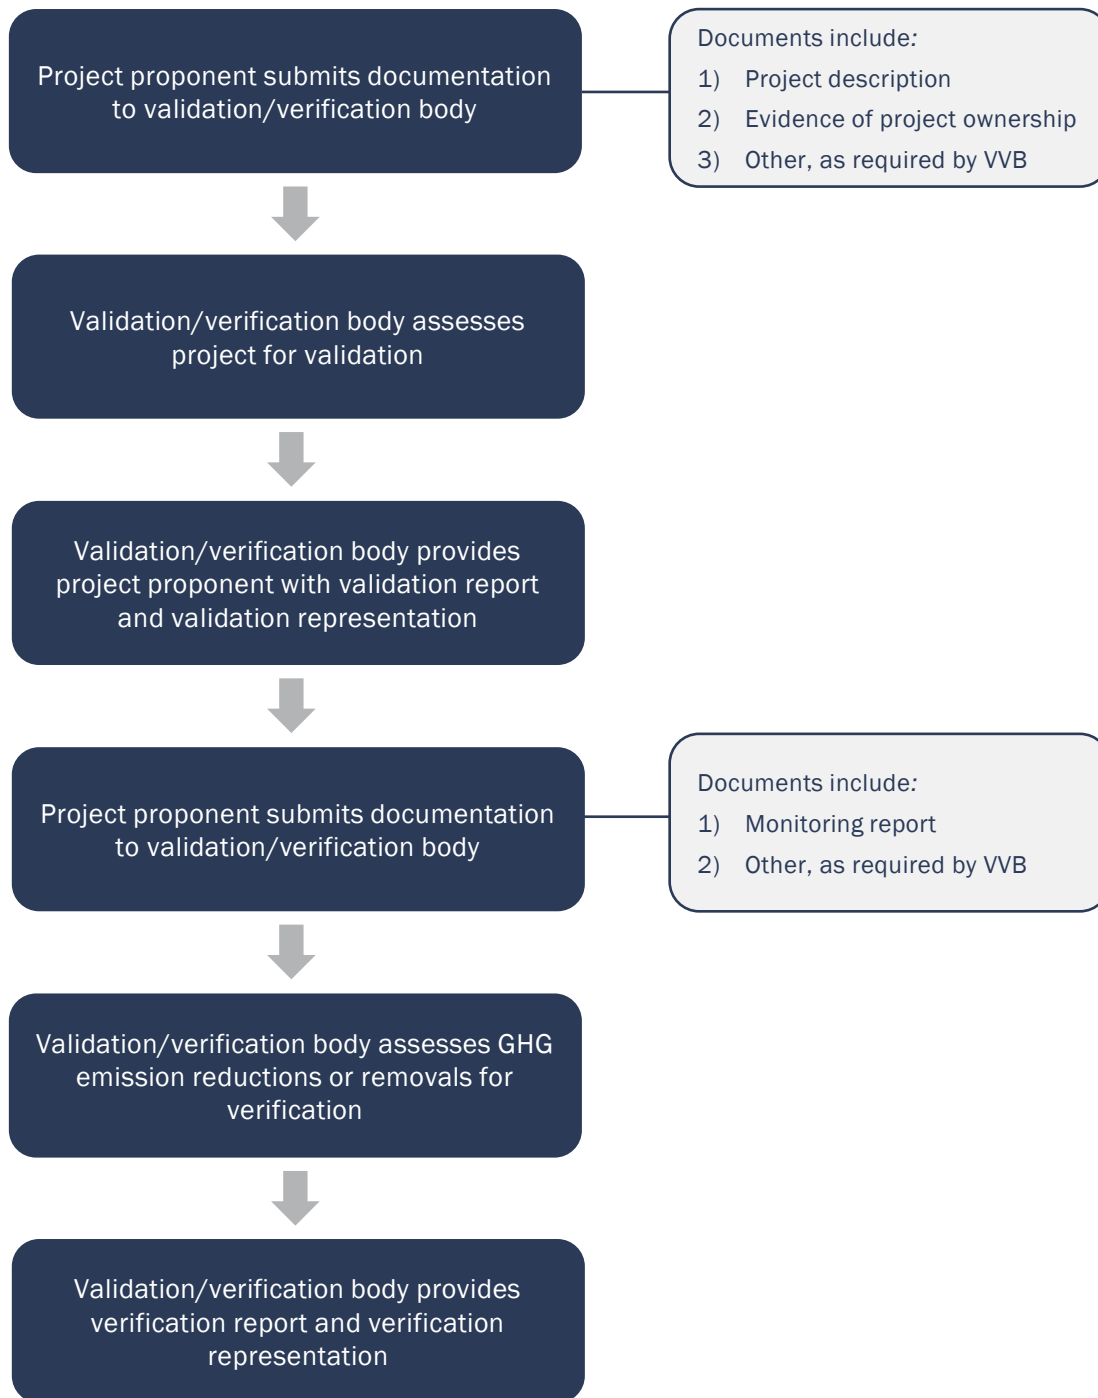

- 1) Project validation and verification
- 2) Registration and issuance request
- 3) Project review
- 4) Project registration and initial VCU issuance
- 5) Periodic VCU issuance
- 6) VCU retirements and cancellations
- 7) Project maintenance

For the purposes of this document, the project registration process refers to all or any of these six steps, as the case may be. The entity that initiates the project registration process may terminate the process at any one of these steps if it decides it does not want to register the project or have VCUs issued.

4.1 Step 1: Project Validation and Verification

The project shall be validated and the GHG emission reductions or removals verified as set out in Diagram 3 below, with the notes that follow providing further details.

Diagram 3: Validation of Project and Verification of GHG Emission Reductions or Removals

4.1.1 The requirements for validation and verification, including the requirements for validation/verification bodies, are set out in the *VCS Standard* and the *VCS Program Guide*. Projects must complete validation prior to requesting registration and projects must complete verification prior to requesting VCU issuance. The process for requesting registration and issuance,

including the documents required to be submitted for each type of request, are set out in Section 4.2 below.

4.1.2 The Verra registry can display separate vintages within one verification period.

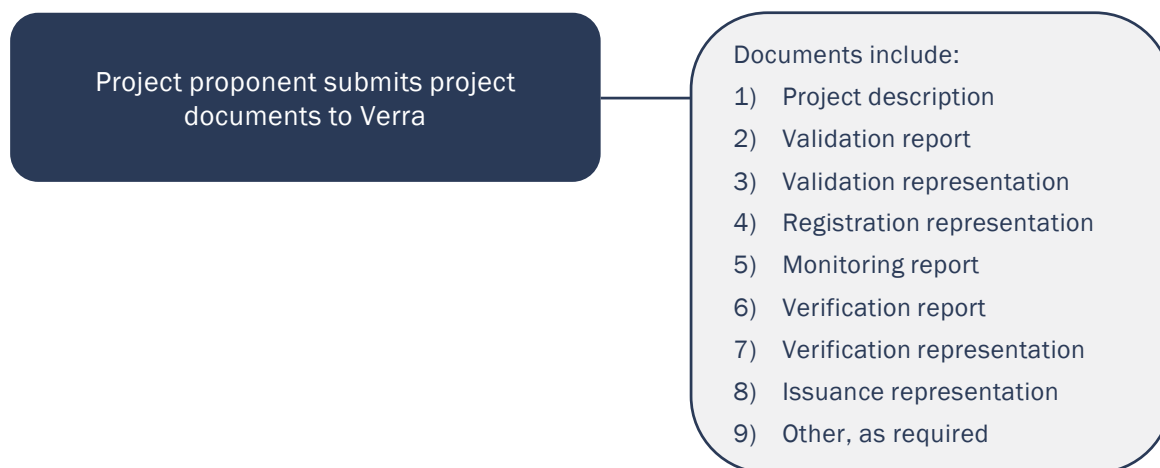

For example, where the verification period is 1 January 2012 to 30 June 2013, the project proponent may wish to have one VCU issuance record for the 2012 VCUs and a separate VCU issuance record for the 2013 VCUs. The creation of such separate VCU issuance records in respect of one verification period is only possible where the monitoring report and associated verification report specify the vintage breakdown. Thus, the monitoring report and associated verification report will need to specify the number of GHG emission reductions or removals generated in 2012 and the number generated in 2013. Vintage breakdown may be specified at a finer granularity than calendar years, and where vintage dates are specified with day, month and year, corresponding VCU issuance records can be created in the Verra registry accordingly. Where the vintage breakdown or the day, month and year start and end dates for the vintage period are not provided, there can only be one VCU issuance record in respect of the verification report (i.e., the Verra registry shall not arbitrarily assign a vintage breakdown where none is specified in the verification report).

Note – Due to the intricacies of accounting for GHG emission reductions and removals in AFOLU ARR and IFM projects with harvesting, such projects may not break down verification periods into vintage periods when any year within the verification period has a negative number of GHG emission reductions or removals. For such projects, the vintage period shall be equivalent to the verification period.

4.2 Step 2: Registration and Issuance Request

The project is presented to the Verra registry for registration and issuance as set out in Diagram 4 below, with the notes that follow providing further details.

Diagram 4: Project Registration Request

- 4.2.1 The only entities that may initiate the project registration process are the project proponent, an entity to which the project proponent has assigned sole right to the GHG emission reductions or removals for the entire project crediting period, or the authorized representative of either of these entities. No other entity can initiate the project registration process.
- 4.2.2 Registration of a project may be requested when the project has completed project validation but before the first verification of GHG emission reductions or removals. Some project proponents may be interested in doing this by way of giving market visibility and credibility to their projects.
- 4.2.3 Where the project is presented for registration without VCU issuance, the relevant documents that shall be provided to the Verra registry are the project description, the validation report, the validation representation, the registration representation, and any AFOLU specific documentation, communications agreement, proof of right or proof of contracting.
- 4.2.4 Where the project is presented for registration and VCU issuance, the relevant documents that shall be provided to the Verra registry are the project description, the validation report, the validation representation, the registration representation, the monitoring report, the verification report, the verification representation, the issuance representation, and any AFOLU specific documentation, communications agreement, proof of right, proof of contracting or evidence and representation with respect to cancellation of GHG credits under another GHG program. Where a project description deviation has been applied, and a revised project description is issued, such project description shall be provided to the Verra registry. Likewise, where a project crediting period has been renewed, the revised project description and new validation report and validation representation shall be provided to the Verra registry.
- 4.2.5 The following shall apply with respect to the project proponent representations:
- 1) The Verra website provides the templates for the registration representation, issuance representation and all other project proponent representations. The templates shall not be altered other than to fill in the project specific details.
 - 2) The project proponent representations shall be properly executed as deeds in accordance with applicable local laws and the organization's own constitutional documents (e.g., signature by directors, requirement of company seals).
 - 3) Where more than one individual or organization can claim rights in respect of the execution of the project proponent representations, all such individuals and organizations shall execute the project proponent representations, using the appropriate templates available on the Verra website for projects with multiple project proponents, as applicable. Note that such representations may be executed in any necessary number of counterparts.
- 4.2.6 Proof of contracting shall be provided to the Verra registry where required, as set out in Section 3.1.4. The project proponent or its authorized representative shall provide evidence of the legal agreement between the project proponent (or other entity that has contracted the validation/verification body to undertake validation) and the validation/verification body, in

relation to validation of the project. A final legal agreement, letter of intent, memorandum of understanding or term sheet shall serve as proof of contracting. Such evidence of proof of contracting shall be uploaded to the Verra registry as a private document (for Verra internal auditing purposes) and therefore will not be publicly available.

- 4.2.7 All project documents may be submitted to the Verra registry in electronic format.
- 4.2.8 There is no need to submit proof of right to the Verra registry where the project proponent or its authorized representative is initiating the project registration process. Proof of right shall be submitted to the Verra registry where an entity other than the project proponent or its authorized representative is initiating the project registration process. Evidencing proof of right is as set out below.
- 4.2.9 The entity initiating the project registration process or its authorized representative shall submit to the Verra registry the legal agreement(s) transferring the right to the GHG emission reductions or removals for the entire project crediting period to it from the project proponent. Where there are one or more intermediaries standing between the entity initiating the project registration process and the project proponent, Verra shall check all the legal agreements documenting the complete chain of transfer of right to the GHG emission reductions or removals to the entity from the project proponent. Legal agreement(s) shall be in English or shall be an official translation of the legal agreement(s).
- 4.2.10 In consideration of confidentiality, the entirety of the aforementioned legal agreement(s) need not be shown, but Verra shall undertake the checks set out in Table 1 (if submitting an official translation of the legal agreement(s), only such information needs to be translated and shown to Verra).

Table 1: Evidence for Proof of Right

Information required	Verra registry check
Names of the parties to the agreement	The parties are the entity initiating the project registration process (buyer or transferee) and the project proponent (seller or transferor), or where there is one or more intermediaries, the parties shall be the relevant parties in the chain of ownership between project proponent and the entity initiating the project registration process
Date of the agreement	Appropriate to the project and transaction subject of the legal agreement
Project name	Same as the project that the entity is presenting for registration
Project crediting period	The project crediting period is defined, with a start date and duration (or end date) specified

<p>Clause that transfers the right to the GHG emission reductions or removals between the parties to the agreement</p>	<p>The clause transfers the right to the GHG emission reductions or removals generated by the project for the project crediting period</p>
<p>Signatures of parties to the legal agreement</p>	<p>The legal agreement is signed by both parties to the agreement</p>

- 4.2.11 The project proponent may protect commercially sensitive information by uploading a public project description and a private project description. The private project description will not be publicly available. The public project description differs from the private project description only in that it does not contain commercially sensitive information.
- 4.2.12 The VCS Program allows projects registered under an approved GHG program (e.g., CDM) to also register with the VCS Program. In such cases, the documentation required for the project registration process is the same as required for projects registering under the VCS Program only, but noting the following:
- 1) The project description from the approved GHG program and a project description using the *VCS Project Description Template* with the relevant sections complete, as set out in the *VCS Standard*, must be submitted.
 - 2) Where GHG emission reductions or removals from one verification period are split between the VCS Program and an approved GHG program, evidence shall be submitted to the Verra registry that any GHG emission reductions or removals presented for VCU issuance have not been issued as GHG credits under the approved GHG program, or where such GHG credits have been issued under the approved GHG program that they have been cancelled. In the latter of these cases, the project proponent or its authorized representative shall also sign and submit to the Verra registry a VCU conversion representation.
 - 3) AFOLU projects are subject to the rules and requirements for non-permanence risk analysis and buffer withholding set out in Section 5. The buffer withholding percentage determined by the *AFOLU Non-Permanence Risk Tool* shall be applied to the proportion of GHG credits to be issued under the VCS Program (only).
 - 4) Where a loss event or a reversal occurs, the project shall comply with the rules for reporting a loss event and holding and cancelling credits set out in Section 5.3. Such reporting, holding and cancelling shall apply to the proportion of credits (GHG credits and buffer credits) granted to date under the VCS Program. For example, if 50 percent of the total credits (GHG credits and, where applicable, buffer credits) granted to the project to date have been granted under the VCS Program and a loss event results in a reversal of GHG emission reductions or removals achieved to date (in relation to which credits have been issued and buffered), buffer credits would be cancelled to cover 50 percent of the reversal.

- 4.2.13 Where the project is registered with both the VCS Program and the CDM, and where temporary GHG credits have been issued to the project (i.e., tCERs and ICERs) which have expired without having been sold or retired, such credits may be issued under the VCS Program in accordance with the requirements in Section 4.2.15. Where temporary credits have expired, evidence of their expiration shall be provided.
- 4.2.14 The VCS Program also allows projects registered under a non-approved GHG program to also register with the VCS Program. In such cases, the documentation required for the project registration process is the same as required for projects registering under the VCS Program only. Where GHG emission reductions or removals from one verification period are split between the VCS Program and a non-approved GHG program, the same requirements set out in Section 4.2.12(2) shall apply.
- 4.2.15 The VCS Program allows projects registered under an approved GHG program to cancel GHG credits issued under the approved GHG program and have them issued as VCU in the Verra registry. Project activities must be eligible under the VCS Program (i.e., included within the scope of the VCS Program, as set out in the *VCS Standard*) in order to be eligible for such conversion. In such cases, the following applies:
- 1) An official notification or other evidence of cancellation of the GHG credits under the approved GHG program and a signed VCU conversion representation shall be provided to the Verra registry.
 - 2) Where the project is registered under the CDM, those documents required for project registration and Certified Emission Reduction (CER) issuance under the CDM shall be provided to the Verra registry. Verra shall create a project record on the Verra registry, noting that such record shall have the status *credits transferred from other GHG program*. Such projects are not considered to be registered under the VCS Program and are not eligible for verification under the VCS Program without first complying with the procedures for registration with the VCS Program and an approved GHG program set out in Section 4.2.12.
 - 3) Where the project is registered under the JI program, the project shall also register with the VCS Program before Emission Reduction Units (ERUs) may be converted into VCUs¹. Following registration with the VCS Program, such projects shall provide those documents required for ERU issuance under the JI program to the Verra registry.
 - 4) Where the project is registered under the Climate Action Reserve (CAR), those documents required for registration and Climate Reserve Tonne (CRT) issuance shall be provided to the Verra registry. Verra shall create a project record on the Verra registry, noting that such record shall have the status *credits transferred from other GHG program*. Such projects are

¹ The flexibility inherent within the JI program (e.g., use of an approved methodology not required) means it is necessary for JI projects to register with the VCS Program in order to determine whether ERUs issued to such projects are eligible for conversion into VCUs.

not considered to be registered under the VCS Program and are not eligible for verification under the VCS Program without first complying with the procedures for registration with the VCS Program and an approved GHG program set out in Section 4.2.12.

- 5) Where the project is an AFOLU project, the project shall also register with the VCS Program before GHG credits issued under an approved GHG program may be converted into VCUs. The buffer withholding percentage for such projects shall be applied to the number of GHG credits being converted.

4.2.16 Where projects have created another form of GHG-related environmental credit, such as renewable energy certificates, evidence shall be provided to the Verra registry demonstrating that the GHG emission reductions or removals presented for VCU issuance have not also been recognized as another GHG-related environmental credit, or that any such credits have not been used and have been cancelled under the relevant program.

4.2.17 Grouped projects and AFOLU projects with geographic areas characterized by one or more geodetic polygons shall provide the geodetic information to the Verra registry in the format specified in the *VCS Standard*.

4.2.18 The VCS Program allows VCUs to be labelled with additional certifications that have been granted to the project. The Verra website provides the list of standards that are accepted as VCU labels, together with the procedure for attaining such VCU labels.

4.3 Step 3: Project Review

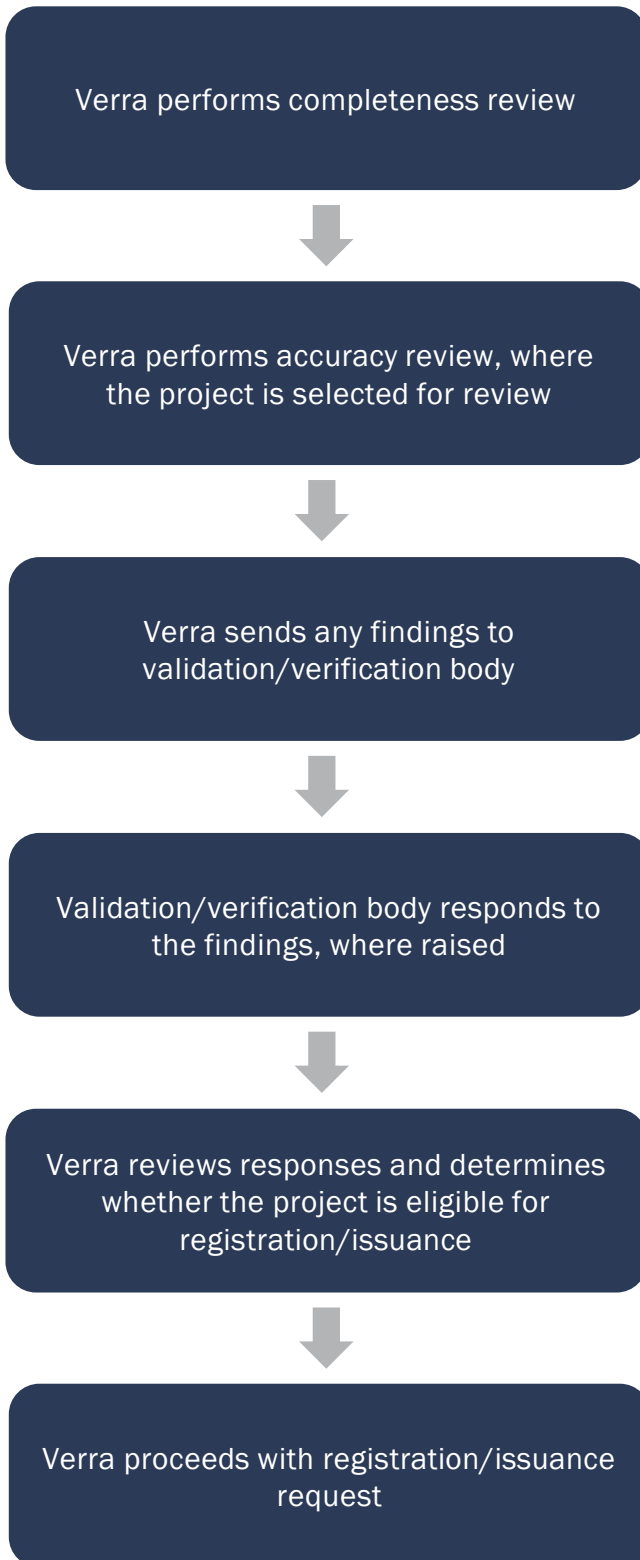

The project review is a two-part process consisting of a completeness review and an accuracy review (undertaken at Verra’s discretion) of the project registration, VCU issuance or project crediting period renewal request. The project review process is set out in Diagram 5 below. Verra notifies the project proponent (or its authorized representative) and the validation/verification body at the start and completion of each review.

Note that the project review process is triggered when the relevant documentation for registration, issuance or project crediting period renewal is submitted to the Verra registry. As such, project proponents are encouraged to submit their documentation to the Verra registry as soon as it is ready, so that the project review process may be completed at an early stage.

Note also that when submitting issuance documentation, it is not necessary to immediately request issuance of VCUs. Instead, Verra will begin the review process following receipt of the relevant documentation. VCUs may then be issued upon request to the Verra registry any time following the completion of such reviews.

Further details on the project review process are provided in this section.

Diagram 5: Review of Project Registration and VCU Issuance Request

Completeness Review

- 4.3.1 Verra undertakes a completeness review of the request. The purpose of the completeness review is to ensure that all documents are complete and duly signed where necessary, the validation or verification has been completed by an eligible validation/verification body and within required timeframes, the GHG emission reductions and removals have not been issued under another GHG program, appropriate information has been used to complete all project documents, and the baseline scenario and additionality have been correctly assessed. Verra completes the review within ten business days.
- 4.3.2 The validation/verification body shall be accredited for the sectoral scope(s) relevant to the project and shall have signed the required agreement with Verra. The Verra website maintains information on validation/verification bodies and Verra shall check the following:
- 1) The validation/verification body that conducted validation of the project was accredited for the relevant sectoral scope for validation at the date(s) on which the validation report and validation representation were issued.
 - 2) The validation/verification body that conducted verification of the project was accredited for the relevant sectoral scope for verification at the date(s) on which the verification report and verification representation were issued.
- 4.3.3 Verra checks that the requirement for rotation of validation/verification bodies has been met, as follows:
- 1) Validation (including project crediting period renewal validation) and the first verification of a project (in a given project crediting period) may be undertaken by the same validation/verification body. However, the subsequent verification shall be undertaken by a different validation/verification body. For example, if validation and verification were undertaken at the same time, the subsequent verification would have to be undertaken by a different validation/verification body. If validation were undertaken first (i.e., separately), the first verification could be undertaken by the same validation/verification body, but the subsequent verification would have to be undertaken by a different validation/verification body.
 - 2) A validation/verification body may not verify more than six consecutive years of a project's GHG emission reductions or removals. The validation/verification body may undertake further verification for the project only when at least three years of the project's GHG emission reductions or removals have been verified by a different validation/verification body. Additionally, where a validation/verification body verifies the final six consecutive years of a project crediting period, the project crediting period renewal validation shall be undertaken by a different validation/verification body. Notwithstanding these rules, where AFOLU projects have verification periods longer than six years, a validation/verification body is permitted to verify more than six consecutive years of a project's GHG emission reductions or removals, and the subsequent verification shall be undertaken by a different validation/verification body.

Where a project violates the requirements for rotation of validation/verification bodies for the first time, the project shall be subject to a mandatory accuracy review and Verra reserves the right to require the project to redo validation and/or verification with a different validation/verification body. Where a project violates these requirements for a second time, the project shall be required to redo validation and/or verification with a different validation/verification body.

4.3.4 Verra checks the project documents submitted to ensure that:

- 1) Each section of the project documents has been completed with appropriate information.
- 2) Each project document, with the exception of the project description, the non-permanence risk report, the validation report, the monitoring report and the verification report, is signed by the relevant responsible parties.
- 3) Validations have been contracted or completed within the appropriate timeframes, in accordance with the VCS Program rules.
- 4) Where VCU issuance is requested, the GHG emission reductions or removals presented for VCU issuance have not been issued under any other GHG program or recognized under a program which creates GHG-related environmental credits (such as renewable energy certificates). Where the GHG emission reductions or removals presented for VCU issuance are found to have been issued under another program, the VCU issuance request shall be rejected and the project shall no longer be eligible for crediting under the VCS Program. Such checks shall be performed upon each and every VCU issuance. Where the project is being presented for registration only (i.e., without VCU issuance requested), such checks need not be undertaken.

Note – As set out in Sections 4.2.12 and 4.2.13, GHG emission reductions or removals from one verification period can be split between the VCS Program and another GHG program.

- 4.3.5 Verra reviews the assessment of the project baseline and additionality (at validation and project crediting period renewal) to ensure adherence to the VCS Program rules and the applied methodology.
- 4.3.6 Verra may request that project documents be updated (e.g., where information is missing or incorrect). Any findings raised as a result of the completeness review shall be addressed before the registration or issuance request can proceed.
- 4.3.7 The Verra registry shall store the electronic project documents in its record-keeping system for a minimum period of 12 years from the retirement date of the last VCU to which the project documents relate.
- 4.3.8 Where Verra determines that the project has failed to comply with the VCS Program rules, Verra shall inform the project proponent (or its authorized representative) and the validation/verification body that the project fails to demonstrate compliance with the VCS

Program rules and is ineligible for registration or issuance, stating the reasons. Upon request by the project proponent or its authorized representative, Verra shall return the project documents to the project proponent or its authorized representative.

Accuracy Review

- 4.3.9 Verra may, at its discretion, undertake an accuracy review of the registration, issuance or project crediting period renewal request, the scope of which is to ensure full adherence of the validation or verification to the VCS Program rules and the applied methodology. Where Verra undertakes such an accuracy review, Verra shall notify the project proponent (or its authorized representative) and the validation/verification body. Any findings issued as a result of the Verra review shall be addressed before the registration or issuance request can proceed. Verra determines whether it will undertake a review, completes the review and issues any findings within 20 business days.
- 4.3.10 Where no findings are raised during the accuracy review, Verra notifies the project proponent (or its authorized representative) that the project registration or VCU issuance may proceed in accordance with Section 4.4.
- 4.3.11 Where material non-conformances are identified during the accuracy review (see the VCS *Standard* for further details on the threshold for materiality), the validation/verification body shall respond to the findings issued (e.g., corrective action requests and clarification requests) by Verra, in accordance with the following procedure:
- 1) The validation/verification body shall provide a written response to each finding, undertake (or ensure that the project proponent undertakes, as appropriate) revisions to the project documents where necessary, and submit all revised documents to Verra. Verra reviews such documents within 10 business days.
 - 2) Where the findings are addressed to the satisfaction of Verra, Verra notifies the project proponent and validation/verification body that the project registration or VCU issuance may proceed in accordance with Section 4.4.
 - 3) Where the findings are not addressed to the satisfaction of Verra, Verra may issue a further round of findings (not to exceed a total of three rounds of findings).
 - 4) Where the findings are not addressed to the satisfaction of Verra after the third round and/or where Verra otherwise determines that the project has failed to demonstrate compliance with VCS Program rules, the registration and/or issuance request shall not be accepted. Verra notifies the project proponent (or its authorized representative) and the validation/verification body of same. The findings may be addressed and the request resubmitted three months after such notification, except where the project is ultimately deemed by Verra to not qualify under the VCS Program.
 - 5) Where the accuracy review identifies errors or quality issues in a previous validation or verification, the procedures set out in Section 6 shall apply.

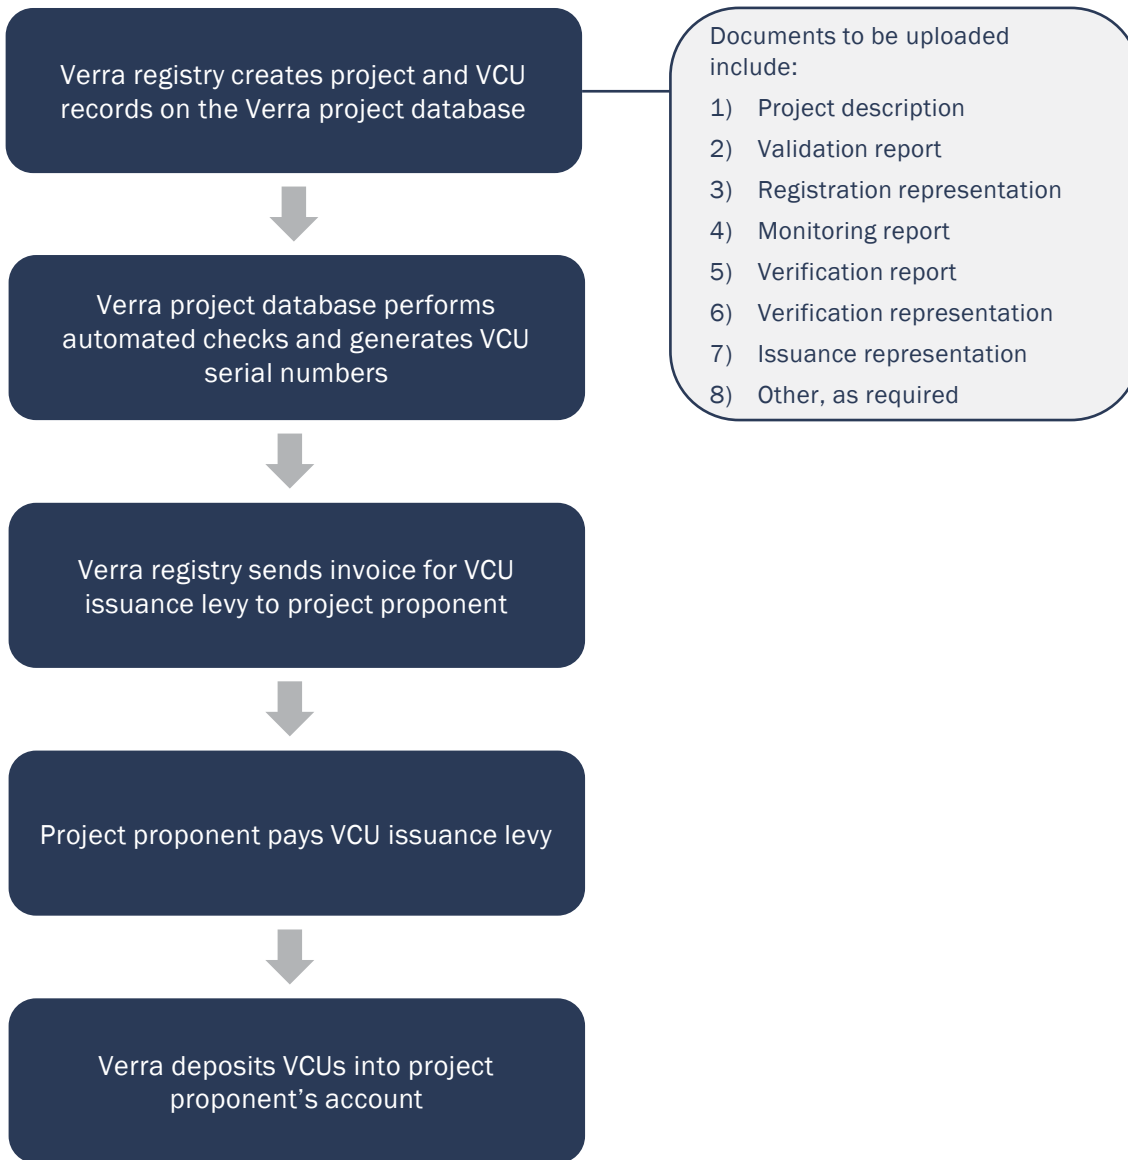

- 6) Where no response is received from the validation/verification body within 60 business days from the date the findings were issued, Verra reserves the right to assume that the project proponent does not intend to pursue the project registration or VCU issuance request. Where Verra determines this to be the case, the project registration and VCU issuance request shall not be accepted, and Verra notifies the project proponent (or its authorized representative) and the validation/verification body of same. The registration and/or issuance request may be resubmitted three months after such notification, except where the project is ultimately deemed by Verra to not qualify under the VCS Program.

Note – For the purpose of determining adherence to deadlines with respect to methodology validity and completion of validation and verification, the dates of the project documents submitted under the initial registration or issuance request shall be used (rather than the dates of the revised documents).

4.4 Step 4: Project Registration and Initial VCU Issuance

The project is registered and the VCUs are issued on the Verra registry as set out in Diagram 6, with the notes that follow providing further details.

Diagram 6: Project Registration and Initial VCU Issuance

- 4.4.1 Where the project is presented for registration without VCU issuance, the project description, validation report, validation representation, registration representation and any AFOLU specific documentation or communications agreement shall be uploaded to the Verra registry as public documents. Any proof of right or proof of contracting shall be uploaded to the Verra registry as private documents (for Verra internal auditing purposes) and therefore will not be publicly available.
- 4.4.2 Where the project is presented for registration and VCU issuance, the project description, validation report, validation representation, registration representation, monitoring report, verification report, verification representation, issuance representation and any AFOLU specific documentation, communications agreement or VCU conversion representation shall be

uploaded to the Verra registry as public documents. Any proof of right or proof of contracting shall be uploaded to the Verra registry as private documents (for Verra internal auditing purposes) and therefore will not be publicly available. Where a project description deviation has been applied, and a revised project description is issued, such project description shall be uploaded to the Verra registry as a public document. Likewise, where a project crediting period has been renewed, the revised project description and new validation report and validation representation shall be uploaded to the Verra registry as public documents.

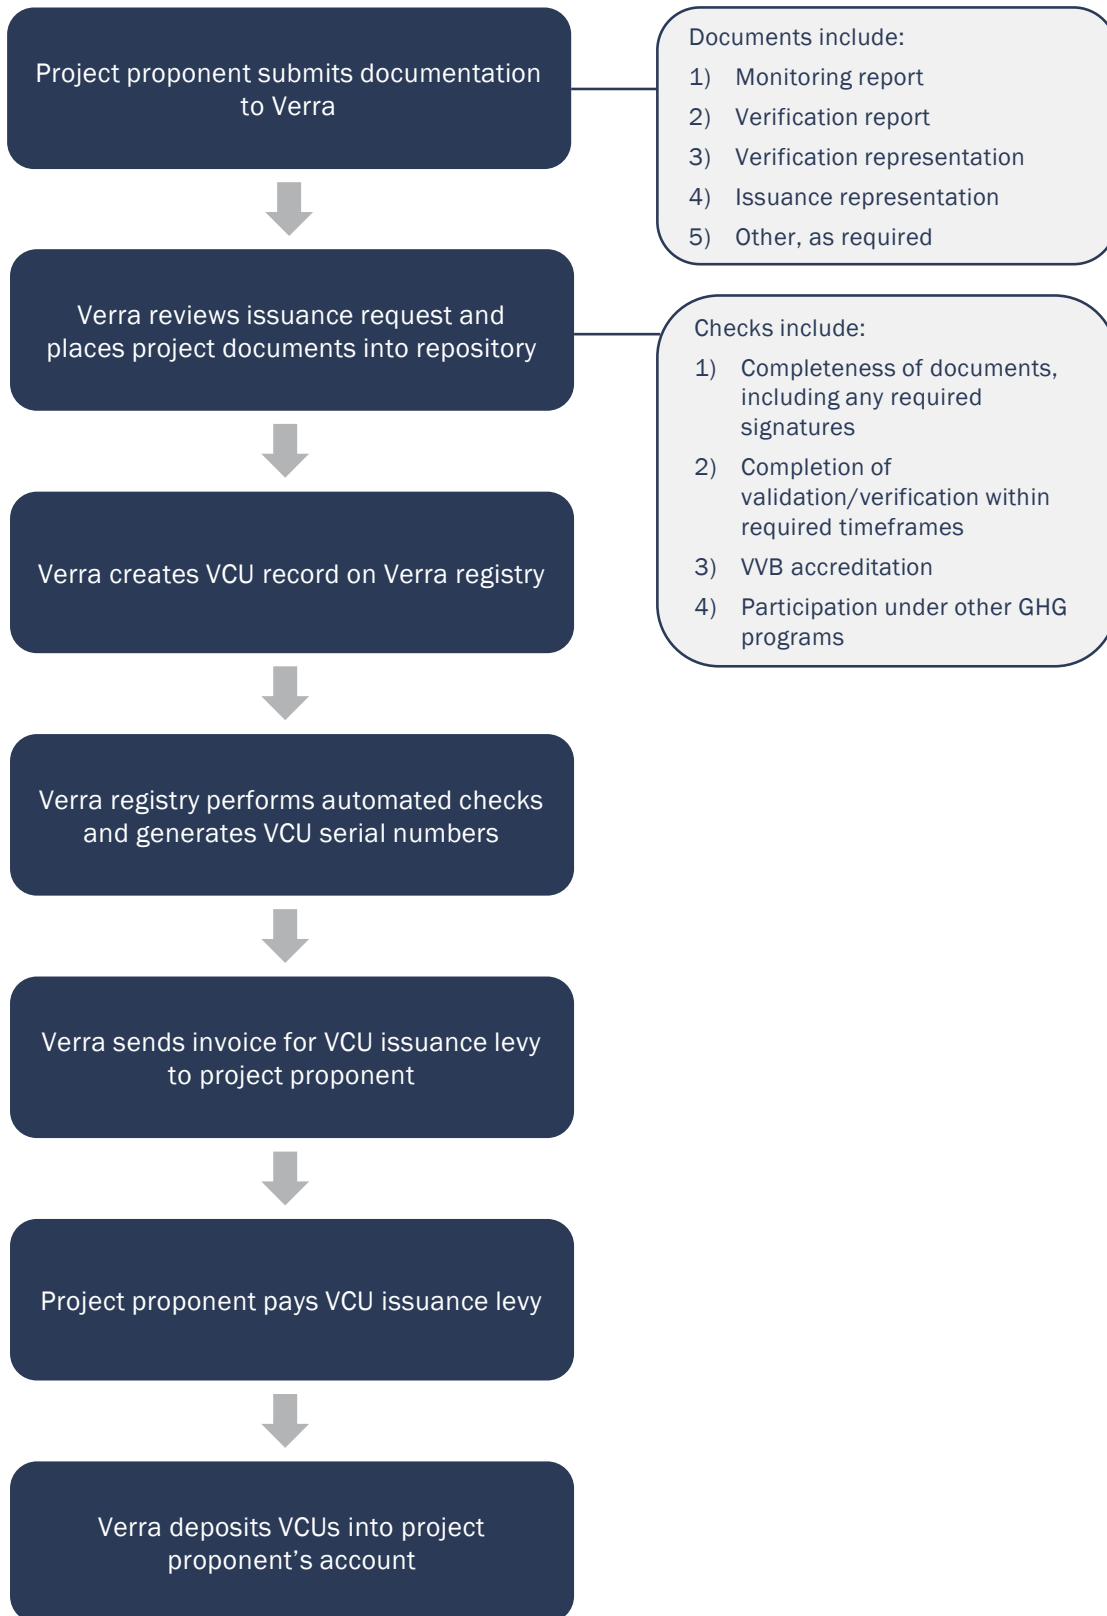

- 4.4.3 The project’s geodetic co-ordinates shall be entered onto the project record on the Verra registry. The Verra registry system checks that there are no other projects within a five kilometer radius. Where there are projects within a five kilometer radius, the Verra registry system notifies Verra and provides a list of the overlapping projects. Verra shall confirm that the project being presented for registration is unique and not one of the overlapping projects, noting that it is possible to have two projects operated by the same project proponent at the same location (they would be different activities described in separate project descriptions, with separate validation and verification). It may do this on its own if sufficient information is available or by contacting the validation/verification body of the project being presented for registration who shall confirm that it is unique and not one of the overlapping projects. Where Verra is unable to confirm uniqueness of the project, the project cannot be registered.
- 4.4.4 The registration fee shall be collected by Verra before the project is registered.
- 4.4.5 VCUs can be issued incrementally from a verification report (i.e., when the project proponent or its authorized representative requests VCU issuance, it can request issuance of part of the verification report volume and request issuance of the remaining volume at a later date). The following shall apply:
 - 1) The entity requesting VCU issuance shall instruct the Verra registry that it is requesting VCU issuance for only part of the verification report volume and shall specify the volume for which it is requesting VCU issuance.
 - 2) The VCU issuance levy and any fees charged by Verra are payable on the volume of VCUs which are issued, not the total verification report volume.
 - 3) Verra does not specify thresholds or timeframes on incremental VCU issuance (e.g., the total number of incremental VCU issuances that can be made from a verification report and the elapsed time between first and last VCU issuance from the verification report). Verra is entitled to apply such thresholds and timeframes as it deems necessary.
 - 4) The Verra registry displays the total verification report volume, the volume of VCUs issued to date and the history of VCU issuances with respect to the verification report.
 - 5) The entity requesting VCU issuance does not have to request VCU issuance of the total verification report volume (i.e., it can choose to only request VCU issuance for a part of the verification report volume and never request issuance of the remaining verification report volume).

- 6) VCUs are not subject to any discounting with respect to their fungibility. VCU owners, programs or other climate change efforts that accept VCUs may apply a discount at their own discretion.
- 4.4.6 Where the project has cancelled GHG credits issued under an approved GHG program and is having them issued as VCUs (as set out in Section 4.2.15), the project reference number under the approved GHG program shall be noted on the project record on the Verra registry.
- 4.4.7 The VCU issuance levy shall be collected by Verra before VCUs are deposited into an account.

4.5 Step 5: Periodic VCU Issuance

There may be issuance of VCUs subsequent to the initial issuance of VCUs to the project as set out in Diagram 7 below, with the notes that follow providing further details.

Diagram 7: Periodic VCU Issuance

4.5.1 All and any periodic VCU issuances shall be initiated by the project proponent stated on the project record in the Verra registry or its authorized representative. Where another entity wants to become the project proponent (and therefore assume the roles and responsibilities of a project proponent with respect to the Verra registry), the process set out in Section 7 shall be followed. The new project proponent on the project record in the Verra registry or its authorized representative can then initiate VCU issuance.

4.6 Step 6: VCU Retirements and Cancellations

The Verra registry displays the status of every VCU issued under the VCS Program. VCUs may have a status of active, retired or cancelled. Note that VCU *retirement* and *cancellation* have specific meanings, as set out in the VCS Program document *Program Definitions*.

The process for retiring active VCUs is set out in Sections 4.6.1 - 4.6.4 below. The process for cancelling active VCUs is set out in Sections 4.6.5 - 4.6.8 below.

4.6.1 VCUs may be retired as set out in Diagram 8 below, with the notes that follow providing further details.

Diagram 8: VCU Retirement

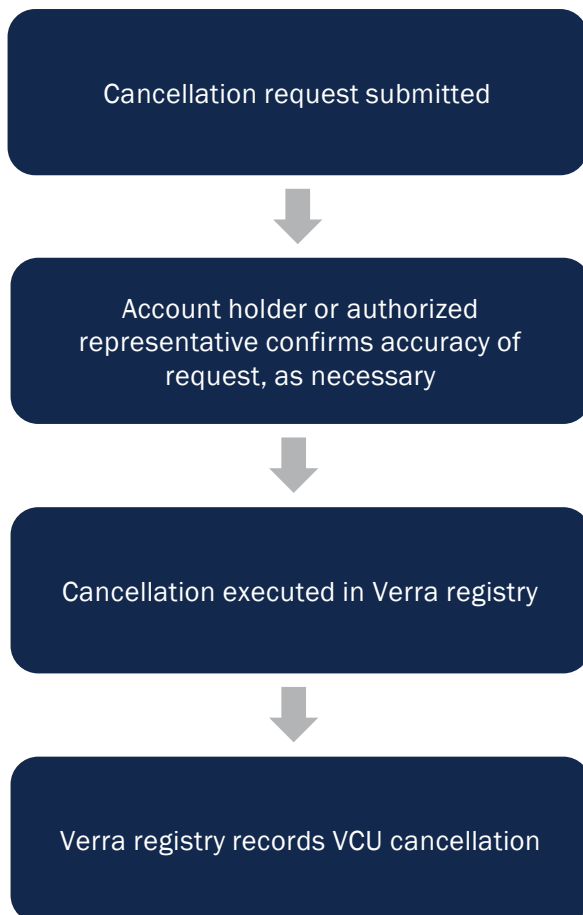

4.6.2 All and any VCU retirements shall be initiated by the registry account holder or its authorized representative.

4.6.3 The registry account holder or its authorized representative may execute a VCU retirement through its Verra registry account. The Verra registry system records the details of all VCU retirements.

- 4.6.4 VCUs can be retired incrementally from a registry accountholder’s VCU holdings (i.e., when the VCU holder or its authorized representative requests VCU retirement, it can request retirement of part of the VCU holdings and request retirement of any or all of the remaining holdings at a later date). In such cases, the following shall apply:
- 1) The registry account holder or its authorized representative shall designate the specific set of VCUs for retirement through its Verra registry account.
 - 2) Any fees charged by the Verra registry are payable on the volume of VCUs which are retired, not the total VCU holdings volume.
 - 3) Verra does not specify thresholds or timeframes on incremental VCU retirement (e.g., the total number of incremental VCU retirements that can be made from a registry accountholder’s VCU holdings and the elapsed time between first and last VCU retirement from those holdings). Verra is entitled to apply such thresholds and timeframes as it deems necessary.
- 4.6.5 VCUs may be cancelled as set out in Diagram 9 below, with the notes that follow providing further details.

Diagram 9: VCU Cancellation

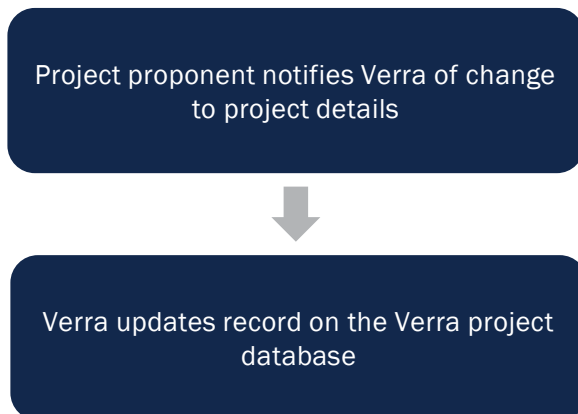

- 4.6.6 The registry account holder, its authorized representative, the other GHG program in which the registry account holder is participating or Verra may initiate a VCU cancellation. Note that the initiator and recipient of a VCU cancellation request depends on the specific circumstances of the cancellation (e.g., where VCUs are being converted into another form of GHG credit, the cancellation request may be submitted to Verra by the other GHG program in which the registry account holder is participating).
- 4.6.7 The registry account holder or its authorized representative may be asked to confirm the details of the VCU cancellation request.
- 4.6.8 VCUs are cancelled in the Verra registry and the Verra registry records the details of all VCU cancellations.

4.7 Step 7: Project Maintenance

Project details may be updated as set out in Diagram 10 below, with the notes that follow providing further details.

Diagram 10: Project Maintenance

- 4.7.1 Where a project fails to submit a verification report to the Verra registry within five years of its last verification, the following applies:
 - 1) Verra will send written communication to the project proponent to request evidence that the project is still active despite not having verified.
 - 2) The project proponent shall submit such evidence within one year of receiving the written communication from Verra.
 - a) Evidence may take the form of a letter submitted by the project proponent to Verra and should explain in detail the status of the project, including an explanation as to why the project has not verified and, where relevant, why it should still be considered active.

- b) The letter may be accompanied by any relevant documentation of activity implementation (e.g., photographic evidence, monitoring reports, contract for verification in the near future).
- 3) Where a letter is received, it shall be posted publicly to the Verra registry and the project status in the registry shall be changed to *late to verify*.
- 4) Where no letter is received, the project status shall still be changed to *late to verify*, but will not benefit from an explanation being available to potential buyers and other stakeholders. The project proponent is encouraged to submit an updated letter annually.

Note – Where a project has not verified because it has transitioned to another GHG program (e.g., integrated into a government program), its project status shall be changed to project transferred to other GHG program instead of late to verify.

Note – Where an AFOLU project fails to submit a verification report to the Verra registry within five, ten and fifteen years of its last verification, buffer credits are put on hold or canceled (and the project labeled as inactive), as appropriate, per the requirements set out in Section 5.3.4, below.

- 4.7.2 Where the project proponent wishes to withdraw the project from the VCS Program (e.g., in order to transfer the project to another GHG program), the following applies:
- 1) The project proponent shall submit a letter (in English) on its organization letterhead, to the Verra registry, requesting that the project be withdrawn. Such letter must include the project name, project ID, the reason for the withdrawal request and the signatures and contact information of all project proponents.
 - 2) Verra reviews the withdrawal request and may request additional information prior to approving the request.
 - 3) Upon approval, Verra shall update the status of the project to *withdrawn*. The project information shall remain publicly available on the Verra registry, but the project will not be able to issue VCUs.
 - 4) In the case of an AFOLU project where VCUs have been previously issued, the following applies:
 - a) The project shall not be eligible for any release of buffer credits.
 - b) Where Verra confirms that the project has registered with another GHG program, all buffer credits associated with the project shall be cancelled.
 - c) Where Verra is unable to confirm that the project has registered with another GHG program, buffer credits shall be cancelled over time in accordance with the rules set out in Section 5.3.4 below.
 - 5) Withdrawn projects may rejoin the VCS Program where the project proponent submits a letter to the Verra registry requesting same. Such letter must include the information specified in Section 4.7.1(1) above. Verra reviews the project to determine whether it is

eligible to rejoin the VCS Program, and notifies the project proponent of the outcome of the review. Where the project is eligible to rejoin the VCS Program, Verra updates the status of the project accordingly. Where the project is not eligible to rejoin the VCS Program, the project shall remain withdrawn.

5 AFOLU POOLED BUFFER ACCOUNT

The VCS Program addresses the non-permanence risk associated with AFOLU project activities by requiring projects to set aside non-tradable buffer credits to cover unforeseen losses in carbon stocks. The buffer credits from all projects are held in a single AFOLU pooled buffer account, which can be drawn upon in the event of a reversal in carbon stocks in any individual project.

5.1 Assignment of Buffer Credits at First Request for Issuance

At first VCU issuance, buffer credits shall be deposited into the AFOLU pooled buffer account, in accordance with the procedures below.

- 5.1.1 The number of credits to be deposited in the AFOLU pooled buffer account is determined by the non-permanence risk report assessed by the validation/verification body(s), in accordance with the requirements set out in the *VCS Standard*. The report establishes the non-permanence risk rating, and this percentage is applied to the net change in the project's carbon stocks (stated in the verification report) to determine the number of credits to be deposited in the AFOLU pooled buffer account.
- 5.1.2 Buffer credits are not issued a VCU serial number nor are they considered to be VCUs. They are not subject to the VCU issuance levy.

5.2 Assignment and Release of Buffer Credits at Subsequent Requests for Issuance

Buffer credits associated with the project may be released over time, as an incentive for continued verification and to recognize that certain project risks decrease as the project's longevity is demonstrated, in accordance with the procedures below.

- 5.2.1 The project is eligible to release buffer credits where the non-permanence risk rating in the current verification report remains the same or decreases from the previous verification report. The release of buffer credits from the AFOLU pooled buffer account occurs when a verification report is presented to the Verra registry and VCU issuance is requested. When buffer credits are released from the AFOLU pooled buffer account, they shall be issued as VCUs into the designated Verra registry account upon payment of the VCU issuance levy.
- 5.2.2 Release of buffer credits may only occur where a verification report (submitted to request VCU issuance) was issued at least five years after the issuance date of the verification report previously submitted to request VCU issuance. The first release of buffer credits shall be no sooner than five years after the first verification report was issued and presented to the registry for VCU issuance. Subsequent releases of buffer credits shall not occur more frequently than once every five years. Where verification reports are issued at intervals shorter than once every five years, buffer credits shall be released no sooner than the issuance date of a verification

report that is at least five years after the issuance date of the verification report used to request the previous release of buffer credits (and shall be released at the request for VCU issuance). Where verification events occur at intervals longer than five years, the 15 percent time release (see Section 5.2.4) shall be compounded based on the number of five-year intervals that have passed since the last verification report was issued.

- 5.2.3 Where the project’s non-permanence risk rating at the current verification period remains the same as the non-permanence risk rating at the last verification period, buffer credits shall be deposited into the AFOLU pooled buffer account in accordance with the procedure set out in Section 5.1 above.

A 15 percent “time release” of buffer credits is then applied where the five-year interval set out in Section 5.2.2 has passed. This 15 percent time release shall be applied to the total number of buffer credits associated with the project to-date (i.e., the number of buffer credits previously held in the AFOLU pooled buffer account plus the number of buffer credits newly deposited). The deposit and release of buffer credits may be calculated and handled so that the Verra registry carries out a single transaction for the deposit/release of net buffer credits. An example of how the buffer withholding may be reduced over time is available on the Verra website.

- 5.2.4 Where the project’s non-permanence risk rating at the current verification period is lower than the non-permanence risk rating at the previous verification period, the new non-permanence risk rating shall be applied and buffer credits shall be deposited into the AFOLU pooled buffer account in accordance with the procedure set out in Section 5.1 above.

The new non-permanence risk rating is also applied to all buffer credits associated with the project that are already deposited in the AFOLU pooled buffer account from previous verification periods. This means previously deposited buffer credits that are in excess of the reduced withholding percentage shall be released and issued as VCU where the five-year interval set out in section 5.2.2 has passed.

A 15 percent “time release” of buffer credits is then applied to the total number of buffer credits associated with the project to-date (i.e., the number of buffer credits previously held in the AFOLU pooled buffer account plus the number of buffer credits newly deposited). The deposit and release of buffer credits may be calculated and handled so that the Verra registry carries out a single transaction for the deposit/release of net buffer credits.

- 5.2.5 Where the project’s non-permanence risk rating at the current verification period is higher than the non-permanence risk rating at the previous verification period, no release of buffer credits shall occur. Buffer credits shall be deposited into the AFOLU pooled buffer account in accordance with the procedure set out in Section 5.1 above.

5.3 Cancellation and Holding of Buffer Credits

Buffer credits are cancelled from the AFOLU pooled buffer account where there are negative net GHG emission reductions or removals associated with the project (as compared to the baseline), and are put on hold in certain situations, as outlined in this section.

5.3.1 Where an event occurs that is likely to qualify as a loss event (see the VCS Program document *Program Definitions* for definition of loss event), the project proponent shall notify Verra within 30 days of discovering the likely loss event. Where VCUs have been previously issued, a loss event report shall be prepared and submitted to the Verra registry, as follows:

- 1) The loss event report shall be prepared using the *VCS Loss Event Report Template*.
- 2) The loss event report shall be accompanied by a loss event representation signed by the project proponent. The template for the loss event representation is available on the Verra website.
- 3) The loss event report shall be submitted to the Verra registry within two years of the date of discovery of the loss event. Where a loss event report is not submitted within two years of the date of discovery of the loss event, the project shall no longer be eligible to issue VCUs.
- 4) Verra shall put buffer credits from the AFOLU pooled buffer account on hold, in an amount equivalent to the estimated loss stated in the loss event report.

5.3.2 The following applies with respect to the verification report submitted subsequent to a loss event:

- 1) Where the net GHG benefit of the project for the verification period is negative, a reversal has occurred (see the VCS Program document *Program Definitions* for definition of reversal) and the following applies:
 - a) Where the total reversal is less than the number of credits put on hold after the submission of the loss event report, Verra shall cancel buffer credits equivalent to the reversal. Any remaining buffer credits shall be released from their on-hold status (though remain in the AFOLU pooled buffer account).
 - b) Where the reversal is greater than the number of credits put on hold after the submission of the loss event report, the full amount of buffer credits put on hold with respect to the submission of the loss event report shall be cancelled, and additional buffer credits from the AFOLU pooled buffer account shall be cancelled to fully account for the reversal.
- 2) Where the net GHG benefit for the verification period is positive (i.e., all losses have been made up over the verification period), a reversal has not occurred and buffer credits put on hold after the submission of the loss event report shall be released from their on-hold status (but shall remain in the AFOLU pooled buffer account).

5.3.3 The following applies with respect to the VCU issuance subsequent to a reversal:

- 1) Where the reversal is a catastrophic reversal (see the VCS Program document *Program Definitions* for the definition of catastrophic reversal) the following applies:
 - a) GHG credits shall be deposited in the AFOLU pooled buffer account in an amount equivalent to the additional number of buffer credits cancelled after the reversal, above what has been previously contributed by the project. For example, if the project previously contributed 100 buffer credits and 150 credits were cancelled from the AFOLU pooled buffer account after a reversal, the project would deposit 50 buffer credits (to replenish the pool at large). Buffer credits deposited to replenish the pool after a reversal (50 in the example above) shall never be eligible for release back to the project.
 - b) Where further GHG credits are available for VCU issuance after replenishing the AFOLU pooled buffer account, additional buffer credits shall be deposited in the AFOLU pooled buffer account in accordance with Section 5.2 (applying the non-permanence risk rating only to those remaining GHG credits eligible for VCU issuance).
- 2) Where the reversal is a non-catastrophic reversal, the following applies:
 - a) GHG credits shall be deposited in the AFOLU pooled buffer account in an amount equivalent to the full reversal.
 - b) Where further GHG credits are available for VCU issuance after replenishing the AFOLU pooled buffer account, additional buffer credits shall be deposited in the AFOLU pooled buffer account in accordance with Section 5.2 (applying the non-permanence risk rating only to those remaining GHG credits available for VCU issuance).

5.3.4 Where a project fails to submit a verification report to the Verra registry within five years of its last verification, 50 percent of the buffer credits associated with the project shall be put on hold. After a further five years, all of its remaining buffer credits shall be put on hold. Where no subsequent verification report has been presented within a period of 15 years, and the project crediting period has not yet expired, buffer credits shall be cancelled from the AFOLU pooled buffer account in an amount equivalent to the total number of VCUs issued to the project (including buffer credits put on hold) and the project shall be labeled as *inactive*.

Note – Where a project has not verified because it has transitioned to another GHG program (e.g., integrated into a government program), it shall be labeled as project transferred to other GHG program instead of inactive.

5.3.5 Where buffer credits are put on hold because a project does not submit a verification report within five years of the previous verification, the project may re-claim buffer credits. A new verification report shall be submitted prior to the expiration of the project crediting period. Verra shall re-assign buffer credits that have been put on hold in accordance with the procedure set out in Section 5.1.1 above. The remaining balance of buffer credits associated with a project shall be cancelled at the end of the project crediting period.

6 QUALITY CONTROL OF REGISTERED PROJECTS

6.1 Process

6.1.1 Verra may, at its discretion, review registered projects and issued VCUs where it has concerns about adherence of the project to the VCS Program rules and the applied methodology. A review may be triggered by any of the following:

- 1) A validation/verification body performing a verification of a registered project identifies an error or quality issue in a previous validation or verification.
- 2) A project proponent identifies an error or quality issue after the registration or issuance of the project.
- 3) A stakeholder has concerns about a registered project².
- 4) Verra itself identifies an error or quality issue, as part of routine operations.

6.1.2 Where a review is triggered, Verra notifies the project proponent (or its authorized representative) and the relevant validation/verification body of the review and may suspend further VCU issuance while the review is performed.

6.1.3 Where material non-conformances are identified during the review (see the *VCS Standard* for further details on the threshold for materiality), the validation/verification body shall provide a written response to findings (e.g., corrective action requests or clarification requests) issued by Verra. Verra also suspends further VCU issuance, where it has not already done so.

Note – Where the relevant validation/verification body is unable to respond due to reasons such as a cease of operations or accreditation, Verra may solicit a response to the findings from alternative entities such as the project proponent or another validation/verification body.

6.1.4 The follow-up actions of the validation/verification body and/or project proponent shall depend on whether the relevant validation or verification was completed before, on or after 8 April 2014, and shall be as set out in Tables 3 and 4 below. In all cases, the relevant validation/verification body shall undertake a root cause analysis to identify why such quality issues occurred.

² Concerns may be raised, in confidence, with Verra at any time.

Table 3: Actions for Validations and Verifications Completed Before 8 April 2014

	Issues found, but no excess VCU issuance and no risk of future excess issuance	Issues found, with excess VCU issuance and/or risk of future excess issuance

<p>Project does not qualify under program</p>	<p>1) Validation/verification body shall conduct a root cause analysis</p> <p>2) Where significant performance issues are found, and as appropriate, disciplinary action shall be taken against the validation/verification body</p> <p>3) No further VCU issuance is permitted</p>	<p>1) Validation/verification body shall conduct a root cause analysis</p> <p>2) Where significant performance issues are found, and as appropriate, disciplinary action shall be taken against the validation/verification body</p> <p>3) Project proponent may need to compensate for excess issuance (see Section 6.1.5)</p> <p>4) No further VCU issuance is permitted</p>

6.1.5 Where Verra determines that VCUs have been issued in excess of the correct amount, the following applies:

- 1) The project proponent is responsible for compensating for excess VCU issuance where Verra deems, acting reasonably, that there has been a material erroneous issuance of VCUs in respect of the project, as a result of the fraudulent conduct, negligence, intentional act, recklessness, misrepresentation or mistake of the project proponent, as set out further in the issuance representation.
- 2) Any compensation for excess VCU issuance shall be through the following, with Verra using reasonable efforts to work with the project proponent to ensure that any adverse impacts on the project proponent are minimized to the extent possible.
- 3) Where the excess VCUs remain in the project proponent’s Verra registry account and it can be demonstrated that they have not been used for offsetting purposes, immediate cancellation of the VCUs.
- 4) Replacement of VCUs through immediate cancellation from subsequent issuances of VCUs to the project.
- 5) Purchase by the project proponent of an equivalent number of replacement VCUs, and cancellation of same, within 60 business days of receiving formal Verra notification of such required action.
- 6) Where the project proponent fails to compensate for excess VCU issuance, Verra may take action against the project proponent, including applying sanctions with respect to its registry account activities until such time as the excess issuance has been compensated.

7 FURTHER INFORMATION

7.1 Communications Agreement

7.1.1 The purpose of the communications agreement is to allow an authorized representative to interact with the Verra registry on behalf of the project proponent and designate the account into which VCUs may be deposited. Templates for Verra registry communications agreements are available on the Verra website. The following is provided by way of further clarification:

- 1) Where there are multiple project proponents stated in the project description a communications agreement shall be provided to the Verra registry signed by all project proponents. The communications agreement shall designate an authorized representative and the account into which any VCUs shall be issued. Where a subsequent registration representation is provided to the Verra registry for the purpose of switching the project proponent, a communications agreement shall also be provided in respect of designation of an authorized representative or the account into which any VCUs shall be issued. Such communications agreement shall supersede any prior communications agreement.
- 2) Where there is a single project proponent and a registration representation is provided to the Verra registry, a communications agreement may also be provided in respect of designation of an authorized representative or the account into which any VCUs shall be issued. Where a subsequent registration representation is provided to the registry for the purpose of switching the project proponent, a communications agreement may also be provided. Any such communications agreement shall supersede any prior communications agreement. Where a communications agreement is not provided, authorized representation reverts to the (new) project proponent.

7.2 Release and Accession of Project Proponents

7.2.1 Project proponents may join or leave a project subsequent to project validation and registration. Such accession and release is handled via representations made by acceding entities and project proponents as follows:

- 1) Where an entity wants to join a project, it and the existing project proponent(s) shall sign an accession representation, which shall be prepared using the *VCS Deed of Accession Template* and properly executed as a deed in accordance with applicable local laws and the organization's own constitutional documents. Where more than one entity wants to join the project, one accession representation shall be signed for each acceding entity.
- 2) Where a project proponent wants to leave a project (i.e., give up its rights and obligations in respect of the project), it, the remaining project proponent(s) and the Verra registry shall sign a partial release representation, which shall be prepared using the *VCS Deed of Partial*

- Release Template* and properly executed as a deed in accordance with applicable local laws and the organization's own constitutional documents. Where more than one project proponent wants to be released from the project, one partial release representation shall be signed for each project proponent that is leaving. Note that a project shall always have at least one project proponent, so there shall always be at least one remaining registration representor (project proponent) that signs the partial release representation.
- 3) The accession and/or partial release representations shall be submitted to the Verra registry, who shall upload the accession and/or partial release representations to the Verra registry and update the project record to reflect the change in project proponent.
 - 4) Once this process is complete, only the new project proponent or its authorized representative can initiate subsequent VCU issuance.

Note – Where a project has one project proponent only and the project proponent wants to leave the project in favor of another entity, this is handled by having the new entity accede to the project via an accession representation and the original project proponent released from the project via a release representation.

Title	Terms of Use
Parties	Verra a not-for-profit organization incorporated in the District of Columbia, USA, whose registered office is at 1090 Vermont Ave, NW, Suite 910, 20005 (Verra)
	You (User)

Recitals

- A These Terms of Use set out the terms on which Verra offers to make the Verra Registry (**Registry**) available to the user.
- B The Registry serves as the registry for the Verra Programs.
- C The User wishes to use the Registry on the terms and conditions of this Agreement, as amended from time to time.

Operative provisions

1. General Terms of Use

- 1.1 The User acknowledges and agrees that when using the Verra Registry, the User will be subject to, and must comply with, these Terms of Use as modified from time to time in accordance with the terms hereof.
- 1.2 Where there is any inconsistency between these Terms of Use and the Program Rules and Requirements of a Verra Program, the Program Rules and Requirements of the relevant Verra Program will prevail over these Terms of Use.
- 1.3 In addition, the User agrees to comply with any and all applicable Scheme Regulations imposed and updated from time to time by a third-party Scheme Regulator.
- 1.4 If the User does not agree to these Terms of Use, the User may not access or otherwise use the Verra Registry.

2. Term

- 2.1 These Terms of Use commence on the date on which the User indicates on the Verra Registry website that the User agrees with and accepts the Terms of Use (**Commencement Date**), and these Terms of Use shall continue in effect until terminated in accordance with clause 14 (**End Date**).

3. Services

- 3.1 Verra, through the Verra Registry, provides an electronic platform to list projects that follow the applicable protocols and standards for the relevant Verra Program and record the issuance, transfer, retirement and cancellation of Instruments within the Verra Registry.
- 3.2 The Verra Registry lists projects and issues Instruments in accordance with the Program Rules and Requirements of each of the Verra Programs it administers. Accordingly, before a project

can be listed or an Instrument issued, the User must provide Verra with appropriate documentation for its approval in accordance with the procedures set out by Verra including any Program User Guidelines.

- 3.3 The User is responsible for providing and maintaining all communications lines, telephone/transmission services, and all equipment and technology, necessary for the User to access and use the Verra Registry, and all costs and expenses associated with its accessing and using the Verra Registry.
- 3.4 The User shall take all appropriate steps and precautions to safeguard and protect the access, use, and security of the Verra Registry and the User's access information from unauthorized users.

4. Opening an Account

- 4.1 A User may request that Verra open a Verra Registry Account for that User in accordance with the procedures set out by Verra.
- 4.2 Verra will only open a Verra Registry Account for a User if:
 - (a) the User has indicated their acceptance of these Terms of Use; and
 - (b) the User has provided sufficient identification information including satisfying any relevant Know-Your-Client (**KYC**) or other background check requirements in accordance with the procedures set out by Verra including any Program User Guidelines.
- 4.3 Verra may, in its absolute discretion, refuse to open a Verra Registry Account for a User.

Program Sub-Accounts

- 4.4 A User may request that Verra open a Program Sub-Account under its Verra Registry Account for all transactions related to a particular Verra Program. For the avoidance of doubt, a User shall have a separate Program Sub-Account for each Verra Program it participates in.

5. Listing a Project or Activity

- 5.1 Once the User has opened a Verra Registry Account, the User may request that Verra list a Project or Activity in accordance with the procedures set out by Verra including any Program User Guidelines.
- 5.2 Verra will require any User who intends to list a Project or Activity to provide all documentation and information as required by the relevant Verra Program Rules and Requirements.
- 5.3 Verra will only list a Project or Activity if:
 - (a) the User has registered with Verra or any relevant Scheme Regulator (as applicable) and submitted all necessary information to Verra or the relevant Scheme Regulator in accordance with the applicable Verra Program Rules and Requirements or Scheme Regulations;
 - (b) the User has confirmed that it is not subject to any holding account restrictions in accordance with the applicable Scheme Regulations;
 - (c) the User has complied with all relevant laws in relation to the Project or Activity; and

- (d) the User has complied with any other requirements specified in the relevant Program Rules and Requirements or by the relevant Scheme Regulator or by Verra from time to time.
- 5.4 For the avoidance of doubt, a Project or Activity may be listed under more than one Program, provided that it meets the requirements for listing of each of the applicable Verra Program Rules and Requirements or Scheme Regulations.
- 5.5 Verra may, in its absolute discretion, refuse to list any Project or Activity in the Verra Registry.

6. Issuance of Registry Instruments

- 6.1 A User may request that Verra issue Instruments to its Verra Registry Account in accordance with the relevant Verra Program Rules and Requirements.
- 6.2 Verra will require any User who intends to issue Instruments in the Verra Registry to provide all documentation, attestations and information as required by the relevant Verra Program Rules and Requirements.
- 6.3 Verra will only issue Instruments if:
- (a) the User has submitted complete and signed original or certified electronic versions of all attestations and documentation required under the relevant Verra Program Rules and Requirements or by the relevant Scheme Regulator, these Terms of Use or the procedures set out by Verra including any Program User Guidelines;
 - (b) Verra is satisfied (based solely on the information provided by the User and third parties) that the project or activity for which Instruments are to be issued meets the relevant Verra Program Rules and Requirements;
 - (c) the User complies with all relevant laws;
 - (d) the User has established a Program Sub-Account for the relevant Program; and
 - (e) the User has complied with any other requirements specified in the relevant Verra Program Rules and Requirements or by the relevant Scheme Regulator or by Verra from time to time.
- 6.4 The User acknowledges and understands that Verra's issuance of Instruments is no guarantee of any relevant Scheme Regulator's issuance of corresponding Scheme Instruments, and that a Regulator may determine, pursuant to the relevant Program Rules and Requirements, that fewer or no Scheme Instruments will be issued relative to the quantity of Instruments issued by Verra. In such instances, Verra maintains the right to cancel the quantity of Instruments that it issued in excess of the number of Scheme Instruments issued by the relevant Scheme Regulator or take other action that it deems appropriate, considering the circumstances and facts available to Verra.
- 6.5 The User acknowledges and agrees that in the event that Verra or a relevant Scheme Regulator determines that GHG reductions or removals for a project or activity were incorrectly quantified or reported, such that the number of Instruments issued to the User was in excess of the correct number according to the requirements of the applicable Verra Program Rules and Requirements, it is the User's responsibility to compensate for the over-issuance of Instruments, irrespective of whether the Instruments are still held by the User.
- 6.6 The obligation to compensate for any over-issuance of Instruments survives the End Date.

- 6.7 Verra may, in its absolute discretion, refuse to issue Instruments to the User's Verra Registry Account.

7. Recording the Transfer of Instruments within the Verra Registry

- 7.1 Upon receiving notification from the User or a Financial Market Settlement System that there has been an erroneous or fraudulent dealing related to Instruments in the Verra Registry, Verra may at its total discretion reverse the transaction or movement of Instruments or remove any Instruments being held in a User's Verra Registry Account or Program Sub-Account in accordance with any instructions received from the User or the relevant Financial Market Settlement System.
- 7.2 Upon receiving any written instruction from a Scheme Regulator in relation to any dealing with Instruments in the Verra Registry, Verra may at its total discretion reverse any transaction or movement of Instruments or remove any Instruments being held in a User's Verra Registry Account in accordance with any written instructions received from the Scheme Regulator.

8. Cancellation and Retirement of Instruments

- 8.1 The User may request that Verra cancel or retire Instruments in accordance with the relevant Verra Program Rules and Requirements and the procedures set out by Verra including any Program User Guidelines.
- 8.2 The User acknowledges and agrees that if the User wishes Verra to cancel or retire Instruments:
- (a) all legal and beneficial title in such Instruments will be extinguished and to the extent that any legal or beneficial title remains, the User will transfer its remaining interest and title to Verra subject to any limitations or requirements as may be imposed from time to time by the relevant Verra Program Rules and Requirements, these Terms of Use or the procedures set out by Verra including any Program User Guidelines;
 - (b) neither it nor any third party will have any further rights to take the benefit of such Instruments nor the underlying Environmental Benefits corresponding to such Instruments; and
 - (c) it will procure that all relevant third parties enter into such agreements as are necessary to ensure that neither the User nor any third parties have any further rights to take the benefit of such Instruments nor the underlying Environmental Benefits corresponding to such Instruments.
- 8.3 Subject to clauses 11.4(o) and 11.4(p), any instruction by the User to Verra to cancel or retire Instruments in accordance with this clause 8 is irrevocable, and the User acknowledges that any such instruction will not be reversed.
- 8.4 Verra acknowledges and agrees that, once the User has complied with this clause 8 and Verra has cancelled or retired the Instruments, Verra will not take any action to exercise or purport to exercise any right or interest, or deal with or otherwise use, the cancelled or retired Instruments or the underlying Environmental Benefits corresponding to such Instruments and considers that no person has any further rights to take the benefit of the cancelled or retired Instruments or the underlying Environmental Benefits corresponding to such Instruments.

9. Legal Title to Instruments

- 9.1 Notwithstanding anything in clause 6, the User acknowledges and agrees that Verra does not in any way guarantee legal title to the Instruments and the User relies on any content obtained through the Verra Registry at its own risk.
- 9.2 For the avoidance of doubt, Verra is under no obligation to verify or otherwise enquire into the validity of, or legal title to, the Instruments.

10. Fees and Charges

- 10.1 Fees payable for use of the Verra Registry will be published by Verra from time to time.
- 10.2 The User shall provide User's billing information prior to opening a Verra Registry Account with the Verra Registry. Invoices will be sent to User by email. All payments made to Verra should be made by wire transfer of immediately available funds in United States dollars to the Verra Bank Account. For the avoidance of doubt, all costs associated with the User's payment of fees shall be borne by the User.

Late Payment

- 10.3 If User fails to pay when due any fees, costs or other amounts which User is obligated to pay under these Terms of Use, such amounts will be deemed delinquent and will accrue interest at the Interest Rate, such interest to be calculated from and including the due date to, but excluding, the date on which the delinquent amount is paid in full.
- 10.4 Acceptance of late payment of any such amounts or of any interest accrued thereon shall not constitute a waiver by Verra of the User's default with respect to such late payment, nor prevent Verra from exercising any other rights or remedies available to it under these Terms of Use or any applicable law.
- 10.5 If delinquent fees are not paid by the User within thirty (30) days of the Due Date, Verra maintains the right to freeze the User's access to its Verra Registry Account and Program Sub-Accounts until such time as User pays all outstanding fees, inclusive of interest.
- 10.6 Verra shall bear no liability to the User or any third party in connection with Verra's exercise of its rights and remedies hereunder.

Changes in Fees and Costs

- 10.7 Verra may, upon thirty (30) days' notice to User and in its sole discretion, increase or decrease any or all of the fees and costs payable hereunder at any time. In no event shall any portion of such fees and costs be prorated or refunded to User upon termination of these Terms of Use or termination or suspension of User's access to the Verra Registry.
- 10.8 Any use of the Verra Registry by the User after the effective date set forth in the notice shall be deemed to constitute acceptance of such changes to the fees and costs payable hereunder.

Taxes and Other Charges

- 10.9 User shall be responsible for all taxes and charges imposed by a governmental authority related to the use of the Verra Registry and all related hardware, software, and services, and any other costs the User incurs in connection with the purchase, sale, posting, or transfer of Instruments or any other use of the Verra Registry.

- 10.10 For the purposes of these Terms of Use, "taxes" includes, but is not limited to, any or all ad valorem, property, occupation, severance, first use, conservation, gross receipts, privilege, sales, use, consumption, excise, lease, and transaction taxes, and any other taxes and governmental charges, fees, and assessments, or increases therein, other than taxes based on Verra's net income or net worth.

11. Representations, Warranties and Covenants

- 11.1 On the Commencement Date and throughout the term of these Terms of Use, the User represents and warrants to Verra that:
- (a) it is duly organized, validly existing, and in good standing under the laws of the jurisdiction of its formation;
 - (b) it has all corporate and other authority and all regulatory and other consents, approvals and authorizations necessary for it to legally:
 - (i) enter into and perform its obligations under these Terms of Use and the associated procedures set out by Verra including any Program User Guidelines; and
 - (ii) engage in all of its activity (including the creation, receipt and transfer of Instruments) on or relating to the Verra Registry,
 - (c) the person indicating the User's acceptance of these Terms of Use through a website maintained by Verra has the authority to enter into these Terms of Use on behalf of the User, and these Terms of Use are binding on the User and enforceable against the User in accordance with their terms;
 - (d) it has examined and is familiar with the statements and other data and information submitted by it or on its behalf to Verra, and, to the best of its knowledge and belief, such statements and information are true, accurate, and complete;
 - (e) any Instruments issued by the Verra Registry have been created and verified in accordance with the relevant Verra Program Rules and Requirements;
 - (f) all legal title to and all Beneficial Ownership Rights in each Instruments held, retired or cancelled in any Verra Registry Account and Program Sub-Account held by the User are held by the User;
 - (g) all rights, title and interest in all data and other information provided to Verra or input into the Verra Registry by the User are held by the User, and all such data and other information are true and correct in all material respects; and
 - (h) any other representation, warranty, attestation or certification made to Verra by or on behalf of the User, whether prior to, on or following the Commencement Date is true and correct in all respects.

Covenants of User

- 11.2 On the Commencement Date and throughout the term of these Terms of Use, the User covenants to Verra that:
- (a) it will maintain its user ID and password in strict confidence, will allow only its employees and other representatives access to its Verra Registry Account and Program Sub-Accounts and will promptly notify Verra of any suspected unauthorized use of the Verra Registry or other breach of security; and

- (b) it will comply at all times with the relevant Verra Program Rules and Requirements as applicable, these Terms of Use, the procedures set out by Verra including any Program User Guidelines, and all laws applicable to its use of the relevant Verra Program.

Representations and Warranties of Verra

- 11.3 On the Commencement Date and throughout the term of these Terms of Use, Verra represents and warrants to User that:
- (a) to Verra's knowledge:
 - (i) the Verra Registry, the procedures set out by Verra including any Program User Guidelines and these Terms of Use comply in all material respects with any applicable laws, regulations and orders to which they may be subject; and
 - (ii) Verra possess any applicable licenses, authorizations, permits, consents and approvals of any governmental entity or other governmental authority that may be required to be possessed by Verra in connection with the operation of the Verra Programs and the Verra Registry; and
 - (iii) to Verra's knowledge, use of the Verra Registry by User in accordance with the provisions of these Terms of Use does not and will not infringe the intellectual property rights of any third party in the United States.

User Acknowledgements

- 11.4 User acknowledges and agrees that Verra is merely providing a service and, accordingly, acknowledges and agrees that:
- (a) neither Verra nor the Verra Registry Software Provider has any special or fiduciary relationship to the User or any other user of the Verra Registry;
 - (b) neither the Verra Registry nor the Verra Registry Software Provider is the User's agent or advisor;
 - (c) these Terms of Use create no relationship of partnership, joint venture, employment, franchise, or agency between Verra or the Verra Registry Software Provider and the User;
 - (d) all Instrument transactions shall be performed or settled by it and any third party in accordance with such separate agreements as may exist between the User and the relevant third party;
 - (e) neither the Verra Registry nor the Verra Registry Software Provider assumes any responsibility for the performance or settlement of any transactions;
 - (f) Verra is not in any way involved with and has no control over the disbursement of Scheme Instruments under any Scheme Regulations;
 - (g) it shall perform or settle any separate Scheme Instrument transactions in accordance with such separate agreements as may exist between User and any third party(ies), including Scheme Regulators;
 - (h) Verra makes no representations as to the achievement of the underlying Environmental Benefits of any Instruments;

- (i) Verra does not warrant that the Verra Registry software is free of bugs or errors;
- (j) Verra does not warrant that the information provided by Users and uploaded on the Verra Registry is true and correct at any point in time;
- (k) neither Verra or the Verra Registry Software Provider acts as a buyer or seller, or holds title to any Instrument or product listed on the Verra Registry;
- (l) once project information has been uploaded or posted to the Verra Registry; such project information cannot and shall not be deleted, removed, expunged or altered, except in accordance with Verra's normal operating procedures or as required by a relevant Scheme Regulator. Any subsequent changes or additions to information previously posted shall be posted as an update/amendment, but shall not replace the original posting;
- (m) Verra and the Verra Registry do not and will not provide any matching services whereby Users will be matched with any potential buyer or seller of Instruments or services related to the aggregation, verification or certification of emissions data;
- (n) in the event that a User does enter into an Instrument transaction or an aggregation, verification or certification arrangement with any third party using the Verra Registry, Verra does not guarantee and shall not be responsible for any obligation arising out of such transaction or arrangement or provide any assurance or guaranty that any such transaction or arrangement ultimately will be consummated;
- (o) Verra has the authority and power to reverse any transaction or movement of Instruments upon instruction from a relevant Scheme Regulator, Financial Market Settlement System or any other Government Authority without the authorisation of the User. If a transaction or movement of Instruments is reversed in accordance with this clause 11.4(o), the User will have no claim against Verra for any remedy;
- (p) the User has the right and the obligation to instruct Verra to correct any incorrect or inaccurate information held in the Verra Registry and inform Verra in writing of any changes to that information; and
- (q) Verra may, in its sole discretion, with or without cause or prior notice to the User:
 - (i) temporarily or permanently cease to operate the Verra Registry;
 - (ii) temporarily or permanently cease to make Instrument issuances or other services described hereunder available; or
 - (iii) terminate or suspend the User's access to the Verra Registry.

12. Limitation of Liability and Indemnification

Limitation of Liability

- 12.1 The User assumes full responsibility and risk of loss resulting from its use of the Verra Registry and will have no claim whatsoever against Verra or its independent contractors (including, without limitation, the Verra Registry Software Provider), other than where liabilities are determined by final adjudication to have been caused by Verra's or its independent contractors' wilful misconduct.
- 12.2 Verra's sole liability relating in any way, whether directly or indirectly, to the Verra Registry or these Terms of Use (including without limitation the performance or non-performance by Verra of its obligations), whether caused by the negligence of Verra or otherwise, and

regardless of whether any claim for damages is based on contract, tort, strict liability or otherwise, is limited to an aggregate amount equal to the fees paid by the User to Verra during the one-year period immediately preceding the earliest date on which any such claim(s) are made by the User.

- 12.3 In no event shall Verra or the Verra Registry Software Provider be liable for any:
- (a) consequential, incidental, special, exemplary, punitive or indirect damages;
 - (b) economic or commercial loss; or
 - (c) any loss of use, loss of data, loss of business, personal injuries, or property damages, sustained by the User or any third-parties.

Even if Verra has been advised by the User or any third-party of the possibility of such damages, the User hereby releases and discharges Verra and the Verra Registry Software Provider, any wholly owned subsidiaries of Verra and the Verra Registry Software Provider, any other corporate affiliates of Verra and the Verra Registry Software Provider, their successors and assigns, agents, directors, officers, employees, contractors, service providers and vendors from any and all liability with respect to any damage or injuries incurred by the User as relation to the Verra Registry.

No Counterparty Liability

- 12.4 Verra shall not be liable:
- (a) for the acceptability of or for any action or omission of any counterparty to or other third party involved in any transaction or arrangement that relates to Instruments or that is entered into or consummated with the use of the Verra Registry (including without limitation any Instrument provider or buyer and any verification or certification provider); or
 - (b) for the enforceability of or for any loss, expense or other liability arising from any such transaction or arrangement.

Indemnification

- 12.5 To the fullest extent permitted by law, the User agrees to indemnify, defend, and hold harmless Verra and its independent contractors (including, without limitation, the Verra Registry Software Provider) and their respective officers, directors, owners, employees, agents, subsidiaries, affiliates, successors and assigns (collectively, the **Indemnified Party**) against and from any losses, liabilities, damages, judgments, awards, fines, penalties, actions, claims, costs, and expenses, including, without limitation, any amounts paid in settlement or compromise and any fees and costs of counsel and experts, (collectively, **Losses**) incurred, directly or indirectly, in connection with or by reason of, or in any way relating to, arising out of or attributable to:
- (a) the User's use of the Verra Registry or Verra's website and/or any violation of any law, rule, or regulation arising from such use;
 - (a) any breach of any representation or warranty set forth in, and any failure to perform any covenant, obligation or agreement under, these Terms of Use by User, or any violation by User of these Terms of Use or the procedures set out by Verra including any user guidelines;
 - (b) any claim, action or proceeding asserted or brought by a third party arising out of any actual or alleged act or omission of the User;

- (c) any failure of any Instrument posted or transferred by the User on the Verra Registry to conform with Verra's or a relevant Scheme Regulator's requirements;
- (d) any information supplied by or through User, any transaction or arrangement entered into by User with any third party, or any misuse or improper disclosure of any information by User;
- (e) any dispute between User and any third party with respect to any Instruments (including, without limitation, any such dispute arising from or relating to any transaction between User and a third party with respect to the purchase, sale, or exchange of Instruments, or to the aggregation, verification or certification of emissions data or any other data underpinning claimed Environmental Benefits);
- (f) any loss suffered by or other harm to any person or property (including, without limitation, any personal injuries or death of any third person) in any way relating to or caused in whole or in part by the posting, purchase, sale or exchange of Instruments by the User or any other activity of User conducted using the Verra Registry;
- (g) any action (including, without limitation, any message, request to transfer, buy, offer to sell, bid to buy, and request for new suppliers) taken by any third person through the User's Verra Registry Account or Program Sub-Accounts or using the User's password on the Verra Registry, whether or not such third person gains access to such Verra Registry Account or Program Sub-Account or password as the result of any negligence or lack of vigilance by the User; and
- (h) the enforcement of the release, indemnity and other obligations referred to in this clause 12.5,

in any case, except to the extent that such Losses result from the Indemnified Party's fraudulent conduct or wilful misconduct.

- 12.6 For the avoidance of doubt, the Losses referred to in clause 12.5 include, and are not limited to, any Losses arising out of or related to:
- (a) any inaccuracy, error, or delay in or omission of any data, information, or service, or the transmission or delivery of any data, information, or service;
 - (b) any interruption of any such data, information, or service (whether or not caused by such Indemnified Party); or
 - (c) any financial, business, commercial or other judgment, decision, act or omission based upon or related to the information or the Registry.

13. Limited Warranty; Disclaimer of Warranty

- 13.1 The data contained in the Verra Registry has been gathered by Verra from sources believed by Verra to be reliable. However, neither Verra nor the Verra Registry Software Provider warrants that the information in the Verra Registry is correct, complete, current, or accurate, or that the software programs used in the Verra Registry will be error or bug-free, secure or free from service disruption.
- 13.2 The User acknowledges, understands and accepts that the Verra Registry is provided on an "As Is" basis at the User's sole Risk. Neither Verra nor the Registry Software Provider makes any representations, or warranties, express or implied, with respect to these Terms of Use, the procedures set out by Verra including any Verra Program User Guidelines or compliance with

the relevant Verra Program Rules and Requirements, or the adequacy or performance of the Verra Registry.

- 13.3 Verra and the Verra Registry Software Provider hereby disclaim any such warranties, including but not limited to warranties of merchantability, non-infringement or fitness for a particular purpose, and any implied warranties arising from any course of dealing, usage, or trade practice.
- 13.4 The User acknowledges that service or maintenance disruptions may occur from time to time. Verra and the Verra Registry Software Provider further disclaim liability for:
- (a) errors, omissions or other inaccuracies in any party of the Verra Registry, or the reports, Instruments or other information compiled or produced by or from or input into the Verra Registry;
 - (b) any delays, omissions or interruptions therein, and
 - (c) for the acts or omissions of any broker or Agent authorized within the Verra Registry by the User to utilize the Verra Registry services on behalf of the User.
- 13.5 Verra and the Verra Registry Software Provider are not responsible for the acts or omissions of parties who aggregate, input, verify or certify data for the Verra Registry or from whom data is obtained for inclusion in the Verra Registry, nor is Verra or the Verra Registry Software Provider responsible for any obligation of any User to provide or deliver a product or service or to pay any User for a product or service.
- 13.6 Neither Verra nor the Verra Registry Software Provider assumes any responsibility for, and neither shall be liable for, any damages to, or viruses that may infect, the User's equipment or other property on its Verra Registry Account and Program Sub-Accounts or the User's access to and use of the Verra Registry.
- 13.7 The User is solely responsible for the protection, security, and management of its computer network and of all usage thereof. Neither Verra nor the Verra Registry Software Provider will compensate the User for damages incurred due to violations of the security of the User's computer network, nor shall the User make deductions or set offs of any kind from or against fees due to Verra in respect of any such damages.

14. Termination and Suspension

Termination

- 14.1 Verra may terminate these Terms of Use by giving 10 Business Days notice to the User except in the event of a breach of the Terms of Use in which case Verra may terminate these Terms of Use immediately. For the avoidance of doubt, the power to terminate these Terms of Use in this clause 14.1 can be exercised immediately.
- 14.2 The User may terminate these Terms of Use and its use of the Verra Registry by providing thirty (30) Business Days written notice to Verra.
- 14.3 If these Terms of Use are terminated, the following provisions shall survive termination: 7 (Recording the Transfer of Instruments within the Verra Registry), 8 (Cancellation and Retirement of Instruments), 16 (Confidentiality), 10 (Fees and Charges), 12 (Limitation of Liability and Indemnification), 17 (Intellectual Property), and 19 (Dispute Resolution).

Suspension

- 14.4 Verra may suspend the User's access to the Verra Registry and the User's Verra Registry Account and/or Program Sub-Accounts at any time with or without cause and without prior notice to the User. Without limiting any other remedies or limiting the foregoing, Verra may suspend the User's access to the Verra Registry if:
- (a) Verra reasonably suspects that the User has engaged in fraudulent, unethical or illegal activity in connection with the Verra Registry, Verra or its website;
 - (b) it has received instructions to do so from the relevant Scheme Regulator;
 - (c) the User has failed to pay any fees, costs or other amounts required to be paid under these Terms of Use within five (5) Business Days of the applicable due date;
 - (d) the User has breached any representation, warranty, covenant or agreement contained herein, or otherwise failed to abide by these Terms of Use, the procedures set out by Verra including any Program User Guidelines, the Verra Program Rules and Requirements or any relevant Scheme Regulations;
 - (e) accreditation or approval for any Instruments listed by or on behalf of the User is withdrawn or threatened to be withdrawn for any reason other than such units having been issued in error;
 - (f) any Instruments listed by or on behalf of the User are the subject of, or become the subject of, a Dispute, other than to an issue of erroneous issuance; or
 - (g) if the User is acting as an Agent, any authorisation to act in that capacity has been revoked by the Principal.
- 14.5 Verra shall provide the User with written notice via email of any suspect circumstances affected under this section within fifteen (15) Business Days following such suspension.
- 14.6 While a User's access to the Verra Registry and/or Verra Registry Account and any Program Sub-Accounts is temporarily suspended, the User will have no right to deal with any listed Instruments in the Verra Registry and any instruction by the User to Verra to list, record the transfer of, retire or cancel Instruments in the Verra Registry will be declined.
- 14.7 When Verra forms a reasonable belief in accordance with clause 14.4(a), Verra may exercise one or more of the following rights:
- (a) a notation may be made in the Verra Registry and / or the Verra website indicating the temporary suspension and indicating the Disputed Instruments; and
 - (b) where the dispute concerns Instruments transferred, or purportedly transferred, by the User to another Verra Registry Account in accordance with clause 7, Verra may require the User to supply replacement Instruments of a quality and quantity specified by Verra.
- 14.8 Upon notification by Verra of temporary suspension, the User will have ten Business Days to:
- (a) show cause in writing as to why the User should not be permanently suspended from the Verra Registry and why the serial numbers of the Disputed Instruments should not be cancelled and
 - (b) where requested by Verra in accordance with clause 14.7(b), supply to Verra, replacement Instruments of a quality and quantity specified by Verra.

- 14.9 If within the ten Business Day period, the User fails, to the satisfaction of Verra, to show cause and/or provide replacement Instruments, Verra may exercise one or more of the following rights:
- (a) permanently suspend the User from the Verra Registry;
 - (b) close the User's Verra Registry Account(s) and any Program Sub-Accounts (in which case the provisions of clause 15 shall apply);
 - (c) record the serial numbers of the Disputed Instruments into the Verra Cancellation Account; and / or
 - (d) terminate these Terms of Use under clause 14.1.
- 14.10 For the avoidance of doubt, in the event that a listing or a transaction on the Verra Registry is found to be fraudulent or illegal, Verra reserves the right to refer the matter to the appropriate Governmental and legal authorities.

15. Closing an Account

- 15.1 The User may close a Verra Registry Account or Program Sub-Account at any time by providing written notice to Verra in accordance with the procedures set out by Verra including any user guidelines.
- 15.2 In the event of the User providing written notice to Verra in accordance with clause 15.1, the User will retain access to its other accounts on the Verra Registry (if any) and these Terms of Use will continue to apply until terminated under clause 14.
- 15.3 Upon receiving notification under clause 15.1, or carrying out its powers under clause 14, Verra will record the serial number of the Instruments listed in the relevant Verra Registry Account or Program Sub-Account of that User (if any) in Verra 's Cancellation Account.

16. Confidentiality

- 16.1 Verra agrees to use and maintain Confidential Information provided by User in accordance with the procedures set out by Verra including any Program User Guidelines and the relevant Verra Program Rules and Requirements, except as may be otherwise required or permitted under clause 16.4(a), or as requested by a relevant Scheme Regulator pursuant to its Scheme Regulations.
- 16.2 The User acknowledges that Verra will relay Confidential Information to the Registry Software Provider for the purpose of maintaining the Verra Registry and consents to and authorizes data sharing between Verra and the Registry Software Provider.
- 16.3 Verra and User shall each use commercially reasonable efforts to protect any Confidential Information of the other party from unauthorized disclosure or use, using at least the same level of care as it uses to protect its own Confidential Information.
- 16.4 Verra and the User each agree not to use or disclose Confidential Information of the other party except to the extent that such use or disclosure is:
- (a) reasonably necessary to perform under the procedures set out by Verra including any Program User Guidelines, Program Rules and Requirements, or these Terms of Use (including, without limitation, in connection with the production of reports or information requested and required by a relevant Scheme Regulator); or

(b) authorized in writing by the other party.

16.5 Neither Verra nor the User shall be deemed to have breached these Terms of Use on account of the use or disclosure of any Confidential Information of the other party if:

- (a) such use or disclosure is reasonably necessary to comply with any applicable law, regulation, order or other legally enforceable requirement, or any request by any governmental authority having jurisdiction (including a relevant Scheme Regulator) over Verra; and
- (b) the party using or disclosing such Confidential Information provides to the other party, as soon as reasonably practicable and, in any event, in advance of such use or disclosure, written notice of such use or disclosure so that the other party may seek a protective order or other appropriate remedy.

With respect to requests from a relevant Scheme Regulator for Confidential Information relating to a particular project or activity in connection with the relevant Scheme Regulator's review or crediting of that project or activity, Verra may disclose User information to the relevant Scheme Regulator without providing written disclosure to User.

16.6 If a User cancels or retires one or more Instruments, notwithstanding anything to the contrary in these Terms of Use, the following information related to such cancellation or retirement shall be subject to public disclosure by or at the direction of Verra, in such manner (including, without limitation, by inclusion in one or more reports posted on the Verra's website) and at such times as Verra may determine in its sole discretion:

- (a) the name of User;
- (b) the number of cancelled or retired Instruments;
- (c) the vintage and serial numbers of the cancelled or retired Instruments;
- (d) the date of such cancellation or retirement;
- (e) the name, type and identification number of the project or activity and the location of the project or activity site associated with the cancelled or retired Instruments;
- (f) if applicable, a statement to the effect that the cancellation or retirement was effected on behalf of another person or organization; and
- (g) any information not covered by the preceding clause 16.6(f) voluntarily disclosed by User to Verra regarding the reason for such cancellation or retirement.

16.7 If User obtains access to data in the Verra Registry that:

- (a) is not data provided or owned by User;
- (b) is not part of a publicly available Verra Registry report; and
- (c) the User is not otherwise authorized to use, then, regardless of whether such data is otherwise considered information subject to the provisions of this clause 16, the User shall:
 - (i) immediately notify Verra that the User has obtained such access; and
 - (ii) not disclose, disseminate, copy, or use any such information.

- 16.8 Verra and the User will each be entitled to all remedies available at law or in equity to enforce, or seek relief in connection with, the obligations of the other party under this clause 16.

17. Intellectual Property

- 17.1 The User hereby grants to Verra and the Verra Registry Software Provider, a perpetual, royalty-free license to:
- (a) use, reproduce, distribute, display and prepare derivative works from data provided by the User (**User Data**) and Confidential Information provided by the User; and
 - (b) grant sublicenses to such User Data and Confidential Information to subcontractors and other third parties,
- in each case to the extent reasonably necessary to perform any obligations of Verra under these Terms of Use, the procedures set out by Verra including any Program User Guidelines, and the relevant Verra Program Rules and Requirements, and to fulfil the purposes of the Verra Registry.
- 17.2 The rights and obligations of these Terms of Use shall run to the named parties and their successors in interest and permitted assigns. User shall ensure that any of its owners, trustees, members, officers, directors, employees and Agents to whom it has provided access to the Verra Registry agree to be bound by these Terms of Use.
- 17.3 The User acknowledges and agrees that the rights and licenses provided to User under these Terms of Use and the procedures set out by Verra including any user guidelines are solely for the benefit of the User and are to be exercised only in connection with the User's use of the Verra Registry. The User may not transfer, assign or sublicense its rights, licenses or Verra Registry Account(s) and Program Sub-Accounts, or any portion thereof, to any third party without the prior written consent of Verra, which consent Verra may withhold in its sole discretion.
- 17.4 The User acknowledges that Verra is and shall remain the sole owner of all aggregated data embodied in the Verra Registry, and of the selection, arrangement and compilation of such aggregated data.
- 17.5 Other than with Verra 's written permission, reproduction of part or all of the contents in any form of the Verra Registry is prohibited other than for individual use only and may not be copied and shared with a third party. The permission to copy by an individual does not allow for incorporation of material or any part of it in any work or publication, whether in hard copy, electronic, or any other form.
- 17.6 Unless otherwise noted, all materials in the Verra Registry are protected as the Intellectual Property Rights owned by Verra or by other parties that have licensed their material to Verra.

18. Privacy and User Information

- 18.1 Personal information about any individual will be maintained in accordance with the Privacy Policy.
- 18.2 The User acknowledges that Verra may be required by law or in compliance with its Know-Your-Client (**KYC**) policy to conduct background checks on the User.
- 18.3 The User agrees to use its best endeavours to assist Verra in carrying out any such obligations.

- 18.4 The User will review any communication issued by Verra in connection with the Verra Registry and will immediately notify Verra in writing if any information contained in the communication is inaccurate or incorrect.

19. Dispute Resolution

Governing Law

- 19.1 These Terms of Use shall be governed by the laws of the District of Columbia without regard to its rules on conflicts of laws.

Dispute Resolution

- 19.2 In the event of any claim or controversy arising out of or relating to these Terms of Use, or the breach thereof, or any other claim or controversy between the parties (any such claim or controversy, a **Dispute**), the parties first shall attempt to settle such claim or controversy by mediation administered by JAMS, which mediation shall take place in Washington, DC.
- 19.3 Either party may commence mediation by providing to JAMS and the other party a written request for mediation, setting forth the subject of the dispute and the relief requested, including the amount sought in the dispute.
- 19.4 The parties will cooperate with JAMS and one another in selecting a mediator from the JAMS panel of neutrals and in scheduling the mediation proceedings. The parties agree that they will participate in the mediation in good faith and that they will share equally its costs. At least fifteen (15) days prior to the commencement of the mediation, the party seeking to mediate (the **Demanding Party**) shall give the other party all documents available to the Demanding Party that support its position in the Dispute.
- 19.5 All offers, promises, conduct and statements, whether oral or written, made in the course of the mediation by any of the parties, their agents, employees, experts and attorneys, and by the mediator or any JAMS employees, are confidential, privileged and inadmissible for any purpose, including impeachment, in any arbitration or other proceeding involving the parties, provided that evidence that is otherwise admissible or discoverable shall not be rendered inadmissible or non-discoverable as a result of its use in the mediation.
- 19.6 Any Dispute that has not been resolved by mediation as provided herein within thirty (30) days after commencement of the mediation shall be finally resolved by arbitration administered by JAMS and all proceedings shall be held in Washington, DC. The arbitration will be conducted in accordance with the provisions of JAMS's Comprehensive Arbitration Rules and Procedures in effect at the time of filing of the demand for arbitration. The parties will cooperate with JAMS and with one another in selecting an arbitrator from JAMS panel of neutrals, and in scheduling the arbitration proceedings. The parties shall participate in the arbitration in good faith and shall share equally in its costs.
- 19.7 The provisions of this clause 19 may be enforced by any court of competent jurisdiction, and the party seeking enforcement shall be entitled to an award of all costs, fees, and expenses, including attorney fees, to be paid by the party against whom enforcement is ordered.
- 19.8 The parties shall continue to perform their respective obligations under these Terms of Use during the pendency of dispute resolution proceedings, including mediation and arbitration.
- 19.9 Each party waives, to the fullest extent permitted by applicable law, any right it may have to a trial by jury in respect of any Dispute.

- 19.10 Except as otherwise provided herein, each party shall be responsible for the payment of all of its costs associated with the resolution of any Dispute, whether in mediation, arbitration or before a court of law, including but not limited to any filing fees, mediator or arbitrator fees, its reasonable attorneys' fees, and other costs incurred in such proceeding, provided that if a Dispute is initiated in bad faith, as determined by the mediator, arbitrator or court, the party initiating the Dispute shall be responsible for all of the other party's defense costs.
- 19.11 The parties agree that neither may bring a claim nor assert a cause of action against the other, in any forum or manner, more than one (1) year after the later of:
- (a) the date on which the claim or cause of action accrued; and
 - (b) the earliest date on which the aggrieved party could have reasonably discovered the wrong giving rise to the claim or cause of action.

20. Force Majeure

- 20.1 To the extent Verra is prevented by Force Majeure from fully performing any of its obligations under the Verra Program Rules and Requirements, the procedures set out by Verra including any Program User Guidelines or these Terms of Use, then Verra shall be excused from the performance of such obligations for as long as the Force Majeure event is continuing.
- 20.2 Verra shall seek to remedy the Force Majeure using commercially reasonable efforts.
- 20.3 The User shall not be required to perform or resume performance of its obligations under the relevant Verra Program Rules and Requirements, the procedures set out by Verra including any Program User Guidelines or these Terms of Use corresponding to the obligations of Verra excused by Force Majeure.

21. General

Assignment

- 21.1 The User shall not assign these Terms of Use or any of its rights, benefits, duties, and obligations hereunder without the prior written consent of Verra, which consent Verra may withhold in its sole discretion. These Terms of Use shall be binding upon and inure to the benefit of the respective parties and their respective successors and permitted assigns.

No Third Party Beneficiaries

- 21.2 Except as set forth elsewhere in these Terms of Use, these Terms of Use confer no rights whatsoever upon any person other than the parties and shall not impose, or be interpreted as imposing, any standard of care, duty, or liability upon any person other than a party.

Severability

- 21.3 If any term or provision of these Terms of Use is held to be invalid or unenforceable in any respect, the validity and enforceability of the remaining terms and provisions of this Terms of Use shall not in any way be affected or impaired thereby.

Audit

- 21.4 Verra has the right, at its sole expense, upon reasonable notice and during normal working hours, to examine, audit, and obtain copies of the records of User to the extent reasonably necessary to verify:

- (a) the accuracy of any representation, warranty or attestation made by User to Verra; and
- (b) the User's performance during the prior (12) month period of its obligations under the procedures set out by Verra including any user guidelines or, as applicable, the relevant Verra Program Rules and Requirements, and these Terms of Use.

This right to examine, audit, and obtain copies shall not be available with respect to any information that is not directly relevant to the subject matter of the procedures set out by Verra including any user guidelines or, as applicable, the relevant Verra Program Rules and Requirements, or these Terms of Use.

Notices

- 21.5 All notices and other communications under these Terms of Use must be in writing and will be duly given hereunder:
- (a) upon delivery, if personally delivered, delivered by email or facsimile, or delivered by overnight courier with confirmation of delivery; and
 - (b) on the fourth business day after the postmark date, if mailed by certified or registered mail with postage prepaid.
- 21.6 Street and email addresses and facsimile numbers of each party are as indicated below or as subsequently modified by written notice to the other party.

If to Verra:

Verra
 Attn: Registry Administrator
 One Thomas Circle, NW, Suite 1050
 Washington, DC 20005
 Facsimile: 202-360-4257
 Email: registry@verra.org

If to the User:

To the address provided at the time of registration, as updated by the User from time to time.

Electronic Documents

- 21.7 To the extent permitted by law, for the purposes of this Declaration, Parties understand and agree that any document that is signed, executed, or submitted electronically will have the same force of law as if the same process had been conducted using physical documents.

Injunctive Relief

- 21.8 The User acknowledges that money damages would not adequately compensate Verra and the Verra Registry Software Provider in the event of a breach by the User of its obligations hereunder and that injunctive relief may be essential for Verra and the Verra Registry Software Provider to adequately protect themselves hereunder. Accordingly, the User agrees that, in addition to any other remedies available to Verra and the Verra Registry Software Provider or at law or in equity, including but not limited to any monetary damages, Verra and the Verra Registry Software Provider shall be entitled to seek injunctive relief in the event of any breach by User of any covenant, agreement, representation or warranty contained herein or in the procedures set out by Verra including any user guidelines.

Rights Cumulative

- 21.9 The rights, remedies and powers of the parties under these Terms of Use are cumulative and do not exclude any other rights, remedies or powers.

Schedule 1

Definitions

Agent means any User of the Verra Registry who does so in the capacity as a broker, agent or representative of any kind on behalf of a Principal for the purposes of utilising the Verra Registry services.

Agreement means these Terms of Use.

Beneficial Ownership Rights, with respect to any Instrument, means any contractual or other right to direct or control the sale or other disposition of, or the retirement of, such Instrument.

Business Day means any day except a Saturday, Sunday, or a Federal Reserve Bank holiday. A Business Day shall open at 8:00 a.m. and close at 5:00 p.m. Eastern Prevailing Time.

Cancellation Account means an account in the Verra Registry that lists the serial numbers of disputed Instruments, Instruments transferred to third parties without accounts in the Verra Registry and Instruments held by Users that have exited the Verra Registry.

Commencement Date means the date on which User indicated User's acceptance of these Terms of Use through a website maintained by Verra.

Confidential Information shall mean:

- (a) all information:
 - (i) to which User, Verra or the Verra Registry Software Provider, or any third party (to the extent such third party owes a duty of confidence to User, Verra or the Verra Registry Software Provider) has rights; and
 - (ii) which is marked to expressly indicate its confidential, restricted, or proprietary nature by the party having rights in the same, or which, under all of the circumstances, a reasonable business person should know to treat as confidential, restricted, and/or proprietary; and
- (b) all information that, at the applicable time, is deemed to be Confidential Information pursuant to clause 16.
- (c) Notwithstanding the foregoing and any provision of clause 16, Confidential Information does not include information:
 - (i) that is, as of the time of its disclosure, or thereafter becomes, part of the public domain through a source other than the receiving party;
 - (ii) that was known to the receiving party as of the time of its disclosure;
 - (iii) that is independently developed by the receiving party without reference to the Confidential Information of the disclosing party;
 - (iv) that subsequent to its disclosure, is received by the receiving party from a third party not subject to an obligation of confidentiality with respect to the information disclosed; or
 - (v) with respect to which the disclosing party provides to the receiving party in accordance with clause 16 or through an electronic interface comprising part of the Verra Registry an express waiver of any confidentiality protection under these Terms of Use.

Demanding Party has the meaning given to it in clause 19.3.

Dispute means any disagreement, claim, allegation, concerning the generation, creation, ownership, issuance, validity, legality or registration of any Instruments that may arise between the User and any third party including Verra.

Disputed Instruments means Instruments subject to a suspension notice in accordance with clause 14.5.

Due Date means the date at which any Fees charged and invoiced under this Agreement must be paid, which is no later than 30 days after the date of the relevant invoice.

End Date means the date these Terms of Use are terminated in accordance with clause 14.

Environmental Benefit(s) means all legal and equitable right, title, interest and benefit arising from or associated with (i) the protection, conservation or enhancement of the environment and/or biodiversity, or (ii) GHG Reductions, or (iii) the achievement of sustainable development outcomes; or (iv) any other legal and equitable right, title, interest or benefit relating to the environmental benefit as approved by Verra.

Financial Market Settlement System means an exchange, clearing house, central counterparty or other settlement system (as determined by Verra) that acts on settlement instructions to settle transactions.

Force Majeure means an event or circumstance which prevents Verra from performing its obligations under these Terms of Use, which event or circumstance was not anticipated as of the date these Terms of Use were agreed to, which is not within the reasonable control of, or the result of the negligence of, Verra, and which, by the exercise of reasonable commercial efforts, Verra is unable to overcome or avoid or cause to be avoided.

Government Authority means:

- (a) a government, whether foreign, federal, state, territorial or local;
- (b) a department, office or minister of a government acting in that capacity; or
- (c) a commission, delegate, instrumentality, agency, board, or other governmental, semi-governmental, judicial, administrative, monetary or fiscal authority, whether statutory or not, and includes any relevant international agency.

Instrument means a unit issued by, and held in the Verra Registry representing the right of an account holder in whose account the unit is recorded to claim the achievement represented by the unit. Such achievement may include, but is not limited to, a GHG emission reduction or removal in an amount of one (1) metric tonne of CO₂ equivalent that has been verified in accordance with the applicable Verra Program Rules.

Intellectual Property Rights means all rights in any patent, copyright, database rights, registered design or other design right, utility model, trade mark (whether registered or not and including any rights in get up or trade dress), brand name, service mark, trade name, eligible layout right, chip topography right and any other rights of a proprietary nature in or to the results of intellectual activity in the industrial, commercial, scientific, literary or artistic fields, whether registrable or not and wherever existing in the world, including all renewals, extensions and revivals of, and all rights to apply for, any of the foregoing rights owned, used, or intended to be used, by a party whether or not registered, registrable or patentable.

Interest Rate means, for any date, the per annum rate of interest equal to the prime lending rate published in The Wall Street Journal on such day (or if not published on such day, on the most recent preceding day on which published), plus two percent (2%).

Principal means a third party who owns Instruments or wishes to utilise the Verra Registry services and who has appointed an Agent to act on its behalf for the purposes of using the Verra Registry services.

Privacy Policy means the Verra Registry Privacy Policy available on the Verra Registry website, as amended from time to time.

Program Rules and Requirements means those rules and requirements adopted by Verra and set forth in the relevant Verra Program Rules and Requirements, Verra's formal guidance documents, and any additional direction provided by Verra as part of its implementation of the relevant Verra Program.

Program Sub-Account means a sub-account in a User's Verra Registry Account for the holding of Instruments related to a specific Verra Program.

Program User Guidelines means any user guidelines adopted for a Verra Program.

Scheme Instrument means a credit issued by a Scheme Regulator for a greenhouse gas (GHG) reduction or GHG removal enhancement of one metric ton of carbon dioxide equivalent, pursuant to the Scheme Regulations, including but not limited to an ARB Offset Credit.

Scheme Regulations means the regulations adopted by a Scheme Regulator for a national or sub-national emissions trading or offsets scheme, including any offset protocols adopted by the Scheme Regulator and which may be amended from time to time.

Verra Bank Account means the bank account nominated by Verra from time to time for the payment of fees by the User.

Verra Program means the following programs and standards managed by Verra:

- (a) the Verified Carbon Standard (VCS) Program;
- (b) VCS Jurisdictional and Nested REDD+ (JNR) Framework;
- (c) Climate, Community and Biodiversity (CCB) Program;
- (d) Verra California Offset Project Registry (OPR);
- (e) Sustainable Development Verified Impact Standard (SD VISTa)
- (f) LandScale;
- (g) Initiative for Climate Action Transparency (ICAT); and

any other sustainable development and /or climate action program or standard administered by Verra from time to time.

Verra Registry Account means an account held by the User in the Verra Registry in accordance with the procedures set out by Verra including any Program User Guidelines.

Verra Registry Software Provider means APX.

ABOUT VERRA

Verra supports climate action and sustainable development through the development and management of standards, tools and programs that credibly, transparently and robustly assess environmental and social impacts, and drive funding for sustaining and scaling up these benefits. As a mission-driven, non-profit (NGO) organization, Verra works in any arena where we see a need for clear standards, a role for market-driven mechanisms and an opportunity to achieve environmental and social good.

Verra manages a number of global standards frameworks designed to drive finance towards activities that mitigate climate change and promote sustainable development, including the [Verified Carbon Standard \(VCS\) Program](#) and its [Jurisdictional and Nested REDD+ framework \(JNR\)](#), the [Verra California Offset Project Registry \(OPR\)](#), the [Climate, Community & Biodiversity \(CCB\) Standards](#) and the [Sustainable Development Verified Impact Standard \(SD VISta\)](#). Verra is also developing new standards frameworks, including [LandScale](#), which will promote and measure sustainability outcomes across landscapes. Finally, Verra is one of the implementing partners of the [Initiative for Climate Action Transparency \(ICAT\)](#), which helps countries assess the impacts of their climate actions and supports greater transparency, effectiveness, trust and ambition in climate policies worldwide.

1 INTRODUCTION

The methodology approval process is the process by which new methodologies, methodology revisions, modules and tools (referred to in this document as “methodologies”) are approved under the VCS Program. The process consists of two main steps. First, the methodology developer submits a methodology concept note for evaluation and acceptance by Verra. Second, following Verra acceptance of the methodological concept (“concept”), the methodology developer drafts the full methodology and submits it for assessment and approval. Such methodologies are subject to an in-depth review by Verra, a public stakeholder consultation hosted on the Verra website and an independent assessment by one validation/verification body, before final approval by Verra.

The methodology approval process is outlined at a high level in the *VCS Program Guide* and the purpose of this document is to provide detailed requirements and practical guidance on the process. The document lays out the steps involved in the methodology approval process and then provides further requirements and guidance for specific elements that are subject to the process. This document is intended for use by methodology developers (“developers”), project proponents, validation/verification bodies and any other parties who use the methodology approval process.

This document will be updated from time-to-time and readers shall ensure that they are using the most current version of the document.

2 SCOPE AND COST OF THE METHODOLOGY APPROVAL PROCESS

2.1 Scope of the Methodology Approval Process

The following are subject to the methodology approval process:

- 1) New methodologies.
- 2) Methodology revisions.
- 3) New modules and tools.
- 4) Module and tool revisions.

2.2 Methodology Approval Process

New methodologies, new methodology modules and tools, and methodology revisions are approved through the process set out in Section 4 below, which consists of an in-depth review by Verra, a public stakeholder consultation, an independent assessment by one validation/verification body and final review and approval by Verra.

Verra may pilot alternative processes for approving methodologies where it is deemed that an alternative approach may be more efficient, and equally robust. In such instances, Verra will define and transparently document the alternative process.

2.3 Cost of the Methodology Approval Process

The cost of the methodology approval process consists of two separate administration fees and the cost of contracting the validation/verification body to undertake assessment of the methodology. All costs are borne by the developer.

Specifically, an application fee is payable upon submission of a methodology concept note, as set out in Section 3.3. Following Verra acceptance of the concept, a processing fee is payable upon submission of the full methodology, as set out in Section 4.3. The administration fee rates are set out in the VCS Program document *Program Fee Schedule*.

In addition, validation/verification bodies charge for undertaking assessment of the methodology. Their rates are primarily dependent on the scope and complexity of the methodology. Developers are encouraged to contact several validation/verification bodies to determine their cost and service options.

Financial compensation is available to developers of new methodologies, the details and conditions of which are set out in the *VCS Program Guide*.

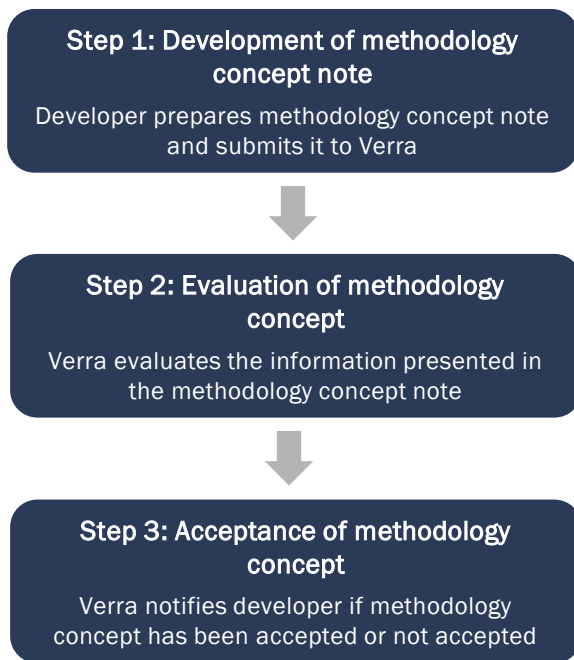

The time taken to complete the methodology approval process is largely dependent upon the initial quality of the methodology and the length of time taken by the validation/verification body to complete its assessment.

3 METHODOLOGY CONCEPT ACCEPTANCE

3.1 Overview

Diagram 1 summarizes the methodology concept acceptance process, which is further described in the sections that follow.

Diagram 1: Steps in the Methodology Concept Acceptance Process

3.2 Step 1: Development of Methodology Concept Note

- 3.2.1 The developer prepares the methodology concept note that will be subject to evaluation by Verra. The methodology concept note shall be prepared using the VCS Methodology Concept Note Template and written in a clear and concise manner. All instructions in the template shall be followed.
- 3.2.2 A methodology concept note shall be developed and submitted for new methodologies, modules and tools, as well as substantive methodology revisions. Minor methodology revisions shall be handled according to the procedure set out in Section 7.

3.3 Step 2: Evaluation of Methodology Concept

3.3.1 The developer shall submit the methodology concept note to Verra electronically at secretariat@verra.org. Upon submission, Verra invoices the developer for the methodology concept note application fee, the fee rate of which is set out in the VCS Program document *Program Fee Schedule*. The methodology concept note application fee shall be paid by the developer before Verra begins evaluation of the concept.

Note – Where a concept includes a group of methodology elements (e.g., a new methodology with associated modules), the concept will be handled as a single unit of work.

3.3.2 Verra evaluates the concept to determine whether:

- 1) The project activities covered by the concept are not covered by an existing methodology.
- 2) The concept is broadly applicable (i.e., not for a specific technology or process).
- 3) An overview of key methodological approaches is provided, and in particular the method for emission reduction quantification has been well thought through.
- 4) The methodology will be developed by an appropriately experienced team, and sufficient funding is in place to ensure that the methodology approval process can be completed.

3.3.3 Preference will be given to methodology concepts that include one or more of the following:

- 1) An innovative approach to demonstrating additionality or quantifying emission reductions or removals (e.g., the methodology concept uses a standardized method, modeling and/or approaches that simplify monitoring).
- 2) Demonstration that the concept has the potential for significant environmental impact (e.g., projects applying the methodology could generate more than 1 million tonnes of GHG emission reductions and/or removals during a 10-year period).
- 3) Demonstration that the concept is applicable to a sector or region that is underrepresented in the carbon markets.
- 4) Demonstration that proposed projects are awaiting the development and approval of the methodology.

3.4 Step 3: Acceptance of Methodology Concept

3.4.1 Verra will complete its initial evaluation of the concept within 25 business days of submission, and will submit questions or comments to the developer, as appropriate, where additional information is required for Verra to complete its evaluation.

Once Verra has sufficient information to complete its evaluation of the concept note, Verra will notify the developer of one of the following outcomes:

- 1) The concept has been accepted.
- 2) Revisions are required to the concept before it can be accepted.
- 3) The concept has not been accepted.

3.4.2 Where the concept is accepted, the developer drafts the full methodology and may submit it for approval following the procedure set out in Section 4.

3.4.3 Where revisions are required to the concept, Verra will specify the criteria that have not been met. The developer may then revise and resubmit the concept note for Verra to continue its evaluation.

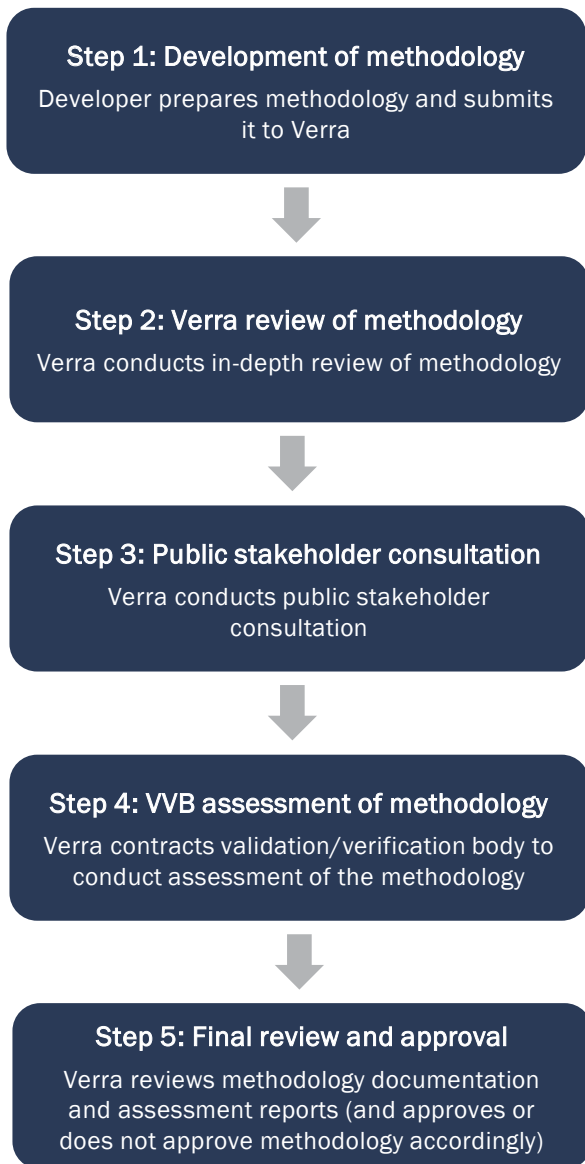

3.4.4 Where the methodology concept is not accepted, the concept note may be resubmitted if substantial revisions are undertaken. Resubmission of such concept notes shall be treated as original submissions and require payment of an application fee.

4 METHODOLOGY APPROVAL PROCESS

4.1 Overview

Diagram 2 summarizes the methodology approval process, which is further described in the sections that follow.

Diagram 2: Steps in the Methodology Approval Process

Attachment: WLC Responses to Appeal_9JUNE2020_Part 2 (4074 : World Logistics Center)

4.2 Step 1: Development of Methodology

- 4.2.1 The developer prepares the methodology documentation that will be subject to review by Verra, public stakeholder consultation and independent assessment by one validation/verification body.
- 4.2.2 The methodology documentation shall be prepared in accordance with all the applicable VCS rules. Methodology documentation shall be written in a clear, logical, concise and precise manner, to aid readability and ensure that criteria and procedures set out in the methodology can be applied consistently by intended users. In addition, the methodology documentation should apply the guidance on language and terminology set out in the *Validation and Verification Manual*.

Methodologies and methodology revisions shall be prepared using the *VCS Methodology Template* and modules and tools shall be prepared using the *VCS Module Template*. All instructions in the templates must be followed. The methodology documentation shall state clearly the date on which it was issued and its version number.

Note – The entity acting as developer may change during the course of taking a methodology through the methodology approval process, provided that any necessary authorization is secured from the original developer, Verra is notified and the new entity submits to Verra a signed methodology approval process submission form (see Section 4.3).

4.3 Step 2: Verra Review of Methodology

- 4.3.1 The developer shall submit to Verra a signed methodology approval process submission form (available on the Verra website) and the methodology documentation. Upon submission, Verra invoices the developer for the methodology processing fee, the fee rate of which is set out in the VCS Program document *Program Fee Schedule*. The methodology processing fee shall be paid by the developer before Verra begins its review of the methodology documentation.
- 4.3.2 Verra conducts a review of the methodology documentation to ensure that the methodology is of sufficient quality to enable its assessment under the VCS methodology approval process, and to ensure that the methodology documentation has been completed in accordance with VCS Program rules. Verra’s review of the methodology will focus on ensuring that the methodology is well-structured and clearly written, there is logical and technical consistency within the methodology and there are no major inconsistencies with VCS Program rules and requirements.

Note – Methodology developers must take the time to ensure that methodology documentation is professionally written, structured and formatted. Verra will not post methodology documentation for public comment until it is of acceptable quality (e.g., is free from typos and grammatical errors). Verra may contract, at its own expense, an external expert where Verra staff do not have sufficient technical expertise to review all technical aspects of the methodology or where Verra deems that an external expert would add value to the Verra review

of the methodology. Where it is deemed necessary, the developer shall revise the methodology documentation before it is accepted into the methodology approval process.

- 4.3.3 Where the Verra review of the methodology reveals that it is not yet of the requisite standard or would sanction politically or ethically contentious project activities, or may otherwise impact the integrity of the VCS Program or the functioning of the broader carbon market, Verra reserves the right not to accept the methodology into the methodology approval process.

4.4 Step 3: Public Stakeholder Consultation

- 4.4.1 Verra posts the methodology documentation on the Verra website for a period of 30 days, for the purpose of inviting public comment. As part of the consultation process, Verra may also host a presentation of the methodology. Any comments shall be submitted to Verra at secretariat@verra.org and respondents shall provide their name, organization, country and email address.
- 4.4.2 At the end of the public comment period, Verra provides all and any comments received to the developer. The developer shall take due account of such comments, which means it will need to either update the methodology or demonstrate the insignificance or irrelevance of the comment. It shall demonstrate to the validation/verification body what action it has taken.
- 4.4.3 All and any comments received are posted by Verra on the Verra website, alongside the methodology information.

4.5 Step 4: VVB Assessment of Methodology

- 4.5.1 Verra will send a request for proposals (RFP) to all validation/verification bodies which meet the relevant eligibility criteria to conduct the methodology assessment (set out in Section 5.1 below). Upon receipt of any proposals, Verra will narrow the pool of eligible validation/verification bodies based on those with the most relevant expertise and experience. Verra will forward the remaining proposals to the methodology developer, and the methodology developer may make a selection amongst the eligible pool of validation/verification bodies provided by Verra. Verra contracts the validation/verification body selected by the methodology developer, using its standard agreement. The developer pays the validation/verification body directly, as provided for in the contract between Verra and the validation/verification body and the methodology approval process submission form.
- 4.5.2 The validation/verification body shall not begin their assessment until the Verra review is complete and shall issue the assessment report only after the public stakeholder consultation period has ended.
- 4.5.3 The developer shall respond to all and any of the validation/verification body's findings. As a result of any such findings, the developer may need to amend the methodology documentation.

- 4.5.4 The validation/verification body shall produce an assessment report in accordance with the VCS Program rules and best practice. The assessment report shall be prepared using the *VCS Methodology Assessment Report Template*. The assessment report shall address the scope of assessment applicable to the methodology (see Sections 6.1, 7.2 and 8.1 for methodologies, methodology revisions and modules/tools respectively). In addition, the assessment report shall contain the following:
- 1) An explanation of whether and how the developer has taken due account of all comments received during the public stakeholder consultation (see Step 3 above).
 - 2) A summary of all methods, criteria and processes used to determine whether and how the methodology adheres to VCS Program rules and requirements. For example, the assessment process may include background research, document reviews, interviews and site visits.
 - 3) A list of the members on the assessment team, including their role and a summary description of the qualifications of each member of the team indicating their expertise and experience in the sectoral scope(s) relevant to the methodology. Where applicable, the name of the VCS-approved expert and his/her role in the assessment shall also be stated.
 - 4) A description of all and any of the validation/verification body's findings and the developer's response to them.
 - 5) An assessment statement prepared in accordance with the requirements for validation statements set out in the VCS Standard, *mutatis mutandis*. Such statement shall also state the version number of the methodology documentation upon which the statement is based.
 - 6) Evidence of fulfillment of eligibility requirements for validation/verification bodies, as set out in Section 5.2.

4.6 Step 5: Final Review and Approval

- 4.6.1 The developer shall provide Verra with the most recent methodology documentation, the assessment report produced by the validation/verification body and a signed *Methodology Element Approval Request Form*.
- 4.6.2 Verra reviews the most recent methodology documentation and the assessment report produced by the validation/verification body to ensure the methodology has been assessed in accordance with VCS Program rules. Where the review finds that the methodology has not been assessed in accordance with VCS Program rules, it will require the developer to revise the methodology documentation, involving the validation/verification body, as required. Where necessary, the validation/verification body shall revise the assessment report. Verra may withhold the acceptance of the assessment report until all findings from Verra's review have been satisfactorily addressed. Verra may also make revisions to the methodology where it deems necessary.

- 4.6.3 Where Verra approves the methodology, it notifies the developer and the validation/verification body of same. The approved methodology is assigned a reference number and posted with the assessment report on the Verra website. The methodology can then be used by project proponents to develop projects.
- 4.6.4 Where the assessment report does not approve the methodology and attempts to resolve the situation in accordance with Section 4.6.2 have been unsuccessful, it is not approved by Verra. Verra may also withhold approval where it is not satisfied with the quality of the methodology documentation, the assessment report, or where it deems that the methodology does not comply with the VCS Program rules or would sanction politically or ethically contentious project activities, or may otherwise impact the integrity of the VCS Program or the functioning of the broader carbon market.

Note – The validation/verification body shall be responsible for reviewing any minor modifications, edits or clarifications that need to be made to the methodology within two years of its approval. The process for such updates is set out in Section 9.

4.7 Procedure for Clarification and Facilitation by Verra

- 4.7.1 The developer and/or the validation/verification body may request that Verra provides clarification with respect to unresolved findings or the VCS Program rules. Verra consults all necessary parties before providing any clarification and notifies the developer as well as the validation/verification body when such clarification is provided.

4.8 Inactive Methodologies

- 4.8.1 Where a methodology under the methodology approval process does not progress to the subsequent step of the process within 12 months or where the developer chooses to withdraw the methodology from consideration under the methodology approval process, Verra updates the status of the methodology on the Verra website to *inactive*. However, recognizing that certain complex methodologies under the methodology approval process may require more time for assessment, Verra will not update the status of a methodology to *inactive* where a methodology is under ongoing assessment or where the developer notifies Verra that it is still pursuing the methodology under the approval process. The developer may reactivate the methodology at any time by notifying Verra.

5 ELIGIBILITY REQUIREMENTS FOR VALIDATION/VERIFICATION BODIES

5.1 Eligibility Requirements

- 5.1.1 The eligibility requirements for validation/verification bodies are set out in Table 1 below. Recognizing that the approval of methodologies has implications for more than a single project, the eligibility requirements ensure that the appropriate level of expertise and experience is applied in the methodology approval process. Table 1 also states (third column) for which of the applicable eligibility requirements the validation/verification body shall submit evidence of its fulfillment of same. The specific requirements regarding evidence of fulfillment of applicable eligibility requirements are outlined in Section 5.2.

Note – The eligibility requirements for validation/verification bodies set out in Table 1 are in addition to the requirements for competence set out in the VCS Standard.

Table 1: Eligibility Requirements for Validation/Verification Bodies

Methodology	Eligibility Requirements	Evidence Required?
Non-AFOLU methodologies	1) The validation/verification body shall be eligible under the VCS Program to perform validation for the applicable sectoral scope(s). Where there is more than one sectoral scope applicable to the methodology, the validation/verification body shall be eligible for all relevant sectoral scopes for validation; AND	N
	2) The validation/verification body shall have completed at least ten project validations or methodology assessments under the methodology approval process in the sectoral scope group applicable to the methodology. ¹ Project validations can be under the VCS Program or an approved GHG program and projects shall be registered under the applicable program. A validation of a single project under more than one program (e.g., VCS and CDM) counts as one project validation. Methodology assessments shall be for methodologies that have been approved by Verra.	Y
AFOLU methodologies	1) The validation/verification body shall be eligible under the VCS Program to perform validation for sectoral scope 14 ² (AFOLU); AND	N
	2) For non-ARR methodologies, the validation/verification body shall use an AFOLU expert (see Section 10) in the assessment; AND	Y
	3) The validation/verification body shall have completed at least ten project validations in any sectoral scope. Project validations can be under the VCS Program or an approved GHG program and projects shall be registered under the applicable program. A validation of a single project under more than one program (e.g., VCS and CDM) counts as one project validation.	Y
Methodologies using a standardized method	In addition to the above, the validation/verification body shall use a standardized methods expert (see Section 10) in the assessment.	Y

¹ The sectoral scope groups shall be determined in accordance with the ANSI project level groups to which the VCS sectoral scopes are mapped. The mapping of ANSI project level groups to VCS sectoral scopes is available on the Verra website. Where the methodology has more than one applicable sectoral scope and such scopes fall under more than one sectoral scope group, the validation/verification body must have validated at least ten projects or methodologies in each of the relevant sectoral scope groups.

² Or the approved GHG program equivalent to VCS Program sectoral scope 14, where the validation/verification body is accredited under an approved GHG program and the sectoral scopes under the approved GHG Program are not directly equivalent to the VCS Program numbering system for sectoral scopes.

- 5.1.2 In the unlikely event of there being no validation/verification bodies that meet the eligibility requirements set out in Table 1, the developer shall contact Verra, who will work with the developer to choose an appropriately qualified validation/verification body.

5.2 Evidence of Fulfilment of Requirements

- 5.2.1 The validation/verification body shall submit evidence of its fulfillment of eligibility requirements where indicated in the third column of Table 1. Such evidence shall be provided in the validation/verification body's assessment report of the methodology and shall be as follows:
- 1) Where the validation/verification body is required to have undertaken a certain number of project validations or methodology assessments, a summary of such work shall include the following:
 - a) For project validations, the name of the project, the date that the validation report was issued, the date that the project was registered and the name of the GHG program under which the project was registered.
 - b) For methodology assessments, the name of the methodology and the date that the assessment report was issued.
 - 2) Where the validation/verification body is required to use an AFOLU expert or a standardized methods expert, the assessment report shall state the name of the expert and their role in the assessment.

6 NEW METHODOLOGIES

6.1 Scope of Assessment

- 6.1.1 The validation/verification body shall determine whether the proposed methodology complies with the requirements set out in the VCS Program document *VCS Methodology Requirements* and any other applicable requirements set out under the VCS Program.
- 6.1.2 Validation/verification bodies shall adhere to the instructional text in the *Methodology Element Assessment Report Template* and refer to the guidance in the *Validation and Verification Manual* when completing the methodology assessment report.
- 6.1.3 The scope of assessment shall include (at a minimum) the following, and the assessment report shall provide an explanation of whether and how the methodology addresses these:
- 1) Relationship to approved or pending methodologies: Assessment of whether any existing methodology could reasonably be revised to meet the objective of the proposed methodology, determined in accordance with Section 6.2.
 - 2) Stakeholder consultation: Assessment of whether the developer has taken due account of all stakeholder comments.
 - 3) Structure and clarity of methodology: Assessment of whether the methodology is written in a clear, logical, concise and precise manner.
 - 4) Definitions: Assessment of whether the key terms in the methodology are defined clearly and appropriately, and are consistently used in the methodology.
 - 5) Applicability conditions: Assessment of whether the proposed methodology's applicability conditions are appropriate, adequate and in compliance with the VCS Program rules.
 - 6) Project boundary: Assessment of whether an appropriate and adequate approach is provided for the definition of the project's physical boundary and sources and types of GHGs included.
 - 7) Baseline scenario: Assessment of whether the approach for determining the baseline scenario is appropriate, adequate and in compliance with the VCS Program rules.
 - 8) Additionality: Assessment of whether the approach/tools for determining whether the project is additional are appropriate, adequate and in compliance with the VCS Program rules.
 - 9) Baseline emissions: Assessment of whether the approach for calculating baseline emissions is appropriate, adequate and in compliance with the VCS Program rules.
 - 10) Project emissions: Assessment of whether the approach for calculating project emissions is appropriate, adequate and in compliance with the VCS Program rules.

- 11) Leakage: Assessment of whether the approach for calculating leakage is appropriate, adequate and in compliance with the VCS Program rules.
- 12) Net GHG emission reductions and/or removals: Assessment of whether the approach for calculating the net GHG benefit of the project is appropriate, adequate and in compliance with the VCS Program rules.
- 13) Monitoring: Assessment of whether the monitoring approach is appropriate, adequate and in compliance with the VCS Program rules.
- 14) Data and parameters: Assessment of whether the specification for data and parameters (available at validation, and monitored) is appropriate, adequate and in compliance with the VCS Program rules.

6.1.4 Where the proposed methodology references tools or modules approved under the VCS Program or an approved GHG program, the validation/verification body shall determine whether the tool or module is used appropriately within the methodology. Reassessment of the actual tool or module is not required.

6.2 Relationship to Approved or Pending Methodologies

6.2.1 In order to safeguard against the unnecessary proliferation of methodologies, methodology developers are required to demonstrate that no approved or pending methodology under the VCS Program or an approved GHG program could reasonably be revised to meet the objective of the proposed methodology. Methodology revisions are appropriate where a proposed activity or measure is broadly similar to an activity or measure covered by an existing approved methodology such that the proposed activity or measure can be included through reasonable changes to that methodology. The procedure for demonstration and assessment that no existing methodology could reasonably be revised to meet the objective of the proposed methodology is as follows:

- 1) The methodology developer shall list the approved or pending methodologies, under the VCS Program or an approved GHG program, that fall under the same sectoral scope or same AFOLU project category³ or combination of sectoral scopes or AFOLU project categories, as applicable. The list shall include, at a minimum, all such methodologies that are available sixty days before the proposed methodology is submitted to Verra. Such list of methodologies (“listed methodologies”) shall contain the methodology name and reference number, and the GHG program under which it is approved or pending.
- 2) The methodology developer shall state whether, and explain how, the proposed methodology uses, includes, refers to or relies upon all or part of any of the listed methodologies. Where it does, the methodology developer shall demonstrate that none of the identified methodologies (“similar methodologies”) could have been reasonably revised

³ The current AFOLU project categories are ARR, ALM, IFM, ACoGS, WRC and REDD.

(i.e., developed as a methodology revision) to meet the objective of the proposed methodology. The onus is upon the methodology developer to demonstrate that a methodology revision would not have been more appropriate, failing which the proposed methodology shall not receive a positive assessment from the validation/verification body. Examples that sufficiently demonstrate the requirement for a new methodology include, but are not limited to, the following:

- a) The proposed methodology uses an approach to setting the baseline and assessing additionality that is different to any of the similar methodologies (e.g., the similar methodologies use a project method for additionality, whereas the proposed methodology uses a performance method).
- b) The proposed methodology uses, includes, refers to or relies upon all or part of a number of the similar methodologies, such that it would have been problematic to revise any particular one of the similar methodologies.
- c) The proposed methodology uses a modular approach to provide a more flexible methodology with wider applicability than any of the similar methodologies.
- d) The proposed methodology draws upon the similar methodologies to provide a simplified methodology for micro-scale projects.
- e) None of the similar methodologies could be revised without substantial changes to the sections on project boundary or procedure for determining the baseline scenario.
- f) None of the similar methodologies could be revised without the addition of new procedures or scenarios to more than half of its sections.

6.2.2 The methodology developer shall document the above in the relevant section of the methodology document, such document being subject to review by Verra, public consultation and independent assessment by the validation/verification body. Where Verra or the validation/verification body is unable to conclude that any approved or pending methodology under the VCS Program or an approved program could not have been reasonably revised to meet the objective of the proposed methodology, in accordance with the procedure set out above, it shall not grant the methodology a positive assessment.

6.3 Proposals for Methodologies Currently Excluded under the Scope of the VCS Program

- 6.3.1 The scope of the VCS Program is revised from time to time, such as with the inclusion of AFOLU into the program in November 2008 and ozone-depleting substances in January 2010. As part of the process of revising the scope of the VCS Program, it is useful for Verra to have a view of possible methodologies and projects that might be eligible under such revisions. Where developers would like to prepare methodologies that currently fall outside of the scope of the VCS Program and have them assessed by a validation/verification body, they are encouraged to contact Verra and to follow the requirements in this document if continuing with such methodology development and assessment.

7 METHODOLOGY REVISIONS

Methodology revisions shall be prepared using the *VCS Methodology Template*. The VCS Program distinguishes between three types of revisions based on the extent of the revisions and between revisions to VCS methodologies and revisions to approved GHG program methodologies. The requirements for each are set out in the sections below.

7.1 Types of Methodology Revisions

- 7.1.1 Verra determines on a case-by-case basis whether a methodology revision is substantive, minor, or represents a limited modification, edit or clarification, based on the extent and type of changes proposed.
- 7.1.2 Where the methodology requires revision (substantive or minor), the methodology shall be revised and approved via the methodology approval process set out in Sections 3 and 4 above.
- 7.1.3 For minor revisions the following applies:
 - 1) A description shall be developed and submitted using the *VCS Minor Methodology Revision Description Template*. All instructions in the template shall be followed. Upon submission, Verra invoices the developer for the methodology application fee, the rate of which is set out in the VCS Program document *Program Fee Schedule*.
 - 2) Verra will evaluate the description to determine whether the proposed revision meets the conditions for minor revisions.
 - 3) Where Verra determines that the proposed revision is substantive, the developer may submit a methodology concept note following the procedure set out in Section 3 and is subject to the appropriate application fee (in addition to the application fee paid upon the original submission).
- 7.1.4 For limited modifications, edits or clarifications to the methodology, the methodology may be updated via a process whereby Verra makes the required changes or coordinates with the developer to make the changes, and issues a revision (i.e., new version) of the methodology.

7.2 Scope of Assessment

The scope of assessment for methodology revisions shall be the same as for new methodologies (see Section 6.1), though excluding assessment of relationship to approved or pending methodologies.

7.3 Revisions to VCS Methodologies

A revision to a VCS methodology is handled as an update to the prevailing version of the methodology and the following applies:

- 1) The methodology revision shall not narrow the methodology's applicability or in any other way exclude project activities that are eligible under the prevailing version of the methodology, unless such narrowing or exclusion is authorized by Verra.
- 2) The methodology document of the prevailing version of the methodology shall be edited to incorporate the methodology revision. The Word version of the prevailing methodology document may be requested from Verra. Where the prevailing version of the methodology does not use the *VCS Methodology Template*, the methodology shall be transferred into the template.
- 3) Where the methodology revision is approved by Verra, the prevailing version of the methodology is withdrawn and the revised methodology replaces it. The previous version of the methodology may be used for up to six months from the date it was withdrawn.

7.4 Revisions to Approved GHG Program Methodologies

A revision to an approved GHG program methodology creates a parallel, revised methodology and the following applies:

- 1) The methodology revision shall reference the (underlying) methodology that it is revising, including the methodology name, version number, issue date and approved GHG program. The methodology revision shall require the use of the latest version of such methodology, such that the methodology revision keeps pace with developments that may occur in the underlying methodology.
- 2) The methodology revision shall use the *VCS Methodology Template*. The rationale for developing the methodology revision shall be clearly stated. Where sections of the underlying methodology are not altered, this shall be stated in the relevant section of the methodology revision document.
- 3) Where a methodology revision has been approved by Verra and a new version of the underlying methodology is issued such that the integrity of the methodology revision is affected and it no longer meets with VCS Program requirements, projects will not be able to use the methodology revision (as set out in the validation and verification section of the *VCS Standard*). The methodology revision may be updated and approved via the methodology approval process.

Note – Methodology deviations and monitoring plan deviations do not require the project proponent to prepare new methodology documentation and are not managed via the methodology approval process. Instead, the validation/verification body validates the deviation as part of the project validation or verification process (as applicable) in accordance with the VCS Standard.

8 NEW MODULES AND TOOLS

8.1 Scope of Assessment

- 8.1.1 New modules and tools shall be assessed against the aspects of the assessment scope for new methodologies set out in Section 6.1 that are relevant to the specific module or tool.
- 8.1.2 The assessment of a revision to a module does not require the reassessment of all methodology framework documents which reference it, though the assessment shall determine whether the revised module is appropriate for the methodologies and that all methodologies maintain their overall integrity. Likewise, the assessment of a revision to a tool shall ensure that the integrity of methodologies that use the tool is not adversely impacted.

9 REVIEW OF APPROVED VCS METHODOLOGIES

On occasion, Verra may review methodologies approved under the VCS Program to ensure that they continue to reflect best practice and scientific consensus. This includes ensuring that methodologies approved under the program are consistent with any new requirements issued by Verra and that methodologies have appropriate criteria and procedures for addressing all VCS Program rules and requirements.

As a result of a review, Verra may need to put on hold the prevailing versions of methodologies or permanently withdraw methodologies approved under the VCS Program. Relevant stakeholders will be kept informed during the review process. The procedure for reviews is set out in the sections below. Note that these procedures are applicable to all types of methodologies and a module may be put on hold or withdrawn without the parent methodology being put on hold. The statuses of all methodologies are available on the Verra website.

9.1 Trigger for Review

9.1.1 A review of a methodology may be triggered as a result of the following:

- 1) Verra periodically issues new requirements that reflect the on-going development of the program, best practice and/or emerging scientific consensus with respect to projects and methodologies. On occasion, methodologies may become materially inconsistent with new requirements subsequently issued (e.g., the inconsistency could lead to a material difference in the quantification of GHG emission reductions or removals by projects applying the methodology).
- 2) Verra may periodically review methodologies where there are concerns that they do not reflect best practice or scientific consensus, or they are materially inconsistent with VCS requirements. Such reviews may be triggered by general scientific or technical developments in the sector or specific concerns about a methodology that are brought to Verra's attention.
- 3) Verra sanctions the consolidation of a number of methodologies into one single methodology (requiring the withdrawal of the original methodologies).

9.2 Procedure for Review

- 9.2.1 The review of the methodology and any relevant issue that triggered the review is undertaken by Verra, with input sought from the developer, the validation/verification body(s) that initially assessed the methodology and appropriately qualified external experts, as required.
- 9.2.2 Where the review is triggered by new requirements being issued by Verra, Verra undertakes the review of approved VCS methodologies within 60 days of the new requirements being issued.

9.3 Outcome of Review

- 9.3.1 Where the review determines that the methodology meets all VCS Program rules and requirements and reflects best practice and scientific consensus, no further action is required.
- 9.3.2 Where the review determines that the methodology requires limited modifications, edits or clarifications, Verra coordinates with the developer to update the methodology documentation, in accordance with procedure set out in Section 7.1.4. Verra may require the validation/verification body that initially assessed the methodology to review and approve the updates via email. Likewise, Verra may seek input from appropriately qualified external experts.
- 9.3.3 Where the review determines that the methodology requires substantive revision, the methodology is put on hold. Where the developer or another entity would like to have the methodology reissued, the methodology shall be revised and approved via the methodology approval process set out in Section 4 (though the methodology shall be exempt from the submission of a methodology concept note and corresponding application fee, processing fee and the public stakeholder consultation). Verra may seek input from appropriate qualified external experts prior to approving the new version of the methodology.
- 9.3.4 Where the review determines that the methodology is fundamentally flawed, the methodology is withdrawn (or in certain circumstances put on hold pending further investigation). The withdrawal of a methodology is considered permanent.
- 9.3.5 Where the review determines that the methodology needs to be withdrawn due to consolidation of a number of methodologies, the methodology is withdrawn. The withdrawal of the methodology is considered permanent.

9.4 Grace Periods

- 9.4.1 Versions of methodologies put on hold or withdrawn may be used for the grace period set out for the methodology on the Verra website, provided the project has been listed on the VCS project pipeline on the Verra project database by the date the methodology is put on hold or withdrawn. Projects shall have their validation reports issued before the end of the grace period. Beyond such date, projects may only use any new approved version of the methodology. Grace periods are determined by Verra using the following guidelines:

- 1) Where the methodology only requires limited modifications, edits or clarifications (consistent with Section 9.3.2), the prevailing version of the methodology is considered withdrawn when the updated version of the methodology is issued and the prevailing version of the methodology may be used for up to six months from the date it was withdrawn. Where the continued use of the prevailing version of the methodology is not appropriate (e.g., a typo in an equation could lead to material misstatement in the estimation of GHG emission reductions or removals), no grace period is granted for the use of the prevailing version of the methodology.
 - 2) Where the methodology requires substantive revision (consistent with Section 9.3.3), or is withdrawn or put on hold due to fundamental flaws (consistent with Section 9.3.4), the following applies:
 - a) The prevailing version may be used for up to six months after it was put on hold.
 - b) Where the prevailing version of the methodology impacts the integrity of the VCS Program or the functioning of the broader carbon market, no grace period is granted (to any projects), subject to approval from the Verra Board.
 - 3) Where the methodology is withdrawn due to consolidation of methodologies in accordance with Section 9.3.5, the withdrawn methodology may be used for up to twelve months after the date of withdrawal.
- 9.4.2 Methodologies being developed under the methodology approval process do not have to comply (immediately) with new requirements where the assessment report has been submitted to Verra in accordance with the VCS Program rules before the time Verra issues such new requirements. However, such methodologies, where finally approved by Verra, are valid for six months from the date that the new requirements were issued by Verra (i.e., any projects shall have their validation report issued within such time periods). After such time period, projects cannot use the methodology and it is considered put on hold or withdrawn, as determined by Verra.
- 9.4.3 Notwithstanding the above, methodologies being developed under the methodology approval process shall be required, subject to Verra Board approval, to comply (immediately) with new requirements where a failure to do so would impact the integrity of the VCS Program or the functioning of the broader carbon market.

10 USE OF EXPERTS IN THE ASSESSMENT OF METHODOLOGIES

10.1 Purpose of Expert

10.1.1 Recognizing that there is currently limited experience and expertise within the broader validation/verification body community regarding the assessment of certain methodologies and the precedent that is set by new methodologies approved under the VCS Program, an expert shall be used in the assessment of the following:

- 1) Non-ARR AFOLU methodologies (see Table 1).
- 2) Methodologies that use a standardized method.

10.1.2 The process for use and designation of experts shall operate as set out in Sections 10.2 and 10.3. The requirement and necessity for validation/verification bodies to use an expert shall be revisited by Verra as and when it has been demonstrated that the validation/verification body community has developed sufficient experience and expertise in assessing the relevant types of methodologies.

10.2 Use of Expert

10.2.2 As set out in Section 5.1, a validation/verification body conducting an assessment of an AFOLU methodology or a methodology that uses a standardized method may need to use an expert in the assessment, and the following applies:

- 1) Experts shall be approved by Verra in accordance with the procedure set out in Section 10.3.
- 2) AFOLU experts shall be approved for the AFOLU project category relevant to the methodology.
- 3) Standardized method experts have the authority to assert their expert judgment in relation to the appropriateness of the proposed level(s) of the performance benchmark metric in ensuring environmental integrity and provision of sufficient financial incentive to potential projects, and therefore to require the methodology to use a level it deems appropriate.

10.2.3 The expert can be part of the validation team or act as technical expert to the validation team. Where the expert is acting as technical expert to the validation team, they shall meet all the requirements of technical experts set out in *ISO 14065:2013* and shall not carry out the assessment alone.

10.2.4 As set out in Section 5.2 the methodology assessment report shall state the name of the expert and its role in the assessment.

10.3 Application Procedure for Experts and List of Experts

10.3.1 The procedure for applying to be an expert is as follows:

- 1) The applicant shall complete the expert application form, available on the Verra website, and submit this together with two references, at least one of which shall be a professional non-academic reference, to Verra at secretariat@verra.org. The applicant shall also pay the expert application fee, the rate of which is set out in the VCS Program document *Program Fee Schedule*.
- 2) The application is assessed by members of an assessment panel and on a quarterly basis. Further information about the assessment panel, process and schedule is available on the Verra website.
- 3) The assessment criteria for AFOLU experts are as follows:
 - a) **AFOLU expertise and experience:** The applicant shall possess significant expertise in the project category. The applicant shall have at least three years of relevant work experience or an equivalent combination of education and work experience as follows:
 - i) Have expertise in assessing carbon baselines, modeling, leakage, and measurement and monitoring frameworks, as they relate to AFOLU methodologies;
 - ii) Have experience in developing AFOLU projects or methodologies or assessing projects or methodologies under the VCS Program or an approved GHG program; and,
 - iii) Be well-versed in current scientific thinking and best practices associated with AFOLU project design and implementation, and carbon accounting and reporting.

Such experience shall be demonstrated and supported with direct work experience, education/training, peer-reviewed journal articles, publications, publicly available reports and/or methodologies developed, applied or assessed.

Based on the above requirements, the following expertise and experience are expected for ALM, IFM, REDD, ACoGS and WRC AFOLU expert applicants:

- i) ALM AFOLU expert applicants shall demonstrate the above AFOLU expertise and experience with respect to agricultural and cropland systems. Applicants shall have knowledge and experience related to farming, fertilization and nutrient cycling.

Applicants shall have experience in quantifying emissions from agricultural systems and from fertilizer application and have experience modeling, measuring and monitoring soil carbon stocks and GHG emissions from agricultural activities and crop systems.

- ii) IFM AFOLU expert applicants shall demonstrate the above AFOLU expertise and experience with respect to plantations, silviculture, agro-forestry, and timber harvesting. Applicants shall have experience in determining baseline scenarios for managed forests and shall demonstrate an understanding of forest stand dynamics. Applicants shall demonstrate experience in modeling timber harvests or forest rotations and shall have experience quantifying carbon stock. Applicants shall have experience in measuring and monitoring forest carbon. Applicants shall understand the dynamics of market leakage with respect to timber production.
- iii) REDD AFOLU expert applicants shall demonstrate the above AFOLU expertise and experience with respect to forests facing threats of deforestation and degradation. Applicants shall have experience in determining the most plausible baseline scenario in either a planned or unplanned deforestation and/or degradation situations. Applicants shall demonstrate an understanding with regard to drivers of deforestation and/or degradation and approaches to modeling deforestation and/or degradation patterns, and be able to apply that knowledge to leakage. Applicants shall demonstrate an understanding of forest stand dynamics. Applicants shall demonstrate experience in measuring and monitoring changes in land use and carbon stock.
- iv) ACoGS AFOLU expert applicants shall demonstrate the above AFOLU expertise and experience with respect to grasslands and shrublands. Applicants shall have experience in establishing the most plausible baseline scenario in either a planned or unplanned land use conversion of forest or non-forest ecosystems. Applicants shall demonstrate an understanding with regard to drivers of land use conversion and approaches to modeling land use conversion, and be able to apply that knowledge to leakage. Applicants shall demonstrate an understanding of grassland and shrubland ecosystem dynamics. Applicants shall have experience modeling, measuring and monitoring soil carbon stocks.
- v) WRC AFOLU expert applicants are expected to demonstrate the above AFOLU expertise and experience with respect to wetland ecosystems. WRC experts many demonstrate wetlands expertise for peatlands only, wetlands excluding peatlands or wetlands including peatlands. WRC expert applicants for non-peatlands shall have knowledge and experience related to wetlands conservation and restoration activities such as enhancing, creating and/or managing hydrological condition, sediment supply, salinity characteristics and water quality. Applicants shall have experience in quantifying, measuring, modeling and monitoring GHG emissions or gas fluxes from wetland ecosystems. WRC AFOLU expert applicants for peatlands

shall have experience establishing the most plausible baseline scenario and quantifying trace gas fluxes from drained and undrained peatland ecosystems. Applicants shall demonstrate experience in measuring and monitoring changes in peat depth and extent as well as changes in site conditions relevant to GHG fluxes and shall demonstrate expertise in hydrological connectivity as it relates to ecological leakage.

- b) AFOLU project category and regional scope: The applicant shall possess appropriate regional experience in the relevant project category. For example, REDD applicants shall possess relevant developing country and tropical forest experience. This is required because it is expected that most REDD methodologies will be applied within such contexts and because of the unique characteristics that must be considered when establishing robust deforestation and degradation baselines in these regions.
 - c) Organizational affiliation and independence: The applicant shall demonstrate independence and freedom from conflict of interest in relation to the methodology assessment process.
- 4) The assessment criteria for standardized methods experts are as follows:
- a) Standardized methods expertise and experience: The applicant shall possess significant expertise in the development and use of standardized methods. The applicant shall have at least three years of relevant work experience or an equivalent combination of education and work experience as follows:
 - i) Have expertise and experience in developing projects or methodologies or assessing projects or methodologies that use standardized methods; and,
 - ii) Be well versed in current scientific thinking and best practices associated with standardized methods and their implementation.

Such experience shall be demonstrated and supported with direct work experience, education/training, peer-reviewed journal articles, publications, publicly available reports and/or methodologies developed, applied or assessed.
 - b) Organizational affiliation and independence: The applicant shall demonstrate independence and freedom from conflict of interest in relation to the methodology assessment process.
- 5) Applicants will be notified of the outcome of the assessment and, where approved, shall be added to the list of experts. The list shall state the name of the expert, the AFOLU project category(s) for which they are approved (for AFOLU experts), and their contact details. The list of experts is available on the Verra website.
- 6) An expert can request to be removed from the list of experts at any time by contacting Verra and requesting same. Verra also reserves the right to remove an expert from the list where it determines that the expert no longer meets the required criteria or performance quality for experts.

11 POST-APPROVAL ASSESSMENTS

Recognizing that market and sector conditions change over time, the procedures set out in this section are provided to ensure that methodologies, once approved, remain appropriate to evolving market and sector conditions. These procedures also provide an important safeguard given the limited experience to date with the development and use of standardized methods under GHG programs. These procedures may be revised as experience with standardized methods is acquired.

11.1 Post-Approval Assessment of Standardized Methods

11.1.1 For methodologies using a standardized method, an assessment shall be undertaken within five years of the approval of the standardized method and each subsequent five years, as follows:

- 1) The developer (or another entity) shall re-evaluate the standardized method to reflect current data or demonstrate that there have not been significant changes in data, as follows:
 - a) For performance methods, the data and dataset characterizing available technologies, current practices and trends within a sector (which may be documented and contained in the methodology or may be maintained in a separate database referenced by the methodology) shall be evaluated, and updated if there have been significant changes in the data. The developer does not need to undertake stakeholder consultation with respect to the level of the performance benchmark metric (as is required for the initial development of performance methods).
 - b) For activity methods, additionality shall be re-determined (from scratch using the activity penetration, financial viability or revenue streams options). Where the activity method uses the activity penetration option and the level of activity penetration has risen (since initial approval) to exceed the five-percent threshold level, the activity method may not be revised to use either of the other two options. Such activity methods become invalid and shall be withdrawn.

Note – The VCS Methodology Requirements should be read for further information on the use of data within standardized methods and appropriateness of the level of performance benchmarks.

- 2) The developer or another entity shall submit to Verra a report documenting the standardized method revaluation. This report shall be issued no earlier than four years after the previous approval of the methodology. Verra reviews the report and determines whether a revision to the standardized method or methodology is required.
- 3) Where a methodology revision is required, the revised methodology shall be approved via the methodology approval process set out in Section 4. In addition, the following applies:

- a) The methodology shall be exempt from the submission of a methodology concept note or minor methodology revision description, and corresponding application fee, processing fee and the public stakeholder consultation.
 - b) The scope of assessment shall be limited to assessment of the revisions undertaken as set out in Section 11.1.1(1) above.
 - c) For performance methods where data is maintained in a central repository (i.e., not documented and contained within the methodology), the validation/verification body shall assess whether there are still clear and robust custody arrangements for the data and defined roles and responsibilities with respect to the central repository.
 - d) For performance methods, Verra re-examines the appropriateness of the level(s) of the performance benchmark metric to ensuring environmental integrity and provision of sufficient financial incentive to potential projects, by re-evaluating the original (and any subsequent) analysis undertaken to determine the level of the performance benchmark metric and considering evidence from use of the methodology by projects. The methodology may need to be revised to reflect the outcome of such re-examination and Verra will co-ordinate with the developer accordingly.
 - e) Verra reviews the revised methodology and the assessment report submitted by the validation/verification body, together with the outcome of the re-examination of the appropriateness of the level(s) of the performance benchmark metric, following the procedure set out in Section 4.6, *mutatis mutandis*.
- 4) Where a report is not submitted to Verra within five years of the methodology's initial or previous approval, the methodology is put on hold until such time as it is determined that the methodology does not require revision or the revised methodology is approved. Where the methodology remains on hold on the day that is seven years after its previous approval, the methodology will be withdrawn.

Note – Where methodologies are put on hold or withdrawn, grace periods apply (as set out in Section 9) and registered projects may continue to issue VCUs for the remainder of their project crediting periods.

11.2 Interim Assessment of Activity Methods

11.2.1 For methodologies or modules using an activity method that uses the activity penetration option for establishing a positive list, an interim assessment shall be undertaken within three years of the initial or previous (where the activity method has already undergone post-approval assessment in accordance with Section 11.1) approval of the activity method, as follows:

- 1) The scope of the assessment shall be to assess whether the activity penetration level for the project activity remains within the permitted threshold.
- 2) The developer or another entity shall submit to Verra a report documenting the assessment. A full re-analysis of the activity penetration level is not required and other

proxies may be used to confirm that the activity penetration level for the project activity remains within the permitted threshold. Proxies may include the continued existence of barriers to the implementation of the project activity (such as cost of technology, cost of implementation of the project activity or level of awareness of the project activity) and the continuing validity of assumptions made within the activity method.

- 3) The report shall be submitted to Verra no sooner than 30 months, and no later than 34 months, after the initial (or previous) approval of the activity method.
- 4) Where Verra deems that the report does not adequately justify that the activity penetration level remains within the permitted threshold, and the developer (or other entity) does not provide sufficient further evidence, the methodology will be put on hold. It may be revised and assessed via the methodology approval process.

11.3 Periodic Assessment of Default Factors

11.3.1 For methodologies that establish (their own) default factors which may become out of date (see the *VCS Methodology Requirements* for further information on default factors), an assessment shall be undertaken within five years of the approval of the methodology and each subsequent five years, as follows:

- 1) The scope of the assessment shall be to assess whether the value of the default factor remains appropriate to current market, sector or other relevant conditions.
- 2) The developer or another entity shall submit to Verra a report documenting the assessment. An assessment of the key parameters used to establish the value of the default factor may be used to ascertain whether the value of the default factor remains appropriate (i.e., a full re-evaluation of the value is not required).
- 3) The report shall be issued no earlier than four years after the previous approval of the methodology.
- 4) Where Verra deems that the report does not adequately justify that the value of the default factor remains appropriate, and the developer (or other entity) does not provide sufficient further evidence, the methodology will be put on hold. It may be revised and assessed via the procedure set out in Section 9.3.2 or 9.3.3, as appropriate. The scope of assessment shall be limited to assessment of whether the new value of the default factor is appropriate.

APPENDIX 1: DOCUMENT HISTORY

Version	Date	Comment
v4.0	19 Sep 2019	Initial version released under VCS Version 4.

Standards for a Sustainable Future

**CITY OF MORENO VALLEY
CITY COUNCIL
NOTICE OF PUBLIC HEARING**

**VIA TELECONFERENCE ONLY
PURSUANT TO COVID-19
GOVERNOR EXECUTIVE ORDER N-29-20**

**WORLD LOGISTICS CENTER
CONSIDERATION OF DEVELOPMENT AGREEMENT
APPEALS OF PLANNING COMMISSION'S CERTIFICATION OF
REVISED FINAL ENVIRONMENTAL IMPACT REPORT (PEN18-0050)
APPEAL OF PLANNING COMMISSION'S APPROVAL OF**

TENTATIVE PARCEL MAP FOR FINANCE AND CONVEYANCE PURPOSES ONLY (PEN20-0017)

NOTICE IS HEREBY GIVEN that a teleconferenced Public Hearing will be held by the City Council of the City of Moreno Valley on the date and time set forth below:

Date and Time: June 16, 2020 at 6:00 p.m.
Location: **VIA TELECONFERENCE ONLY**
Go to <http://morenovalleyca.igm2.com/Citizens/default.aspx> for instructions.

Items: Statutory Development Agreement (Case No. PEN20-0018)
 Appeals of Planning Commission's Certification of Revised Final Environmental Impact Report (PAA20-0001 and PAA20-0002 - Appeals of Case No. PEN18-0050)
 Appeal of Planning Commission's Approval of the Tentative Parcel Map for Finance and Conveyance Purposes Only (PAA20-0003 - Appeal of Case No. PEN20-0017)

Appellant: Adriano L. Martinez, Council for Center for Biological Diversity, Center for Community Action & Environmental Justice, Coalition for Clean Air, San Bernardino Valley Audubon Society and Sierra Club. (PAA20-0002 & PAA20-0003)
 Angel Lopez (PPA20-0001)

Applicant: Highland Fairview
Property Owner: Highland Fairview
Project Location: World Logistics Center Specific Plan area, located generally south of SR-60, east of Redlands Boulevard, west of Gillman Springs Road and north of the San Jacinto Wildlife Area.

Proposal: (1) Consideration of a Development Agreement between the City of Moreno Valley and Highland Fairview regarding the World Logistics Center Project. (Proposed Project).
 (2) Deny Appeals and uphold the Planning Commission's Certification of the Revised Final Environmental Impact Report; and (3) Deny the Appeal and uphold the Planning Commission's Approval of Tentative Parcel Map 36457 for Finance and Conveyance Purposes Only which does not pertain to physical development.

Council District: 3

ENVIRONMENTAL DETERMINATION: The Proposed Project has been extensively evaluated pursuant to the California Environmental Quality Act (CEQA) and the CEQA Guidelines. A Revised Final Environmental Impact Report (EIR), Statement of Overriding Considerations, a Mitigation Monitoring and Reporting Program and Findings contained therein, have been prepared for the Proposed Project, Adopted and Certified by the Planning Commission. A "Revised Sections of the Final Environmental Impact Report" was circulated for public review pursuant to CEQA and the CEQA Guidelines in July 2018 and the "Recirculated Draft RSFEIR" was circulated for public review in December 2019. The "Revised Final EIR," along with the proposed Tentative Parcel Map and Development Agreement are available for review online at www.moval.org.

PUBLIC TESTIMONY: All interested parties will be provided an opportunity to submit oral testimony during the teleconferenced Public Hearing and/or provide written testimony at or prior to the teleconferenced Public Hearing. The application file and related environmental documents may be inspected by appointment at the Community Development Department at 14177 Frederick Street, Moreno Valley, California by calling (951) 413-3206 during normal business hours (7:30 a.m. to 5:30 p.m., Monday through Thursday).

COVID-19 – IMPORTANT NOTICES: Please note that due to the COVID-19 pandemic situation, the City will attempt to make reasonable arrangements to ensure accessibility to inspect the aforementioned

addition, special instructions on how to effectively participate in the teleconferenced Public Hearing, as approved by Governor Executive Order No. N-25-20 will be posted at <http://morenovalleyca.ig2.com/Citizens/default.aspx> and will be described in the Planning Commission agenda.

PLEASE NOTE: The City Council may consider and approve changes to the proposed items under consideration during the teleconferenced Public Hearing.

GOVERNMENT CODE § 65009 NOTICE: If you challenge any of the proposed actions taken by the City Council in court, you may be limited to raising only those issues you or someone else raised during the teleconferenced Public Hearing described in this notice, or in written correspondence delivered to the Planning Division of the City of Moreno Valley during or prior to, the teleconferenced Public Hearing.

ACCESSIBILITY: Upon request and in compliance with the Americans with Disabilities Act of 1990, any person with a disability who requires a modification or accommodation in order to participate in a meeting should direct such request to Guy Pegan, ADA Coordinator, at (951) 413-3120 at least 48 hours before the meeting. The 48-hour notification will enable the City to make reasonable arrangements to ensure accessibility to this meeting.

STAFF CONTACT: If you have questions regarding this teleconferenced Public Hearing, please contact Julia Descoteaux, Associate Planner, by telephone at (951) 413-3209 or via email at juliad@moval.org.

subject **World Logistics Center – Response to Comments Submitted Prior to the Planning Commission Hearing**

Subsequent to the distribution of the Final Response to Comments and Revised Final EIR for the World Logistics Center (WLC) Project, and prior to and during the Planning Commission hearing on May 14, 2020, comment letters on the Revised Final EIR were submitted to the City. Formal responses to those comments are not required pursuant to State CEQA Guidelines Section 15088. However, written responses have been prepared and included herein for the benefit of the City Council and for completeness of the record. Each comment letter includes an alphanumeric identifier and each comment within each letter includes a numeric identifier within the right margin of the letter. Responses to each comment letter follow the corresponding letter. None of the responses provide significant new information that requires recirculation of the Revised Final EIR in accordance with the California Environmental Quality Act (CEQA) Guidelines Section 15088.5.

Subject: CDFW comments on Revised Final EIR for the World Logistics Center, SCH No. 2020121045
Attachments: 2012021045_FEIR_CityofMorenoValley_WorldLogisticsCenter.pdf

Importance: High

Warning: External Email – Watch for Email Red Flags!

Hi Julia,

Please find attached the California Department of Fish and Wildlife's (CDFW) comments on the City of Moreno Valley's World Logistics Center Revised Final Environmental Impact Report (Revised FEIR).

CDFW has identified significant concerns with the Revised FEIR. CDFW requests that the Planning Commission not approve the Revised FEIR until the issues identified by CDFW in the attached letter are addressed. To help address our concerns CDFW has provided specific language for the revision of mitigation measures. CDFW requests that a copy of our letter and this email, which includes a brief summary of our concerns, be provided to the Planning Commission in advance of tomorrow's meeting.

A brief summary of some of CDFW's concerns:

- The Project, as proposed, will directly impact the public's use of the San Jacinto Wildlife Area (Wildlife Area; SJWA). The Project proposes to construct buildings and associated infrastructure within 450 feet of the SJWA's northern perimeter. SJWA is an active hunting area, and hunts are regularly conducted along the SJWA's northern boundary. Fish and Game Code section 3004 prohibits the discharging of firearms within 150 yards (450 feet) of any building without express permission of the owner. Because the City is proposing the construction of buildings and associated infrastructure within 450 feet of the northern property boundary of the SJWA, the City's actions will directly constrain the public's use of the SJWA. Unless the City increases the buffer distance between the SJWA and constructed elements of the Project to a minimum of 450 feet, the City will directly impact public use and enjoyment within the Wildlife Area.

CDFW has previously provided the City with information related to Fish and Game Code section 3004, however per the CEQA, the City still intends to construct Project elements within 450 feet of the SJWA's northern perimeter. As such, the City will directly impact public use and enjoyment on the SJWA. Unless the environmental document is revised, it continues to be deficient in its analysis of impacts on public access and recreational pursuits within the SJWA.

CDFW recommends that the buffer distance between the northern boundary of the SJWA and the Project be increased to a minimum of 450 feet.

- The Project will significantly increase traffic along Gilman Springs. It is critical to maintain connectivity for wildlife movement between the badlands and the SJWA. The CEQA does not include mitigation measures that require fencing to facilitate continued wildlife movement during and after Project construction. CDFW recommends that the City include the requirement for fencing before issuance of discretionary permits issued by the City. To ensure that fencing is constructed and that it is constructed appropriately, CDFW has proposed specific language for two new mitigation measures conditioned on the issuance of grading permits by the City. The two new measures require:
o Fencing along the project's eastern and southern boundary.
o Wildlife fencing along Gilman Springs Road and State Route 60 to ensure that wildlife are directed to existing undercrossings.
- Due to increased traffic associated with the Project improved wildlife crossings will be needed to maintain wildlife movement from the SJWA to the badlands. The CEQA identifies that the Project should contribute a fair share of improvements to Gilman Springs Road, but it does not include any specific measures that make this measure enforceable. CDFW is concerned that the CEQA currently lacks specific, enforceable measures conditioned on the City's discretionary actions. To ensure enforceability, CDFW has submitted specific language to the City for a new mitigation measure to improve wildlife crossings. The new measure is conditioned on the issuance of grading permits by the City.
- The City has proposed the review and approval of translocation plans for sensitive plant and wildlife species. CDFW should review and approve these proposals. CDFW has submitted specific language for the City to revise the mitigation measures to include review and approval by CDFW, and the USFWS and RCA, where relevant.
- The mitigation measures for translocation of sensitive plant and wildlife species also do not include specific or enforceable language identifying the entity responsible to fund all costs associated with the translocation, and the short-and long-term management costs of the receiver site. CDFW has submitted specific language to the City to revise the mitigation measures to identify that the Project Applicant will be responsible for these costs.
- The CEQA includes a mitigation measure for the development of a Biological Resource Management Plan for the Project's proposed 250-foot setback area, to be located immediately north of the SJWA's northern perimeter. The measure discusses that the plan will be reviewed by the City's "Planning Official in consultation with the San Jacinto Wildlife Area Manager." The SJWA's Land Manager has not been contacted by the City regarding the preparation of this Plan. CDFW appreciates that the City is requesting review of the proposed Biological Resource Management Plan, but we request that the City contact CDFW to discuss this proposal.
- The CEQA discusses the preparation of a Fuel Management Plan for areas adjacent to MSHCP lands. The CEQA makes no reference to whether this plan would adequately protect the SJWA. CDFW has submitted specific language to the City to revise the mitigation measure to also protect CDFW's SJWA.

CDFW appreciates the opportunity to provide comments on the City of Moreno Valley's World Logistics Center Project. We request that the Planning Commission be provided with copies of this email which summarizes CDFW concerns, along with copies of CDFW's comment letter in advance of the City's meeting scheduled for tomorrow, May 14, 2020.

If you have any questions, please feel free to contact me.

Subject: Revised Final Environmental Impact Report
 City of Moreno Valley, World Logistics Center Project
 State Clearinghouse No. 2012021045

Dear Ms. Descoteaux:

The California Department of Fish and Wildlife (CDFW) received the Revised Final Environmental Impact Report (RFEIR) on May 5, 2020 from the City of Moreno Valley (City) for the World Logistics Center Project (Project) pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.¹

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code. CDFW is concerned with the adequacy of the City's assessment of impacts to the San Jacinto Wildlife Area (Wildlife Area; SJWA), and with the adequacy and enforceability of mitigation measures for biological resources. CDFW's concerns related to the SJWA and recommended edits to the City's mitigation measures to improve specificity and enforceability are identified and discussed below.

CDFW ROLE

CDFW is California's Trustee Agency for fish and wildlife resources, and holds those resources in trust by statute for all the people of the State. (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA

3-B1-1
 3-B1-1
 3-B1-1

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

¹ CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

Guidelines § 15386, subd. (a).) CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (*Id.*, § 1802.) Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), the Project proponent may seek related take authorization as provided by the Fish and Game Code.

CDFW previously provided comments on the Draft EIR on April 8, 2013, on the Final EIR June 11, 2015, and on the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Determination of Biologically Equivalent or Superior Preservation (DBESP) on December 19, 2014.

CDFW Comments and Recommendations

CDFW's comments and recommendations on the Project are summarized below.

Impacts to rare, listed, and sensitive species

Mitigation Measures (MM) 4.4.6.2A, 4.4.6.4D, and 4.4.6.4E identify the preparation of translocation plans for rare and listed plant species (MM 4.4.6.2A), burrowing owl (MM4.4.6.4D), and Los Angeles pocket mouse (MM 4.4.6.4E).

Sensitive Plant Species

MM 4.4.6.2A provides mitigation measures for impacts to sensitive plant species:

Each Plot Plan application shall include a focused plant survey of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, Plummer's' mariposa lily, or thread-leaved brodiaea) are present. If any of the listed plants are found, they may be relocated to the 250-foot setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, at the applicant's discretion, an impact

3-B1-1: CONT.
3-B1-1:
3-B1-1:

fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species. This measure shall be implemented to the satisfaction of the Planning Official.

CDFW is concerned that City's "Planning Official" is not sufficiently qualified to review and approve a translocation plan for rare plant species. Further, thread-leaved brodiaea is a state endangered and federally threatened species and CDFW should review this proposal. To ensure that this proposal is implemented in compliance of rules and regulations related to state and/or federally listed plant species CDFW recommends that the City revise mitigation measure (MM) 4.4.6.2A and condition the measure to include the following (edits are in **bold** and ~~strikethrough~~):

MM 4.4.6.2A Each Plot Plan application shall include a focused plant survey of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, Plummer's' mariposa lily, or thread-leaved brodiaea) are present. If any of the listed plants are found, **the City will consult with the California Department of Fish and Wildlife (CDFW) and the U.S. Fish and Wildlife Service (USFWS). If translocation of the species is deemed appropriate by CDFW and/or USFWS a translocation plan shall be developed and submitted to CDFW and USFWS for review and approval** ~~they may be relocated to the 250-foot setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A.~~ Alternatively, at the applicant's discretion, an impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species. This measure shall be implemented to the satisfaction of the Planning Official.

Burrowing Owl

MM 4.4.6.4D provides mitigation measures for impacts to burrowing owl:

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, active and/or passive relocation may be conducted following consultation with the California Department of Fish and Wildlife. A relocation plan may be required by California Department of Fish and Wildlife if active and/or passive relocation is necessary. The relocation plan will outline the basic process and provides options for avoidance and mitigation. Artificial burrows - may be constructed within the buffer area south of the World Logistics Center

3-B1-1
CONT.

3-B1-1

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Specific Plan. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor in consultation with CDFW.

A relocation plan may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated to the SJWA, the 250-foot buffer area or other suitable on-site or off-site areas. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor.

CDFW previously provided comments on the City’s proposal to translocate burrowing owl to the “250-foot buffer area” in a joint CDFW – US Fish and Wildlife Service (USFWS) comment letter written in response to the City’s DBESP submitted for review as required by the Western Riverside MSHCP. In the joint letter (dated December 19, 2014) CDFW and the USFWS articulated to the City that the 250-foot buffer area is not appropriate as a receptor site for burrowing owl because it is insufficient in terms of area, spatial configuration, and conflicting planned use (the City has proposed the construction of detention basins, etc., within the buffer area). Burrowing owl require large open expanses of sparsely vegetated habitat to forage and nest, and the 250-foot buffer area would not provide these ecological needs. Further, because the buffer area is proposed to be planted with trees, CDFW and the USFWS also stated that the City’s proposal to plant trees within the buffer area would provide perch sites for bird-eating raptors, such as red-tailed hawks, which eat burrowing owls, further reducing the appropriateness of the City’s proposed mitigation approach.

MM 4.4.6.4D also includes reference to Planning Area 30. CDFW maintains similar concerns regarding the suitability of this area for burrowing owl: Planning Area 30 is insufficient in terms of area and spatial configuration. Further, based on CDFW’s review of aerial photography the topography of much of Planning Area 30 is unlikely to be suitable for burrowing owl.

CDFW appreciates that the City has included an additional relocation option: CDFW’s San Jacinto Wildlife Area. However, CDFW is concerned that MM 4.4.6.4D does not include specific and enforceable language to ensure that the financial burden of any proposed translocation of burrowing owl (including the translocation itself, short-term habitat management needs, as well as long-term management needs) is provided by the Project Applicant. CDFW is unable to assume this financial burden, and it is the responsibility of the Project Applicant to mitigate Project impacts.

3-B1-16
CONT.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

MM 4.4.6.4D identifies that CDFW would review any active and/or passive relocation plan for burrowing owl. Please note that these plans will also need to be reviewed and approved by the USFWS and the Western Riverside County Regional Conservation Authority (RCA).

To improve the specificity and enforceability of MM 4.4.6.4D and to ensure consistency with the MSHCP, CDFW recommends that the City revise mitigation measure MM 4.4.6.4D and condition the measure as following (edits are in **bold** and ~~strikethrough~~):

MM 4.4.6.4D If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, active and/or passive relocation may be conducted following consultation with the California Department of Fish and Wildlife (**CDFW**), **U.S. Fish and Wildlife Service (USFWS)**, and the **Western Riverside County Regional Conservation Authority (RCA)**. A relocation plan may **will** be required by ~~California Department of Fish and Wildlife~~ **CDFW, the USFWS, and the RCA** if active and/or passive relocation is necessary. The relocation plan will outline the basic process, ~~and provides~~ options for avoidance and mitigation, **identify short- and long-term habitat management needs of the receiver site, and identify the entity responsible for all financial costs associated with the relocation plan and long-term management of the receiver site.** Artificial burrows - may be constructed within the buffer area south of the World Logistics Center Specific Plan. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor in consultation with CDFW, **the USFWS, and RCA.**

A relocation plan may **will** be required by ~~California Department of Fish and Wildlife~~ **CDFW, the USFWS, and RCA** if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated **following written approval by CDFW, the USFWS, and RCA, to habitat deemed suitable by CDFW, the USFWS, and RCA (which may include** the SJWA, the 250-foot buffer area or other suitable on-site or off-site areas). Construction activity may occur within 500 feet of the burrows at the discretion of

3-B1-16
CONT.

the biological monitor, **following consultation with CDFW, the USFWS, and RCA.**

Los Angeles Pocket Mouse

MM 4.4.6.4E provides mitigation measures for impacts to Los Angeles pocket mouse (LAPM):

Prior to the approval of any Plot Plans proposing the development of land including or adjacent to Drainage 9, a protocol survey for the Los Angeles Pocket Mouse (LAPM), including 100 feet upstream and downstream of the affected reach shall be prepared by a qualified biologist and submitted to the City. If the affected drainage is not occupied, the area is considered not to be occupied and development can continue without further action. If the species is found within the specific survey area, no development shall occur until an appropriate mitigation fee is paid or appropriate amount of land set aside on the project site or off site to compensate for any loss of occupied Los Angeles Pocket Mouse habitat. Alternatively, individuals may be relocated to the 250-foot setback zone along the southern boundary of the property identified in Mitigation Measure 4.4.6.1A, or other appropriate areas as determined by the United States Fish and Wildlife Service. If necessary, this measure shall also be coordinated with Mitigation Measure 4.4.6.2B regarding preparation and processing of a Determination of a Biological Equivalent or Superior Preservation report. This measure shall be implemented to the satisfaction of the City Planning Division.

MM 4.4.6.4E identifies that the City will review LAPM “protocol surveys,” and the USFWS will review any relocation plan for LAPM. CDFW is concerned that City staff are not appropriately qualified to determine if appropriate survey methodology has been employed by the Project Applicant, or review trapping results. CDFW recommends that proposed survey methodology and trapping results be reviewed and/or approved by CDFW and the USFWS. Further, any relocation plan prepared for LAPM will also need to be reviewed and approved by CDFW (in addition to the USFWS).

CDFW appreciates that MM 4.4.6.4E identifies that LAPM translocation, if deemed necessary, may occur to a site other than the 250-foot buffer area. CDFW and the USFWS previously commented that the 250-foot buffer area may not be appropriate as a receiver site because of size and configuration (it will be a narrow, relatively restricted area), and because of potential disruptions to existing small mammal populations, and predator-prey relationships. CDFW appreciates that the City has included an additional relocation option however, CDFW is concerned that MM 4.4.6.4E does not include specific and enforceable language to ensure that the financial burden of any proposed translocation of

3-B1-16
CONT.

3-B1-17

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

LAPM (including the translocation itself, short-term habitat management needs, as well as long-term management needs) is provided by the Project Applicant.

To improve the specificity and enforceability of MM 4.4.6.4E CDFW recommends that the City revise mitigation measure MM 4.4.6.4E and condition the measure as following (edits are in **bold** and ~~strikethrough~~):

MM 4.4.6.4E Prior to the approval of any Plot Plans proposing the development of land including or adjacent to Drainage 9, a protocol survey for the Los Angeles Pocket Mouse (LAPM), including 100 feet upstream and downstream of the affected reach shall be prepared by a qualified biologist and submitted to **CDFW and the USFWS for review and approval prior to submission to the City**. If the affected drainage is not occupied, the area is considered not to be occupied and development can continue without further action. If the species is found within the specific survey area, no development shall occur until an appropriate mitigation fee is paid or appropriate amount of land set aside on the project site or off site to compensate for any loss of occupied Los Angeles Pocket Mouse habitat. Alternatively, individuals may be relocated **to locations pre-approved by CDFW and the USFWS (which may include to the 250-foot setback zone along the southern boundary of the property identified in Mitigation Measure 4.4.6.1A, or other appropriate areas)**~~as determined by the United States Fish and Wildlife Service~~. **All costs associated with the relocation, as well as short-and long-term management and monitoring of the receiver site shall be the responsibility of the Project Applicant**. If necessary, this measure shall also be coordinated with Mitigation Measure 4.4.6.2B regarding preparation and processing of a Determination of a Biologically Equivalent or Superior Preservation report. This measure shall be implemented to the satisfaction of the City Planning Division **following coordination with CDFW and the USFWS**.

Fish and Game Code section 1602

MM 4.4.6.3C conditions the Project Applicant(s) to submit to the City copies of appropriate permits/agreements for impacts to Waters of the State and Waters of the U.S. The measure identifies the “need for permits based on the results of the 2012 jurisdictional delineation.” Please note that CDFW will require that any stream mapping submitted to CDFW as a component of a Notification of Lake or Streambed Alteration be current. CDFW recommends the measure be revised to remove all reference to the “2012 jurisdictional delineation.” In addition to removing reference to out-of-date mapping, CDFW recommends that errors

3-B1-1
CONT.

3-B1-1

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

included in the measure be corrected. CDFW recommends that the City revise mitigation measure MM 4.4.6.3C as follows (edits are in **bold** and ~~strikethrough~~):

MM 4.4.6.3C Prior to issuance of any grading permit for any offsite improvements that support development within the World Logistics Center Specific Plan, the developer shall retain a qualified biologist to prepare a jurisdictional delineation (JD) for any drainage channels affected by construction of the offsite improvements. This jurisdictional delineation shall be submitted to the U.S. Army Corps of Engineers (USACE), **Regional Water Quality Control Board**, and California Department of Fish and Wildlife (CDFW) for review and concurrence. If the offsite improvements **are deemed by the regulatory agencies to not require regulatory permits/agreements, a written copy of this determination shall be submitted to the City** ~~will not affect any identified jurisdictional areas, no United States Army Corps of Engineers permitting is required.~~ **The Applicant shall consult with** ~~However, permitting through the Regional Water Quality Control Board (RWQCB), and California Department of Fish and Wildlife (i.e., Streambed Alteration Agreement) may still be required for these improvements. The applicant shall consult with~~ **and United States Army Corps of Engineers, California Department of Fish and Wildlife and Regional Water Quality Control Board** to establish the need for permits based on the results of the 2012 **current stream mapping jurisdictional delineation** and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with any altered offsite drainages shall be in agreement with the permit conditions. Any landscaping associated with these offsite improvements shall use only native species to help protect biological resources residing within or traveling through these drainages per Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Table 6.1.2. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the ~~U.S. Fish and Wildlife Service~~ **Regional Water Quality Control Board**, U.S. Army Corps of Engineers, and the California Department of Fish and Wildlife.

Wildlife Movement

The Biological Resources section (Section 4.4) of the Revised Sections of the FEIR (page 4.4-37) discusses that the Project will incorporate fencing to separate development areas from MSHCP open space areas to the south and along Gilman Springs Road. CDFW agrees that fencing is appropriate to minimize unauthorized public access, illegal trespass, and dumping. In addition, fencing

3-B1-18
CONT.

3-B1-19

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

along Gilman Springs Road should be designed to minimize wildlife movement and direct wildlife towards wildlife crossings. CDFW is concerned that because a mitigation measure has not been developed and included in the FEIR the City will be unable to enforce the construction of such fences as the Project is developed. To ensure enforceability, CDFW recommends that the City include a new mitigation measure in the FEIR conditioning the construction of fencing along the Project's southern and eastern boundaries, and wildlife fencing along Gilman Springs Road. CDFW recommends the inclusion of the following new mitigation measure in the FEIR:

Prior to issuance of any grading permit for Projects constructed immediately west of Gilman Springs Road (Planning Areas 6, 8, 11, 12), or north of the San Jacinto Wildlife Area (Planning Areas 10, 12) the Project Applicant shall provide for review and approval to the California Department of Fish and Wildlife and City design plans for the construction of appropriate fencing along the Project's eastern and/or southern boundary, as appropriate. The City shall also inspect fence construction prior to issuance of occupancy permits, or equivalent.

CDFW is concerned about the project's potential to restrict wildlife movement to and from the San Timoteo Badlands (Badlands) and SJWA/Mystic Lake area. As proposed, the Project will border the Badlands along portions of its northern border as well as its nearly 2-mile long eastern border at Gilman Springs Road, creating an obstruction to wildlife movement between the Badlands and open areas to the south (Mystic Lake, Lake Perris, and SJWA). The Project is located between the SJWA and the two existing culverts under State Route 60 (SR-60), and will also be located immediately west of Gilman Springs Road and the existing culverts under this road. Because the Project encompasses logistics centers that will significantly increase traffic volume, CDFW argues that the Project will have substantial effects on existing wildlife movement patterns. Species of concern include mountain lion, bobcat, badger, coyote, deer, long-tailed weasel, black-tailed jackrabbit, and desert cottontail. A fair argument can be made that the Project will increase noise, lighting, and traffic which may in turn negatively affect wildlife through direct mortality or alter movement patterns by forcing wildlife to move east or west, away from the Project. CDFW recommends that the Project install appropriate fencing along Gilman Springs Road and SR-60 to reduce wildlife mortality and direct animals to future or existing wildlife crossings.

CDFW recommends that the City condition the Project to require the installation of wildlife fencing along SR-60 and Gilman Springs Road to reduce Project-related wildlife mortality. CDFW recommends the inclusion of the following new mitigation measure in the FEIR:

3-B1-19
CONT.

3-B1-20

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Prior to issuance of any grading permit for Projects constructed immediately west of Gilman Springs Road (Planning Areas 6, 8, 11, 12), or south of State Route 60 (Planning Area 6) the Project Applicant shall provide for review and approval to the California Department of Fish and Wildlife and City design plans for the construction of wildlife fencing along State Route 60 and Gilman Springs Road. The City shall inspect wildlife fence construction prior to issuance of occupancy permits, or equivalent.

Section 4.4 of the Revised Sections of the FEIR (page 4.4-61) discusses that the RCA submitted comments to the City stating that the project would likely cause an increase in truck traffic along Gilman Springs Road which “could significantly affect wildlife movement between Core H and proposed Core 3.” To mitigate these impacts the Revised Sections of the FEIR (page 4.4-61) states that it would be appropriate for the Project to contribute (financially) to the “fair share of the improvements to Gilman Springs Road, including provisions for wildlife movement or crossings.” CDFW agrees that contribution of funding for improvements to wildlife crossings along Gilman Springs Road would be appropriate, but CDFW is concerned that because a mitigation measure has not been developed and included in the FEIR the City will be unable to enforce the contribution of funds for this purpose. To ensure enforceability, CDFW recommends that the City include a new mitigation measure in the FEIR conditioning the contribution of funds to a mitigation account, to held by CDFW-approved entity, for later use for improvements to wildlife crossings along Gilman Springs Road. CDFW recommends the inclusion of the following new mitigation measure in the FEIR:

Prior to issuance of any grading permit the Project Applicant shall provide to the City 5% of total Project costs to be deposited into a mitigation account, held by a CDFW-approved entity, for later use for improvements to wildlife crossings along Gilman Springs Road.

Impacts to the San Jacinto Wildlife Area

CDFW previously provided comments on the Project’s proposal to construct buildings within 450 feet of the SJWA (refer to CDFW’s April 8, 2013, and June 11, 2015 comment letters). SJWA is an active hunting area, and hunts are regularly conducted along the SJWA’s northern boundary. Fish and Game Code Section 3004 prohibits the discharging of firearms within 150 yards (450 feet) of any building without express permission of the owner. Given that the City is proposing the construction of buildings within 450 feet of the northern property boundary of the SJWA, the City’s actions will directly constrain the public’s use of the SJWA. CDFW reiterates that unless the City increases the buffer distance between the SJWA and constructed elements of the Project to a minimum of 450 feet, the City will have effectively created restraints on hunting with the Wildlife

Area. Further unless the environmental document is revised, it continues to be deficient in its analysis of impacts on public access and recreational pursuits within the SJWA.

CDFW strongly recommends that the buffer distance between the northern boundary of the SJWA and the Project be increased to a minimum of 450 feet.

Project’s Consistency with Adopted HCPs/NCCPs

Projects proposed for construction within the MSHCP and the Stephens’ kangaroo rat Habitat Conservation Plan (SKR HCP) are subject to payment of mitigation fees. Pages 4.4-60 and 4.4-61 discuss the required payment of these fees, however the City did not include a mitigation measure to ensure the enforceability of payment of fees. To ensure enforceability, CDFW recommends that the City include a new mitigation measure in the FEIR conditioning the payment of MSHCP and SKR HCP fees, as appropriate, prior to issuance of grading permits. CDFW recommends the inclusion of the following new mitigation measure in the FEIR:

Prior to issuance of any grading permit the Project Applicant shall pay appropriate Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP), and Stephens’ kangaroo rat Habitat Conservation Plan mitigation fees.

Resource Management

MM 4.4.6.4F discusses the development of a Biological Resource Management Plan for the proposed 250-foot setback area. The measure discusses that the plan will be reviewed by the City’s “Planning Official in consultation with the San Jacinto Wildlife Area Manager.” CDFW is unaware that the City contacted CDFW’s SJWA manager to verify that CDFW were available and able to contribute to the review of this plan, or whether this workload element could be accommodated based on CDFW’s current staffing levels. CDFW appreciates that the City is requesting review of the proposed Biological Resource Management Plan, but we request that review of this document be determined by CDFW.

CDFW recommends that the City revise mitigation measure MM 4.4.6.4F as follows (edits are in **bold** and ~~strikethrough~~):

- 4.4.6.4F Prior to approval of any discretionary permits for development within Planning Areas 10 and 12, a Biological Resource Management Plan (BRMP) shall be prepared to prescribe how the 250-foot setback area outlined in Mitigation Measure 4.4.6.1A will be developed and maintained **in perpetuity**. This plan will identify frequent and infrequent vegetation management requirements (i.e.,

removal of invasive plants) and the planting and maintaining trees to provide roosting and nesting opportunities for raptors and other birds. **The Biological Resource Management Plan will include an estimate of short-and long-term management costs, a discussion of how funds will be made available in perpetuity, and entities responsible for contribution of funds to support the Biological Resource Management Plan.** The Biological Resource Management Plan will also describe how relocation of listed or sensitive species will occur from other locations as outlined in Mitigation Measures 4.4.6.2A, 4.4.6.4D, and 4.4.6.4E.

The Biological Resource Management Plan, **including the short-and long-term funding strategy** shall be reviewed and approved by the Planning Official in consultation with **California Department of Fish and Wildlife** ~~San Jacinto Wildlife Area Manager~~. The Biological Resource Management Plan shall cover all the land within the 250-foot setback zone within Planning Areas 10 and 12. Implementation of the plan shall be supervised by a qualified biologist, to the satisfaction of the City Planning Division.

Fuel Management

MM 4.4.6.4J discusses the preparation of a Fuel Management Plan for those Planning Areas adjacent to the south and east boundary of the Project and MSHCP lands. The measure identifies that the plan shall demonstrate that adjacent MSHCP lands are adequately protected from expected fire risks. CDFW recommends that MM 4.4.6.4J be revised to also demonstrate that the Fuel Management Plan adequately protect CDFW's SJWA lands. CDFW recommends that the City revise mitigation measure MM 4.4.6.4J as follows (edits are in **bold** and ~~strikethrough~~):

- 4.4.6.4J A Fuel Management Plan shall be prepared on a project-by-project basis for those Planning Areas adjacent to the south and east boundary of the World Logistics Center Specific Plan adjacent to Western Riverside County Multiple Species Habitat Conservation Plan Conservation Areas **and/or San Jacinto Wildlife Area (SJWA) lands**. The Fuel Management Plan shall be prepared by the project proponent and submitted for approval to the prior to plot plan approval for those projects on the southern and eastern Western Riverside County Multiple Species Habitat Conservation Plan **and/or SJWA** boundary. Per the Western Riverside County Multiple Species Habitat Conservation Plan guidelines, the Fuel Management Plan shall include the following:

3-B1-2
CONT.

3-B1-2

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

- A plant palette of adequate plant species that may be planted within the Fuel Management Area, which will be approved by a biologist familiar with the plant requirements of the area.
- A list of non-native invasive plants that are prohibited from installation.
- Maintenance activities and a maintenance schedule.

Fuel modification zones shall be mapped and include an impact assessment as required under California Environmental Quality Act guidelines for a project-level analysis. The plan shall demonstrate that the adjacent Western Riverside County Multiple Species Habitat Conservation Plan Areas **and SJWA lands** are adequately protected from expected fire risks.

Minor Errors

MM4.4.6.2B and 4.4.6.3B include reference to the “Resource Conservation Agency (RCA).” CDFW assumes that the City is referring to the Western Riverside County **Regional Conservation Authority**. CDFW recommends that the City review the aforementioned mitigation measures and correct all references to the Regional Conservation Authority.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDDB). Information can be submitted online or via completion of the CNDDDB field survey form at the following link: <https://wildlife.ca.gov/Data/CNDDDB/Submitting-Data>. The completed form can be mailed electronically to CNDDDB at the following email address: CNDDDB@wildlife.ca.gov. The types of information reported to CNDDDB can be found at the following link: <https://wildlife.ca.gov/Data/CNDDDB/Plants-and-Animals>.

FILING FEES

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.).

CDFW CONCLUSIONS AND FURTHER COORDINATION

CDFW appreciates the opportunity to comment on the RFEIR for the City of Moreno Valley’s World Logistics Center Project (SCH No. 2012021045) and recommends that the City address the CDFW’s comments and concerns prior to adoption of the RFEIR. Pursuant to CEQA Guidelines section 15097(f) CDFW has prepared a draft mitigation monitoring and reporting program (MMRP) for the new mitigation measures identified in this letter. The draft MMRP is enclosed at the end of this letter.

3-B1-29

If you should have any questions pertaining to the comments provided in this letter, and to schedule a meeting, please contact Joanna Gibson at (909) 987-7449 or at Joanna.Gibson@wildlife.ca.gov.

Sincerely,

DocuSigned by:

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-B1: CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE (CDFW)

Response to Comment 3-B1-1: The comment states that the California Department of Fish and Wildlife (CDFW) identified significant concerns with the Revised Final EIR, and provided proposed specific revisions to several of the mitigation measures. CDFW also requested that their letter and email be provided to the Planning Commission for the May 14, 2020 public hearing. Responses to the specific revisions to the mitigation measures are found below in Responses to Comments 3-B1-15 to 3-B1-21, 3-B1-24, and 3-B1-25. The CDFW comment letter and email were provided to the Planning Commissioners prior to their action.

Response to Comment 3-B1-2: The comment claims that the proposed WLC project will have a direct impact on public use of the San Jacinto Wildlife Area (SJWA) for hunting as a consequence of buildings within 450 feet of the SJWA northern boundary. California Fish and Game Code (CFGC) Section 3004 prohibits discharge of firearms within 150 yards of any building without express permission of the property owner. The comment continues that CDFW previously submitted comments to the City regarding CFGC Section 3004 but the proposed WLC project would permit project elements within 450 feet of the SJWA northern boundary.

It is correct that the WLC Project does not require buildings to be setback 450 feet from the shared southern property boundary with SJWA. However, the Project design features to reduce potential impacts to resources and uses to the south include a 250-foot development setback, which the Specific Plan shows, an additional minimum 150-foot building setback from the development setback (total 400 feet), and the construction of a wall at the development setback and a fence along the southern boundary of the WLC site. The SJWA area adjacent to the WLC site is designated as Management Subunit D2 in the December 2017 Draft Land Management Plan for the SJWA. Subunit D2 consists of 715 acres and the entire area was previously leased for agricultural purposes. There are no wetlands resources located within this subunit and habitat conditions are generally poor with broad-leaved non-native herbaceous cover. Subunit D2 is a potential upland small game hunting area, which may occur year round. As stated in the Draft Land Management Plan, only shotguns using certified non-lead shot are allowed for upland small game hunting within the SJWA. However, the Draft Land Management Plan depicts the existing land use as “Agricultural” (Draft Land Management Plan, Figure 2-7a) and the Upland Game Hunting Map for SJWA does not include Subunit D2 as a designated hunting area.¹

Furthermore, the CDFW routinely includes hunting prohibitions for its recreation areas within 150 yards of occupied areas located within or external to the recreation area, consistent with Section 3004 of the California Fish and Game Code. For example, the General Hunting Information for Picacho State Recreation Area, states: “No hunting is permitted within 150 yards of any occupied campsite.” For Auburn State Recreation Area, the CDFW states: “No hunting is allowed at the following locations: . . . Within 150 yards of any access road, building, campground . . .” CDFW does not itself prohibit the existence of occupied areas within its recreation areas to accommodate hunting activities. CDFW manages the recreation areas that allow hunting in a manner that allows for other recreational uses. In addition, Section

¹ California Department of Fish and Wildlife, Inland Deserts Region. Upland Game Hunting Map San Jacinto Wildlife Area, Riverside County. December 2016. Available online [:https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=135649&inline](https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=135649&inline)

3004 does not authorize CDFW to prevent all uses in adjacent properties along the perimeter of its recreation areas.

The effective range for hunting with a shotgun is between 20 and 50 yards.^{2 3} With a maximum effective range of 50 yards for upland small game hunting, the WLC building setback of 400 feet (133 yards) would have a negligible impact on public use of the SJWA for hunting since a small percentage of upland small game would be within 17 yards of the northern SJWA boundary.

The April 8, 2013 CDFW comment letter recommended a 250-meter setback from the SJWA northern boundary. At the time of that comment letter, the SJWA Management Subunit D2 was actively disked farmlands and contained no documented special-status species or sensitive wetland/riparian habitat. The WLC 250-foot development setback is one of the design features that lessens impacts on the SJWA and would be located between the northern SJWA boundary and the southern building development area within the WLC. As discussed in Section 4.4.1.15, Other Issues, a. Setbacks, on page 4.4-49 of the 2018 RSFEIR, “typical setbacks to protect wildlife from human presence (though not warehousing) ranges from 50 to 500 feet, but 200–250 feet appears adequate for the most sensitive species”.⁴ In addition to the 250-foot development setback, the WLC Project includes a 150-foot building setback resulting in a total setback of 400 feet. Furthermore, the WLC Project includes a minimum 11-foot high solid wall along the southern boundary of the WLC site that would reduce potential urban/wildlands interface impacts. Because the programmatic project features would reduce potential interface issues between the WLC site and the SJWA, no further expansion of the setback area along the boundary with the SJWA is required. Additionally, prohibiting a building within 150 yards of the SJWA Management Subunit D2 hunting area in conformance with CFGC Section 3004 would have the effect of the taking of property.

Response to Comment 3-B1-3: The comment expresses concern regarding the increased traffic on Gilman Springs Road and need to allow wildlife movement between the SJWA and the Badlands to the east and recommends fencing along the southern and eastern WLC site boundary and wildlife fencing along Gilman Springs Road and State Route 60. The 2018 RSFEIR acknowledges that roadkill from vehicle traffic on Gilman Springs Road will occur but the impacts will be less than significant “as long as the County coordinates with the Resource Conservation Authority and takes wildlife movement between Core H and proposed Core 3 (to the north and east of the WLC site) into account when designing and improving Gilman Springs Road” (2018 RSFEIR page 4.4-67).). There are no existing or proposed linkages, or constrained linkage areas in the vicinity of the WLC project (Final MSHCP Volume 1, The Plan, Section 3.0 Conservation Planning Process, Figure 3.2, 2003).

Development within the WLC site along the west side of Gilman Springs Road will be separated from the roadway by fencing or walls as appropriate (see Revised Final EIR, Part 4 Appendix H, Specific Plan Section 4.2.4.4; this will help restrict human access to Gilman Springs Road and native areas along the east side of the roadway, and may incrementally reduce roadkill along Gilman Springs Road. Construction fencing, including the use of buried silt fencing for erosion control, will be erected at the perimeter of

² North Dakota Game and Fish Department. 2019. Tom Roster’s 2016 Nontoxic Shot Lethality Table. Available at: <https://gf.nd.gov/hunting/nontoxic-shot-lethality>

³ Diana Yang. 2003. The Physics Factbook: Range of a Shotgun Pellet. Available at: <https://hypertextbook.com/facts/2003/DianaYang.shtml>

⁴ McElfish, J., Kihlslinger, R., and Nichols, S., 2008. *Setting Buffer Sizes for Wetlands*. Available online: http://staging.ecosystemmarketplace.com/wp-content/uploads/archive/documents/Doc_456.pdf

construction work areas at the beginning of each separate construction project. Because there will be no wildlife habitat on the WLC site once the Specific Plan area is build out, wildlife fencing other than exclusionary fencing along Gilman Springs Road and State Route 60 is not appropriate as it would facilitate wildlife movement to a habitat dead end with the potential to increase mortality.

Response to Comment 3-B1-4: The comment states that improved wildlife crossings from the SJWA to the Badlands areas to the east will be needed because of the increased traffic associated with the WLC project. The comment recommends a new mitigation measure be included to improve wildlife crossing.

Migratory corridors/linkages are described in Section 4.4.1.12.g of the 2018 RSFEIR page 4.4-61). Both the southern portion of the WLC Specific Plan area and the northern portion of the SJWA do not provide suitable habitat or resources to support wildlife migration or regular wildlife movement. Wildlife movement through this area between SJWA and the Badlands is generally anticipated to take place further to the south, across the Mystic Lake portion of the SJWA. The 2018 RSFEIR acknowledges that roadkill from vehicle traffic on Gilman Springs Road will occur but the impacts will be less than significant “as long as the County coordinates with the Resource Conservation Agency and takes wildlife movement between Core H and proposed Core 3 into account when designing and improving Gilman Springs Road” (2018 RSFEIR page 4.4-67).

The appropriate resolution for increased traffic on Gilman Springs Road is payment of the Project’s fair share of the improvements to Gilman Springs Road, including provisions for wildlife movement or crossings (2018 RSFEIR page 4.4-61). Payment of the required MSHCP developer fees will contribute toward the design and implementation of wildlife crossings, which would be located in areas not directly associated with the WLC project.

Response to Comment 3-B1-5: The comment recommends that CDFW review and approve translocation plans for sensitive plant and wildlife species and provides recommended language to revise the mitigation measures. Please see Responses to Comments 3-B1-15, 3-B1-16 and 3-B1-17 below regarding modifications to mitigation measures for sensitive plant species, burrowing owl and Los Angeles pocket mouse.

Response to Comment 3-B1-6: The comment states that the mitigation measures for translocation of sensitive plant and wildlife species do not include specific or enforceable language to identify the responsible entity for funding such measures. The comment provides recommended revisions to the mitigation measures to identify the Project applicant to be responsible for mitigation costs. Please see Responses to Comments 3-B1-15, 3-B1-16 and 3-B1-17 below regarding modifications to mitigation measures for sensitive plant species, burrowing owl and Los Angeles pocket mouse and financial responsibility.

Response to Comment 3-B1-7: The comment states that the development of a required Biological Resource Management Plan is to be reviewed in consultation with the SJWA area manager and requests that the City contact CDFW for discussion of the Biological Resource Management Plan. Please see Response to Comment 3-B1-24 below regarding modification to Mitigation Measure 4.4.6.3F and consultation with CDFW.

Response to Comment 3-B1-8: The comment references the Fuel Management Plan required by the

mitigation measures and provides revised specific language to the mitigation measure to verify protection of the SJWA. Please see Response to Comment 3-B1-25 below regarding modification to Mitigation Measure 4.4.6.3J and application to SJWA properties.

Response to Comment 3-B1-9: The comment thanks the City for the opportunity to comment on the WLC project and asks that their email and comment letter be provided to the Planning Commission prior to May 14, 2020 public hearing. All materials received prior to the public hearing were provided to the Planning Commission. No specific comments on the contents of the Revised Final EIR are provided by this comment.

Response to Comment 3-B1-10: The comment thanks the City for the opportunity to comment on the WLC project and the Revised Final EIR. No specific comments on the contents of the Revised Final EIR are provided by this comment.

Response to Comment 3-B1-11: The comment expresses the general CDFW concern about the adequacy of the assessment on impacts to the SJWA and the adequacy of the mitigation measures for biological resources. The comment indicates that revised mitigation edits are recommended in the following comments to improve specificity and enforceability of the mitigation measures, which are addressed below.

Response to Comment 3-B1-12: The comment summarizes the role of the CDFW as a Trustee Agency in conserving and protecting the fish, wildlife, native plants and their habitats. In addition, as a Trustee Agency, CDFW provides biological expertise on environmental efforts that may adversely affect fish and wildlife resources. No specific comments on the contents of the Revised Final EIR are provided by this comment.

Response to Comment 3-B1-13: The comment summarizes the role of the CDFW as a Responsible Agency as a regulatory authority provided by the California Fish and Game Code. The comment references potential regulatory jurisdiction under Fish and Game Code Section 1600 *et seq.* and Section 2050 *et seq.* No specific comments on the contents of the Revised Final EIR are provided by this comment.

Response to Comment 3-B1-14: The comment states that CDFW previously provided comments on the Draft EIR on April 8, 2013, on the Final EIR on June 11, 2015 and the Determination of Biologically Equivalent or Superior Preservation (DBESP) on December 19, 2014. No specific comments on the contents of the Revised Final EIR are provided by this comment.

Response to Comment 3-B1-15: The comment provides specific recommendations to revise the sensitive plant species Mitigation Measure 4.4.5.2A (identified as MM 4.4.6.2A in the CDFW letter) because CDFW is concerned that the City's planning official will not be sufficiently qualified to review a translocation plan.

After review of the May 13, 2020 CDFW comment on this mitigation measure, the City accepts the following revision to Mitigation Measure 4.4.5.2A (RSFEIR page 4.4.63).

4.4.5.2A Each Plot Plan application shall include a focused plant survey of the proposed development site prepared by a qualified biologist to identify if any of the following sensitive plants (i.e., Coulter's goldfields, smooth tarplant, Plummer's mariposa lily, or thread-leaved brodiaea) are present. If any of the listed plants are found, the City will consult with the California Department of Fish and Wildlife (CDFW) and the U.S. Fish and Wildlife Service (USFWS). If translocation

of the species is deemed appropriate by CDFW and/or USFWS a translocation plan shall be developed and submitted to CDFW and USFWS for review. They may be relocated to the 250-foot setback area outlined in the Specific Plan and discussed in Mitigation Measure 4.4.6.1A. Alternatively, at the applicant's discretion, an impact fee may be paid to the Western Riverside County Regional Conservation Authority (RCA) or other appropriate conservation organizations to offset for the loss of these species. This measure shall be implemented to the satisfaction of the Planning Official.

Response to Comment 3-B1-16: The comment references burrowing owl Mitigation Measure 4.4.6.3D (identified as MM 4.4.6.4D in the CDFW letter) and explicitly indicating that the proposed 250-foot setback area from the northern SJWA boundary and WLC Specific Plan Planning Area 30 are not appropriate locations to relocate burrowing owls. The commenter also writes that the financial responsibility for any translocation and subsequent management should be the Project Applicant. After review of the May 13, 2020 CDFW comment on this mitigation measure, the City accepts the following revision to Mitigation Measure 4.4.6.3D (RSFEIR page 4.4.80).

4.4.6.3D A pre-construction clearance survey for burrowing owl shall be conducted by a qualified biologist no more than thirty (30) days prior to any grading or ground disturbing activities within the WLC site.

In the event no burrowing owls are observed within the limits of ground disturbance, no further mitigation is required.

If construction is to be initiated during the breeding season (February 1 through August 31) and burrowing owl is determined to occupy any portion of the disturbance area during the 30-day pre-construction survey, construction activity shall maintain a 500-foot buffer area around any active nest/burrow until it has been determined that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow. If this avoidance buffer cannot be maintained, consultation with the California Department of Fish and Wildlife (CDFW) shall take place and an appropriate avoidance distance established. No disturbance to active burrows shall occur without appropriate permitting through the Migratory Bird Treaty Act and/or California Department of Fish and Wildlife.

If active burrowing owl burrows are detected outside the breeding season (September through January), or within the breeding season but owls are not nesting or in the process of nesting, active and/or passive relocation may be conducted following consultation with the California Department of Fish and Wildlife (CDFW), U.S. Fish and Wildlife Service (USFWS), and the Western Riverside County Regional Conservation Authority (RCA). A relocation plan may will be required by California Department of Fish and Wildlife CDFW, the USFWS, and the RCA if active and/or passive relocation is necessary. The relocation plan shall outline the basic process and provides options for avoidance and mitigation, identify short- and long-term habitat management needs of the receiver site, and identify the entity responsible for all financial costs associated with the relocation plan and long-term management of the receiver site. Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor in consultation with CDFW.

A relocation plan ~~will~~ may be required by California Department of Fish and Wildlife if active or passive relocation is necessary. Artificial burrows may be constructed within appropriate burrowing owl habitat within the proposed open space/conservation area (Planning Area 30), a 74.3-acre area in the southwest portion of the Specific Plan. This area abuts the Lake Perris State Recreation Area (LPSRA) which is already in conservation. If suitable habitat is not present in Planning Area 30, owls may be relocated following consultation with the CDFW, the USFWS, and RCA, to habitat deemed suitable by CDFW, the USFWS, and RCA (which may include ~~to~~ the SJWA, the 250-foot setback area or other suitable on-site or off-site areas). Construction activity may occur within 500 feet of the burrows at the discretion of the biological monitor, following consultation with CDFW, the USFWS, and RCA.

Response to Comment 3-B1-17: The comment references Los Angeles pocket mouse Mitigation Measure 4.4.6.3E (identified as MM 4.4.6.4E in the CDFW letter) because CDFW is concerned that City staff will not be appropriately qualified to review a translocation plan. Also of concern to CDFW is the potential use of the 250-foot setback area as a translocation receiver site and the financial responsibility to implement the mitigation measure.

After review of the May 13, 2020 CDFW comment on this mitigation measure, the City accepts the following revision to Mitigation Measure 4.4.6.3E (RSFEIR page 4.4.81).

4.4.6.3E Prior to the approval of any Plot Plans proposing the development of land including or adjacent to Drainage 9, a protocol survey for the Los Angeles Pocket Mouse (LAPM), including 100 feet upstream and downstream of the affected reach shall be prepared by a qualified biologist and submitted to CDFW and the USFWS for review prior to submission to the City. If the affected drainage is not occupied, the area is considered not to be occupied and development can continue without further action. If the species is found within the specific survey area, no development shall occur until an appropriate mitigation fee is paid or appropriate amount of land set aside on the WLC site or off site to compensate for any loss of occupied Los Angeles Pocket Mouse habitat. Alternatively, individuals may be relocated to locations pre-approved by CDFW and the USFWS (which may include ~~to~~ the 250-foot setback zone along the southern boundary of the property identified in Mitigation Measure 4.4.6.1A, or other appropriate areas). ~~as determined by the United States Fish and Wildlife Service.~~ All costs associated with the relocation, as well as short- and long-term management and monitoring of the receiver site shall be the responsibility of the Project Applicant. If necessary, this measure shall also be coordinated with Mitigation Measure 4.4.6.2B regarding preparation and processing of a Determination of a Biological Equivalent or Superior Preservation report. This measure shall be implemented to the satisfaction of the City Planning Division following coordination with CDFW and the USFWS.

Response to Comment 3-B1-18: The comment references Fish and Game Code Section 1602 Mitigation Measure 4.4.6.2C (identified as MM 4.4.6.3C in the CDFW letter) because the Revised Final EIR references a 2012 jurisdictional delineation, which is not current for the processing of a Lake or Streambed Alteration application. Also of concern to CDFW are unintended errors included in the mitigation measure.

After review of the May 13, 2020 CDFW comment on this mitigation measure, the City accepts the following revision to Mitigation Measure 4.4.6.2C (RSFEIR page 4.4.77).

4.4.6.2C Prior to issuance of any grading permit for any offsite improvements that support development within the WLC site, the developer shall retain a qualified biologist to prepare a jurisdictional delineation (JD) for any drainage channels affected by construction of the offsite improvements. This jurisdictional delineation shall be submitted to the U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board, and California Department of Fish and Wildlife (CDFW) for review and concurrence. ~~If the offsite improvements are deemed by the regulatory agencies to not require regulatory permits/agreements, a written copy of this determination shall be submitted to the City will not affect any identified jurisdictional areas, no United States Army Corps of Engineers permitting is required.~~ The Applicant shall consult with ~~However, permitting through the Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (i.e., Streambed Alteration Agreement) may still be required for these improvements. The applicant shall consult with and~~ United States Army Corps of Engineers, California Department of Fish and Wildlife and Regional Water Quality Control Board to establish the need for permits based on the results of the current stream mapping 2012 jurisdictional delineation and final design plans for each of the proposed the facilities. Consultation with the three agencies shall take place and appropriate permits obtained. Compensation for losses associated with any altered offsite drainages shall be in agreement with the permit conditions with a minimum 1:1 mitigation ratio. Any landscaping associated with these offsite improvements shall use only native species to help protect biological resources residing within or traveling through these drainages per Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Table 6.1.2. This measure shall be implemented to the satisfaction of the City Planning Division in consultation with the Regional Water Quality Control Board ~~U.S. Fish and Wildlife Service~~, U.S. Army Corps of Engineers, and the California Department of Fish and Wildlife.

Response to Comment 3-B1-19: The comment references the WLC fencing along Gilman Springs Road and the southern WLC project boundary shared with SJWA. The comment concurs that fencing is appropriate in certain circumstances and that fencing along Gilman Springs Road should be designed to minimize wildlife movement onto the WLC site. CDFW recommends the inclusion of a new mitigation measure to require fencing along Gilman Springs Road and on the southern WLC property boundary.

Section 5.2.12 Walls and Fences of the WLC Specific Plan describes that walls and fences must be designed as an integral part of the overall architectural or landscaping design concept. Within designated edge treatment areas (Planning Areas 10 and 12) along the SJWA boundary, special fencing shall be used to restrict animals from passing between the SJWA property and the project site. This fencing shall be of a durable material (metal or plastic) and shall be partially buried to resist burrowing animals. Plot Plans shall include all site fencing details.

The proposed mitigation measure to require the review of fencing plans by the City and CDFW prior to the issuance of a grading permit is not tied to any specific biological resource impact. The WLC site does not contain any designated wildlife movement corridors or MSHCP linkages. The EIR concludes that impacts related to wildlife movement are less than significant, and no mitigation is needed. The commenter did not

provide evidence to change this conclusion. Consequently, the City does not determine that a mitigation measure is necessary for a less than significant impact.

Response to Comment 3-B1-20: The comment expresses concern about wildlife movement from SJWA, adjacent on the south and the San Timoteo Badlands to the northeast of the WLC site and adjacent along Gilman Springs Road. The comment states that the WLC project would create an obstruction to wildlife movement between the Badlands and open areas to the south. CDFW recommends the inclusion of a new mitigation measure to require wildlife fencing along Gilman Springs Road and State Route 60. Wildlife movement success within the Badlands will depend on circumventing the barrier that State Route 60 currently imposes on wildlife. The area with the best wildlife resources south of State Route 60 is the SWJA. The nearest linkage area as identified under the MSHCP is Proposed Linkage 5, which is located approximately 3 miles north of the WLC site and Proposed Constrained Link 20, which is approximately 3.6 miles south of the WLC site. The development of the WLC site will not impede the movement of any wildlife at these linkages. Wildlife movement onto the WLC site currently faces a substantial obstacle to movement in State Route 60 on the north and Gilman Springs Road on the east. While there may exist current wildlife linkages with culverts or nighttime movements, the WLC site will increasingly lose the current marginal habitat to support wildlife species through Project buildout. The Specific Plan includes provisions for fencing or walls where appropriate, and whose design will be primarily to exclude wildlife from entering the WLC site. The EIR concludes that the WLC project will not affect any wildlife movement corridor. Consequently, the City does not determine that a mitigation measure is necessary for a less than significant impact.

Response to Comment 3-B1-21: The comment states that increased traffic associated with the WLC project would significantly affect wildlife movement between Core H (Lake Perris and SJWA to the south) and proposed Core 3 (the Badlands east of the WLC site and SJWA). The comment recommends a new mitigation measure be included to assist in funding wildlife crossing improvements in order to enforce funding by the WLC project. Migratory corridors/linkages are described in Section 4.4.1.11.g of the 2018 RSFEIR (page 4.4-38). Both the southern portion of the WLC Specific Plan area and the northern portion of the SJWA do not provide suitable habitat or resources to support wildlife migration or regular wildlife movement. Wildlife movement through this area between SJWA and the Badlands is generally anticipated to take place further to the south, across the Mystic Lake portion of the SJWA. The 2018 RSFEIR acknowledges that roadkill from vehicle traffic on Gilman Springs Road will occur but the impacts will be less than significant “as long as the County coordinates with the Resource Conservation Agency and takes wildlife movement between Core H and proposed Core 3 into account when designing and improving Gilman Springs Road” (2018 RSFEIR page 4.4-67). The appropriate resolution for increased traffic on Gilman Springs Road is payment of the Project’s fair share of the improvements to Gilman Springs Road, including provisions for wildlife movement or crossings (2018 RSFEIR page 4.4-61). Payment of the required MSHCP developer fees will contribute toward the design and implementation of wildlife crossings, which would be located in areas not directly associated with the WLC project. The City concludes that a new mitigation measure is not necessary for a less than significant impact.

Response to Comment 3-B1-22: The comment expresses the CDFW concern regarding impact to hunting areas within the northern portion of the SWJA.

Please see Response to Comment 3-B1-2 above that concludes the programmatic project features of the WLC Specific Plan would reduce potential interface issues between the WLC site and the SJWA, and no further expansion of the setback area along the boundary with the SJWA is required.

Response to Comment 3-B1-23: The comment expresses the concern that payment of required mitigation fees for development within the MSHCP and the Stephen's kangaroo rat HCP may not be enforceable. The comment recommends the inclusion of a new mitigation measure to require payment of the mitigation fees prior to the issuance of a grading permit. This mitigation is unnecessary because the City already includes a mechanism for the collection of the required MSHCP and HCP fees for new development (Mitigation Measure 4.4.6.3C and City of Moreno Valley Municipal Code Title 3, Chapter 8.60, pursuant to Fee Resolution 89-92).

Response to Comment 3-B1-24: The comment references the Resource Management Mitigation Measure 4.4.6.3F (identified as MM 4.4.6.4F in the CDFW letter) because CDFW is concerned that the SJWA manager workload may not allow availability for review of the Biological Resource Management Plan at the time of submittal. After review of the May 13, 2020 CDFW comment on this mitigation measure, the City accepts the following revision to Mitigation Measure 4.4.6.3F (RSFEIR page 4.4.81).

4.4.6.3F Prior to approval of any discretionary permits for development within Planning Areas 10 and 12, a Biological Resource Management Plan (BRMP) shall be prepared to prescribe how the 250-foot setback area outlined in Mitigation Measure 4.4.6.1A will be developed and maintained. This plan shall identify frequent and infrequent vegetation management requirements (i.e., removal of invasive plants) and the planting and maintaining trees to provide roosting and nesting opportunities for raptors and other birds. The Biological Resource Management Plan shall also describe how relocation of listed or sensitive species will occur from other locations as outlined in Mitigation Measures 4.4.5.2A, 4.4.6.3D, and 4.4.6.3E.

The Biological Resource Management Plan shall be reviewed and approved by the Planning Official in consultation with California Department of Fish and Wildlife ~~the San Jacinto Wildlife Area Manager~~. The Biological Resource Management Plan shall cover all the land within the 250-foot setback zone within Planning Areas 10 and 12. Implementation of the plan shall be supervised by a qualified biologist, to the satisfaction of the City Planning Division.

The above revision to mitigation measure 4.15.7.4E is provided in the Mitigation Monitoring and Reporting Program.

Response to Comment 3-B1-25: The comment references the Fuel Management Plan Mitigation Measure 4.4.6.3J (identified as MM 4.4.6.4J in the CDFW letter) in requesting that the mitigation measure language to include protection of the SJWA lands to the south.

After review of the May 13, 2020 CDFW comment on this mitigation measure, the City accepts the following revision to Mitigation Measure 4.4.6.3J (RSFEIR page 4.4.82).

4.4.6.3J A Fuel Management Plan shall be prepared on a project-by-project basis for those Planning Areas adjacent to the south and east boundary of the WLC site adjacent to Western Riverside County Multiple Species Habitat Conservation Plan Conservation Areas and/or San Jacinto

Wildlife Area (SJWA) lands. The Fuel Management Plan shall be prepared by the project applicant and submitted for approval ~~to the~~ prior to plot plan approval for those projects on the southern and eastern Western Riverside County Multiple Species Habitat Conservation Plan and/or SJWA boundary. Per the Western Riverside County Multiple Species Habitat Conservation Plan guidelines, the Fuel Management Plan shall include the following:

- A plant palette of adequate plant species that may be planted within the Fuel Management Area, which will be approved by a biologist familiar with the plant requirements of the area.
- A list of non-native invasive plants that are prohibited from installation.
- Maintenance activities and a maintenance schedule.

Fuel modification zones shall be mapped and include an impact assessment as required under California Environmental Quality Act guidelines for a project-level analysis. The plan shall demonstrate that the adjacent Western Riverside County Multiple Species Habitat Conservation Plan Areas and SJWA lands are adequately protected from expected fire risks.

Response to Comment 3-B1-26: The comment correctly cites minor errors found in the RSFEIR where the Regional Conservation Authority is listed as Resource Conservation Agency in Mitigation Measures 4.4.5.2B and 4.4.6.2B

Based on the error, the following revisions to Mitigation Measures 4.4.5.2B (RSFEIR page 4.4.63) and 4.4.6.2B (RSFEIR page 4.4.76) are made.

4.4.5.2B Prior to the approval of any tentative maps for development including or adjacent to any Criteria Cells identified in the Western Riverside County Multiple Species Habitat Conservation Plan, the applicant shall prepare and process a Joint Project Review (JPR) with the Riverside County ~~Resource-Regional Conservation Agency-Authority~~ (RCA). All criteria cells shall be identified on all such tentative maps. This measure shall be implemented to the satisfaction of the City Planning Division and Riverside County ~~Resource Regional Conservation Agency-Authority~~ (“RCA”).

4.4.6.2B As required by the ~~Resource-Regional Conservation Agency-Authority~~ (RCA), a program-level Determination of a Biological Equivalent or Superior Preservation (DBESP) for impacts to Riverine/Riparian habitat has been prepared and shall be approved by the ~~Resource-Regional Conservation Agency-Authority~~ prior to project grading permit approval. The Determination of a Biological Equivalent or Superior Preservation includes a general discussion of mitigation options for impacts to riverine/riparian areas as well as general location and size of the mitigation area and includes a monitoring program.

If impacts to riparian habitat within the WLC site cannot be avoided at the time of specific development, then a separate project-level Determination of Biologically Equivalent or Superior Preservation (DBESP) shall be prepared to identify project-specific impacts to riparian habitat and incorporate mitigation options identified in Mitigation Measure 4.4.6.2A.

A project-level Determination of a Biological Equivalent or Superior Preservation for each specific development shall be prepared to document measures to reduce impacts to riparian/riverine habitats in accordance with the Western Riverside County Multiple species Habitat Conservation Plan (MSHCP). The project-level Determination of a Biological Equivalent or Superior Preservation shall include specific measures to reduce impacts to riparian areas and provide mitigation in the form of onsite preservation of riparian areas and/or a combination of compensation through purchase and placement of lands with riparian/riverine habitat into permanent conservation through a conservation easement and/or restoration or enhancement efforts at offsite or onsite locations. Mitigation required for compensation for impacts to riparian/riverine areas shall require a minimum of 1:1 mitigation ratio of riparian/riverine mitigation land.

As outlined in the WLC programmatic DBESP, erosion control improvements shall be installed within Drainage 9 to reduce sediment transport, and additional riparian habitat shall be enhanced within this drainage following the installation of the erosion control improvements (MM DBESP 4 and 5).

Response to Comment 3-B1-27: The comment requests that any special-status species or natural communities detected during Project surveys be reported to the California Natural Diversity Database (CNDDDB). The City concurs with this comment and will remind the environmental consultants conducting the Project surveys to report such occurrences to the CNDDDB.

Response to Comment 3-B1-28: The comment concludes that the Project would have an impact on fish and/or wildlife and consequently filing fees are necessary. The City concurs with this comment and will pay the required filing fees at the time the Notice of Determination is issued.

Response to Comment 3-B1-29: The comment thanks the City the opportunity to comment on the Revised Final EIR and provided appropriate timing and responsible party recommendations for the new mitigation measures recommend in this comment letter. The City welcomes the constructive comments provide by the CDFW and will incorporate the mitigation recommendations as discussed in the earlier comments above.

Response to Comment 3-B1-30: The comment is the ending of the letter and has no specific comments on the Revised Final EIR. No specific comments on the contents of the Revised Final EIR are provided by this comment.

Response to Comment 3-B1-31: The comment provides mitigation language for WLC project fencing. See Response to Comment 3-B1-3 and 3-B1-19 above.

Response to Comment 3-B1-32: The comment provides mitigation language for WLC project wildlife fencing. See Response to Comment 3-B1-3 and 3-B1-20 above.

Response to Comment 3-B1-33: The comment provides mitigation language for WLC project wildlife crossing improvements. See Response to Comment 3-B1-21 above.

Response to Comment 3-B1-34: The comment provides mitigation language for WLC project mitigation

fee payment for both the Western Riverside County MSHCP and the Stephen's kangaroo rat HCP. See Response to Comment 3-B1-23 above.

**RE: World Logistics Center Revised Final Environmental Impact Report
(SCH # 2012021045)**

Dear Ms. Descoteaux:

Attorney General Xavier Becerra, in his independent capacity,¹ and the California Air Resources Board (CARB) jointly submit the following comments on the April 2020 Final Environmental Impact Report (FEIR) prepared for the World Logistics Center (the Project) in advance of the Project’s May 14, 2020 Moreno Valley (City) Planning Commission hearing.

3-B2-1

The Attorney General and CARB have the following concerns regarding the FEIR, as explained in detail below:

1. The FEIR does not correct the improper GHG analysis the Attorney General and CARB critiqued in multiple comment letters on prior versions of the Project’s environmental impact report.²

3-B2-2

¹ The Attorney General’s Office submits these comments pursuant to his independent power and duty to protect the environment and natural resources of the State from pollution, impairment, or destruction, and in furtherance of the public interest. (See Cal. Const., art. V, § 13; Gov. Code, §§ 12511, 12600–12612; *D’Amico v. Bd. of Medical Examiners* (1974) 11 Cal.3d 1, 14–15.) This letter is not intended, and should not be construed, as an exhaustive discussion of the FEIR’s compliance with the California Environmental Quality Act (CEQA).

² The Attorney General and CARB previously reviewed the City’s July 2018 Revised Final Environmental Impact Report (RFEIR) and submitted comments regarding the RFEIR on September 7, 2018. As noted in those comment letters, the RFEIR’s analysis of greenhouse gas (GHG) related impacts does not meet CEQA’s requirements. On January 30, 2020, CARB also

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Ms. Descoteaux
May 14, 2020
Page 2

- 2. The FEIR also continues to misrepresent CARB’s positions.
- 3. The FEIR’s new GHG Mitigation Measure 4.7.7.1 is inadequate.
- 4. The FEIR fails to adopt feasible mitigation measures that would substantially lessen the Project’s significant adverse effects.
- 5. The addition of Mitigation Measure 4.7.7.1 is “significant information” that requires recirculation of the FEIR.

3-B2-2
CONT.

Until these shortcomings are corrected, the FEIR should not be certified by the City.

I. THE FEIR CONTINUES TO RELY ON ENVIRONMENTALLY IRRESPONSIBLE AND LEGALLY FLAWED ARGUMENTS TO AVOID PROPERLY ANALYZING AND MITIGATING THE PROJECT’S ENORMOUS GREENHOUSE GAS IMPACTS.

Under CEQA, a project’s significant GHG impacts must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact. 14 Cal. Code Regs. (CEQA Guidelines) § 15064.4. Yet, the FEIR continues to improperly divide the Project’s GHG emissions into two categories, which it terms “capped” and “uncapped”; classifications that are created by the FEIR and have no relevance under CEQA. The FEIR asserts that “capped” emissions are “covered” by CARB’s Cap-and-Trade Program, and therefore claims that they are exempt from any further CEQA analysis or mitigation.³

3-B2-3

To purportedly support its improper approach to GHG analysis and mitigation, the FEIR relies on a few weak, misguided bases: (1) two mitigated negative declarations (MND); (2) an outdated guidance document from an air district with no jurisdiction in the South Coast Air Basin; (3) an inapposite appellate court decision that did not benefit from the input of California’s expert agencies and other key stakeholders, and (4) unsupported arguments about indirect costs.

The FEIR does not, and cannot, explain why its GHG analysis and mitigation approach did not comply with the CEQA Guidelines, applicable case law, and other relevant guidance regarding GHG analysis and mitigation. In addition, the FEIR ignores the objections in our previous comment letters.

filed comments on the Draft Recirculated Revised Sections of the Final Environmental Impact Report (RRSFEIR). These three comment letters are attached to this letter as Exhibits A-C. Further, the Attorney General and CARB’s amicus brief in *Paulek et al. v. Moreno Valley Community Services District et al.* (E071184) (*Paulek*), which further discusses the legal inadequacies of the GHG analysis, is attached hereto as Exhibit D.

³ Though Mitigation Measure 4.7.7.1 agrees to offset “capped” emissions in the event the City’s GHG analysis is invalidated in *Paulek*, the improper legal arguments regarding the distinction between “capped” and “uncapped” emissions will remain.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Ms. Descoteaux
May 14, 2020
Page 3

The City cites the San Joaquin Valley Air Pollution Control District (SJVAPCD) Policy APR-2025, issued in 2014, and two MNDs approved by SCAQMD in 2014. The City states that its approach has been applied “for years” in light of those same documents. (FEIR at 23.) However, as the California Supreme Court has repeatedly held in more recent years, GHG law continues to evolve, and lead agencies have an obligation under CEQA to “stay in step.” *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 504 (*SANDAG*).⁴ The documents the City relied on are out of date and not the appropriate guidance for analyzing GHG impacts under CEQA.

Note that in 2014, the California Supreme Court had not yet issued its seminal *Newhall* decision, which was published on November 30, 2015. *Center for Biological Diversity v. Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 230 (*Newhall*). The Court then issued the *SANDAG* decision on July 13, 2017. (*SANDAG, supra*, (2017) 3 Cal.5th 497.) The FEIR ignores post-2014 materials that establish its approach is unlawful, including the *SANDAG* California Supreme Court decision referenced above, as well as CARB’s 2017 Scoping Plan.⁵

The City also relies on *Association of Irrigated Residents v. Kern County Board of Supervisors* (2017) 17 Cal.App.5th 708 (*AIR*). However, as previously noted, *AIR* did not broadly validate the City’s approach of excluding all fuel and electricity related emissions from its GHG analysis, particularly for a project that is not regulated by the Cap-and-Trade Regulation. (See FEIR at 22, 23.) That issue simply was not before the court, and was not given due consideration as a result. (See Exhibit A at 6; Exhibit B at 11-12; Exhibit D at 30-31.) *AIR* is thus inapposite.

Finally, the City also attempts to argue that the Project would effectively be paying for GHG mitigation through fuel and electrical costs passed down to the end consumer. (FEIR at 18-19.) It still remains unclear how there would be any price signal to Project proponents in this situation, given that any fuel-related costs would be paid by the fuel suppliers, and potentially passed down to the Project’s tenant logistics companies. Regardless, these fuel costs would not be paid by the Project proponents.

⁴ As the California Supreme Court has held, “CEQA requires public agencies ... to ensure that such analysis stay in step with evolving scientific knowledge and state regulatory schemes.” (*SANDAG* at 504.) The Court viewed the Scoping Plan as a particularly useful source of information, given the extensive study and public participation involved in its preparation. (*Ibid.*) A recent article provides a useful primer on this body of law. (See Janill Richards, *The SANDAG Decision: How Lead Agencies Can “Stay in Step” with Law and Science in Addressing the Climate Impacts of Large-Scale Planning and Infrastructure Projects* (2017) 26:2 Environmental Law News 17.)

⁵ Available at https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. See, in particular, the “Climate Action through Local Planning and Permitting” chapter beginning at page 99, which describes the critical role played by local government contributions to CEQA reductions, including through the CEQA review process. See also CARB’s 2018 comment letter for more information on this point.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Ms. Descoteaux
May 14, 2020
Page 4

In sum, the City’s weak attempts to support the FEIR’s unlawful GHG analysis and mitigation approach are without merit. Thus, the FEIR violates CEQA by failing to fully analyze and mitigate the significant GHG impacts of the Project.

3-B2-3
CONT.

II. THE FEIR CONTINUES TO INCORRECTLY CLAIM THAT CARB SUPPORTS THE WLC’S GHG APPROACH.

The FEIR continues to misrepresent CARB’s views on GHG analysis and mitigation.⁶ As noted in CARB’s September 7, 2018 letter and in its *Paulek* amicus brief, CARB does not support the approach proposed; the approach is unlawful, inconsistent with relevant climate plans and regulations, and likely to set back the state’s climate mitigation efforts if applied. Once again, the Cap-and-Trade Program was not designed to mitigate all GHG impacts associated with land use planning decisions. Rather, it was designed with responsible local CEQA compliance in mind as a complementary strategy. (See, e.g., 2017 Scoping Plan at 99-102.) Cap-and-Trade, which is neither tailored to nor affected by the Project, simply does not provide project-level mitigation in this case.

3-B2-4

The FEIR points to several cherry-picked provisions from the 2011 Final Statement of Reasons for the Cap-and-Trade Project. (FEIR at 18-19.) Yet it fails to explain why there is not a single provision, from any point in time, indicating that CARB intended Cap-and-Trade compliance to constitute CEQA mitigation for unregulated entities and projects, or that it excuses land use projects wholesale from evaluating or mitigating their GHG emissions. Cap-and-Trade does not and CARB plainly never intended Cap-and-Trade to obviate CEQA mitigation requirements; that is a much bigger change that CARB would have expressly addressed had that been the intent. While the FEIR points out selected Scoping Plan provisions (FEIR at 25), it conveniently omits the directly applicable “Climate Action through Local Planning and Permitting” chapter describing how CARB relies on complimentary local planning actions (including robust CEQA analysis and mitigation) to accomplish the state’s GHG mandates and goals. (See 2017 Scoping Plan at 99-102.) The City’s approach would effectively render superfluous the CEQA mitigation recommendations in CARB’s Scoping Plan, as there would be essentially nothing left to mitigate if agencies took the City’s approach. It would also allow lead agencies to disregard their CEQA obligations and make less informed decisions. (See, e.g.,

3-B2-5

⁶ In the *Paulek* litigation, attorneys for the developer argued that because CARB did not specifically object to the project’s GHG significance methodology in its early comment letters, CARB “apparently had no problem with the EIRs not counting capped emissions against the [WLC] in order to determine the significance of greenhouse gas emissions.” (Transcript of January 22, 2018 hearing in *Paulek* case, before Hon. Sharon J. Waters, p. 18, lines 3–7.) The City has failed to address this issue or otherwise correct this clear and consequential misrepresentation in its responses to comments.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Ms. Descoteaux
May 14, 2020
Page 5

SANDAG, supra, 3 Cal.5th at p. 519 [“nothing we say today invites regional planners to ‘shirk their responsibilities’ under CEQA”].)

3-B2-5
CONT.

Despite failing to mitigate 95% of the Project’s emissions, the FEIR appears to claim that the Project would be consistent with the “Climate Action through Local Planning and Permitting” chapter of the Scoping Plan mentioned above. (FEIR at 29.) This is incorrect. As noted above, that chapter of the Scoping Plan discusses how the State needs more, not less, responsible GHG planning and mitigation from project developers and lead agencies. Here, the City seeks to avoid almost entirely its obligation to mitigate its GHG emissions.

3-B2-6

III. THE NEW GHG MITIGATION MEASURE 4.7.7.1 IS INADEQUATE.

As stated in our previous comments, under CEQA, the City must revise the FEIR to analyze all of the Project’s significant impacts relating to GHG emissions, including capped emissions. The FEIR must also adopt all feasible mitigation to address the Project’s significant GHG impacts. (*Newhall, supra*, 62 Cal.4th at p. 231.) Instead, the City revised the FEIR to add a mitigation measure for the Project, but this measure does not correct the FEIR’s CEQA violations. The new GHG mitigation measure would require the Project to purchase GHG offsets to mitigate its emissions, but only if the City loses the *Paulek* appellate litigation. (Measure 4.7.7.1.) This measure is inadequate for multiple reasons.

First, the City should adopt meaningful GHG mitigation measures in the FEIR, rather than continuing to avoid its responsibility to require mitigation unless specifically so ordered by a court. The City has conceded that such a measure is feasible by including its contingent GHG mitigation measure in the FEIR. (CEQA Guidelines, § 15092, subd. (b)(2)(A) [“A public agency shall not decide to approve or carry out a project for which an EIR was prepared unless . . . [t]he agency has . . . [e]liminated or substantially lessened all significant effects on the environment where feasible.”].) Indeed, more beneficial mitigation measures are feasible – including the use, for instance, of electrified trucks for the Project, which would reduce both GHGs and air pollution risk, as CARB has long recommended. Yet, the Project has not even adopted its inadequate offset measure, much less failed to explained why it has not adopted ostensibly feasible measures presented by CARB regarding design changes to favor zero emission vehicles. There is no indication in the record that even a more robust, legally-adequate GHG mitigation measure would be infeasible for the Project.

3-B2-7

Second, the proposed measure, if it ever becomes effective, may not actually reduce the Project’s GHG emissions. Mitigation Measure 4.7.7.1 uses similar language to CARB’s offsets program, it lacks the essential safeguards that make CARB’s program successful. For example, the measure states that any offsets used must be “real, permanent, additional, quantifiable, verifiable, and enforceable by an appropriate agency.” (FEIR at 36.) However, these terms are not defined in the mitigation measure. They are left to the sole interpretation and discretion of the City’s Planning Official and thus not enforceable as CEQA requires. (See Pub. Resources Code, § 21081.6, subd. (b); CEQA Guidelines, § 15126.4, subd. (a)(2).) There is a broad continuum of voluntary-market offsets available for purchase by project proponents, ranging

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Ms. Descoteaux
May 14, 2020
Page 6

from ineffective and unenforceable to rigorous. It remains unclear which types of offsets would be deemed by the City’s Planning Official to meet these undefined criteria.

In the land-use planning context, offsets—particularly offsets that are not tied to local projects—have distinct disadvantages as compared to on-site mitigation or other direct emission reduction measures. Offsets do not provide the important co-benefits of on-site mitigation such as local jobs, reduced local air pollution, local infrastructure and efficiency improvements. (See e.g. 2017 Scoping Plan at 102 (“CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from [vehicle miles traveled], and direct investments in GHG reductions within the project’s region that contribute potential air quality, health, and economic co-benefits locally.”) This is why the 2017 Scoping Plan prioritizes local direct investments, and recommends turning to offset credits “[w]here further project design or regional investments are infeasible or not proven to be effective.” (2017 Scoping Plan at 102.) The proposed measure, by contrast, does not obligate the Project to first consider additional direct reductions, or other local or regional GHG emissions reductions, before deciding to purchase offsets. Such direct or local measures could otherwise benefit those in the Project vicinity. Furthermore, the measure does not in any way limit the percentage of offsets which may be used to mitigate the Project’s GHG emissions, as compared to more direct methods of GHG reduction. California’s Cap-and-Trade Program, for its part, sets a quantitative usage limit, which allows only 4-8% (depending on the calendar year) of an entity’s compliance obligation to be met through surrendering offsets. (See 17 Cal. Code Regs., § 95854.) This helps ensure that offsets are a relatively small part of the overall Cap-and-Trade Program, ensuring that the majority of GHG reductions come from reductions by regulated entities rather than from non-covered sectors.

The FEIR’s proposed measure entirely lacks this protection, instead allowing offsets (even ones that may not actually result in GHG reductions, as described above) as the sole GHG mitigation mechanism. These disadvantages, combined with the lack of any adequate criteria to ensure quality or enforceability of the offsets that may be purchased in this case, make the mitigation measure ineffective and unreliable.

Mitigation Measure 4.7.7.1 also seems to imply that CARB has broadly “approved” the offset registries it lists. The measure’s text states: “Credits registered by a carbon registry approved by the California Air Resources Board, such as, but not limited to, the Climate Action Reserve, American Carbon Registry, Verra (formerly Verified Carbon Standard) or GHG Reduction Exchange (GHG RX), shall be conclusively presumed to meet all of the criteria set forth above.” (FEIR at 36). CARB has approved only the American Carbon Registry, Climate Action Reserve, and Verra for the limited purpose of participation as Offset Project Registries in CARB’s Cap-and-Trade Program, pursuant to the process set forth in section 95986 of Title 17 of the California Code of Regulations. This approval only pertains to the registry’s participation in the Cap-and-Trade Regulation, in connection with issuing CARB offset credits. By contrast, the offsets contemplated by Mitigation Measure 4.7.7.1 are known as “voluntary market” offsets, which are generated under separate protocols adopted by the registries. CARB does not review

3-B2-7
CONT

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Ms. Descoteaux
May 14, 2020
Page 7

these voluntary market protocols. CARB’s “approval” of a registry as an Offset Project Registry under the Cap-and-Trade Program does not mean CARB has reviewed or approved that registry’s voluntary market offset protocols.

Mitigation Measure 4.7.7.1 improperly bypasses onsite and local mitigation and violates CEQA because of its unenforceability and thus must be revised.

IV. THE FEIR IMPROPERLY DECLINES TO ADOPT FEASIBLE MITIGATION MEASURES THAT WOULD SUBSTANTIALLY LESSEN THE PROJECT’S SIGNIFICANT ADVERSE EFFECTS.

The FEIR simultaneously argues the proposed use of offsets and credits is a feasible mitigation measure, and yet refuses to adopt such a measure now by conditioning it on the outcome of the *Paulek* litigation. This approach violates CEQA, which instructs that “public agencies should not approve projects as proposed if there are... feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects.” (Pub. Res. Code 21002). The FEIR recognizes it is possible to offset the entire 232,402 metric tons of GHG from this Project but only guarantees the offset of 8,563 metric tons of GHG emissions. (See FEIR at page 39.) The entire 232,403 metric tons of GHGs will *not* be offset if the “trial court’s judgment in *Paulek* is affirmed after the appellate process is completed or if the appeal is dismissed.” However, if the appeal is dismissed, an appellate court will not have upheld the City’s GHG analysis and, as described above, the City’s misleadingly-named “capped” emissions would be considered a significant environmental effect. These emissions would need to be mitigated, and could be via a feasible and rigorous GHG mitigation measure (as described above). By refusing to adopt such a feasible mitigation measure here, the FEIR violates CEQA. (See CEQA Guidelines, § 15092.)

V. MITIGATION MEASURE 4.7.7.1 IS “SIGNIFICANT NEW INFORMATION” THAT REQUIRES RECIRCULATION OF THE FINAL EIR.

Pursuant to Public Resources Code section 21092.1, Mitigation Measure 4.7.7.1 is “significant new information” that requires a new opportunity for public comment. “Significant new information” includes a new “feasible way to mitigate or avoid [a substantial adverse environmental effect]... that the project’s proponents have declined to implement.” (*Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1129, as modified on denial of reh. (Feb. 24, 1994)). As described above, Mitigation Measure 4.7.7.1 identifies a feasible, although not necessarily proper, way to mitigate the Project’s greenhouse gas emissions, yet declines to adopt such mitigation unconditionally.

When “significant new information... is added to an environmental impact report after notice... but prior to certification” the public agency must “give notice again pursuant to Section 21092... before certifying the environmental impact report.” (Pub. Resources Code, § 21092.1). Notice pursuant to Public Resources Code Section 21092(b)(2) requires a comment period.

However, Mitigation Measure 4.7.7.1 was added to the FEIR through a “Response to Comments on the Revised Sections of the Final EIR and Draft Recirculated Revised Sections of the Final EIR” without any such comment period. Instead, the City simultaneously released that document and a Notice of Completion informing the public that the Moreno Valley Planning Commission would review the Revised FEIR at a public hearing on May 14, 2020. Moreno Valley should have recirculated the EIR and provided an opportunity for public comment on the EIR with the addition of Mitigation Measure 4.7.7.1.⁷

3-B2-9
CONT.

VI. CONCLUSION

The Attorney General and CARB urge the City of Moreno Valley not to certify the FEIR without further revisions to the GHG analysis as described above. As stated in our previous comments, the City must take its obligations as a local government to mitigate climate change impacts seriously. The addition of a weak GHG measure that would apply only if the City’s approach is invalidated on appeal is not enough. However, if the City implements the actions that the state’s expert agencies have requested for years, the Project could be an important environmental leadership project. Indeed, the Project could create jobs by building a world-leading clean logistics project, protecting communities all along its supply chains. We encourage the City to take this opportunity to innovate and to lead. As always, we would be happy to work with the City to take the additional steps needed to fully comply with CEQA’s GHG analysis and proper mitigation requirements for the Project. We appreciate your consideration of our comments.

3-B2-10

Sincerely,

HEATHER LESLIE
Deputy Attorney General

For XAVIER BECERRA
Attorney General

⁷ In its January 30, 2020 comments, CARB informed the City of its concerns with not being able to review the new GHG-related mitigation measure. (See January 30, 2020 CARB comment letter at page 1.) When CARB reached out to a City representative at that time, CARB was informed that the reference to the new GHG mitigation measure was included in the RRSFEIR in error, and it would be removed in the FEIR. Rather than remove that measure, the FEIR now includes a new GHG mitigation measure that has never before been circulated for public review, and which the City had previously indicated would not be part of the FEIR. The City only now has decided to release this measure as part of a vast FEIR package, just 14 days prior to the Project approval hearing.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-B2: STATE OF CALIFORNIA DEPARTMENT OF JUSTICE

Response to Comment 3-B2-1: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-B2-2: The comment summarizes the concerns of the commenter and the content of the comment letter, which are addressed below.

Response to Comment 3-B2-3: Topical Response A, The Use of Cap-and-Trade, and Topical Response B, Scoping Plan, were prepared prior to the submission (with the Applicant's approval) of revisions to Mitigation Measure 4.7.7.1. Mitigation Measure 4.7.7.1 has been revised to mitigate all Project emissions to net zero, not relying on Cap and Trade, and therefore mitigates Project GHG impacts fully. The Project does not violate CEQA and does not fail to fully mitigate GHG impacts. See revisions to Mitigation Measure 4.7.7.1, below.

4.7.7.1 The developer shall mitigate the WLC Project's GHG emissions to net zero by purchasing and retiring ~~providing offsets and/or~~ carbon credits, based upon where the amount of GHG emissions set forth in ~~to be mitigated is either "Total Uncapped" GHG emissions from Table 4.7-8 or "Project Emissions" from new Table 4.7-16 of the Revised Final EIR, depending on the outcome of the appeal in *Paulek v. Morono Valley Community Services District* ("*Paulek*"). If the trial court's judgment in *Paulek* is affirmed after the appellate process is completed or if the appeal is dismissed, then the GHG emissions to be mitigated to net zero will be the "Total Uncapped" GHG emissions from Table 4.7-8. If the trial court's judgment is reversed after the appellate process is completed, then the amount of GHG emissions to be mitigated to net zero will be the "Project Emissions" shown on Table 4.7-16. Upon the purchase and retirement ~~provision of offsets and/or the retirement of~~ carbon credits, no further analysis of capped and uncapped GHG emissions will be required, and no further reduction of those emissions will be required.~~

The developer, in its sole discretion, shall demonstrate its reduction of GHG emissions through the purchase and retirement of ~~provide the city with any combination of qualified offsets and/or~~ carbon credits ~~in its sole determination~~ provided that the following conditions are satisfied:

- a) ~~Offsets: A developer shall provide proof of offsets to reduce or sequester GHG emissions (as distinguished from carbon credits) to the City's Planning Official that the offsets are real, permanent, additional, quantifiable, verifiable, and enforceable by an appropriate agency.~~
- ba) Offset Carbon Credits: A developer shall provide proof to the City's Planning Official that purchased offset credits were registered with, and retired by, an Offset Project Registry, as defined in 17 California Code of Regulations an Offset Project Registry, as defined in 17 California Code of Regulations § 95802(a), the carbon credits represent reductions in GHG emissions that are real, permanent, additional, quantifiable, verifiable, and enforceable by an appropriate agency. Credits registered by a carbon registry approved by the California Air Resources Board, such as, but not limited to, the Climate Action Reserve, American Carbon

~~Registry, or Verra (formerly Verified Carbon Standard), or GHG Reduction Exchange (GHG RX), shall be conclusively presumed to meet all of the criteria set forth above. In order to prove that the offset carbon credits provided are real, permanent, additional, quantifiable, verifiable, and enforceable, as those terms are defined in 17 California Code of Regulations § 95802(a), and have been retired, the developer shall provide the City's Planning Official with (i) the protocol used to develop those credits, (ii) the third-party verification report concerning those credits, and (iii) the unique serial numbers of those credits showing that they have been retired.~~

- ~~eb) Timing: The developer shall provide proof to the City that with offsets and/or carbon credits equal to the proportionate amount of GHG emissions resulting from the grading, construction and operation of facilities within the WLC have been purchased and retired as follows: (i) The purchase and retirement of offset carbon credits required to mitigate the GHG emissions resulting from grading shall be a condition of the issuance of a grading permit. (ii) The purchase and retirement of offset carbon credits required to mitigate the GHG emissions resulting from the construction of a facility shall be a condition of the issuance of a building permit for the facility. (iii) The purchase and retirement of offset carbon credits required to mitigate the GHG emissions resulting from the operation of a facility shall be a condition of the issuance of a certificate of occupancy, temporary or permanent, for the facility. The developer shall also have the right, at any time, to purchase and retire offset carbon credits for some or all of the grading, construction and operation of facilities in the WLC Project in advance of the issuance of grading or construction permits or certificates of occupancy, temporary or permanent, for the facilities proposed in each plot plan (by square footage as compared to the total square footage of the project) as a condition of the issuance of a certificate of occupancy for such facilities, using either Table 4.7-8 or Table 4.7-16, as appropriate. The City shall retire the carbon credits upon their receipt. The developer shall have the right at any time to provide such offsets and/or carbon credits in advance of the issuance of any certificate of occupancy for any of the facilities in the WLC Project.~~

Response to Comment 3-B2-4: The FEIR does not misrepresent CARB's view on the GHG analysis. All of CARB's comments have been addressed; please see Response to Comments 1-B1-1 through 1-B1-47 and 2-B1-1 through 2-B1-4.

Response to Comment 3-B2-5: Please Refer to Topical Response B, Scoping Plan which discusses aspects of the "Climate Action through Local Planning and Permitting" (pages 99 through 102 of the Scoping Plan). As discussed in Topical Response B, the 2017 Scoping Plan's guidance for project-level actions states: "... CARB recommends that projects incorporate design features and GHG reduction measure, to the degree feasible, to minimize GHG emissions." (2017 Scoping Plan, p. 101.) The 2017 Scoping Plan also states that lead agencies should prioritize on-site design features and regional improvements. The City's approach to GHG reduction followed the Scoping Plan recommendation by requiring Project Design Features and mitigation measures at the project-level, the community and the region although that

geographical hierarchy is not required by law or regulation. Topical Response B also, lists all the specific mitigation the City required that adheres to Scoping Plan guidelines. In addition, as discussed in Topical Response C, Project Approvals, Litigation, and the Effects of Litigation, the Revised Final EIR suggests Mitigation Measure 4.7.7.1, which makes the GHG emissions for the Project net zero, regardless of the outcome of the *Paulek v. Moreno Valley Community Services District* appeal. This measure has been revised to mitigate all Project emissions to net zero, not relying on Cap and Trade and not differentiating between capped and uncapped emissions. This mitigation measure is in line with the 2017 Scoping Plan which states “achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development”, (2017 Scoping Plan, p. 101.).

Response to Comment 3-B2-6: Please see Response to Comment 3-B2-5, above, and Topical Responses B and C, regarding consistency with the “Climate Action through Local Planning and Permitting” chapter of the 2017 Scoping Plan and net zero GHG emissions resulting from the Project. Refer to Response to Comment 3-B2-3 for revised Mitigation Measure 4.7.7.1.

Response to Comment 3-B2-7: As summarized below, the WLC Project incorporates on-site design features, feasible mitigation measures, and regional investment to reduce GHG emissions, and commits to reducing the Project’s GHG emissions to net zero by providing offsets carbon credits registered by a carbon registry approved by the California Air Resources Board (CARB). Refer to Response to Comments 1-B1-4 and 1-B2-12 for discussion of all feasible mitigation measures implemented by the Final EIR, including a discussion of the use of zero-emission technology and current status of commercial availability. Refer to Master Response to the Earthjustice Appeal for a discussion of the legitimacy of voluntary market carbon credits.

Design Features

The Project incorporates multiple building design features to achieve LEED certification for buildings over 500,000 square feet and energy conservation measures to enable the project to exceed 2019 Title 24 energy standards by 10 percent or meet current Title 24 requirements in place at the time the building permit is approved. (Revised Final EIR Part 2, p. 4.7-32, Table 4.7-6 and Mitigation Measure 4.7.6.1D) The Project is committed to maximize the use of onsite rooftop solar PV generation, subject to MVU’s restrictions on distributed solar (see Topical Response E). (Revised Final EIR Part 2, p. 4.7-28.) The Air Quality mitigation measures will also reduce GHG emissions, requiring that construction equipment greater than 50 horsepower by USEPA Tier 4 engines (Mitigation Measure 4.3.6.2[a]) and that heavy-duty trucks have model year 2010 engines (Mitigation Measure 4.3.6.2[h]). (Revised Final EIR Part 2, p. 4.7-29.) All plot plans approved within the Specific Plan area will include rideshare participation, pedestrian and bicycle improvements, bicycle storage space and shower and changing facilities, EV charging infrastructure, carpool/vanpool priority spaces, and informational packets of these benefits for tenants. (Revised Final EIR Part 2, p. 4.7-29.) Utility mitigation measures including high efficiency building systems, cool pavement materials, and energy efficient appliances will also help to reduce GHG emissions. (Revised Final EIR Part 2, p. 4.7-30.)

In particular, consistent with CARB’s recommendation, the Project analyzed the feasibility of integrating electrified vehicles and the status of the EV market to reduce GHG emissions. As described in response to Comment 1-F8-16, the 2019 Draft Recirculated RSFEIR and the Renewable Energy Technology Report

(RETR) (Revised Final EIR Part 2, Appendix E) evaluated the energy requirements for transportation activities to, from, and on the WLC site using the projected number of trips and the estimated vehicle miles traveled (VMT) per trip (2019 Draft Recirculated RSFEIR, page 4.17-14) although the court ruling only required an analysis of renewable energy (See Topical Response C). The energy assessment quantified the increased electricity use and decreased fuel use associated with a higher fleet percentage of electric vehicles due to California's 2016 Mobile Source Strategy. Three scenarios demonstrating low, medium, and high electric vehicle penetration were developed based on what can be reasonably expected for zero emission vehicle technology. The RETR compared feasible, cost-effective options for integrating the use of renewable energy and improving the overall energy performance of transportation operations by looking at a wide range of fuel and vehicle options, across all vehicle classes and assessed feasibility based on applicability to the project, relative cost, commercial readiness, funding availability, policy and regulatory support, potential industry partners, and other factors (2019 Draft Recirculated RSFEIR, page 4.17-24).

The RETR found that zero emission vehicle technology is steadily developing for both light-duty and heavy-duty vehicles, driven by both regulatory developments and market forces. Zero emission vehicles encompass a range of technologies including battery electric vehicles (BEVs), hybrid electric vehicles (HEVs), plug-in hybrid electric vehicles (PHEVs), and range extended electric vehicles (REEVs) that utilize a fuel cell as an additional energy source. As outlined in the RETR and summarized in the 2019 Draft Recirculated RSFEIR, commercialization of passenger vehicles is occurring rapidly. A significant population of passenger electric vehicles is expected at the site by Phase 1 (2025) and that number will increase substantially by full buildout of the project (2035), representing a potential significant demand for on-site charging. The study also found that development of electric medium- or heavy-duty vehicles is still in the pilot or demonstration phase and it is speculative to predict when they will become commercially available.

Although it is speculative to state what the regional fleet mix will be as each phase of the project is completed, and the adoption of zero electric vehicles by WLC employees and customers will be beyond the direct control of the WLC, all EV types should be anticipated in planning for the onsite charging infrastructure. To that end, the Project will construct the WLC parking areas with cable raceways for installing future EV charging stations, which will enable WLC to more readily and cost effectively provide this service to future tenants if and when demand dictates. The analysis indicates that the low electric vehicle penetration scenario would use approximately 14 percent less electricity than the 2025 baseline scenario and approximately 16 percent less electricity than the 2035 baseline scenario (2019 Draft Recirculated RSFEIR, page 4.17-26). Although the medium electric vehicle scenario would use more electricity than the low electric vehicle scenario, the net electrical demand on MVU would still be 11 percent less than the 2025 baseline scenario and it would be 12 percent more than the 2035 baseline scenario due to the much higher electric vehicle penetration rates for light duty passenger cars consistent with the 2016 Mobile Source Strategy (2019 Draft Recirculated RSFEIR, page 4.17-26). For the high electric vehicle scenario, total electrical demand driven by populations of electric vehicle trucks would exceed total electrical demand in both the 2025 and 2035 baseline scenarios. However, a substantial reduction in the use of liquid transportation fuels (diesel and gasoline) would also be expected to occur under this scenario as more vehicles and trucks utilize electricity for power instead of gas or diesel. Replacing VMT powered by the combustion of diesel and gasoline fuels with EV-generated VMT, especially as electricity becomes less GHG-intensive under the State's Renewables Portfolio Standard (RPS), has the added advantage of reducing the emission of harmful air pollutants such as particulate matter nitrogen oxide associated with fuel combustion. (2019 Draft Recirculated RSFEIR, page 4.17-29). Additionally, the 2019 Draft Recirculated

RSFEIR discusses that the Project would accommodate alternative forms of transportation through the construction of sidewalks, improving site design to enhance pedestrian connections, providing bike storage and showers, and designing streets to accommodate bus service or other rideshare transportation options. Compliance with current building codes would include the installation of required electric vehicle charging stations. Furthermore, the WLC is committing to a publicly-accessible fueling station offering alternative fuels (natural gas, electricity, etc.) for purchase by the motoring public.

Recognizing the challenges in transitioning to zero-emission heavy duty trucks, CARB proposed in late 2019 the Advanced Clean Truck Regulation to require manufacturers to make a certain percentage of sales of zero-emission trucks and buses. CARB received numerous comments on the proposed Regulation, and it has not been formally adopted, but CARB's Staff Report in support of the Regulation provided a detailed evaluation of the market in the Staff Report, including Appendix E, Zero Emission Truck Market Assessment. The Staff Report notes the importance of heavy duty trucks: "Heavy-duty trucks operate through California in numerous vocations and are an essential part of the state's economy." (Staff Report, p. I-4.) The Staff Report outlines the challenges in ZEV market, particularly with respect to heavy-duty trucks, including the incremental cost of ZEVs, infrastructure investment cost and availability, matching vehicle capability with fleet need and diverging standards. (Staff Report, pages. I-14 – I-17.) The Regulation sets forth proposed percentage sales for Class 7-8 Tractor Group at 3% by 2024. CARB's evaluation of the market and its proposed goal of 3% for 2024 demonstrates that Class 7-8 heavy-duty truck are not currently commercially available.

Moreover, according to a Feasibility Assessment for Drayage Trucks for the San Pedro Bay Ports Clean Air Action Plan, zero-emission and near zero-emission on-road haul truck availability, as of late-2018, includes one zero-emission and one near zero-emission fuel-technology platform sold by Original Equipment Manufacturers (OEMs) in commercially available Class 8 trucks suitable for drayage. With the development of zero-emission and near zero-emission platforms, infrastructure has emerged as one of the most significant near-term barriers to wide-scale adoption of these technologies due to standardization difficulties and the ability to develop the full charging infrastructure required by 2021. Additionally, according to the Feasibility Assessment, one OEM plans to begin offering a zero-emission battery-electric Class 8 truck by 2021, the other OEMs have similar or later timeframes. Furthermore, the International Council on Clean Transportation (ICCT) in a November 2017 white paper titled "Transitioning to Zero-Emission Heavy-Duty Freight Vehicles" states that there are "prevailing barriers to widespread viability" of plug-in electric heavy-duty freight vehicles, primarily limited electric range, high vehicle cost, long recharging time, and tradeoffs on cargo weight and/or volume. This report does not cite drayage trucking (Class 8) as a promising segment for widespread commercialization, further proof that the zero-emission and near zero-emission truck fleet won't be viable during construction of the Project or possibly be readily available enough for use during operation of the Project.

CARB's latest working group meeting Third Work Group for the FY 2019-20 Heavy-Duty Three-Year Investment Strategy on May 8, 2019 shows that the Zero Emission Vehicle technology readiness for medium- and heavy-duty trucks is primarily in the demonstration phase in 2019 which includes technology development and early stage demonstrations. As of late last year, CARB is funding a couple of pilot programs for electric truck fleets. BYD (Build Your Dreams) and Anheuser-Busch announced that Anheuser-Busch will pilot a scale project by deploying 21 BYD battery electric trucks at four Anheuser-Busch distribution facilities across southern California: Sylmar, Riverside, Pomona, and Carson. This is a

landmark achievement as the largest Class 8 electric truck deployment in North America. Additionally, another pilot program includes replacing PepsiCo's existing diesel powered freight equipment with fifteen Tesla Semi electric trucks with "zero-emission (ZE) and near-zero emission (NZE)" trucks and equipment at its Frito-Lay Modesto, California, manufacturing site by 2021. Automakers are expanding their electric vehicles to heavy duty trucks. However, the extent of commercial availability of such trucks as the WLC begins operations is unknown. Furthermore, since the Project will support a variety of future users which are unknown at this time, it is not possible to specify or require future users to have zero emission or alternative fuel fleets since most logistics companies use independent contractors and truck drivers rather than maintain their own fleets. Nonetheless, the Project has committed under various mitigation measures to require the most stringent levels of emission mitigation under existing emission control regulations.

Regional Investment

With respect to regional investment, the Scoping Plan references "direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally." (Scoping Plan 2017, p. 102.) On October 21, 2016, the Project entered into a settlement agreement with the SCAQMD to pay an Air Quality Improvement Fee of 64 cents per square foot for each building as the Project is constructed for a total of approximately \$26,000,000. The settlement agreement states:

"[T]he payment of the Air Quality Improvement Fee will adequately mitigate heavy-duty truck related air quality impacts that may result from the construction and operation of the World Logistics Center as described in the EIR and that no additional charges will be imposed on the World Logistics Center to mitigate emissions, including NOx, described in the EIR from heavy-duty trucks."

Funds may be used by SCAQMD for any purpose to improve air quality in the South Coast Air Basin. For example, individual or fleet truck owners could be offered a financial incentive to purchase a near-zero or zero-emission truck model, similar to the Carl Moyer Program. This type of program has been an effective tool for more than 19 years in speeding the transition of heavy-duty trucks and other equipment to cleaner models. The \$26,000,000 Air Quality Improvement Fee will have co-benefits of reducing air pollutants locally and GHG emissions globally. Because it is not yet known how the SCAQMD will use the funds, no credit in emissions has been taken by the Project.

The WLC Project is consistent with the Scoping Plan's guidance to local governments on the use of carbon offset for GHG emissions mitigation. The WLC Project incorporates on-site design features and feasible mitigation measures to reduce GHG emissions and invests regionally through the SCAQMD agreement with \$26,000,000 in air quality improvement fees. With these enforceable Project components as the foundation for the Project's GHG reductions, it would "be appropriate and feasible to mitigate project emissions through purchasing and retiring carbon credits." (Scoping Plan 2017, p. 102.)

Response to Comment 3-B2-8: Refer to Response to Comments 1-B1-4 and 1-B2-12 for discussion of all feasible mitigation measures implemented by the Final EIR, including a discussion of the use of zero-emission technology and current status of commercial availability. The implementation of Mitigation Measure 4.7.7.1 (as revised) will mitigate to net zero all Project GHG emissions (without differentiation of capped and uncapped emissions) remaining after the application of other mitigation measures. Refer to Response to Comment 3-B2-3 for revised Mitigation Measure 4.7.7.1.

Response to Comment 3-B2-9: The comment asserts that the information within the Revised Final EIR includes significant new information, including new mitigation strategies, and therefore, a public comment period is required. The responses and errata provided in the Revised Final EIR does not alter the significance conclusions provided in the draft EIRs (i.e., Revised Sections of the Final EIR [RSFEIR]). The reference to new mitigation strategies refer to the addition of Mitigation Measure 4.7.7.1. Mitigation Measure 4.7.7.1 has been revised to mitigate all Project emissions to net zero, not relying on Cap and Trade (see Response to Comment 3-B2-3 for revised measure). The addition and subsequent revision of the mitigation does not change the impact determination, will reduce the impact of greenhouse gas emissions and would not result in a new significant impact as discussed on pages 755 to 756 within Section 4.3.1 of the Final Response to Comments. The introduction of a new Mitigation Measure therefore does not meet any of the requirements for recirculation set forth in CEQA Guidelines Section 15088.5(a). As required by CEQA Guidelines Section 15088, the City of Moreno Valley as the Lead Agency, provided written responses to public agencies that commented on either the RSFIER or Draft Recirculated RSFEIR at least 10 days prior to certifying the Revised Final EIR.

Response to Comment 3-B2-10: No specific comments on the contents of the Revised Final EIR are provided.

Hi Julia,

Thank you for transmitting the above reference project to ALUC for review. Please note that the project is located outside the AIA and therefore ALUC has no comments at this time.

3-D1-1

If you have any questions, please feel free to contact me.

ashleya@moval.org

RE: Deny Public Hearing Item #2 - Mitigation Monitoring and Reporting Program (“MMRP”), Statement of Overriding Consideration, Revised Final Environmental Impact Report, a Tentative Parcel Map 36457 that divides property for finance and conveyance purposes only, and the Development Agreement between the City of Moreno Valley and Highland Fairview within the World Logistics Center Specific Plan boundary.

Dear Planning Commissioners,

These comments are submitted on behalf of the Center for Biological Diversity’s (the “Center”) members, staff and supporters, regarding the Revised Final Environmental Impact Report (“RFEIR”) for the World Logistics Center. The Center has reviewed the RFEIR and provides comments on primarily the biological issues. At this point, we urge the Planning Commission to reject the project and instead require the issues we raise below be addressed in a renewed CEQA process. The Center has closely monitored this project for many years and remains concerned about the RFEIR inadequate analysis and mitigation of the project’s impacts to sensitive species and habitats. The current RFEIR fails to adequately preserve southern California’s, and specifically western Riverside County’s incredible biodiversity. Troublingly, extensive conservation investments by State, County and local agencies remain imperiled by inconsistent language and inadequate impact analysis in the current RFEIR.

3-F1-1

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in western Riverside County.

I. The RFEIR Fails to Provide a Cumulative Impacts Analysis

The RFEIR simply fails to provide a cumulative impact analysis to biological resources (at page 4.4-118 to 119). While Table 1.1-1: World Logistics Center Project Environmental Impact Summary provides a section on Cumulative Biological Impacts (at pg. 1-26) it does not

3-F1-2

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

actually provide an analysis, but instead references proposed project mitigation measures. In accordance with CEQA (CEQA Guidelines Section 15130 *et seq.*) an EIR must analyze the cumulative impacts of the proposed project in conjunction with other developments that affect or could affect the project area. According to CEQA, a cumulative impact refers to two or more individual effects that are considerable when taken together, or that compound or increase other environmental impacts (CEQA Guidelines Section 15355). And while an agency is not expected to foresee the unforeseeable, it is expected to use its “best efforts to find out and disclose all that it reasonably can.” (CEQA Guidelines § 15144; see also *City of Richmond*, *supra*, 184 Cal.App.4th at 96; *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal. 4th 412, 428 [hereinafter *Vineyard*].)

3-F1-2
CONT.

Therefore, to comply with CEQA, a cumulative scenario needs to be developed that identifies and evaluates past, present, and reasonably foreseeable future projects within the cumulative study area that would be constructed or commence operation during the timeframe of activity associated with the proposed project. For example, but not limited to, the Villages of Lakeview housing development will also impact the southern portion of the San Jacinto Wildlife Area (“SJWA”). The lack of a cumulative impact analysis to biological resources violates CEQA. The purpose of analyzing cumulative environmental impacts is to assess adverse environmental change “as a whole greater than the sum of its parts.” (*Environmental Protection Information Center v. Johnson* (1985) 170 Cal.App.3d 604, 625.) Absent meaningful cumulative analysis there would be no control of development and “piecemeal development would inevitably cause havoc in virtually every aspect of the [] environment.” (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721.)

II. The RFEIR Fails to Provide an Adequate Development Setback for the SJWA

The RFEIR still proposes only a 250-foot wide development setback from the southernmost property line along the SJWA boundary with a 150-foot area for truck traffic and other activities other than actual buildings (at pg. 4.4-97). Negative edge effects from human activity, traffic, lighting, noise, pollutants, invasive weeds, and increased fire frequency have been found to be biologically significant up to 300 meters (~1000 feet) away from anthropogenic features in terrestrial systems (Environmental Law Institute 2003). The RFEIR states “250-foot development setback is adequate for a project-SJWA **bufferseparation** and supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and also the distance established in nesting bird surveys for setbacks from human activity” (at pg. 4.4-97, emphasis original), but the RFEIR does not provide the literature and studies to support this assertion.

3-F1-3

The SJWA is a core area under the Western Riverside Multi-Species Habitat Conservation Plan (“WR HCP”), serves as a mitigation site for a prior project’s impacts and is a regionally important wildlife area. Therefore, a larger development setback needs to be incorporated to prevent negative edge effects from occurring to the project’s southernmost property line along the SJWA boundary. While down lighting as required in the RFEIR will help minimize light pollution, the other negative edge effects – increased traffic, noise, pollutants, invasive weeds and increased fire frequency - have not been adequately addressed.

3-F1-4

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

For example, Mitigation Measure 4.4.6.3J requires “A Fuel Management Plan shall be prepared on a project-by-project basis for those Planning Areas adjacent to the south and east boundary of the WLC site adjacent to Western Riverside County Multiple Species Habitat Conservation Plan Conservation Areas” (at pg. 4.4-118), but absent that plan being available, the plan’s adequacy is unclear. In this case, the fuels to be manage are actually wildlife habitat. The RFEIR should require a comprehensive Fire Management Plan to protect not only the development where fire ignitions are more likely to occur but also requirements to prevent the fires from escaping onto the SJWA, as well as actions to implement if indeed fire originating on the development spreads to the SJWA.

3-F1-5

III. The RFEIR Proposes Inconsistent Mitigation Measures

Despite the inadequate 250-foot development setback along the boundary with the SJWA, the RFEIR proposes inconsistent information as to where impact-mitigating fences/walls are to be constructed. First, MM 4.4.6.1A states “All development proposals in Planning Areas 10 and 12 shall include a minimum six-foot tall chain link fence or similar barrier to separate warehouse activity from the setback area” (at pg. 1-16). MM 4.4.6.1A also states “all truck activity areas adjacent to the 250- foot buffer area along the southern property line shall be enclosed by minimum 11-foot tall solid walls” (at pg. 1-17). The purpose of the mitigation measure is to reduce impacts to the SJWA. (*California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 180.) Therefore, in order to minimize negative edge effect impacts, a solid wall, not a chain link fence, needs to be constructed. Secondly, the RFEIR states that “Warehousing will have a minimum 11-foot solid wall along the SJWA boundary” (at pg. 4.4-60) and “the Specific Plan requires solid walls along the property line.” (at pg. 4.4-97). However, having a wall at the boundary of the 250-foot development setback with the SJWA defeats the setback’s impact minimization purpose. The wall needs to be placed at the northern edge of the development setback nearest the development in order to help minimize the edge effect impacts.

3-F1-6

IV. The RFEIR Fails to Provide All Required Plans

The RFEIR does not provide even a draft of all of the required plans in order for the decision-makers and the public to be able to evaluate the adequacy of the avoidance, minimization and mitigation. In addition to the Fuel Management Plans, other missing plans include but are not limited to:

- Traffic Control Plan (at pg. 1-10)
- Landscape plan for the 250-foot setback area (at pg. 1-17 and 1-23)
- Compensatory Mitigation Plan (at pg. 1-18)
- Burrowing owl Relocation plan (at pg. 1-22) and,
- Biological Resource Management Plan (BRMP) to prescribe how the 250-foot setback area is maintained (at pg. 1-23)

3-F1-7

These plans are all key parts to evaluating the effectiveness of the proposed mitigation measures and should be included as part of the RFEIR.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

V. The RFEIR Fails to Address Traffic Impacts to Wildlife on Gilman Springs Road including through the SJWA

While truck and vehicle traffic will increase on Gilman Springs Road for both construction and operation, the RFEIR fails analyze much less avoid, minimize or mitigate the anticipated wildlife “roadkill”. The RFEIR fails to provide any analysis of the increasing wildlife injury and mortality that will occur from the increased traffic and instead states “these impacts would be less than significant as long as the County coordinates with the RCA and takes wildlife movement between Core H and proposed Core 3 into account when designing and improving Gilman Springs Road” (at pg. 4.4-97). By failing to adequately analyze impacts from increased traffic on wildlife injury and mortality, the RFEIR also fails to also provide avoidance, minimization and mitigation measures. Under CEQA, “the public agency bears the burden of affirmatively demonstrating that, notwithstanding a project’s impact on the environment, the agency’s approval of the proposed project followed meaningful consideration of alternatives and mitigation measures.” (*Mountain Lion Foundation v. Fish & Game Com.* (1997) 16 Cal.4th 105, 134.) It is not the RCA’s and the County’s responsibility to analyze, avoid, minimize and mitigate the impacts from this project, it the developer and the City’s responsibility as the lead agency.

3-F1-8

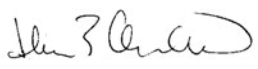

VI. CONCLUSION

Thank you for the opportunity to comment on the RFEIR for the World Logistics Center. Because of the numerous inaccuracies, short-comings and confusion in the RFEIR, we request that the Planning Commission deny recommending certification of the RFEIR, and the Mitigation Monitoring and Reporting Program (“MMRP”), Statement of Overriding Consideration, the Tentative Parcel Map 36457 that divides property for finance and conveyance purposes only, and the Development Agreement between the City of Moreno Valley and Highland Fairview within the World Logistics Center Specific Plan boundary. Rather than allowing this project to move forward with inadequate and incomplete environmental review, the City should send the RFEIR back t for revisions to address the failures identified above.

3-F1-9

Please keep the Center to your notice list for all future updates to the Project and do not hesitate to contact the Center with any questions at the number or email listed below.

Sincerely,

 Ileene Anderson

RESPONSES TO LETTER 3-F1: Ileene Anderson, Center for Biological Diversity

Response to Comment 3-F1-1: The comment is introductory and summarizes the subsequent comments in concluding that the current Revised Final EIR provides an inadequate analysis with respect to biological issues and recommends a new CEQA process.

As detailed in the responses below, the Revised Final EIR addresses the Project's potential impacts to biological resources in compliance with CEQA.

Response to Comment 3-F1-2: The comment states that the Revised Final EIR does not provide a Biological Resources cumulative impact analysis.

The Revised Final EIR provides an extensive cumulative impact assessment in Sections 6.0 through 6.17 of the document, more than 400 pages of cumulative impact analysis and analyzing more than 360 related projects. The Biological Resources cumulative impact assessment (Section 6.4) is 33 pages by itself and lists more than 100 related projects that are within the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) area with about 30 projects in the immediate area of the WLC site. It appears that this commenter did not see the Section 6 chapters and cumulative discussion.

Response to Comment 3-F1-3: The comment claims that the proposed WLC Project setback from the SJWA is insufficient, referencing the 2003 Environmental Law Institute publication Conservation Thresholds for Land Use Planners and a buffer of 300 meters. The comment claims that the effects discussion in the Revised Final EIR, including diesel emissions, provides no literature or studies to support the adequacy of the proposed WLC setback from the SJWA.

As discussed in Section 4.4.1.15, Other Issues, a. Setbacks, on page 4.4-46 of the 2018 RSFEIR, "typical setbacks to protect wildlife from human presence (though not warehousing) ranges from 50 to 500 feet, but 200–250 feet appears adequate for the most sensitive species" (McElfish, J., Kihslinger, R., and Nichols, S., 2008. *Setting Buffer Sizes for Wetlands*. Available online: http://staging.ecosystemmarketplace.com/wp-content/uploads/archive/documents/Doc_456.pdf). In addition to the 250-foot development setback, the WLC Project includes a 150-foot building setback resulting in a total setback of 400 feet. Furthermore, the WLC Project includes a minimum 11-foot high solid wall along the southern boundary of the WLC site that would reduce potential urban/wildlands interface impacts. The referenced 2003 Environmental Law Institute publication discusses buffers in relation to edge effects as a consequence to habitat fragmentation. For this location, the edge effects are pre-existing because of the current and past agricultural activities that have taken place on both the WLC site and the northern portion of the SJWA. Consequently, the size of the buffer is less critical as long as some buffer/setback is provided to minimize urban intrusions such as light, noise and pollutants into preserved areas such as the SJWA. The scientific literature regarding setbacks includes a variety of recommendations, depending upon a variety of parameters including adjacent habitat, species of concern and microclimates, and range from as little as eight meters to over five kilometers. Setbacks to avoid edge effects for birds and mammals range from a minimum of 16 to 45 meters up to 900 meters. In light of the current conditions, the proposed 250-foot setback is adequate to minimize urban/interface consequences.

Literature references are included as footnotes in the RSFEIR, e.g., page 4.4-70, in discussion of air emission impacts on wildlife.

Response to Comment 3-F1-4: The comment states that the SJWA is a core area within the MSHCP and as a consequence a larger development setback is required to prevent edge effects on the SJWA. The comment continues that impacts from increased traffic, noise, pollutants, invasive plant species and fire frequency have not been adequately addressed.

While this comment does not specify what development setback is considered adequate, it is assumed that that a distance of 300 meters is recommended, as specified in Comment 3-F1-3. The RSFEIR acknowledges the SJWA is a component of the MSHCP Core H, which also includes the Lake Perris State Recreation Area. The RSFEIR provides a discussion of how the WLC Project is consistent with the provisions of the MSHCP in Section 4.4.1.11 (starting on page 4.4-32) and the proposed setback of 250-foot is adequate to minimize urban/interface consequences, as described above in Responses to Comment 3-F1-3.

Similarly, this comment does not specify how the RSFEIR analysis of impacts to biological resources from traffic, noise, pollutants, invasive plant species and fire frequency is not adequately addressed. Impacts associated as edge effects, especially in regard to MSHCP conservation areas, are analyzed in the RSFEIR in Section 4.4.1.11.f MSHCP Consistency Analysis (page 4.4-36), Section 4.4.5.2.c Adopted Habitat Conservation Plans (page 4.4-62), in which pollutants are discussed, and Section 4.4.6.1 Significant Impacts on Endangered and Threatened Species (page 4.4.66), which includes a more detailed analysis of traffic, noise, lighting, and air pollutants. The RSFEIR states “the WLC sites that are within or adjacent to conservation areas will incorporate the design features and measures related to drainage features, toxics, lighting, noise, invasive plants, barriers, and grading/land development discussed below. These measures will make the project consistent with the MSHCP, Section 6.1.4, Guidelines Pertaining to the Urban/Wildlands Interface” (page 44-36). Lastly, the WLC Specific Plan landscaping palette does not include any of the invasive plant species listed in Section 6.1.4 of the MSHCP (Table 6-2), but there should be mitigation to ensure that no on-site landscaping along the southern boundary of the site conflicts with MSHCP invasive plant guidelines. Mitigation Measure 4.4.6.1A provides the appropriate setback mitigation to reduce impacts to less than significant levels. Mitigation Measure 4.4.6.3J requires the preparation of a fuel management plan to demonstrate adequate protection from potential fire risks to MSHCP areas from the WLC project.

Response to Comment 3-F1-5: The comment references Mitigation Measure 4.4.6.3J and the need for a fuel management plan but questions the effectiveness of such plan because the plan has not yet been prepared. The comment continues that there should be a fire management plan that protects both the WLC project and the SJWA.

Based on review of the comment received from the CDFW, the City has modified Mitigation Measure 4.4.6.3J to include specific reference to SJWA for inclusion of protection from expected fire risks. Please see Response to Comment 3-B1-25 above for the revised mitigation measure language.

Response to Comment 3-F1-6: The comment states that the RSFEIR provides inconsistent descriptions of a fence or wall along the WLC southern boundary shared with the SJWA. The comment states that the solid wall needs to be placed at the northern edge of the development setback.

The WLC project is consistent with the comment and the minimum 11-foot solid wall will be located at the northern edge of the development setback of 250 feet from the SJWA northern boundary. This is consistent

with the design provisions of the WLC Specific Plan (Section 4.2.4.3) that depicts the wall a minimum of 250 feet away from the SJWA boundary.

Response to Comment 3-F1-7: The comment states that without a draft of the required plans, decision makers and the public are not able to evaluate their adequacy. The comment refers to the fuel management plan, traffic control plan, landscape plan for the 250-foot setback area, compensatory mitigation plan, burrowing owl relocation plan, and the biological resource management plan.

The comment correctly states that the RSFEIR does not include drafts of the required plans that will assist in avoiding or minimizing project impacts, especially to biological resources. Because the WLC Specific Plan will be build out over many years, preparing drafts of these various plans prior to individual project designs being processed for entitlement would be speculative for inclusion of the best practices available at the time individual development entitlements are approved in the future. However, the basic components for inclusion into the required plans are listed within the specific mitigation measures. For example, the biological resource management plan required in Mitigation Measure 4.4.6.3F will guide the management of the 250-foot development setback area including the management of non-native species and selection of landscape species to promote roosting or nesting opportunities for raptors and other bird species. The preparation of a burrowing owl relocation plan, as required in Mitigation Measure 4.4.6.3D, at this time would not make sense because there currently is no need to relocate burrowing owls as no development has been approved and if there becomes a need to relocate burrowing owls at some time in the future, the relocation plan would be developed for either passive relocation, i.e., the individual burrowing owl departs the area on its own, or active relocation, e.g., if burrowing owl is found to be nesting onsite and relocation would take place only after the young owls have fledged.

Regarding landscaping plans, the WLC Specific Plan includes conceptual landscape designs for various areas of the WLC site including the 250-foot development setback area separating the SJWA from the WLC project.

Response to Comment 3-F1-8: The comment asserts that the RSFEIR fails to provide any analysis of potential increased wildlife injury and mortality resulting from increased traffic. The comment continues stating that it is the City's responsibility to analyze and appropriately mitigate impacts resulting from the private development project.

The City agrees that as lead agency it is responsible for the adequacy of impact analysis and the inclusion of appropriate and feasible mitigation measures to reduce the effects of potentially significant impacts. The RSFEIR provides the analysis of impacts on wildlife resulting from increased project traffic. The RSFEIR acknowledges increased wildlife injury and mortality as a result of additional traffic on Gilman Springs Road and other roadways. The WLC project design includes the construction of fences or walls along the west side of Gilman Springs Road that may incrementally reduce roadkill. The RSFEIR includes the statement that impacts from traffic would be less than significant as long as the County coordinates with the RCA and takes wildlife movement between Core H and proposed Core 3 into account when designing and improving Gilman Springs Road. This is an accurate statement because the MSHCP includes provisions for wildlife movement, especially along linkages for core conservation areas, and the RCA is the agency implementing those provisions as funding becomes available through the payment of MSHCP mitigation fees. The section of Gilman Springs Road south of the WLC site, where wildlife movement is more likely and preferred, is not

under the authority of the City but the County. The City's authority as an MSHCP permittee is through the collection of the required mitigation fees.

Response to Comment 3-F1-9: The comment summarizes the reasons why the Center for Biological Diversity recommends against certification of the EIR and that the EIR needs to be revised to address the perceived failures.

The City thanks the organization for their comments, which were presenting to the Planning Commission, but does not concur that the EIR needs to be revised for the reasons explained above in Responses to Comments 3-F1-1 through 3-F1-8.

**Re: NOTICE OF COMPLETION - Revised Final Environmental Impact Report
(Revised Final EIR) (2012021045)**

Dear Ms. Descoteaux:

I received an email with the Notice of Completion for the Revised Final Environmental Impact Report (EIR) on Friday of last week in the late afternoon. The email notice mentioned the item will be heard at the Planning Commission on Thursday, May 14, 2020. In reviewing the volumes of materials, there is significant new information, including new mitigation strategies, which the public is only now seeing for the first time. The major impacts of this massive development merit more time for public review of the Revised Final EIR.

Thus, I write to request an extension of time for commenting on the Revised Final EIR, including a delay in the Planning Commission hearing on the Revised Final EIR and related approvals, to allow for sufficient time to evaluate the volumes of materials, including all the new materials released for the first time last week. I respectfully request at least a 30 day window to comment on the Revised FEIR. Please let me know whether the City will accept or reject this request for an extension of the comment period.

Please do not hesitate to contact me if you have questions about this request. I appreciate your consideration of this request.

Sincerely,

Adriano L. Martinez
Staff Attorney

Re: NOTICE OF COMPLETION - Revised Final Environmental Impact Report (Revised Final EIR) (2012021045); Agenda Item No. 2 on May 14, 2020 Planning Commission Meeting (World Logistics Center Project Development Agreement, Tentative Parcel Map for Finance and Conveyance Purposes only with Certification of the Recirculated Revised Final Environmental Impact Report)

Dear Ms. Descoteaux:

I respectfully submit the following comments to the 2020 Revised Final Environmental Impact Report (“Revised FEIR”) for the World Logistics Center Project (“WLC” or “Project”), in addition to the World Logistics Center Project Development Agreement, Tentative Parcel Map for Finance and Conveyance Purposes Only. Please present these comments and the attachments to the Planning Commission prior to hearing this matter.

As described in the Revised FEIR, this Project entails construction of the largest warehouse development in the nation. For a development of this magnitude, it is vital to properly disclose the environmental consequences of the proposed action and to identify and adopt all feasible mitigation measures and alternatives. Unfortunately, the Revised FEIR continues to fail in its duty to comply with the California Environmental Quality Act (“CEQA”). As such, the City cannot rely on the environmental review contained in the document for the purpose of Project approval, and must require preparation and circulation of a new Recirculated Draft Environmental Impact Report (“Recirculated DEIR”) to allow the public and decision-makers an opportunity for meaningful review of the Project’s impacts, prior to issuing any Project approvals.

I. The Air Quality Analysis Continues To Be Flawed.

The various versions of the EIR constantly have sought to understate air quality impacts from this project. But, high levels of emissions and impacts will result from this Project. The thousands of trucks and other vehicles associated with this project will harm a large area of the region with impacts to local residents in the project vicinity most acutely. The decision on this Project is being based on a flawed air quality analysis.

For example, the Statement of Overriding Considerations concludes “[c]urrently, the 2016 AQMP is being reviewed by the U.S. EPA and CARB. Until the approval of the EPA and

3-F2-

3-F2-

3-F2-

3-F2-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

CARB, the current regional air quality plan is the Final 2012 AQMP adopted by the SCAQMD on December 7, 2012. Therefore, consistency analysis with the 2016 AQMP has not been included.” Statement of Overriding Considerations, at 151. This is wrong. The EPA approved the 2016 AQMP on October 1, 2019. 84 Fed. Reg. 52005 (Oct. 1, 2019). Therefore, the EIR must analyze the projects compliance against the 2016 AQMP. Moreover, conclusory statements about compliance with the 2016 AQMP are not sufficient. The Revised FEIR and the Statement of Overriding Considerations must actually analyze compliance with this most recently approved air plan.

3-F2-
CON

The Revised FEIR also continues to ignore the feasibility of implementing zero-emission technologies, including zero-emission trucks – amongst many classes (ie class 2-8) – as a mitigation measure. The Revised FEIR notes “[t]he mitigation measures adopted included some of the suggestions from [California Air Resources Board’s (“CARB”)] previous letters, but do not include the zero-emission technology requirements. Subsequent environmental review may require that specific technology that work with future users be required as condition of approval, but a broad requirement that unknown future users use a specific technology is not currently feasible since current zero-emission technology is very limited in medium-duty and heavy-duty trucks.” Revised FEIR, at 89.

The Revised FEIR’s dismissal of zero-emissions technologies for a project that spans decades based on an analysis from the past is not supported by CEQA. The Revised FEIR notes that “[t]he status of zero-emission technology was addressed in the responses to both of CARB’s previous letters. Essentially, as CARB’s ongoing multi-year planning (not implementation) effort on the Sustainable Freight Plan to lay out pathways to get to a zero-emission freight sector demonstrates, there are no commercially available technology zero-emission on-road heavy-duty trucks available and as CARB’s own progress report on heavy-duty technology and fuels assessment states zero- and non-zero emission technologies are still at the demonstration phase.” Revised FEIR, at 89. This basis is largely based on an analysis completed by CARB in 2015.

3-F2-

In fact in a more recent fact sheet from the Air Resources Board, the commercial availability is answered with the following:

Are any zero-emission trucks commercial available?

There are more than 70 different models of zero-emission vans, trucks, and buses that already are commercially available from several manufacturers. Most trucks and vans operate less than 100 miles per day and several zero-emission configurations are available to serve that need. As technology advances, zero-emission trucks will become suitable for more applications. Most major truck manufacturers have announced plans to introduce market ready zero-emission trucks in the near future.

California Air Resources Board, Advanced Clean Trucks Accelerating Zero-Emission Truck Markets, available at <https://ww2.arb.ca.gov/sites/default/files/2019-07/190521factsheet.pdf>. In fact, CARB feels comfortable enough with this feasibility of zero-emission trucks that next month it will adopt the Advanced Clean Trucks Rule, which will require manufacturers to produce zero-emission trucks starting as soon as 2024. The Revised FEIR never explains with substantial evidence why zero-emission trucks for any of the classes that will visit this Project

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

are infeasible to be used at the project start for a portion (or all) of the trucks servicing the new warehouses as they are built. And the Revised FEIR also does not provide substantial evidence why these zero-emission technologies cannot be used out into the future when CARB will require manufacturers to make zero-emission trucks across a broad class of trucks. See CARB, Proposed Amendments to the Proposed Clean Trucks Regulation, available at <https://ww3.arb.ca.gov/regact/2019/act2019/30daynotice.pdf>. The Revised FEIR failure to address new data on feasibility of zero-emission trucks, including addressing the forthcoming sales mandate from CARB, violates CEQA.

3-F2-
CONT

II. The Revised FEIR Fails to Adequately Disclose, Analyze the Significance of, and Provide Mitigation for the Project’s Significant Climate Impacts.

The City’s review of this Project’s climate and greenhouse gas (“GHG”) emissions impacts has always been fatally flawed, as outlined in numerous prior comment letters, which are hereby incorporated by reference. The sufficiency of that analysis is now pending before the California Court of Appeal. Now, in a final EIR released only days before the Planning Commission once again considers Project-related approvals, the City and developer have proposed an entirely new strategy for analyzing and mitigating GHG emissions. The new strategy, like the old, fails to satisfy CEQA’s requirements.

3-F2-

a. Legal Standards

The City’s determinations regarding the significance of greenhouse gas (“GHG”) emissions and the effectiveness of mitigation must be based on a correct interpretation of the law. (See, e.g., *City of San Diego v. Board of Trustees of California State University* (2015) 61 Cal.4th 945, 956 [agency’s use of erroneous legal standard constitutes a failure to proceed in a manner required by law].) Moreover, because the FEIR continues to use a quantitative threshold as the basis for its significance determination,¹ there must be specific, quantitative evidence to support a conclusion that mitigation measure (“MM”) 4.7.7.1 will actually reduce Project emissions sufficiently to achieve compliance with that threshold. (See *Center for Biological Diversity v. California Department of Fish & Wildlife* (2015) 62 Cal.4th 204, 227-28.) And even to the extent the FEIR is still relying on the prior threshold of 10,000 metric tons CO₂-equivalent (“MM CO₂e”) per year, the same quantitative evidentiary standard controls.

3-F2-

CEQA establishes strict standards for mitigation. “Mitigation measures must be fully enforceable through permit conditions, agreements, or other legally binding instruments.” CEQA Guidelines § 15126.4(a)(2). Development of specific mitigation measures may be deferred only if the agency makes an enforceable commitment to mitigation and adopts specific performance

3-F2-

¹ The EIR contains two independent thresholds of significance. (See Draft Recirculated Revised Sections of the Final Environmental Impact Report at 4.7-18.) Exceedance of either threshold would result in significant climate impacts. Accordingly, the City and developer may not dismiss fatal flaws in the EIR’s analysis of one threshold by attempting after the fact to rely solely on the other.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

standards that measures must meet. (CEQA Guidelines § 15126.4(a)(1)(B); *King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 857-58.)

Proposals for the use of offsets or carbon credits as CEQA mitigation must be evaluated in light of other state statutes addressing these instruments. When it adopted Assembly Bill 32 (“AB 32”) in 2006, the Legislature established standards for greenhouse gas offsets used in any statewide Cap-and-Trade system: (1) they must be “real, permanent, quantifiable, verifiable,” and “enforceable” by the California Air Resources Board (“CARB”); and (2) they must be “in addition to any greenhouse gas emission reduction otherwise required by law or regulation, and any other greenhouse gas emission reduction that otherwise would occur.” (Health & Safety Code, § 38562(d)(1), (2).) CARB adopted regulations applying these standards to carbon credits issued by private “registries”—essentially carbon market brokers—who wish to sell credits for use within the Cap-and-Trade system. (*See* Cal. Code Regs., tit. 17, §§ 95970(a), 95971, 95972.)

Evaluating compliance with these standards requires substantial expertise and rigorous analysis. CARB follows a detailed regulatory process in an effort to establish that offset “protocols”² intended for Cap-and-Trade compliance meet statutory and regulatory requirements. (*See* CARB, *California Air Resources Board’s Process for the Review and Approval of Compliance Offset Protocols in Support of the Cap and Trade Regulation* (May 2013), at <https://ww3.arb.ca.gov/cc/capandtrade/compliance-offset-protocol-process.pdf> (visited May 10, 2020); attached as Exhibit A.) Offset credits must represent greenhouse gas reductions that are “permanent” (i.e., will last at least 100 years), “conservatively quantified to ensure that only real reductions are credited,” independently verifiable, and enforceable through “clear monitoring requirements that can be ... enforced by ARB.” (AR 1383:66171.) Offsets also must be “additional, or beyond any reduction required through regulation or action that would have otherwise occurred in a conservative business-as-usual scenario”; this would exclude any “project type that includes technology or GHG abatement practices that are already widely used.” (*Ibid.*; see also *id.*, pp. 66174-75.)

b. Mitigation Measure 4.7.7.1 Fails to Satisfy CEQA’s Requirements

MM 4.7.7.1 falls far short of CEQA’s standards for adequate mitigation. Any finding that the Project’s climate impacts would be less than significant based on implementation of MM 4.7.7.1 would lack both evidentiary and legal support.

i. Mitigation Measure 4.7.7.1 Cannot Support a Conclusion that the Project’s GHG Emissions Will Be Less Than Significant.

MM 4.7.7.1 proposes that the Project’s massive GHG emissions be mitigated through “proof” of either “offsets” or “carbon credits.” (FEIR 1a at 755-56.) As a threshold matter, the

² “Protocols” are, in effect, the rules offset projects must follow. CARB defines an “offset protocol” as “a documented set of procedures and requirements to quantify ongoing GHG reductions or GHG removal enhancements achieved by an offset project and calculate the project baseline. Offset protocols specify relevant data collection and monitoring procedures, emission factors, and conservatively account for uncertainty and activity-shifting and market-shifting leakage risks associated with an offset project.” (Cal. Code Regs., tit. 17, § 95802.)

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

3-F2-
CON

3-F2-

difference between “offsets” and “carbon credits” is not explained. “Offsets” appear to be purported GHG reductions from projects *other* than those listed by a registry or conducted pursuant to any established protocol or other recognized mechanism for reducing emissions. Yet MM 4.7.7.1 provides no standards for the City’s Planning Official to use in determining whether such “offsets” are “real, permanent, additional, quantifiable, verifiable, and enforceable by an appropriate agency.” These determinations require rigorous, transparent review and substantial expertise, as reflected in CARB’s Cap-and-Trade regulations and protocol review process. There is no evidence that “the City’s Planning Official” has the expertise or capacity to ensure compliance with or enforcement of these standards. Nor does MM 4.7.7.1 provide any performance standards to guide the Planning Official’s determinations. It also appears that the Planning Official would reach his or her determinations without any public or expert review—in short, without any transparency whatsoever. Finally, to the extent MM 4.7.7.1 would apply similar criteria to “offsets” and “carbon credits,” it cannot ensure compliance with those criteria for the reasons discussed below. As a result, MM 4.7.7.1’s reliance on “offsets” is vague, unenforceable, ineffective, improperly deferred, and inadequate under CEQA.

3-F2-
CON

The “carbon credits” provisions of MM 4.7.7.1 similarly are unsupported by either law or evidence.

First, there is no evidence MM 4.7.7.1 will result in effective mitigation. Although MM 4.7.7.1 lists the basic criteria required under Health and Safety Code section 38562(d)(1) and (2), it requires the City to “conclusively presume[]” that these criteria are satisfied by any offset credit purchased from “a carbon registry approved by the California Air Resources Board.” (FEIR 1a at 756 [listing without limitation “Climate Action Reserve, American Carbon Registry, Verra [formerly Verified Carbon Standard] or GHG Reduction Exchange (GHG RX)”].) The City cannot simply presume that every carbon credit purchased from one of these registries will meet the referenced criteria. On the contrary, to support such a conclusion, the City would need to identify substantial evidence showing that each and every credit generated under each and every protocol used by each and every registry “approved” by CARB, now or in the future, would meet these criteria. No such evidence exists. Indeed, MM 4.7.7.1’s reliance on a conclusive presumption is a tacit concession that no such evidence exists.

3-F2-

Tellingly, MM 4.7.7.1 and CARB take complete opposite approaches to review of voluntary market carbon credits marketed by private registries. CARB does not simply presume all credits issued by specified registries are adequate, as MM 4.7.7.1 would require the City to do. Nor does CARB take registries at their word that all of their protocols meet state requirements. Rather, CARB independently evaluates each protocol through a full regulatory process in order to determine whether it complies with state standards. (See generally 17 Cal. Code Regs. §§ 95970-95972; see also Exhibit A.) Using these procedures, CARB has approved only six protocols for use in the Cap-and-Trade system over the last 10 years. (CARB, Compliance Offset Program, at <https://ww3.arb.ca.gov/cc/capandtrade/offsets/offsets.htm> (visited May 8, 2020).) And, as discussed below, CARB’s approved protocols remain beset by serious questions as to their adequacy and efficacy despite this process. MM 4.7.7.1, on the other hand, completely abandons any pretense of review or oversight. It would *require* the City to accept credits generated under any protocol listed by any registry, without any review

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

whatsoever of whether those credits or the protocols they were generated under satisfy the measure’s stated criteria, and without any ability even to question whether the credit is adequate.

3-F2-
CON

Second, CARB “approval” of a registry does not establish anything about the quality of carbon credits sold by that registry on the voluntary market. The reference to CARB approval in MM 4.7.7.1 is therefore deeply misleading.³ The fact that a registry is “approved by CARB” does not establish that voluntary market carbon credits sold by that registry satisfy the criteria listed in MM 4.7.7.1. CARB approval of a registry to list Cap-and-Trade-compliant credits does not entail CARB review or approval of other protocols used or credits listed by that registry; CARB’s procedures for approving compliance protocols and authorizing registries to list credits generated under those protocols are entirely separate. (Compare 17 Cal. Code Regs. §§ 95970-95972 [CARB compliance protocol approval process] with *id.*, § 95986 [establishing conflict of interest, insurance, expertise, and other business requirements for registries that list Cap-and-Trade compliance credits].) At best, MM 4.7.7.1’s reference to “approved” registries reflects a misinterpretation of CARB’s regulations and their application (or lack thereof) to the quality of offsets traded on the voluntary market; at worst, it reflects an intentional effort to mislead decision-makers and the public. Either way, the measure’s reliance on CARB “approval” is legally erroneous. As a result, a registry’s “CARB-approved” status cannot support any conclusion regarding the effectiveness of MM 4.7.7.1, the ability of registry credits to satisfy the measure’s purported criteria, or the significance of the Project’s impacts after mitigation.

3-F2-

Third, although each private registry may use a wide range of protocols or methodologies in determining which carbon credits to list for sale, the City cannot simply presume that compliance with those protocols ensures compliance with the criteria that purportedly govern MM 4.7.7.1. All GHG offsets are inherently uncertain because reductions embodied in offset credits must be compared against what would have happened without the offset project—a counterfactual scenario that cannot be tested because it will never happen. (See Haya et al. 2016, attached as Exhibit B.) Studies have shown that even the Cap-and-Trade compliance protocols adopted through CARB’s regulatory process do not result in one-for-one reductions of GHG emissions. (Haya 2019, attached as Exhibit C; Anderson and Perkins 2017, attached as Exhibit D.) CARB’s compliance protocols are largely based on Climate Action Reserve protocols, which suffer from the same deficiencies. Moreover, American Carbon Standard and Verra both list projects using United Nations Clean Development Mechanism (“CDM”) methodologies.⁴

3-F2-

³ Notably, despite MM 4.7.7.1’s suggestion to the contrary, the “GHG RX” registry has *not* been approved by CARB to handle transactions in Cap-and-Trade offsets. (California Air Resources Board, Offset Project Registries, at <https://ww3.arb.ca.gov/cc/capandtrade/offsets/registries/registries.htm> (visited May 8, 2020), attached as Exhibit M.) The “GHG Rx” program was developed by the California Air Pollution Control Officers Association, but it currently lists no available projects or credits available for purchase, and appears for all practical purposes to be defunct. (See CAPCOA Greenhouse Gas Reduction Exchange (GHG Rx), at www.ghgrx.org (visited May 8, 2020); attached as Exhibit N.)

⁴ See American Carbon Registry, Carbon Accounting, at <https://americancarbonregistry.org/carbon-accounting/old/carbon-accounting> (visited May 8, 2020) (generally accepting CDM methodologies with some additional review); Verra, Verified Carbon Standard Methodologies, at <https://verra.org/methodologies/> (visited May 8, 2020) (accepting “any methodology developed under the [CDM] ... for projects and programs registering with VCS).

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Scientists and academic experts have long criticized CDM offset projects for their lack of additionality and other flaws. (See, e.g., Aldy and Stavins 2012, attached as Exhibit E; Cames et al. 2016, attached as Exhibit F; Haya 2009, attached as Exhibit G; He and Morse 2013, attached as Exhibit H; Wara 2008, attached as Exhibit I; Zhang and Wang 2011, attached as Exhibit J.) Carbon markets can also create perverse incentives that undermine the environmental integrity and additionality of offsets. (Schneider & Kollmuss 2015; attached as Exhibit K.)

3-F2-
CON

ii. MM 4.7.7.1 Improperly Defers Formulation of Mitigation.

Because MM 4.7.7.1 defers the identification of specific measures to offset the Project’s GHG emissions (whether those measures are denominated “offsets” or “carbon credits”), it must meet CEQA’s requirements for deferred mitigation. It fails to do so. MM 4.7.7.1 lacks specific performance standards “the mitigation will achieve.” (CEQA Guidelines § 15126.4(a)(1)(B).) The measure’s list of basic criteria offsets and credits must satisfy does not suffice, because the measure does not establish any performance standards governing how compliance with those criteria will be measured. Performance standards must be specific, not so vague as to grant officials unfettered discretion as to whether effective mitigation will be implemented at all. See *King and Gardiner Farms*, 45 Cal.App.5th at 857-58. As discussed above, there is no evidence the voluntary market registries’ processes are designed to ensure carbon credits comply with these criteria, and the City cannot wish this lack of evidence away by “presuming” otherwise. Nor is there any evidence the City’s Planning Official can credibly implement these criteria in the absence of any performance standards, guidance, or relevant expertise in evaluating offset projects or carbon credit purchases. MM 4.7.7.1 simply requires the City to presume that whatever a developer submits is adequate. That is not a performance standard. Nor is it even an adequate commitment to ensure mitigation is implemented. MM 4.7.7.1 is improperly deferred.

3-F2-

iii. MM 4.7.7.1 Improperly Defers Implementation of Mitigation.

Implementation of mitigation under MM 4.7.7.1 is also improperly deferred until after emissions occur. Under CEQA, mitigation measures must be in place before an impact occurs; unmitigated impacts are not permitted before mitigation is implemented. *King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 860. Rather, “[o]nce the project reaches the point where activity will have a significant adverse effect on the environment, the mitigation measures must be in place.” *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 738. Accordingly, there must be substantial evidence that GHG reductions embodied in offsets or carbon credits have actually occurred prior to any GHG-emitting activity. MM 4.7.7.1 violates this requirement by allowing a developer to provide offsets or carbon credits as a condition of issuance of a certificate of occupancy. (FEIR 1a at 756). However, a certificate of occupancy cannot be issued until after grading and construction are complete and the buildings are inspected. (See generally 2019 California Building Code, tit. 24, Part 2, § 111.) By that time, all construction-related emissions will have occurred *before* mitigation is in place—a clear violation of CEQA’s prohibition against deferred implementation. Moreover, some carbon credit registries (including Climate Action Reserve) are now marketing carbon credits based on “forecasted” emissions reductions that have not yet occurred. Reliance on such credits—which MM 4.7.7.1 does nothing to restrict—also would violate CEQA’s requirement that mitigation be in place before impacts occur.

3-F2-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

iv. MM 4.7.7.1 Is Not Adequately Enforceable.

MM 4.7.7.1 improperly eliminates any role for the City in enforcing the effectiveness of mitigation. At best, MM 4.7.7.1 relies entirely on enforcement by carbon credit registries, without identifying any evidence as to how or whether enforcement might occur, and how or whether City enforcement could serve as a backstop in the event registry enforcement fails. As a result, credits under MM 4.7.7.1 are not “enforceable by an appropriate agency” as MM 4.7.7.1 purports to require. The term “agency” as used in CEQA means a *public* agency, not a third-party broker of offset credits. (See, e.g., Pub. Resources Code §§ 21001.1, 21004, 21062, 21063, 21065, 21069, 21070.) Public agencies are ultimately responsible under CEQA for the efficacy and enforcement of mitigation measures. Public agencies must make findings regarding the significance of impacts and the incorporation of feasible mitigation measures (*id.*, § 21081), and must adopt mitigation monitoring and reporting plans that ensure implementation and enforcement of mitigation (*id.*, § 21081.6). The City cannot delegate its basic legal responsibilities under CEQA to developers, offset program operators, registries, or other third parties.

Nor can MM 4.7.7.1 be deemed enforceable by virtue of any third-party agreements that might govern the registries’ issuance of carbon credits. Under MM 4.7.7.1, it does not appear the City would even be aware of, much less be able to monitor or enforce, any agreement between an carbon credit project developer and the registry listing the credits. And even if any such agreement were capable of being enforced by the registry (for example, where an offset project violated the agreement and credits issued by that project were subsequently invalidated), MM 4.7.7.1 contains no mechanism that would require the developer to provide additional credits or take any other action. As the California Attorney General pointed out in a recent amicus brief addressing a substantively similar mitigation measure proposed by the County of San Diego, such measures “lack any adequate criteria to ensure enforceability of the offsets purchased...” (Amicus Brief of the California Attorney General in Support of Petitioners and Respondents, *Sierra Club, et al. v. County of San Diego*, Cal. Ct. App., Fourth Dist., Div. 1, Case No. D075478 (filed Oct. 29, 2019), attached as Exhibit L.) MM 4.7.7.1 improperly abdicates the City’s basic enforcement responsibility.

v. MM 4.7.7.1 Appears to Arbitrarily Limit Mitigation Obligations to 30 Years.

Although MM 4.7.7.1 is not entirely clear on this point, it appears that the developer’s mitigation obligations may be limited to “construction and 30-years operation [*sic*] of all Project facilities.” (FEIR 1a at 756 [citing Tables 4.7-8 and 4.7-16].) Yet nothing in the FEIR appears to limit the Project’s operations to a 30 years following buildout. Accordingly, the FEIR’s conclusion that MM 4.7.7.1 will reduce Project emissions to “net zero” is unsupported. Moreover, as the California Attorney General pointed out in its *Sierra Club v. County of San Diego* amicus brief, developments like the Project that increase VMT result in “structural” GHG emissions that likely will continue well beyond 2050, jeopardizing the state’s ability to meet its

3-F2-

3-F2-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

long-term emissions reduction goals.⁵ (See Exhibit L at 22-23.) Mitigation obligations must continue throughout the life of the project.

vi. The FEIR Fails to Address Potentially Significant Impacts of Mitigation.

The FEIR adds an entirely new mitigation strategy, but fails to address any of the environmental impacts of that strategy. CEQA requires analysis of potentially significant impacts that could occur from implementation of mitigation measures. (CEQA Guidelines § 15126.4(a)(1)(D).) Two offset project types generating large shares of offsets on the voluntary offset market globally can have significant environmental and social impacts. Large hydropower projects often impact river water quality and river ecosystems (Haya & Parekh 2011; attached as Exhibit O). Numerous articles have documented the impact that avoided deforestation offset projects have had by displacing forest communities or barring forest communities from their traditional use of the forest. (See, e.g. Kansanga & Luginaah 2019, attached as Exhibit P; Beymer-Farris & Bassett 2012, attached as Exhibit Q.) Researchers also have identified severe adverse environmental and social effects from international forest carbon projects. (See, e.g., Cavanagh & Benjaminsen 2014, attached as Exhibit R.) In the United States and around the world, solar and wind energy projects, livestock digesters, and solid waste to energy projects—all of which are eligible carbon offset projects under various registry protocols—can damage wildlife habitat and increase air pollution. The FEIR’s complete omission of any analysis of these readily foreseeable environmental impacts is legal error and also deprives the FEIR of any evidentiary support.

c. The FEIR Must Be Recirculated for Full Public Review and Comment.

The FEIR contains significant new information and must be recirculated for public review and comment before being considered by the City. (CEQA Guidelines § 15088.5.) The FEIR reflects a fundamental change in how climate impacts are disclosed, analyzed, and mitigated. Prior to release of the FEIR, environmental review for this Project assumed that all GHG emissions with some tenuous connection to the state’s Cap-and-Trade system (what the FEIR still misleadingly calls “capped” emissions) could be dismissed as less than significant. Now, with the California Court of Appeal poised to rule on the correctness of this argument, the City and the developer have switched strategies entirely, substituting a “net zero” analysis for the EIR’s previous “capped emissions” analysis.

Recirculation is required here for at least two reasons. First, the FEIR’s new analysis, however conditional, shows that prior versions of the EIR were fundamentally inadequate. By including a brand new mitigation strategy in the FEIR only a few days before the Planning Commission hearing, the City has thwarted meaningful public comment on significant new information raising complex new issues. Recirculation is required on this basis alone. Second, the FEIR’s new analysis in reveals that impacts previously dismissed as insignificant before mitigation are, in fact, significant. Table 4.7-5 as it appeared in the Draft Recirculated Revised

⁵ This aspect of the Project also deprives the FEIR’s conclusions under the second threshold of significance for climate impacts (interference with policies or plans) of support.

3-F2-
CON

3-F2-

3-F2-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Sections of the Final Environmental Impact Report measured only “Total Uncapped” Project emissions in applying the 10,000 MT CO₂e/year significance threshold. (DRRSFEIR at 4.7-27 to 4.7-28.) The table thus concluded that emissions for 2020 through 2023 would be less than significant without mitigation, even though “Total Capped” emissions exceeded 10,000 MT CO₂e for each year. (*Ibid.*) The FEIR, in contrast, at least conditionally considers all Project emissions—both “capped” and “uncapped”—in applying the 10,000 MT CO₂e/year threshold. By this measure, Project emissions for 2020 through 2023 would exceed the 10,000 MT CO₂e threshold in each year, and thus would be significant before mitigation. The FEIR may not dismiss this impact by concluding that MM 4.7.7.1 will prevent any significant impact after mitigation; the significance of impacts must be disclosed and analyzed prior to development and incorporation of mitigation measures, not after. avoidance (See *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-58.) The FEIR must be recirculated.

3-F2-
CON

III. The Revised FEIR’s Continued Reliance on the Cap and Trade Program to Cover the Vast Majority of GHG Emissions Remains Unlawful.

The Response to Comments in the Revised FEIR does not resolve the significant critiques to the GHG analysis. In fact, it doubles down on the flawed approach of using cap and trade as a mechanism to disguise the vast majority of GHG emissions from this Project. This letter solely addresses a few new items included in the Revised FEIR.

Importantly, the California Air Resources Board, the agency responsible for implementation of AB 32 and the Cap-and-Trade Program, has stated several times that the “[Cap-and-Trade] Program does not, and was never designed to, adequately address emissions from local projects and CEQA does not support a novel exemption for such emissions on this ground.”⁶ In fact, this issue was raised in the Final Statement of Reasons for the 2018 revisions to the California Environmental Quality Act Guidelines where the Building Industry Association made the following request:

3-F2-

Comment 44.37

Guideline 15064.4. Analyzing Impacts from Greenhouse Gas Emissions
Consistent with *Association of Irrigated Residents v. Kern County Board of Supervisors* (2017) 17 Cal.App.5th 708, the following sentence should be added at the end of subsection (b)(3): “Project-related greenhouse gas emissions resulting from sources subject to the cap-and-trade program shall not be considered when determining whether the project-related emissions are significant.”⁷

The Natural Resources Agency emphatically rejected this comment from the Building Industry Association in stating the following:

⁶ Letter from California Air Resources Board to Moreno Valley, September 7, 2018, *available at* https://ww3.arb.ca.gov/toxics/ttdceqalist/logisticsfeir.pdf?_ga=2.143040245.1938875667.1580500719-1770248365.1564513994.

⁷ California Natural Resources Agency, Final Statement of Reasons for Regulatory Action Amendments to the State CEQA Guidelines, OAL Notice File No. Z-2018-0116-12, Exhibit A. at p. 219 (November 2018) *available at* http://resources.ca.gov/ceqa/docs/2018_CEQA_ExA_FSOR.pdf.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Response 44.37

The Agency declines to make any changes in response to this comment. The decision in Association of Irrigated Residents v. Kern County Board of Supervisors (2017) 17 Cal.App.5th 708 (“AIR v. Kern”) is from one state appellate court and has not been consistently applied by any other appellate courts. Moreover, the Agency finds that the case does not support the suggested addition. The holding in that case is limited to its facts. That court held only that the CEQA Guidelines may authorize a lead agency to determine that a project's greenhouse gas emissions will have a less than significant effect on the environment based on the project's compliance with the Cap-and-Trade program. The project in that case was directly regulated by the Cap-and-Trade program. The decision did not hold that all emissions from may be subject to the Cap-and-Trade regulation at any point in the supply chain are exempt from CEQA analysis, regardless of how those sources are used by the project.⁸

The Natural Resources Agency further elaborated referencing the Air Resources Board’s letter on the exact project studied in the Draft Recirculated FEIR.

The Agency notes that the California Air Resources Board (CARB) has prepared an extensive legal analysis setting forth why the Cap-and-Trade program does not excuse projects from CEQA’s analysis and mitigation requirements, including emissions from vehicular trips or energy consumption from development projects. (This analysis, prepared by CARB as CEQA comments regarding a major freight logistics facility, is available at <https://www.arb.ca.gov/toxics/ttdceqalist/logisticsfeir.pdf>.) The Agency further notes that CARB’s analysis is consistent with this Agency’s discussion of how greenhouse gas regulations factor into a CEQA analysis of greenhouse gas emissions. (See Final Statement of Reasons (SB 97), December 2009, at p. 100 (“Lead agencies should note ... that compliance with one requirement, affecting only one source of a project’s emissions, may not necessarily support a conclusion that all of the project’s emissions are less than significant”).)

The effect of existing regulations is addressed further in the updates to Sections 15064(b) and 15064.7 of the CEQA Guidelines.⁹

Thus, the agency responsible for implementation of AB 32 and the Cap-and-Trade Program, in addition to the agency responsible for drafting the CEQA Guidelines the Draft Recirculated FEIR relies upon for authority disagrees with the approach taken by the City to rely on Cap-and-Trade for all transportation and energy emissions.

Instead of adhering to the position of the relevant agency, the Revised FEIR continues to rely on two agencies that deserve no deference on this issue. But, even if these agencies positions were entitled to deference on this issue, which they are not, the evidence in the record is flawed. The Revised Final EIR includes new attachments A and B, which are the specific South Coast AQMD Documents relied upon for the conclusion to support the use of cap and trade to erase

⁸ *Id.*

transportation and energy emissions. Importantly, both of these documents are from 2014. Since that time, the South Coast has produced several other CEQA documents. In fact, in the most recent document from 2020, they do not use this same approach of arguing emissions from transportation will be addressed under the cap and trade program. See South Coast AQMD, Phillips 66 Los Angeles Refinery Ultra Low Sulfur Diesel Project Environmental Impact Report, available at <http://www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2020/01-feir-chapters1-7.pdf?sfvrsn=6>. The Developer asked the South Coast to weigh in on its settlement in Attachment Q, so it is unclear why the Developer failed to ask whether the South Coast AQMD continues to use this clearly flawed cap and trade rationale for transportation and energy-related emissions. In reviewing the other CEQA documents where the South Coast AQMD was a lead agency, I could not find other instances of this approach being used after 2014.

3-F2-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

In the context of the San Joaquin Valley APCD document, the Revised FEIR fails to explain the relevance of an agency interpretation that has no nexus to this Project. Because of this, the City must recirculate a Draft EIR to properly disclose the significant climate pollution impacts from this Project.

IV. The FEIR Must Be Recirculated Before Project Approval and Certification.

Under CEQA, an EIR must be re-circulated for review and comment whenever significant new information becomes known to the lead agency and is added to the EIR after public notice of the availability of the draft document has been made, and before the EIR is certified. Pub. Res. Code § 21092.1. Under such circumstances the lead agency is specifically required to re-notice the environmental review document to the public and all responsible agencies, and is required to obtain comments from the same, before certifying the document’s impacts and alternatives analyses as well as any mitigation measures. See *id.*; see also, Pub. Res. Code § 21153. A lead agency’s decision not to recirculate an EIR must be supported by substantial evidence. Cal. Code Regs. tit. 14 (“CEQA Guidelines” or “Guidelines”) § 15088.5(e). “Significant new information” includes any information regarding changes in the environmental setting of the project under review. Guidelines § 15088.5(a). It also includes information or data that has been added to the EIR and is considered “significant” because it deviates from that which was presented in the draft document, depriving the public from a meaningful opportunity to comment upon a significant environmental effect of the project, or a feasible way to mitigate or avoid such an effect at the time of circulation of the draft. *Id.* Some examples of significant new information provided in the CEQA Guidelines are: “(1) information relating to a new significant environmental impact that would result from the project or a new mitigation measure; (2) a substantial increase in the severity of an environmental impact [that] would result unless mitigation measures are adopted; and (3) any feasible alternative or mitigation measure considerably different from others previously analyzed ...” Guidelines § 15088.5 (a)(1)-(3). Recirculation is further required where the draft EIR is “so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.” Guidelines § 15088.5 (a).

3-F2-

The required re-noticing and new comment period for a re-circulated EIR is essential to meeting CEQA’s procedural and substantive environmental review requirements, as the EIR’s

assessment of a project’s impacts, mitigation measures and alternatives and the public’s opportunity to weigh in on the same is at the heart of CEQA. *Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1123. Where new information is added to an EIR in such a way as to highlight informational deficiencies in the draft document’s environmental impacts, mitigation and alternatives analyses, the public must be allowed the opportunity and additional time to comment on the changes made in the final document’s analyses. Moreover, where significant new information that is added to the EIR’s assessment of a particular impact area falls within the purview of another responsible agency’s area of expertise that agency must also be allowed a meaningful opportunity to review and respond to such new information and any changes implicated in the EIR’s analyses.

While re-circulation is indeed an exception and not the rule in the preparation of final environmental review documents, it is an exception that must be invoked here – where the absence of significant information rendered the draft EIR ineffective in meeting CEQA’s substantive mandates, and now, where included, the addition of significant new information substantially changes the FEIR’s analyses and conclusions regarding the Project’s impacts, feasible alternatives and required mitigation. *Laurel Heights Improvement Assn. v. Regents of Univ. of Cal.* (1993) 6 Cal.4th 1112, 1132. As stated in numerous comments to the various versions of the EIR, that document failed to provide critical information regarding the project area and scope of the project’s impacts; it failed to adequately describe fundamental information relating to the phasing and timing of the project’s massive structural and infrastructural developments; it lacked adequate detail specifically regarding the construction and operations phases of the project; and it contained analyses and mitigation measures relating to the Project’s air quality, traffic, human health and biological resources impacts based on outdated or inapplicable studies and data. In some instances the Revised FEIR erratically and arbitrarily includes selective new data into its analysis of the Project’s impacts and mitigation measures, and in others critical information remains absent from the document. Whether referenced in the Revised FEIR as new information, or wholly omitted from the document’s analyses, the addition of such information is essential to the public’s ability to participate in the environmental review process. The Revised FEIR must therefore be re-drafted and re-circulated document to provide the public at large and the Project’s numerous other responsible agencies with more time to review and analyze the Project’s impacts and to assess or prescribe necessary mitigation measure to minimize those impacts. The City cannot render a determination on the issuance of the project approvals under consideration until such recirculation occurs, and CEQA compliance is assured.

V. The Draft Statement of Overriding Considerations is Unsupported by Substantial Evidence and Fails To Justify the Project’s Significant Impacts and Interference with Health Protective Air Quality Standards Attainment

The Statement of Overriding Considerations is insufficient to justify the Project’s significant and unavoidable impacts for the reasons explained below. The statement’s terms are insufficiently analyzed in both the draft EIR and in the Revised FEIR. Moreover because the Revised FEIR as a whole suffers from serious deficiencies that taint the whole of the analyses contained in the document, the draft statement cannot adequately weigh the Project’s adverse, significant impacts with the espoused benefits from the Project contained in any statement of overriding considerations. *Vedanta Society of So. California v. California Quartet, Ltd.* (2000)

3-F2-

3-F2-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

84 Cal.App.4th 517, 530 (a project with significant and unmitigated environmental impacts can only be approved when “the elected decision makers have their noses rubbed” in the Project’s environmental effects, and still vote to move forward). As such the statement and its purported benefits must be rejected.

As the lead agency for the Project, if the City is to approve a project of this magnitude, and with the unmitigated significant environmental and human health impacts that the Project will cause, it “must adopt a statement of overriding considerations.” Pub Res. Code § 21081, subd. (b); Guidelines, § 15093. In contrast with mitigation and feasibility findings, overriding considerations can be “larger, more general reasons for approving the project, such as the need to create new jobs, provide housing, generate taxes, and the like.” *Concerned Citizens of South Central L.A. v. Los Angeles Unified School Dist.* (1994) 24 Cal.App.4th 826, 847. Yet, like mitigation and feasibility studies, a statement of overriding consideration is also subject to a substantial evidence standard of review. *Sierra Club v. Contra Costa County* (1992) 10 Cal.App.4th 1212, 1223; Guidelines § 15093, subd. (b).” Thus, an agency’s unsupported claim that the project will confer general benefits is insufficient, and the asserted overriding considerations must be supported by substantial evidence in the FEIR or somewhere in the record. *Sierra Club v. Contra Costa County* (1992) 10 Cal.App.4th 1212, 1223; Guidelines § 15093, subd. (b).”

As part of the EIR review process, statements of overriding consideration are intended to “vindicate the ‘right of the public to be informed in such a way that it can intelligently weigh the environmental consequences’ of a proposed project[;]” and they must make a good-faith effort to inform the public of the risks and potential benefits of the Project whose approval is proposed. *Woodward Park Homeowners Ass’n, Inc. v. City of Fresno* (2007) 150 Cal.App.4th 683, 717-718 (citing *Karlson v. City of Camarillo* (1980) 100 Cal.App.3d 789, 804).

In accordance with this standard, before approving the Project and the FEIR the City must show that it has considered each of the Project’s significant and unavoidable impacts in light of **each** of the alleged overriding considerations that it asserts will justify those impacts. *Cherry Valley Pass Acres & Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316, 357 (upholding a statement of overriding consideration on the basis that “the City found the project had eight benefits, each of which ‘separately and individually’ outweighed its unavoidable impacts). Thus, the City must specifically consider and set forth overriding considerations to justify the Project’s significant and unavoidable direct indirect and cumulative impacts in each of the following areas: aesthetics, land use and biological resources, noise, traffic and air quality.

The statement of overriding consideration attached to the FEIR asserts two general areas of benefits that it asserts outweigh the Project’s significant and detrimental, un-mitigated impacts: (1) an increase in jobs that improves the job to housing ratio in the City of Moreno Valley, and (2) an increase the in the City’s overall tax revenue, which could be used to improve schools and confer other public benefits to the residents of the City. Any additional public benefits that the draft statement assumes may result from approval of the Project flow from one of those two underlying considerations.

These two alleged benefits are, however, based on erroneous assumptions that (a) the

3-F2-
CON

3-F2-

3-F2-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Project will bring secure, desirable and certain jobs to the City of Moreno Valley; and (b) that the environmental degradation caused by the Project’s significant and unavoidable impacts will not outweigh the benefits conferred by the Project in monetary terms, or based on any other form of valuation methodologies. While the draft statement sites thoroughly to “appendix O” the Fiscal and Economic Impact Study, it fails to account for aspects of the job market that will undoubtedly impact the nature and desirability of the jobs made available at the Project, if it is approved, constructed and permitted to operate. Just some of these unmentioned aspects include trends towards employing largely contract, part-time or temporary or short-term labor to fill the jobs created by the WLC. Indeed the study is based on an assumption that either the WLC or other logistics uses will result in the permanent employment of .5 employees per 1,000 building square feet. Appendix O, at 20. Yet the study fails to calculate what the rate of employment would be if some or all of those jobs were characterized as part-time or temporary contract labor employment.

3-F2-;
CON1

The draft statement of overriding considerations similarly fails to account for any discrepancy in full-time vs. part time, temporary or contract jobs. Moreover, additional aspects of job desirability including working conditions for laborers employed at the WLC or similar logistics enterprises that would operate in the project area are left wholly omitted from both the Appendix O study and the statement, and to the extent the draft statement relies on the development agreement to ensure that such jobs are actually ensured, such assurances are illusory as the development agreement terms remain unclear.

The draft statement of overriding considerations also fails to adequately quantify, either monetarily or based on some other form of valuation method, the consequences of the Project’s impacts, specifically including its impacts to human health, the environment and invaluable threatened and endangered biological resources that surround the proposed project area.

3-F2-;

Weighing the Project’s true impacts against its purported benefits is a critical environmental review requirement. *See Woodward Park Homeowners Ass’n, Inc. v. City of Fresno*, 150 Cal.App.4th, 720. The City must therefore engage in a good faith effort to thoroughly analyze of the full scope of the impacts for which the statement of overriding consideration is being offered.

3-F2-;

Doing so here would involve some process by which to measure conclusory statements that fully contradict the evidence on the record, such as the statement that the Project will improve health public health. Draft Statement of Overrid., at 209.

Finally, the draft statement of overriding considerations fails to justify the Project’s impediment to the South Coast Air Basin achieving federal and state NAAQS, and it’s steady, foreseeable future contribution to the region’s ability to meet Air Quality Management Plan targets, which are essential to ensuring compliance with state and federal law. The statement of overriding consideration cannot, in essence justify the Project’s apparent conflict of potentially causing violations of air quality standards, which carry severe economic sanctions for the 18 million people living the South Coast Air Basin based on parochial economic justifications for one city.

3-F2-;

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

For these reasons stated herein and because the alleged Project benefits included in the draft statement of overriding consideration run counter to the evidence on the record, the City cannot approve the Project, and cannot certify the Revised FEIR as an informational document.

3-F2-1

Given the limited time, this comment only raises some of the issues that are of concern related to this project. We appreciate your consideration of these comments. Please do not hesitate to contact us at amartinez@earthjustice.org if you have questions about this comment letter.

RESPONSES TO LETTER 3-F2: ADRIAN MARTINEZ, EARTHJUSTICE

Response to Comment 3-F2-1: The comment asserts that the information within the Revised Final EIR includes significant new information, including new mitigation strategies, and therefore, the commenter requests additional time for public review. The responses and errata provided in the Revised Final EIR does not alter the significance conclusions provided in the draft EIRs (i.e., Revised Sections of the Final EIR [RSFEIR]). The reference to new mitigation strategies refer to the addition of Mitigation Measure 4.7.7.1. The addition of the mitigation does not change the impact determination, will reduce the impact of greenhouse gas emissions and would not result in a new significant impact as discussed on pages 755 to 756 within Section 4.3.1 of the Final Response to Comments. The introduction of a new mitigation measure therefore does not meet any of the requirements for recirculation set forth in CEQA Guidelines Section 15088.5(a). As required by CEQA Guidelines Section 15088, the City of Moreno valley as the Lead Agency, provided written responses to public agencies that commented on either the RSFIER or Draft Recirculated RSFEIR at least 10 days prior to certifying the Revised Final EIR.

Response to Comment 3-F2-2: The commenter states that their comment is attached to the e-mail and that forthcoming emails will contain relevant attachments referenced in the comment letter. No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F2-3: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F2-4: The comment claims that the Revised Final EIR fails to comply with CEQA and serves as an introduction to specific comments on the contents of the Revised Final EIR.

Response to Comment 3-F2-5: The commenter claims that the Revised Final EIR understates air quality impacts from the Project. To the contrary, the air quality analysis includes several conservative assumptions that include but are not limited to 1) a compressed construction schedule, (see Section 4.3, page 4.3-20), 2) more project construction is occurring sooner rather than later, when air quality improvements in construction equipment could be available (see Section 4.3, page 4.3-20), 3) construction phase and plot activity overlap (see Section 4.3, page 4.3-20), 4) utilizing EMFAC2017 vehicle fuel mix projections which assumes zero electric heavy duty trucks (see Section 4.3, page 4.3-21), and 5) assuming 5-minute idling while Mitigation Measure 4.3.6.2A and 4.3.6.3B limit idling to 3 minutes (Section 4.3, page 4.3-22). Therefore, the Revised Final EIR has not understated air quality impacts, but rather has provided a conservative analysis to properly present potential impacts related to air quality.

Also, in the Settlement Agreement between the developer and the South Coast Air Quality Management District (“SCAQMD”) for the Project as referenced in Response to Comment 2-F2-23, the SCAQMD determined that the approximately \$26 million Air Quality Improvement Fee to be paid by the applicant “will adequately mitigate heavy-duty truck related air quality impacts that may result from the construction and operation of the World Logistics Center”

Response to Comment 3-F2-6: According to 84 Fed. Reg. 52005, the EPA has approved the five state implementation plan (SIP) revisions to meet Clean Air Act requirements for the 1970 1-hour, 1997 8-hour, and 2008 8-hour ozone national ambient air quality standards (NAAQS) in the Los Angeles – South Coast

Air Basin, California ozone nonattainment area.⁵ At the time of preparation of the 2019 Draft Recirculated RSFEIR, the 2016 AQMP had not been approved by the EPA. Nonetheless, a detailed discussion of the 2016 AQMP is included on page 4.3-12 to 4.3-13. Additionally, the 2019 Draft Recirculated RSFEIR states that the “project would comply with all applicable rules and regulations enacted as part of the 2016 AQMP, including transportation control measures from the 2016 RTP/SCS” (2019 Draft Recirculated RSFEIR, page 4.3-37).

Response to Comment 3-F2-7: The commenter claims that the Revised Final EIR ignores the feasibility of implementing zero-emission technologies. See Response to Comments 1-B1-4 and 1-B2-12 for discussion of CARB’s proposed Advanced Clean Trucks Rule and discussion of the viability of such technologies while the Project is under construction. Also discussed are pilot programs funded by CARB for electric truck fleets.⁶ Therefore, the Revised Final EIR does not dismiss nor ignore the feasibility of zero-emission technologies. Section 6.17 (Part 2 of the Revised Final EIR) addresses the potential penetration of electric trucks and potential use in association with the Project. As noted by the commenter, the potential for electric vehicle penetration is possible. However, as noted in Part 2 of the Revised Final EIR (page 4.3-21), the emissions calculations relies on EMFAC2017’s projected vehicle fuel mix, which assumes zero electric heavy-duty trucks, to ensure that worst case emissions have been assumed . Assuming zero electric trucks and analyzing the worst case emissions from the Project fleet does not exempt future development from complying with vehicle fleet fuel requirements at the time of development approval. Therefore, the Revised Final EIR has not failed to address new data on feasibility of zero-emission trucks and, therefore, complies with CEQA.

Response to Comment 3-F2-8: The comment claims that the approach to GHG analysis in the Revised Final EIR is flawed and serves as an introduction to specific comments on the GHG analysis and mitigation strategies, which are addressed below.

Response to Comment 3-F2-9: The implementation of new Mitigation Measure 4.7.7.1, as revised (see Response to Comment 3-B2-3) will mitigate to net zero all Project GHG emissions remaining after the application of other mitigation measures. Therefore, although not required by law, the Project Applicant has committed to net zero GHG emissions per Mitigation Measure 4.7.7.1, which would be below the quantitative significance threshold. Specific quantitative evidence is that Mitigation Measure 4.7.7.1 will provide proof to the City that Project GHG emissions are offset or carbon credits are purchased and these reductions are “real, permanent, additional, quantifiable, verifiable, and enforceable by an appropriate agency” which is the same language that CARB has adopted in their regulations to ensure that offsets and carbon credits do what they are supposed to do. See 17 California Code of Regulations §95802(a). Thus, the mitigation measure is enforceable under CEQA as the appropriate agency will oversee the offsets and/or carbon credits and assure that the requirement is met and then the proof will be submitted to the City.

Response to Comment 3-F2-10: Refer to Master Response to Earthjustice appeal.

⁵ 84 Fed. Reg. 52005. Document Number 2019-21325. <https://www.federalregister.gov/documents/2019/10/01/2019-21325/approval-of-air-quality-implementation-plans-california-south-coast-air-basin-1-hour-and-8-hour>

⁶ California Air Resources Board, 2019. CARB Approves \$533 million funding plan for clean transportation investments, October 25, 2019. Available online: <https://ww2.arb.ca.gov/news/carb-approves-533-million-funding-plan-clean-transportation-investments>

Response to Comment 3-F2-11: The comment claims that MM 4.7.7.1 falls short of CEQA's standards for adequate mitigation, that difference between “offsets” and “carbon credits” is not explained, and that MM 4.7.7.1 provides no standards for the City’s Planning Official to use in determining whether such “offsets” are “real, permanent, additional, quantifiable, verifiable, and enforceable by an appropriate agency.”

Mitigation Measure 4.7.7.1 has been revised to specify that “the developer shall mitigate the WLC Project’s remaining GHG emissions to net zero by purchasing and retiring offset carbon credits” that have been “registered with, and retired by, an Offset Project Registry, as defined in 17 California Code of Regulations § 95802(a).” For an explanation of why Mitigation Measure 4.7.7.1 meets the CEQA standard for adequate mitigation, please see Master Response to Earthjustice appeal.

Response to Comment 3-F2-12: The comment states that there is no evidence MM 4.7.7.1 will result in effective mitigation, and that the City cannot simply presume that every carbon credit purchased from one of CARB’s approved registries will meet the referenced criteria of being “real, permanent, additional, quantifiable, verifiable, and enforceable by an appropriate agency” because the City could not provide substantial evidence that each credit from a CARB-approved registry would meet these criteria.

As explained in Master Response to the Earthjustice appeal, the third-party validation and verification process established by each of the CARB-approved registries is designed to ensure that the offset credits they approve and list do meet these criteria.

Mitigation Measure 4.7.7.1 has been revised to specify that the developer, for each offset carbon credit used for mitigation, “shall provide the City’s Planning Official with (i) the protocol used to develop those credits, (ii) the third-party verification report concerning those credits, and (iii) the unique serial numbers of those credits showing that they have been retired.” As explained in Master Response to the Earth Justice appeal, these records are kept by each of the CARB-approved registries and are publicly available.

Response to Comment 3-F2-13: The comment states that the fact that a registry is “approved by CARB” does not establish that voluntary market carbon credits sold by that registry satisfy the criteria listed in MM 4.7.7.1.

As explained in Master Response to Earthjustice appeal, the third-party validation and verification process established by each of the CARB-approved registries is designed to ensure that the offset credits they approve and list do meet the criteria listed in MM 4.7.7.1. Through their formal verification programs and protocols, each of these registries applies the same standard of quality to all offset credits – regardless of their end use in the compliance or voluntary markets.

Response to Comment 3-F2-14: The comments states that the City cannot presume that compliance with the protocols in the approved registries ensures compliance with the criteria that purportedly govern carbon credits as defined by MM 4.7.7.1. As explained in Master Response to Earthjustice appeal the City can presume that offset credits listed under CARB’s approved registries, as independently validated and verified, are in compliance with the criteria that they be “real, permanent, additional, quantifiable, verifiable, and enforceable.” This applies to all offset projects listed in these registries, regardless of the protocol used to quantify their reductions.

Response to Comment 3-F2-15: The comment claims that MM 4.7.7.1 does not establish any performance standards governing how compliance with offset criteria will be measured. Mitigation Measure 4.7.7.1 has been revised to require the developer, in order to prove that the offset carbon credits meet the required criteria, shall provide the City's Planning Official with (i) the protocol used to develop those credits, (ii) the third-party verification report concerning those credits, and (iii) the unique serial numbers of those credits showing that they have been retired. As explained in Master Response to Earthjustice appeal, the offset carbon credits listed under CARB's approved Offset Project Registries go through a rigorous process of independent validation and verification. As such, they meet the criteria that they are "real, permanent, additional, quantifiable, verifiable, and enforceable" as those terms are defined in 17 California Code of Regulations § 95802(a).

Response to Comment 3-F2-16: Mitigation Measure 4.7.7.1 has been revised to require the retirement of the appropriate amount of carbon credits equal to the amount of GHG emissions resulting from grading, construction, and operation of facilities prior to issuance of grading permits, building permits, and certificate of occupancy, respectively. See Response to Comment 3-B2-3 for the revised measure. Revisions made to Mitigation Measure 4.7.7.1 would ensure that mitigation would be in place prior to occurrence of impacts.

Response to Comment 3-F2-17: The comment claims that MM 4.7.7.1 is not adequately enforceable because it supposedly eliminates any role for the City in enforcing "the effectiveness of the mitigation." CEQA's requirement that mitigation measures be "fully enforceable" means that the performance of the mitigation must be "fully enforceable through permit conditions, agreements, or other measures." (Publ. Res. Code § 21081.6; see also *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova*, 40 Cal.4th 412, 444 (2007).) All of the Project's mitigation measures, including MM 4.7.7.1, are fully enforceable through the Project's approvals and the Development Agreement. The mitigation measure identifies the action to reduce the Project's potentially significant environmental impacts, defines the timing during which the mitigation measure is to be implemented and monitored, and is fully enforceable through permit conditions.

MM 4.7.7.1 requires the developer "to mitigate the WLC Project's emissions to net zero by providing offsets and/or carbon credits" MM 4.7.7.1 also sets forth the specific amounts of GHG emissions to be mitigated through the use of carbon credits or offsets and provides the precise timing as to when the carbon credits are to be retired [at grading permit, building permit or certificate of occupancy stages] correlated to the GHG emissions from each of those stages of development. These requirements are sufficiently concrete to be enforceable. See *Sierra Club v. County of Fresno*, 6 Cal.5th 502, 525-526 (2018) (mitigation measures provide sufficient details to be enforceable). The project mitigation ultimately relies on enforcement from a City planning official which satisfies CEQA's requirement for enforcement by a public agency.

The comment raises concerns regarding reliance on credits that may be subsequently invalidated. The approved registries provide mechanisms to resolve the over-issuance of carbon credits. See Master Response to Earthjustice appeal.

Response to Comment 3-F2-18: As stated on page 4.7-23 of the RSFEIR, "the lifetime of the Project extends until 2064 when the final structures are presumed to have reached their 30-year lifetime." This presumed lifetime is consistent with SCAQMD's Interim CEQA Greenhouse Gas Significance Threshold

Draft Guidance which states, “the project proponent would be required to provide offsets for the life of the project, which is defined as 30 years.”⁷ The Project analysis satisfies this guidance from SCAQMD by calculating year-by-year emissions from the start of construction in 2020 and from Project buildout (2035) through the recommended 30-year lifetime of each warehouse within the Project, ending in 2064.

Response to Comment 3-F2-19: The comment states that the environmental impacts of Mitigation Measure 4.7.7.1 that mitigates the WLC Project’s GHG emissions to net zero by providing carbon offsets and/or credits need to be evaluated. The comment asserts that carbon offsets and/or credits could result in new significant environmental impacts. However, as stated in Mitigation Measure 4.7.7.1, the offsets/credits that are obtained are required to be registered by an Offset Project Registry approved by the California Air Resources Board (CARB). The CARB-approved registries require that the projects generating the carbon offsets/credits must fulfill all applicable local, regional and national environmental requirements that apply based on the offset location as identified in Title 17 of the California Code of Regulations, Sections 95973(b) and 95977.1(b)(3)(D)(2)(f) of the Cap-and-Trade Regulations. Therefore, the potential environmental effects associated with a carbon offset and/or credit are required to be evaluated prior to the carbon offsets/credits being available for the proposed Project.

Response to Comment 3-F2-20: The comment asserts that the information within the Revised Final EIR includes significant new information, including new mitigation strategies, and therefore, recirculation and a public comment period is required. The responses and errata provided in the Revised Final EIR does not alter the significance conclusions provided in the draft EIRs (i.e., Revised Sections of the Final EIR [RSFEIR]). The reference to new mitigation strategies refers to the addition of Mitigation Measure 4.7.7.1. The addition of the mitigation does not change the impact determination, will reduce the impact of greenhouse gas emissions and would not result in a new significant impact as discussed on pages 755 to 756 within Section 4.3.1 of the Final Response to Comments. The introduction of a new mitigation measure therefore does not meet any of the requirements for recirculation set forth in CEQA Guidelines Section 15088.5(a). As required by CEQA Guidelines Section 15088, the City of Moreno Valley as the Lead Agency, provided written responses to public agencies that commented on either the RSFEIR or Draft Recirculated RSFEIR at least 10 days prior to certifying the Revised Final EIR.

The comment also asserts that Revised Final EIR was required to be recirculated because it ostensibly determined that a new significant impact exists prior to the application of MM 4.7.7.1, based on the holding in *Lotus v. Department of Transportation*, 223 Cal.App.4th 645 (2014). The decision in *Lotus* did not involve recirculation, and in fact, the court states: “Whether the correction requires recirculation of the EIR is for Caltrans to decide in light of the standards governing recirculation of an EIR prior to certification.” *Lotus*, 223 Cal.App.4th at 658. Here, the Project’s GHG emissions were fully disclosed in the Draft Recirculated Sections of the FEIR and in the Revised Final EIR, MM 4.7.7.1 was added to reduce the Project’s GHG potentially significant emissions to net zero, a less than significant impact. Recirculation is not required.

Response to Comment 3-F2-21: Mitigation Measure 4.7.7.1, as revised, will mitigate to net zero all Project GHG emissions remaining after the application of other mitigation measures, not relying on Cap and Trade. See Response to Comment 3-B2-3 for the revised measure. This comment is substantially the same

⁷ South Coast Air Quality Management District, 2008. *Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold*, October., page 3-16. Available online: [http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-\(ghg\)-ceqa-significance-thresholds/ghgattachmente.pdf](http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgattachmente.pdf)

comment raised by the commenter on the 2019 Recirculated Draft RSFEIR (Comment 2-F3-3) and has been addressed in the Revised Final FEIR Part 1 (Response to Comments). Refer to Response to Comment 2-F3-3 for a discussion of CARB's response to a comment by the California Building Industry Association (CBIA) on the proposed CEQA Guidelines (adopted in 2018).

The SCAQMD prepared a Final Negative Declaration and Addendum for the Phillips 66 – Ultra Low Sulfur Diesel Project in 2004, prior to the 2010 Cap-and-Trade regulation, and thus, the GHG analysis used in the other SCAQMD MND would not have been used in this one. The Phillips 66 Negative Declaration and Addendum was taken to court (California Superior Court, Los Angeles County, Case Nos. BS091275 and BS091276) and ultimately the California Supreme Court found a deficiency in the previously prepared CEQA document, relating specifically the baseline emissions⁸, which required the preparation of an EIR. Other aspects of the CEQA documents that were challenged in the litigation were rejected by the trial court's rulings and were upheld on appeal. Thus, the Phillips 66 ULSD Final EIR⁹ focused only on the air quality analysis with regard to potential NOX emission from operation of the ULSD Project. Therefore, the approach that was used in the SCAQMD documents discussed in the Revised Final EIR (capped transportation and energy emissions under cap-and-trade) was not used in the Phillips 66 MND because cap-and-trade wasn't in existence at the time the original documents were written and the subsequent document only focused on the air quality analysis, specifically NOX emissions from operation of the ULSD. Thus, stating that subsequent SCAQMD CEQA documents, specifically citing the Phillips 66 ULSD Project Final MND prepared in March 2020, did not use the same GHG approach as used in the WLC Project isn't a viable argument as to why the WLC approach is invalid.

Response to Comment 3-F2-22: The comment asserts that the information within the Revised Final EIR includes significant new information, and therefore, recirculation and a public comment period is required. The responses and errata provided in the Revised Final EIR does not alter the significance conclusions provided in the draft EIRs (i.e., Revised Sections of the Final EIR [RSFEIR]). The reference to new mitigation strategies refer to the addition of Mitigation Measure 4.7.7.1. The comment references Section 15088.5(a)(3) of the CEQA Guidelines, and asserts that "significant new information" includes "any feasible alternative or mitigation measure considerably different from others previously analyzed" but omits the qualifying language to that phrase. Section 15088.5(a)(3) actually states: "A feasible project alternative or mitigation measure considerably different from others previously analyzed *would clearly lessen the environmental impacts of the project, but the project proponents decline to adopt it.*" (Italicized language omitted by commenter.) The Project is adopting MM 4.7.7.1, and the addition of the mitigation does not change the impact determination, will reduce the impact of greenhouse gas emissions and would not result in a new significant impact as discussed on pages 755 to 756 within Section 4.3.1 of the Final Response to Comments. The introduction of a new mitigation measure therefore does not meet any of the requirements for recirculation set forth in CEQA Guidelines Section 15088.5(a). As required in the CEQA Guidelines Section 15088, the City of Moreno Valley as the Lead Agency, provided written responses to

⁸ The court ruled that the proposed Project must be compared to the environmental conditions that exist at the time the CEQA analysis was commenced, not the level of development or activity that would be allowed under existing permits or approvals. Neither the Court of Appeals decision nor the Supreme Court decision invalidated any aspect of the prior CEQA documents except for the baseline used in the analysis of air quality impacts from Project operation.

⁹ South Coast Air Quality Management District, 2020. Phillips 66 Los Angeles Refinery Ultra Low Sulfur Diesel Project Final Environmental Impact Report, March 2020. Available online: <http://www.aqmd.gov/docs/default-source/ceqa/documents/permit-projects/2020/01-feir-chapters1-7.pdf?sfvrsn=6>

public agencies that commented on either the RSFIER or Draft Recirculated RSFEIR at least 10 days prior to certifying the Revised Final EIR.

The comment generally lists the issues raised in other comments to support the recirculation claim, and these other issues have been fully addressed in the Revised Final EIR.

Response to Comment 3-F2-23: The Statement of Overriding Considerations is required for the WLC project because the decision-making body is required to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. The comment asserts that the Statement of Overriding Considerations cannot adequately weigh the Project's adverse, significant impacts with the benefits due to deficiencies within the Revised Final EIR. The commenter's claims regarding alleged deficiencies in the Revised Final EIR have been addressed in other responses. This comment generally identifies that the overriding considerations are not supported by substantial evidence but does not include specific reasons in this comment.

Response to Comment 3-F2-24: The Statement of Overriding Considerations that was prepared for the WLC project included a discussion of the benefits of the project. The decision-making body has reviewed the benefits as well as the significant unavoidable impact of the WLC Project. The Revised Final EIR provides a good-faith effort to inform the decision-making body and the public of the environmental effects of the Project. The benefits are identified in the Statement of Overriding Considerations and supported in the Revised Final EIR. Resolution No. 2020-20 approves and adopts the Statement of Overriding Considerations and finds that economic, social, and environmental considerations of the proposed Project outweigh the unavoidable significant adverse impacts described in the Revised Final EIR. The comment references *Cherry Valley Pass Acres & Neighbors v. City of Beaumont*, 190 Cal.App.4th 316 (2010), where it upheld the statement of overriding considerations, but that case did not require that "each" of the overriding considerations justify "each" of the remaining significant impacts. Here, the findings explain that each of the remaining significant impacts is supported by the Statement of Overriding Considerations.

Response to Comment 3-F2-25: The comment asserts that the benefits identified within the Statement of Overriding Considerations do not account for aspects of the job market that will impact the nature and desirability of the Project jobs. The reference within the comment that the calculation of employment rates was not accurate for the Project is unsubstantiated. No documentation of different employment rates was identified in the comment. The Fiscal and Economic Impact Study (Revised Final EIR Part 4, Appendix O) identifies the employment rates for the Project. These rates provide substantial evidence for the anticipated employment for the Project. The Statement of Overriding Considerations uses this substantial evidence in identifying the benefits of increase employment opportunities with Project development.

Response to Comment 3-F2-26: The comment requests that the Statement of Overriding Considerations quantify the consequences of the Project's impacts. The environmental effects associated with the Project are adequately addressed in the Revised Final EIR. The fiscal and economic impacts associated with the Project are identified in the Fiscal and Economic Impact Study (Revised Final EIR Part 4, Appendix O). The comment requests that a monetary value of the potential environmental impacts of the proposed Project be determined. Documentation to support the comment's claim of assigning monetary values to environmental impacts was not provided in the comment and is not required under CEQA as part of the Statement of

Overriding Considerations. In addition, the Statement of Overriding Considerations was challenged and the trial court found that it did not violate CEQA. Therefore, the adequacy of the Statement of Overriding Considerations cannot be challenged again.

Response to Comment 3-F2-27: The comment questions one of the benefits identified in the Statement of Overriding Considerations. The benefit is the improvement to public health. As stated in the Statement of Overriding Considerations, an increase in employment opportunities in the City would improve public health within the City of Moreno Valley. This statement is substantiated within the discussion of the benefit. The comment does not provide any evidence that the increase in employment opportunities would not improve public health. In addition, the Statement of Overriding Considerations was challenged and the trial court found that it did not violate CEQA. Therefore, the adequacy of the Statement of Overriding Considerations cannot be challenged again.

Response to Comment 3-F2-28: The comment states that the Statement of Overriding Considerations does not justify the significant and unavoidable air quality impacts. As required by CEQA Guidelines Section 15091, the City of Moreno Valley is required to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of the proposed Project against its unavoidable environmental risks when determining whether to approve the project. The Revised Final EIR adequately identifies the potential significant and unavoidable impacts of the Project. The Statement of Overriding Considerations identifies the benefits of the Project. One benefit includes the Settlement Agreement between the developer and the South Coast Air Quality Management District (“SCAQMD”) for the Project as referenced in Response to Comment 2-F2-23. The SCAQMD determined that the approximately \$26 million Air Quality Improvement Fee to be paid by the applicant “will adequately mitigate heavy-duty truck related air quality impacts that may result from the construction and operation of the World Logistics Center” The City of Moreno Valley is not required to justify the significant and unavoidable impacts, but only balance the Project Benefits against the significant and unavoidable impacts of the Project.

Response to Comment 3-F2-29: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F2-30: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F2-31: No specific comments on the contents of the Revised Final EIR are provided, and thus no further response is needed (State CEQA Guidelines §15088(a) requires that a lead agency only evaluate and respond to comments raised on environmental issues.).

Re: Planning Commission May 14, 2020, Public Hearing Agenda Item No. 2
World Logistics Center Project Development Agreement, Tentative Parcel Map for Finance and Conveyance Purposes only with Certification of the Recirculated Revised Final Environmental Impact Report.

We would point out to the Moreno Valley Planning Commission members that the City of Moreno Valley has yet to comply with the June 7, 2018 Superior Court Writ of Mandate. The City of Moreno Valley has yet to perform the Court's direction for re-analysis of the World Logistic Center (WLC) impacts on Biological Resources.

3-F3-1

In performing the mandated/required re-analysis of the WLC impacts on Biological Resources, the City of Moreno Valley cannot continue to disregard/ignore the law as it relates to CEQA Mandatory Findings of Significance (CEQA Guidelines § 15065(a)(1) [The WLC project clearly has the potential to: "substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; substantially reduce the number or restrict the range of an endangered, rare or threatened species..] The failure of the City of Moreno Valley to identify the "take" of MSHCP/NCCP Covered species as a Mandatory Significant Impact in the initial FEIR for the WLC and the City's current efforts to comply with Judge Waters Writ of Mandate has and continues to corrupt the CEQA review of Biological Resources for the WLC project. It allows the City of Moreno Valley to avoid/circumvent the required examination/analysis of alternatives and mitigation measures for the "take" of MSHCP/NCCP covered species.

3-F3-2

The consideration of cumulative impacts on Biological Resources in the 2015 FEIR and the Draft Recirculated RSFEIR fails to consider the cumulative impacts of the "take" of MSHCP Covered species. This is contrary to Judge Waters Ruling on the Peremptory Writ of Mandate indicating: "...any new cumulative impact analysis should also consider and discuss whether any environmental insignificant impacts may be cumulatively significant, taking into account all relevant past, present, probable future projects." The SKRHCP and the MSHCP authorizes the incidental "take" of endangered and special status plants and animals throughout western Riverside County [including the City of Moreno Valley] thereby eliminating habitats and population of already declining species in exchange for the establishment in perpetuity of designated wildlife Conservation Area/Reserves such as the San Jacinto Wildlife Area(SJWA) adjoining the WLC project site. Absent an adequate CEQA cumulative analysis it is impossible for the public and the state and federal Wildlife Agencies to know whether the plant and animal populations are dropping below self-sustaining levels [in jeopardy of extinction] both in the area of "take" and on the designated Conservation Reserves such as the SJWA. (CEQA Guideline § 15065 (a)(3) - Mandatory Finding of Significance)

3-F3-3

We are requesting the City of Moreno Valley NOT certify the proposed Draft Recirculated RSFEIR as being in compliance with CEQA. We are also requesting the City of Moreno Valley comply with the June 14, 2018 Peremptory Writ of Mandate voiding the 2015 World Logistic Center EIR in whole.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-F3: ALBERT PAULEK, FRIENDS OF THE NORTHERN SAN JACINTO VALLEY

Response to Comment 3-F3-1: Refer to Response to Comment 1-F3-4 for discussion of the Court's direction for re-analysis of the Project's impacts on Biological Resources.

Response to Comment 3-F3-2: Refer to Response to Comment 1-F3-4 for discussion of potential significant impacts to wildlife species. The evaluation identified a potential significant impact, but mitigation measures are provided in the RSFEIR to reduce potential impacts to wildlife species to less than significant.

Response to Comment 3-F3-3: Refer to Response to Comment 1-F3-5 for discussion on cumulative biological resource impacts. As discussed, cumulative impacts on biological resources are analyzed in 2018 RSFEIR Section 6.4 (pages 6.4-1 through 6.4-33). The cumulative impact geographic area for biological resources is the MSHCP area, which also includes the San Jacinto Wildlife Area (SJWA).

Response to Comment 3-F3-4: No specific comments on the contents of the Revised Final EIR are provided.

Re: Planning Commission May 14, 2020, Public Hearing Agenda Item 2:
WORLD LOGISTICS CENTER PROJECT DEVELOPMENT AGREEMENT, TENTATIVE PARCEL MAP FOR
FINANCE AND CONVEYANCE PURPOSES ONLY WITH CERTIFICATION OF THE RECIRCULATED
REVISED FINAL ENVIRONMENTAL IMPACTS REPORT.

Ms. Nevins:

Please ensure the Planning Commission is in receipt of these comments prior to the May 14, 2020, public hearing.

The FRIENDS OF THE NORTHERN SAN JACINTO VALLEY strongly object to any further action by the City of Moreno Valley regarding the RECIRCULATED REVISED FINAL ENVIRONMENTAL IMPACT REPORT (hereinafter the RR-FEIR) for a number of procedural and substantive reasons.

THE WLC SPECIFIC PLAN MUST BE REVISED TO COMPLY WITH THE COURT’S FEBRUARY 8, 2018 ORDER.

The City’s RR-FEIR is a legal absurdity and a clear violation of CEQA. The City is putting the cart (EIR) before the horse (Specific Plan). In the same way the City cannot first prepare an EIR and then prepare a Specific Plan, the City cannot revise the Specific Plan by revising the EIR. The court ordered the Specific Plan be amended/revise to exclude all references to the California Department of Fish and Game Wildlife Conservation Buffer Area (hereinafter the CDFWCBA). The WLC Specific Plan was not revised/amended. The court then ordered that based on the removal of the CDFWBA from the Specific Plan, the “potential environmental impacts on biological resources should be re-analyzed without any consideration of said buffer area” in an EIR.

The WLC Specific Plan must be amended and then an EIR prepared for the new/revise Specific Plan. The alleged RR-FEIR is not based on any existing Specific Plan and therefore is a meaningless document. When the Court’s judgment stated that “All references to the ‘CDFW Conservation Buffer Area’ should be removed and the potential environmental impacts should be re-analyzed without any consideration of said buffer area”, the Court was first referring to

3-F4-2

3-F4-3

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

the revising Specific Plan and then to preparing an EIR to reflect the changes in the Specific Plan. There is zero legal authority for the proposition that a revised EIR is a legally adequate document for an unrevised Specific Plan.

THE APPEAL BY PETITIONERS AND THE CROSS APPEAL BY RESPONDENTS MUST BE FINAL BEFORE THE SPECIFIC PLAN/ENVIRONMENTAL IMPACT REPORT CAN BE REVISED.

As stated above, any and all revisions must first be made to the Specific Plan and then, and only then, can those revisions can be reflected in an EIR. However, revisions to the Specific Plan are meaningless until all appeals are final. The judgment is not final until all appeals are final.

The RR-FEIR correctly states that Petitioners appealed the February 8, 2018 Judgment, but omits the fact that Respondents also appealed the February 8, 2018 Judgment. Even after the Court of Appeal Fourth District, Division two issues its opinion, any party may petition the California Supreme Court for review.

Even if a revised Specific Plan had been prepared, this RR-FEIR cannot simply assert that "MITIGATION MEASURE CONDITIONED ON THE OUTCOME OF THE APPEAL IN PAULEK V. MORENO VALLEY." Mitigation Measures cannot be deferred to an indefinite time in the future because no one has a crystal ball.

The contents of the Appeal Courts' future opinions/orders are mere speculation. The court rarely grants exactly the requests of the appealing parties. Even if it were permissible to defer mitigation, the courts' orders as to each of the issues raised in the appeal and cross-appeal cannot be known. The attempt to do so in any revisions to the Specific Plan is magical thinking and has no basis in fact or law.

Please acknowledge receipt of this public comment letter and keep the undersigned informed of any actions taken by the City regarding the World Logistics Center Project by addressing such notices to the above address.

Re: Planning Commission May 14, 2020, Public Hearing Agenda Item 2:
WORLD LOGISTICS CENTER PROJECT DEVELOPMENT AGREEMENT, TENTATIVE PARCEL MAP FOR
FINANCE AND CONVEYANCE PURPOSES ONLY WITH CERTIFICATION OF THE RECIRCULATED
REVISED FINAL ENVIRONMENTAL IMPACTS REPORT.

Ms. Nevins:

Please ensure the Planning Commission is in receipt of these **additional** comments prior to the May 14, 2020, public hearing.

3-F4-8

The RR-FEIR must comply with the requirements of CEQA Guidelines § 15130(a)(3).

CEQA Guidelines 15130(a)(3) states in full:

“An EIR may determine that a project’s contribution to a significant cumulative impact will be rendered less than cumulatively considerable and thus is not significant. A project’s contribution is less than cumulatively considerable if the project is required to implement or fund its fair share of mitigation measure or measures designed to alleviate the cumulative impact. **The lead agency [in the EIR] shall identify facts and analysis supporting its conclusion that the contribution will be rendered less than cumulatively considerable.**” (CEQA Guidelines, § 15130(a)(3).

3-F4-9

The RR-FEIR, in stating that MSHCP compliance is automatically CEQA compliance, provided **zero facts and analysis** to show that the contribution of the Project to the cumulative impacts on all wildlife including endangered, rare or threatened species will be rendered less than cumulatively considerable by the payment of mitigation fees to the MSHCP. (see City of

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Marina v. Board of Trustees of California State University (2006) 39 Cal.4th 341, 346; Anderson First Coalition v. City of Anderson (2005) 130 Cal. App. 4th 1173,1187; Gray v. County of Madera (2008) 167 Cal. App. 1099, 1122).

The RR-FEIR fails to comply with CEQA because it fails to show the **facts and analysis** required by Guidelines § 15130(a)(3) that the Project’s contribution **will be rendered less than cumulatively considerable.**

Please acknowledge receipt of this public comment letter and keep the undersigned informed of any actions taken by the City regarding the World Logistics Center Project by addressing such notices to the above address.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-F4: SUSAN NASH, FRIENDS OF THE NORTHERN SAN JACINTO VALLEY

Response to Comment 3-F4-1: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F4-2: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F4-3: The comment claims that the WLC Specific Plan must exclude reference to the CDFW Conservation Buffer Area and that impacts on biological resources be revised without consideration of the CDFW Conservation Buffer Area.

The WLC Specific Plan was adopted by the City in August 2015 and there is no reference to the CDFW Conservation Buffer Area, which is the northern portion of the SJWA adjacent to the southern boundary of the WLC project site. Further, the court did not order that the Specific Plan be revised to exclude all references to the CDFW Conservation Buffer Area, but to remove any such references from the EIR. The City's EIR was revised in 2018 to remove all reference to the SJWA as a buffer area.

Response to Comment 3-F4-4: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F4-5: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F4-6: Refer to Response to Comment 3-F2-16.

Response to Comment 3-F4-7: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F4-8: No specific comments on the contents of the Revised Final EIR are provided. The comment letter was provided to the Planning Commission for their consideration prior to their action.

Response to Comment 3-F4-9: The comment states that the EIR must comply with the State CEQA Guidelines, specifically Section 15130(a)(3), in regard to cumulative biological resources impacts in compliance with the MSHCP and the analysis must be supported by facts and analysis.

The RSFEIR prepared a comprehensive cumulative analysis of impacts to biological resources in Section 6.4. Specifically, the required cumulative impact analysis is provided in Section 6.4.3 of the RSFEIR in which the WLC project, when considered with cumulative projects, would not cause a cumulatively considerable effect on the MSHCP or the SJWA. When considered in addition to the anticipated impacts of other projects in the cumulative scenario, the Project's incremental contribution to impacts to biological resources would not be cumulatively considerable, and cumulative impacts to biological resources would be less than significant. The substantial evidence supporting this conclusion is found in Section 6.4 of the RSFEIR.

Response to Comment 3-F4-10: No specific comments on the contents of the Revised Final EIR are provided.

Julia Descoteaux

Subject: Sierra Club's WLC letter to the Planning Commissioners

Warning: External Email – Watch for Email Red Flags!

Dear Planning Commissioners May 14, 2020

RE: World Logistic Center (WLC) Project Development Agreement, Tentative Parcel Map for Finance and Conveyance Purposes only with Certification of the Recirculated Revised Final Environmental Impact Report.

The Sierra Club will be very impressed with each Planning Commissioner who will be able to say that (s)he was able to read all the documents under review for tonight’s meeting during the last two weeks — prior to voting. I am still reading and that is why my letter may appear to be last minute, but the public needs even more time to give justice to the comments we want you to consider prior to voting. I also hope if anyone on the commission has accepted gifts of any size from Highland Fairview that they will disclose that at the very beginning and remove themselves from the meeting room during the hearing on the WLC. The public will be grateful for this act of transparency.

3-F5-1

The Sierra Club appreciates this opportunity to express a few of many concerns. A major concern is that one of the alternatives doesn’t require the maximum coverage of each building with solar as well as some of the passenger car parking areas. This would make it much more likely that all equipment, appliances, cars and many large trucks would be zero emission electric. They would run on sunshine which Moreno Valley has plenty. It is a crime not to use it to reduce the harmful health and global effects of diesel and other petroleum as well as other carbon/hydro carbon based products. It is sad that the Moreno Valley Utility (MVU) doesn’t appear to want maximum use of Solar on the WLC’s buildings and other large buildings because they want to make money by selling power to them. The City needs to think of the people and the environment and require this alternative. The noise impacts caused by the WLC would be significantly reduced with electric forklifts, yard goats, hostlers, yard trucks, sweepers, Alternative Power Units (APU’s), pallet jacks, trucks of all different sizes as well as all the job-eliminating automation and robotics.

3-F5-2

3-F5-3

The trucks also emit diesel particulate matter that lingers over communities, creating ‘diesel death zones’ that elevate levels of asthma, heart disease and cancer. Rapidly phasing out diesel trucks for clean electric trucks would be a huge win for our community, public health, and air quality. The WLC must pre-wire the entire project for electric trucks to protect their workers and residents. Much of Moreno Valley’s officially designated “Disadvantage Areas” is the result of diesel pollution, from approved warehouses. Electric trucks are already on the road in California and will be used everywhere well before the proposed 15 year buildout of the WLC. Maximum Solar on all roofs and car parking areas could be a source of energy for these trucks and also help to reduce the pollution in our non-attainment area. To protect the Health, Safety and Welfare of Moreno Valley residents and warehouse workers the City decision makers must do everything possible to reduce particulate pollution of the WLC.

3-F5-4

"Effects of Residential Gas Appliances on Indoor and Outdoor Air Quality and Public Health in California" from UCLA’s Fielding School of Public Health April 2020 study is found in the following link:
<https://ucla.app.box.com/s/xyzt8jclixnetiv0269qe704wu0ihif7>.

On page 54 of this article it reads that Riverside County produces 72 Tons/year of PM 2.5 Emissions from Gas Appliances and 960 Tons/year of NOx Emissions from Gas appliances . The WLC must be required to use only electric appliance which includes all water heaters. Regarding outdoor air quality, this report indicates that under a 2018 scenario where all residential gas appliances were transitioned to clean-energy electric appliances, the reduction of secondary nitrate fine particulate matter (PM2.5) [from nitrogen oxides (NOX)] and primary PM2.5 would result in 354 fewer deaths, and 596 and 304 fewer cases of acute and chronic bronchitis, respectively. The reduction in associated negative health effects is equivalent to approximately \$3.5 billion in monetized health benefits for just one year. While the WLC isn’t a residence it will have many appliance and water heaters. The WLC must be part of the solution of reducing PM2.5 and NOx by requiring it to have only electric appliances/water heaters.

3-F5-5

Both operational and construction noise pollution will have a major impact of those nearby homeowner and those forced to be within the WLC specific plan, but also many of the resources of the San Jacinto Wildlife Area(SJWA) which would be forced to have an almost two mile border with the WLC. The location of the noise level monitoring sensors for the information in Table 4.4.--7 on page 4.4-98 is very import to make these readings valid for their impact on the SJWA. "Available research indicates that increased noise levels near wildlife areas can contribute to behavioral changes such as increased startling in birds, which can be especially harmful during nesting periods, hunting pattern changes or avoidance which decrease habitat value and use, sleep pattern disruption, and decreased overall health from noise stress. These impacts can affect mammals, birds, and other species present within the SJWA." (page 4.4-99) The World Logistic Center may have some set backs from the SJWA, but they are not restricting mechanical equipment/trucks within these setbacks and therefore much noise will still be produced to impact the SJWA.

3-F5-6

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

As shown in the chart found above the range of hearing ability ranges widely within the animal kingdom. There is nothing in the the WLC environmental documents to show the impacts on the many plants, animals and insects of the San Jacinto Wildlife Area. Remember, this is a wildlife area and not urban park. Some of these species are threatened or endangered or species of concern and based on scientific literature the WLC's generated noises will harm many in many ways. Increased noise levels will not only significantly impact the northern portion of the San Jacinto Wildlife Area, but also along major roads adjacent to the SJWA which will handle a significant increase in truck traffic because of the WLC. Riverside County and the Riverside County that Transportation Commission originally litigated the WLC to provide some improvement and relief to these impacted roads which include, but are not limited to the following roads adjacent to the SJWA as seen in the map: Gilman Springs Road, Bridge Street and the Ramona Expressway. All of these roads will generate additional significant noise as a result of the WLC and will impact many parts of the SJWA. The many different species that rely on the SJWA's very important habitat will be impacted and the current noise analysis doesn't do justice to how each species will react and be harmed.

3-F5-6
CONT.

"Gilman Springs Road from Alessandro Boulevard to Bridge Street (S-16) is already deficient and needs to be widened to four lanes and will need to be widened to six lanes in the future. In accordance with General Plan Policy 5.5.7, the City will require the developer to widen Gilman Springs Road to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer will receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair share contribution.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

1. However, because Gilman Springs Road is partially a Riverside County facility and is thus partially outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made outside of its jurisdiction. Moreover, there are right-of-way constraints involving sensitive environmental areas that may limit widening to four lanes between Alessandro Boulevard and Bridge Street, or even preclude any widening at all. The project's impacts in the Existing Plus Project scenario on Gilman Springs Road must therefore be considered significant and unavoidable. The City will work with Riverside County find funding for improvements that would provide an acceptable LOS on this road to the extent feasible.
2. **Gilman Springs Road from SR-60 to Alessandro Boulevard (S-17)** is already deficient and needs to be widened to four lanes. In accordance with General Plan Policy 5.5.7, the City will require the developer to widen Gilman Springs Road to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer will receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair share contribution.

Section 4.15 Traffic and Circulation 4.15-113

Revised Sections of the Final Environmental Impact Report

However, because Gilman Springs Road is partially a Riverside County facility and is thus partially outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made outside of its jurisdiction. The project's impacts in the Existing Plus Project scenario on Gilman Springs Road must therefore be considered significant and unavoidable. The City will work with Riverside County to find funding for improvements that would provide an acceptable LOS on this road to the extent feasible." (four paragraphs found above page" (4.15-112/113)

The Different Charts on the Level of Service along Gilman Springs Road from SR-60 to Bridge St. shows a LOS "F"(Table 4.15-7,Table 4.15-15 and others). Since a large portion of Gilman Springs Road is within the County it may remain a LOS F because the City will not be able to require its improvement. The WLC will add significant traffic to Gilman Springs Road which as the Map found above shows runs along much of San Jacinto Wildlife Area's —Davis unite-- eastern border. Traffic wanting to enter/leave the eastern portion of the WLC as well as other portions will use Gilman Springs Road and many of those will also use Bridge Street to transition with the Ramona Expressway. The improvements to the Ramona Expressway will not reach Bridge Street for many years and therefore the project's impact to Bridge Street and the entire section of the Ramona Expressway west to I-215 needs to be fully analyzed.— from Bridge St, This is a route between the WLC and the I-215 that truckers/commuters will heavily utilize. As the CA Department of Fish and Wildlife map found above shows Gilman Springs Road, Bridge Street and the Ramona Expressway are all adjacent to the SJWA. The air quality, noise/vibration, light and water run off pollution as well as fumes/smells from WLC's trucks/commuters using these roads will all significantly impact the resources of the SJWA. The WLC environmental documents fails to analyze/address all these pollutions impacts on the many different species that rely on the SJWA for their very survival as well as the survival of their species. Each SJWA species — which are different at different times of the year — has their own special senses and their reaction/response to the various forms of pollution caused by the WLC will develop/manifest differently from what you and I might suffer.

"The following article on "Noise pollution and the environment : (<https://www.science.org.au/curious/earth-environment/noise-pollution-and-environment>) expresses concerns on the impact of noise on wildlife. Some of the studies shared by the WLC looked at animals in urban settings which in some cases have adapted to City noises. The SJWA is not an urban park, but a wildlife area and noise from WLC human activity will be a big change for a large portion of it. The article found above and partially printed below has a study from Boise State University which shows how a road can impact an area used by wildlife and wrote that noise "prompt more than the usual number of birds on thousand-mile marathons to skip a chance to rest and refuel". The SJWA is a major stop over for many species of birds. Audubon Society during their Christmas bird count in and around the SJWA usually spots between 140 and 155 different species. This includes 25 species of Raptors of which five are owls. These owls are acoustic predators and will be impacted as explained below. This Christmas bird count usually puts this area in the top 1 or 2 % for diversity of bird species for an inland area in all of North America. How will the WLC impact these counts? Gilman Springs Road currently has very few large trucks, but that will change because of the WLC as will the level of noise impacting wildlife/habitat on both side of the road. The WLC needs to fund at least one linkage under or over Gilman Springs Road to reduce road kill of wildlife and also project human life from vehicles hitting wildlife. The WLC is required to "provide three southbound lanes on one northbound along the frontage of the WLC". This will result in very unsafe conditions on the entire southbound portion of Gilman Springs Road which is south of the WLC. The entire northbound lanes of Gilman Springs Road will be unsafe and put truckers and car drivers in harms way which will jeopardize their lives.

There is also a portion of the article found below that also shows how an impact on a species can impact the entire ecosystem. There is nothing in the WLC environmental documents that shows how all the various pollutions generated by the WLC could easily lead to the decline in the ecological value of the SJWA which in turn could harm many species. The state of California has spent more than \$80,000,000 on the SJWA which is also a

3-F5-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

The following comes from this link: <https://www.science.org.au/curious/earth-environment/noise-pollution-and-environment>

"The population and diversity of certain bird populations has been shown to decline or change when exposed to continuous noise generated by urban environments, such as roads, cities and industrial sites.

Birds may seem well adapted to live alongside humans, but our noises disrupt the way they live. Image source: [Tim Rich and Lesley Katon / Flickr](#).

*Several species have begun to adjust their vocal calls in an attempt to be heard above the din. Male great tits (*Parus major*) for example, have been noted to **change the frequency of their call** in order to be heard over anthropogenic noise. Female great tits prefer lower frequency calls when selecting a mate, but these frequencies are harder to hear over urban noise. Males who sing at higher frequencies are less attractive to females, but females may still mate with them if there are no lower-frequency singers available. Males are therefore placed in a difficult position—sing at a lower frequency and not be heard, or sing at a higher frequency and potentially be dismissed!*

*Another study, conducted in 2007, found that urban European robins (*Erithacus rubecula*), highly territorial birds who rely strongly on vocal communication, **adjusted the timing of their singing** to compensate for acoustic pollution. They began to sing at night when it was quieter, rather than only during the daytime, when noise pollution was at a peak. If birds need to sing at night rather than sleep, it can begin to alter behavioural patterns in urban species.*

The European robin has been known to sing at night, because it's hard to be heard during the day. Image source: [nutmeg66 / Flickr](#).

Scientists **studying the behaviour of scrub jays**, birds common across the western United States, found that they avoid nesting in noisy areas, such as near gas wells where the constantly running compressors drowned out their communication calls. The study's lead author, *Clinton Francis*, said, 'We're starting to see that noise may actually be a big problem, because [it] acts as a form of sensory pollution, forcing animals to adapt their calls to be heard over it, or leave the area altogether'.

3-F5-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

However, the study also found something else—as the scrub jays relocated, the forest they left behind is considered critical to the health of the pinyon pine ecosystem in New Mexico. In normal conditions, the birds collect and bury pine seeds in preparation for winter. The birds fail to collect all the seeds they bury, and these become the next generation of trees. In the areas near the gas wells, without jays to plant the seeds, the pines are disappearing. This could have long-term effects on ecosystem diversity and structure.

When scrub jays leave their homes to find more quiet areas to live, the forests they once helped to seed start to disappear. Image source: [Bob Devlin / Flickr](#).

Similarly, some birds, such as the black-chinned hummingbird (*Archilochus alexandri*), have been shown to commonly select noisy areas, such as near active gas wells, to avoid nest predators who are themselves more susceptible to sound. Again, this change in behaviour can have unexpected flow-on effects. By discouraging species sensitive to loud sound, and replacing them with more tolerant ones, noise may be reshaping ecosystems. This can potentially alter whole food webs and species combinations, resulting in groupings that may never have occurred naturally in the wild. As researcher at Boise State University in Idaho, [Jesse Barber](#), said, 'We're not studying noise. We're studying ecology'.

There are other effects too. A 2013 study by researchers at Boise State University created a 'phantom road' using a series of electronic speakers placed in the woods which played the sounds of a busy highway at regular intervals. The phantom road was situated near an important stop for migratory birds, where they would traditionally rest and fatten up before undertaking the journey ahead. For four days the team turned on the speakers playing the faux traffic noise. The results showed that during the periods of noise, birds stopping to rest in the area declined by more than one-quarter. When the speakers were off, the numbers bounced back. The researchers concluded that *noise can change an animal's most basic stay-or-go assessments of habitat*, and 'prompt more than the usual number of birds on thousand-mile marathons to skip a chance to rest and refuel'.

Birds are not the only animals affected by noise. A study published in 2010 found that noise pollution—specifically traffic noise—decreased the foraging efficiency of an acoustic predator, the greater mouse-eared bat (*Myotis myotis*). Successful foraging bouts decreased and search times increased dramatically with proximity to the highway. As the animals being hunted by the bats are themselves predators, the study noted that 'the noise impact on the bats' foraging performance will have complex effects on the food web and ultimately on the ecosystem stability'. Noise pollution could potentially interfere with other acoustic predators, such as owls, in a similar fashion."

Land species

"Noise pollution can also kill off your sex life—at least if you're a frog. A study conducted in Melbourne, Australia, by Dr Kirsten Parriss and colleagues found that, for some highly vocal frog species, *noise pollution is correlated with an increase in the frequency of their calls*. This increase partially compensates for the loss of communication distance in noise-traffic areas experienced by these frogs. The mating call of male pobblebonk frogs could historically be heard up to 800 metres away by interested females. At very noisy sites, this is reduced to just 14 metres. If male frogs alter their call to a higher frequency to be heard, the females may not like what they hear. Female frogs of some species prefer lower-pitched calls, which often indicate larger and/or more experienced males. Once again for the male frogs, it's a tough call—to not be heard, or to be heard and rejected!

3-F5-
CON

3-F5-

The pobblebonk frog and other highly vocal frog species have trouble being heard in noisy areas. Image source: [Will Brown / Flickr](#).

Researchers noted a *different outcome for the black-tailed prairie dog* (*Cynomys ludovicianus*) in free-ranging colonies in Colorado. The dogs were exposed to simulated traffic noise from a series of speakers, similar to that which would be heard if a real highway were 100 metres from the colony. The dogs did not leave their homes, but the researchers did note a distinct change in their behaviour during times of traffic noise broadcast:

- o The number of prairie dogs above ground declined by 21 per cent.
- o The proportion of individuals foraging declined 18 per cent.
- o Vigilance (looking out for predators) increased by 48 per cent.
- o Social interactions and resting declined by 50 per cent.

The researchers concluded that 'road noise can alter key survival behaviours' and that 'these findings highlight that the presence of animals in a location is no guarantee of population and ecological integrity'. So while noise pollution may not necessarily drive animals away from a site, it may alter their established behaviours and be having a less-obvious negative effect on their physical wellbeing. "

The following link explains of other impacts to wildlife as a result of noise/vibrations:

<https://www.healthyhearing.com/report/52843-Hearing-in-the-animal-kingdom>

It mentions how human ears are controlled by three muscles, but a 'cat's ear is controlled by close to three dozen muscles". The noise analyze by the WLC fails to study all the frequencies/vibration levels that will impact the many animals, insects and plants that use the SJWA during all times of the year. Since the SJWA doesn't have the noise levels of Moreno Valley, these organisms have never had to adapt and this could result in them as well as the SJWA being harmed.

The article further explains how "birds in the wild rely on their keen sense of hearing to alert them of danger" and also locate their next meal. How their ears work in tandem with sharp sight to hunt in the dark. "Scientists say some species of moths have hearing 150 times more sensitive than any human. Their ability to hear the highest frequencies (300 kilohertz), helps them escape bats, their main predator, before they are attacked." The article even mentions that spiders are most sensitive to low-frequency sounds. Snakes and lizards also respond to noise/vibrations. The current WLC documents have not done the sounds studies of all the frequencies at all times of day/night that might impact all the wildlife at the SJWA which makes them inadequate. Page 4.4-98 reads that "The northern portion of the SJWA will experience increased, fluctuating sound levels during construction and operation (e.g., vehicle traffic and truck loading and unloading), but truck traffic and human activity will result in an incremental increase in overall ambient sound over the long term." "The SJWA, may be subject to construction activity on a 24-hour-per-day, 7-day-per-week schedule." (Page 4.4-98) These sounds that are mentioned appear to make the SJWA and all its resources collateral damage to the construction and operation of the WLC. That there is nothing or very little within the documents to show how to make this not the case means that much more needs to be done concerning the impacts of the WLC on the SJWA. No operations of the WLC should be allowed within 450 feet of the border of the SJWA — not just structures as required by the CDFW.

The SJWA's ecosystems has evolved over many years of careful management by the California Department of Fish and Wildlife, resulting in diverse and complex biological communities living in balance with their environment. Harm to anyone of those communities by any of the pollutions generated by the WLC will also impact other SJWA communities. These pollutions include, but are not limited to the following: noise/vibrations, air quality, light and water runoff pollution as well as fumes/smells. These forms of pollution would result from both the project site and also from the roads used by those vehicles connected to the WLC. All of these pollutions' direct, indirect, cumulative impacts on the SJWA's ecosystem, resources and all forms of life must be fully analyzed and

3-F5-
CON

3-F5-

3-F5-

3-F5-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

eliminated to produce no harm or the WLC's environmental document will be inadequate. The WLC documents relied heavily on what they called the "CDFW owned Conservation Buffer Area" within the SJWA to mitigate impacts on some of the resources of the SJWA. Since the judge ruled against using these lands being used to help mitigate/reduce the WLC's impacts to the SJWA and its resources, almost nothing in the recent WLC documents have replaced those lands for mitigation. In previous environmental documents the WLC used these CDFW owned lands to try to show they will not impact the "MSHCP Conservation Criteria Areas" and Federal Migratory Bird Act and CA DF&W" as shown with redlines on pages 4.4-61 through 4.4-74. Throughout the biological section these "CDFW owned Conservation Buffer Area" previous importance are shown with redlines without any adequate mitigations to replace this "buffer" in the latest WLC environmental documents currently being reviewed. The "CDFW buffer area" and "CDFW Conservation Buffer Area" were mentioned beginning on pages 4.4-3 and 4.4-4 and were continued to be redlined throughout the document without any or adequate replacement mitigations for impacts to the SJWA.

3-F5
CON

The article's link found above contain the following paragraphs on the impacts of noise to wildlife and domestic animal life:

Our furry best friends

"Even the most pampered of domesticated cats have excellent hearing. They can detect an extremely wide range of frequencies, hearing higher-pitched sounds than humans or dogs. While a human ear consists of three muscles and the three tiniest bones in the body, a cat's ear is controlled by close to three dozen muscles, which allow them to rotate their ears 180 degrees.

3-F5

By today's standards, most dogs would not be considered wildlife with all the creature comforts lavished upon them by dog lovers, but dogs' sense of hearing is impressive when compared to that of their owners. According to Bark magazine, the frequency range dogs can hear is far greater than that of humans. That's why dogs can hear the ultra high-pitched pulse of the crystal resonator in most alarm clocks and even vibrations emitted by termites inside building walls. Their ears can move independently of one another. If you pay close attention to your best friend, you can gain clues about his mood from the position of his ears.

Birds

Birds in the wild rely on their keen sense of hearing to either alert them of danger or, in the case of birds of prey, to find their next meal with amazing precision. Owls, for example, have crooked ears. One ear is located slightly forward than the other, which aids them in pinpointing sounds of their prey. Because they are nocturnal animals, their hearing works in tandem with sharp sight to help them hunt successfully in the dark. During flight, an owl's left ear picks up sounds from below while the right ear hears sounds from above.

3-F5

Moths and spiders

Consider the lowly moth, an insect that has spent so many centuries evading predators that its hearing has evolved to being the best in the human and animal kingdom. Scientists say some species of moths have hearing 150 times more sensitive than any human. Their ability to hear the highest frequencies (300 kilohertz), helps them escape bats, their main predator, before they are attacked."

3-F5

Since The WLC would be across the street from many homes and it has even forced homes to be within the Specific Plan, its noise impacts will also impact domestic animals and residents of homes that would be forced to live near this massive warehouse project. Nothing or very little will be done to analyze these impacts or to mitigate the WLC's noise and other pollutions that would result from the project site or any of the roads that the trucks/cars use to access/exit the project site. The project noise mitigations have been reduced since the first documents such as construction (grading) activity setbacks have lessened by 2/3 and there are mitigation measure to do away with mitigation measure for sound barriers if there is not 100% approval for installation by those affected. It appears there is a change in how close the Cactus extension will get to Wilmount and there are no longer any mitigation measures for all the streets with increased noise and pollution levels brought on by the project. Allowing more noise and other pollution impacts on people, domestic animals, wildlife and the San Jacinto Wildlife Area is even more evident in these current WLC environmental documents under review versus the previous poorly written WLC documents.

3-F5

"Some available research¹ states that night lighting can have a wide range of adverse effects on wildlife, including mammals, birds, bats, amphibians, insects, fish, even plants. Effects range from reduced health by upsetting diurnal rhythms, reduced clutch size, egg size, or survival success of nesting birds, to actual mortality from increased predation under higher ambient lighting levels. Bats and certain insects are also attracted to outdoor night lighting, which may adversely affect their survival or cause them to become dependent on the lighting. Small mammals would also be attracted to these areas and might suffer increased predation or roadkill crossing streets."

3-F5

Page 4.4-100 The World Logistic Center needs to honor the International Dark Sky standards and without that they Page 106

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

bringing harm to the resources of the SJWA. In addition they need to limit light poles to 20 feet as well as turn off a majority of them by midnight. Failing to do this means the WLC is not doing everything feasible to reduce significant impacts to the ecosystem of the SJWA and all its resources. If WLC is allowed to move ahead without these restrictions on lighting as well as emitting significant noise and as a result the SJWA resources are severely impacted, then what will be the recourse for the SJWA to be able to return to normal and restore its ecosystem? What is the WLC responsibility to make that happen?

3-F5-20
CON

"Research by the California Air Resources Board (CARB)¹ indicates that 80 percent of the particulates generally settle out of the atmosphere within 1,000 feet of emission sources. Therefore, diesel particulate deposition may occur within approximately 1,000 feet of truck activities within the project, which would extend part way into the northern portion of the SJWA. (Page 4.4 104) Read the relined words within this section and one realizes that they relied heavily on the CDFW owned Conservation Buffer Area to mitigate the toxic pollution. The document then does nothing replace what they considered was mitigation — CDFW Buffer — for the construction and operation of the WLC. This impact actually extends beyond 1,000 feet because 80% is not 100% and other experts recognize 500 meters (about 1,500 feet) is the area of impact from diesel truck and car pollution. The quote found above only mentions the northern portions of the SJWA., but as explained above both sides of Gillman Springs Road, Bridge Street and the Ramona Expressway will impact habitat as well as the SJWA. The current documents a woefully inadequate in all the studies of all the forms of biological life that can and will be impacted by the construction and operation of the WLC — especially but not limited to the SJWA. Since different animals and other forms of wildlife/plant life/insect life use the SJWA and surrounding lands at different times of the year, the much needed revised studies will be inadequate unless they are all included.

3-F5

"Most of the available (and most applicable) research is on diesel pollutant impacts on humans. Although the physiology of many animals is very different than humans, data on health effects from diesel pollution may nonetheless be somewhat instructive when attempting to assess diesel impacts on wildlife. Potential health effects on wildlife obviously depend on the species involved, but in general health effects from air pollution/diesel exhaust include impaired cardiac and lung or respiratory function, reduced heart function or longevity, decreased clutch size or hatching success, increased incidence of cancer and other mutagenic or teratogenic effects, ingestion of air deposited particulates, reduction in overall biodiversity, reproductive failure, etc. In general, impacts on higher animals are most commonly attributed to food loss and reproductive effects, rather than to direct toxic effects on adults." *"Research⁶ suggests that wildlife may be more susceptible to air pollutant impacts than humans, due to their smaller size, higher respiration rates, smaller lung capacities, ingestion of local plant materials that have also been exposed, higher metabolic rates, etc., although some factors like shorter lifespans would reduce the length of exposure over time. For these reasons and for the purposes of this analysis, it is assumed that animals within the SJWA would be at least as susceptible to health effects from air pollution, including diesel exhaust compared to, as humans."* (Pages 4.4–101/4.4–102.) The important words in the last sentence are "At Least" which means animals could easily be much more susceptible to all the concerns listed above. The sentence also doesn't address plant life and insect life which are all important parts of the ecosystems. Providing information on tumors may be valid but it doesn't eliminate all the other significant impacts that can befall biological life as a result of the construction and operation of the WLC.

3-F5

"In addition to pollutants associated with diesel trucks, passenger vehicles produce additional air 2 pollutants including carbon monoxide, nitrogen oxides, particulates, etc. These pollutants will also have indirect impacts on wildlife resources of the SJWA. Two impacts of most concern would be ozone degradation (e.g., plants having an unusual dry or "burned" look) and the deposition of additional nitrogen, both of which can disrupt plant growth cycles. (Page 4.4-102). Direct, indirect and cumulative impacts of all pollutions resulting from the construction and operation of the WLC on the entire SJWA ecosystem as well as surrounding lands needs to fully analyzed and subject to peer review prior to any decision maker voting. The winds that are mentioned would blow the WLC pollutions/noise towards the MSHCP Criteria Cells to the east across Giliman Springs Road. These cells also need the same attention as the SJWA when analyzing the WLC's impacts on their resources. While they try to dismiss some impacts to the SJWA by saying that sometimes the winds blow another direction, they fail to mention the cloud cover we often have that makes noise pollution eve worse.

3-F5

"Based on available scientific data, it is reasonable to conclude that the proposed project, due to its size and expected amount of truck traffic, will have potentially significant impacts on wildlife within the SJWA and east across Gilman Springs Road from project air pollution, including diesel truck exhaust." (Page 4.4–103) Nothing is analyzing the significant impact of fumes/urban smells on the wildlife of the SJWA and surrounding lands. I was once in a wolf preserve and was told by the guide that when we stepped out of the car the wolf already smelled us. We were the equivalent of three city blocks away when we parked. Many animals have much keener senses of smell than we humans and could easily be impacted by the smell of diesel and other urban smells. These could be coming from the project site or from diesel trucks as well as the activities of built warehousing. The environmental documents are inadequate in this area and data is missing for all the species that use the SJWA. How will the impacts be manifested by each species and what will the WLC do to significantly reduce them. Again the ideas of electric equipment for all warehouse related work needs to be required and all warehouses being prewired for electric big rigs must also be required.

3-F5

Removing almost 2,600 acres from raptor foraging is recognized as an "adverse" impact, but the WLC believes "no mitigation is necessary or proposed". (page 4.4-111) With 25 species of raptors using the area, this is not an acceptable response to this direct, indirect and cumulative impact to this wonderful natural resource. Migration in the area is needed for the loss of raptor foraging and can be combined with mitigation for loss of Agricultural lands.

3-F5

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

"The SJWA is a significant resource for avian species and other wildlife. In 1981–82, the State Wildlife Conservation Board initially purchased 15,000 acres of the Mystic Lake area as mitigation for habitat impacts associated with the construction of the State Water Project (SWP)" (Page 4.4 - 22) The above sentence is very incorrect about the initial purchase to begin the SJWA and when Mystic Lake became part of the SJWA as well as its size. The WLC must not compromise the California Department of Fish and Wildlife's mission in regards to the SJWA. That mission is as follows: The Mission of the Department of Fish and Wildlife is to manage California's diverse fish, wildlife, and plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public. The WLC's many forms of direct, indirect and cumulative pollutions based on the current proposal will significantly undermine the CDFW's mission and the ecological value/ecosystem/biological life of the SJWA.

3-F5-

"Research by the California Air Resources Board (CARB)¹ indicates that 80 percent of the particulates generally settle out of the atmosphere within 1,000 feet of emission sources. Therefore, diesel particulate deposition may occur within approximately 1,000 feet of truck activities within the project, which would extend part way into the northern portion of the SJWA. (Page 4.4 104) This information means that at the very least family homes within 1,000 feet will also be impacted by what happens during the construction and operation of the WLC. As mentioned above some experts believe pollution impacts will happen to those who live within 500 meters. Articles like the following mention 500 meters,

<https://www.sciencedaily.com/releases/2018/09/180910111237.htm>

<https://dieselnet.com/news/2010/01hei.php>

3-F5-

Operations of the WLC includes all the diesel trucks and cars associated with the project that travel on Moreno Valley roads. Those individuals who at the very least live within 1000 feet of diesel truck routes to and from the WLC will very likely result in health impacts and this may take place over time — especially to the young and elderly. What will be the WLC's responsibility if children along these truck routes or who live within 1,000 feet or 500 meters of the project develop life threatening asthma or other medical problems? Will many develop more underlining conditions and make them more susceptible to COVID—19. The environmental documents must include a large section on COVID — 19 and its impact on Moreno Valley residents — especially those who will live within 500 meters or at the least 1,000 feet of the project and current/proposed truck routes. Making sure all equipment at the WLC is electric and installing electric plugins at all truck docking bays for electric APU's. That all landscape equipment is electric. That each warehouse is required to have a lounge for truckers with TV and fully stocked vending machines to reduce diesel trucks idling their diesel APU's. Require the WLC system to have an enforcement mechanism to immediately refuse entry to the WLC by diesel trucks that do not meet 2010 or newer standards. Build the infrastructure at each warehouse for electric big rig trucks to be recharged and for all electric cars to fast charge. That all homes within a minimum of 1,000 must have a completely new HVAC and air filtration system as well as a ten year maintenance agreement. This happened on two settlement agreements with the Sierra Club on Moreno Valley warehouse projects approved in the last two years and must be required of the WLC.

Title 24 Building Energy Efficiency Standards are updated about every three years and the WLC must be required to meet the current Title 24 standards at time of any construction...Not the Title 24 standards at the time of the entire project approval which could be 15 years old. This will make a big difference in the project's impacts on global warming and Greenhouse Gas as well as other pollutions. The entire project also needs to be required to meet the current LEED standards on all warehouse construction. TUFF fees must be paid throughout the life of the project and at the rate they are at the time they are paid.

3-F5-

We have large areas that are listed as disadvantaged communities because of the pollutions from warehouse projects that have been approved by our decision makers as well a some low income areas. The WLC is a big part of the reason we are on the disadvantaged area map and the current project before the Planning Commission does little to reduce the pollution impacts to our City or the impacted residents. Environmental justice doesn't seem to be important to Moreno Valley's City Council majority. The City is currently undergoing a General Plan Update (GPU) with the World Logistic developer as one of the seven members on the General Plan Advisory Committee. The WLC project before the planning commission will prejudice the General Plan Update and make Moreno Valley's environmental justice and other GPU elements much worse.

3-F5-

The Sierra Club appreciates the opportunity to make comments on the World Logistic Center (WLC) Project Development Agreement, Tentative Parcel Map for Finance and Conveyance Purposes only with Certification of the Recirculated Revised Final Environmental Impact Report. More needs to be written, but time requires that I stop at this point. Most of the pages numbers found above came from the Revised FEIR with Redlines — July 2018. The Sierra Club hopes that all documents where made available to both the public and the decision makers. If any were missing, then the public has a right to see them and use them as the basis for comments prior to any decisions on this project. The Sierra Club believes the current documents are inadequate and incomplete.

Planning Commissioners to vote in favor of any aspect of the project at this time. You need to research the problems/inadequacies/incompleteness we mention above as well as others we didn't have time time to research and convey.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-F5: GEORGE HAGUE, SIERRA CLUB

Response to Comment 3-F5-1: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F5-2: Refer to Response to Comment 1-F6-17 for discussion how the Project would reduce emissions, utilize zero emission technologies, and provide maximum solar as allowed by the utility provider.

Response to Comment 3-F5-3: As explained in Response to Comment 2-F2-9, although electric vehicles and equipment emit less noise than internal combustion engine (ICE) vehicles and equipment, there may not be an appreciable difference due to the minimum sound requirements required by the NHTSA.¹⁰

Response to Comment 3-F5-4: Refer to Response to Comment 1-F6-17 for discussion how the Project would reduce emissions, utilize zero emission technologies, and provide maximum solar as allowed by the utility provider.

Response to Comment 3-F5-5: As discussed on page 123 of the Air Quality, Greenhouse Gas, and Health Risk Assessment Report (Revised Final EIR Part 2, Appendix A1), all heating and cooling for the Project would be provided via direct evaporative cooling and heating pumps and natural gas is not required.

Response to Comment 3-F5-6: Refer to Response to Comment 1-F6-7 for discussion of noise impacts on the SJWA.

Response to Comment 3-F5-7: Refer to Response to Comment 1-F6-19 for discussion of impacts from traffic on Gilman Springs Road with respect to the SJWA.

Response to Comment 3-F5-8: No specific comment on the content adequacy of the Revised Final EIR is provided.

Response to Comment 3-F5-9: The comment claims that the noise from the WLC project would disrupt bird migratory behavior. The comment continues in asking how the WLC project may affect the annual Christmas bird count conducted by the Audubon Society. The comment also recommends that the WLC project fund a wildlife linkage below or over Gilman Springs Road because of the increased truck traffic that will result from the Project. The comment also includes a statement regarding the adequacy for safety of the roadway improvements for Gilman Springs Road for which the WLC proponent will be responsible.

Noise impacts on wildlife are discussed in the RSFEIR in Section 4.4.6 Significant Impacts (page 4.4-67). The RSFEIR concludes that with implementation of the two setback areas (totaling 400 feet) and the proposed solid walls along development setback away from the SJWA boundary, the anticipated increase in operational noise from the Project will not have a significant impact on wildlife and would not require mitigation.

The WLC project bird surveys were not conducted at the same time as the Audubon Society annual Christmas bird count, so it would be speculative to predict what change will be observed during the annual

¹⁰ U.S. Department of Transportation National Highway Traffic Safety Administration. Minimum Sound Requirements for Hybrid and Electric Vehicles Draft Environmental Assessment. January 2013.

Christmas bird count. The results of the annual counts are dependent upon a variety of factors but primarily climate-related (e.g., rainfall, winter temperatures, etc.), which makes comparative casual determinations subjective.

Migratory corridors/linkages are described in Section 4.4.1.11.g of the 2018 RSFEIR (page 4.4-38). Both the southern portion of the WLC Specific Plan area and the northern portion of the SJWA do not provide suitable habitat or resources to support wildlife migration or regular wildlife movement. There are no existing or proposed linkages, or constrained linkage areas in the vicinity of the WLC project. The nearest linkage areas as identified under the MSHCP are Proposed Linkage 5, which is located approximately 3 miles north of the WLC site and Proposed Constrained Link 20, which is approximately 3.6 miles south of the WLC site. The development of the WLC site will not impede the movement of any wildlife at these linkages. The WLC project will be contributing funds in the form of the MSHCP mitigation fees that may be used to improve wildlife linkage connections over or under Gilman Springs Road. Such linkages would have the highest benefit between the SJWA west of the Gilman Springs Road and the Badlands area on the east side of Gilman Springs Road, which is within Riverside County jurisdiction and not within the City's control.

Roadway improvements are detailed in Section 4.15 Traffic and Circulation of the RSFEIR.

Response to Comment 3-F5-10: Refer to Response to Comment 1.F6-6 for discussion on of potential impacts on species from pollution generated by the Project.

Response to Comment 3-F5-11: The comment references an article from the Australian Academy of Sciences that documents various consequences on wildlife as a result of human-made noise. Please see Response to Comment 3-F3-9 regarding potential noise impacts on wildlife.

Response to Comment 3-F5-12: The comment references an article from the Australian Academy of Sciences that documents various consequences on wildlife as a result of human-made noise. Please see Response to Comment 3-F3-9 regarding potential noise impacts on wildlife.

Response to Comment 3-F5-13: The comment criticizes the RSFEIR noise analysis because it fails to analyze all frequencies of noise, since different animal species hear frequencies in a manner different from humans.

The comment is correct that the noise analysis regarding impacts to wildlife species did not complete an analysis over a range of different frequencies. The noise analysis in the Revised Final EIR is based on predominant noise scales of Equivalent Noise Level (Leq) and the Community Noise Equivalent Level (CNEL). Although these noise scales are primarily adapted for impacts to human ears, they have been also applied to some noise impact analyses on wildlife species in general. Please see Response to Comment 3-F5-9 regarding noise impacts on wildlife.

Response to Comment 3-F5-14: The comment states that many different wildlife species will be impacted by noise from the WLC project during both construction and operations.

The noise impact analysis on wildlife in the RSFEIR is based on the most current data available that is specific to the WLC site. The majority of the WLC project will be further than 450 feet away from the SJWA northern boundary and those noise effects will be attenuated by the distance. It is primarily project-related

development activities in Planning Areas 10 and 12, those along the southern WLC project boundary, that have the potential for noise impacts to effect wildlife. Existing noise levels in the northern SJWA area are affected by road noise from Gilman Springs Road to the east and from noise generated at the existing natural gas facilities. Recent noise studies by ESA (2018) conclude that construction noise levels would not exceed 60 dB within the SJWA, with the highest construction noise level projected to be 52 dB at the SJWA boundary with the incorporation of the Specific Plan 250-foot setback.

Response to Comment 3-F5-15: The comment references the property now incorporated into the SJWA that was previously labeled as CDFW Conservation Buffer Area and mentions that it is discussed within the RSFEIR.

The changes to the Revised Final EIR which are referenced in this comment have replaced the “CDFW Conservation Buffer Area” language with text describing this area as the northern portion of the SJWA -- the two areas are physically the same. The revised biological resource analysis contained in the RSFEIR clarifies that the SJWA property is not utilized to buffer impacts associated with the WLC project.

Response to Comment 3-F5-16: The comment references an article from the Healthy Hearing website, an organization providing a directory for hearing clinicians, that describes hearing in non-human animal species. However, there is no specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F5-17: The comment references an article from the Healthy Hearing website, an organization providing a directory for hearing clinicians, that describes hearing in non-human animal species. However, there is no specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F5-18: The comment references an article from the Healthy Hearing website, an organization providing a directory for hearing clinicians, that describes hearing in non-human animal species. However, there is no specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-F5-19: Refer to Response to Comment 2-F5-8 for discussion of the noise analysis. In addition, as noted in the Note to Reader on page 4.12-1 of the 2018 RSFEIR (Revised Final EIR Part 3), the section replaces the 2015 FEIR section. The analysis was redone and based on the new analysis, mitigation measures that would reduce identified impacts are to be implemented. Therefore, it is not appropriate to compare mitigation measures between the 2015 FEIR and the 2018 RSFEIR.

Response to Comment 3-F5-20: The comment lists concern about the impacts from lighting on wildlife species and recommends that WLC project comply with International Dark Sky standards.

Impacts from lighting on biological resources are described in Section 4.4.6 Significant Impacts of the RSFEIR (page 4.4-69). The WLC project will comply with both the City’s Municipal Code regarding night lighting as well as the City’s Dark Sky Lighting Ordinance. Adherence to the City’s lighting design guidelines and restrictions will help ensure that night lighting increases will not result in significant indirect lighting impacts on native wildlife within the SJWA.

Response to Comment 3-F5-21: The comment refers to the pollutant analysis and their impacts on wildlife and concludes that the EIR analysis is inadequate in describing impacts from air pollution on wildlife.

Air emission impacts on wildlife are discussed in Section 4.4.6, Significant Impacts, of the RSFEIR (page 4.4-70). This discussion assumes that animals within the SJWA would be at least as susceptible to health effects from air pollution, including diesel exhaust, as humans. Studies suggest that diesel particulate matter may be a factor in increased allergic reactions in animals. Direct air pollutant impacts on wildlife within the northern end of the SJWA will be reduced somewhat because prevailing winds are mainly to the southeast with the remainder mostly to the east (i.e., very little to the south), based on data from the Project air quality study (MBA 2012). However, some diesel and other Project-related air pollutants will still be expected to disperse toward the SJWA, including gases and particulates, from trucks and passenger vehicles, when prevailing winds are absent. The RSFEIR concludes that the Project, due to its size and expected amount of truck traffic, will have potentially significant impacts on wildlife within the SJWA and east across Gilman Springs Road from project air pollution, including diesel truck exhaust.

Response to Comment 3-F5-22: The comment quotes from the RSFEIR regarding impacts from diesel particulate matter and expresses concern that air pollutant impacts will also affect plants and insects. Nitrogen deposition can lead to impacts on sensitive species including (1) direct toxicity, (2) changes in species composition among native plants, and (3) enhancement of invasive species. Direct toxicity refers to impacts associated with direct contact with the nitrogen pollutants. There is no scientific documentation that links direct toxicity to impacts associated with sensitive plant and wildlife species. Therefore, direct toxicity is not considered a significant impact. An increase in available nitrogen promotes the growth of non-native weedy species, which alone is not considered a significant impact. An increase in nitrogen deposition does not inhibit the growth of native plants, but promotes the rapid growth of non-native invasive species that could out-compete native plants for available water and nutrients. If the increase of non-native plant species is detrimental to the growth of native plants, the result may be a conversion from a native plant community to a non-native plant community. This change in habitat is only considered a significant impact if that change occurs in suitable habitat for a federally threatened or endangered species within USFWS-designated critical habitat, of which there is none on the WLC site. Because of the way in which nitrogen is generated by the WLC project, its overall patterns for dispersion, and the multi-variant parameters that would need to be taken into consideration for such an analysis, there is no established scientific basis or standards to study the effects of nitrogen dispersion for non-point pollution sources; hence, project-specific conclusions or mitigation would be overly speculative. See Response to Comment 3-F5-21 regarding general conclusion of significant impacts on biological resources, including insects, from air pollution.

Response to Comment 3-F5-23: The comment quotes from the RSFEIR regarding impacts from air pollutants and expresses concern that air pollutant impacts will affect areas beyond the SJWA.

There is no established scientific basis or standards to study the effects of nitrogen dispersion for non-point pollution sources, including beyond the WLC site. According to available research previously presented in Section 4.4.1.18a, a 250-foot development setback is adequate for a Project-SJWA separation and is supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and also the distance established in nesting bird surveys for setbacks from human activity. See Response to Comment 3-F5-21 regarding general conclusion of significant impacts on biological resources from air pollution, including beyond the SJWA..

Response to Comment 3-F5-24: The comment raises the potential impact on wildlife olfactory senses and states that the environmental documents do not analyze how the WLC project may affect the sense of smell

on each wildlife species using the SJWA. See Response to Comment 3-F5-21 regarding conclusion of significant impacts on biological resources from air pollution.

The only scientific literature found regarding impacts on wildlife olfactory senses was an article regarding the desert tortoise. The WLC site does not provide habitat for the desert tortoise. Further evaluation of the impacts of odors on wildlife would be speculative because of the lack of information.

Response to Comment 3-F5-25: The comment disputes the conclusion that the loss of raptor foraging habitat does not require mitigation.

The RSFEIR addresses the loss of raptor foraging habitat in page 4.4-75. Because much of the WLC site has experienced continued disturbance from various agricultural activities, the prey base for raptors is limited. In addition, the surrounding core areas of the Lake Perris State Recreation Area, the Badlands and the SJWA possess greater foraging area for raptors than does the WLC site. The payment of MSHCP mitigation fees, for which the MSHCP provides 13 raptor species with protection, will contribute to preserving raptor foraging habitat within the MSHCP area. The MSHCP incorporates suitable raptor foraging habitat within the MSHCP conservation areas. The objective of the long-range planning is to maintain sustainable populations within the MSHCP boundary. As a result of conservation planning within the MSHCP area enabled through the contribution of fees required for approved development, cumulative impacts to raptor foraging habitat will not be considerable.

Response to Comment 3-F5-26: The comment states that the WLC project will significantly undermine the mission of the SJWA.

The SJWA contributes to the Core H of the MSHCP and contains potentially suitable habitat for small rodents, common mammals, and burrowing owl. No WLC logistics development will be allowed within 250 feet of the SJWA. However, development that will be near the SJWA may cause significant indirect impacts to species within the SJWA, which will require mitigation that include a fair share contribution toward safety improvements along Gilman Springs Road. Potential indirect impacts to avian and other biological resources within the SJWA will be reduced to less than significant levels by the creation of a 250-foot on-site development setback.

Response to Comment 3-F5-27: Refer to Response to Comment 3-F5-21.

Response to Comment 3-F5-28: Mitigation Measure 4.7.6.1D (page 4.7-28 of the 2019 Draft Recirculated RSFEIR) requires that new development increase efficiency for buildings by implementing 10 percent over the 2019 Title 24's energy saving requirements "or the Title 24 requirements in place at the time the building permit is approved, whichever is more strict". Each building will need to demonstrate adherence to this measure prior to issuance of building permit and the more strict requirement will be implemented. Additionally, as stated in Table 4.7-6 of the 2019 Draft Recirculated RSFEIR (page 4.7-32), Project buildings would be LEED certified.

With regard to payment of TUMF fees through the life of the Project, the TUMF Program is implemented by the approved Measure A, voted on in 1988 and extended in 2002. The Program includes a single uniform fee program to mitigate the cumulative regional impacts of new development on the area's arterial highway system. Under the TUMF, developers pay a one-time development fee to fund transportation projects when

a development reaches the building permit stage. Therefore, payment of TUMF fees through the life of a project is inappropriate and not consistent with the intent and implementation of the Riverside County TUMF program. For further information on the TUMF program, see page 4.15-109 to 4.15-111 of the 2018 RSFEIR.

Response to Comment 3-F5-29: Emissions potentially impacting air quality were evaluated in Section 4.3 of the 2019 Draft Recirculated RSFEIR. Maximum regional daily emissions of VOC, NOX, CO, and PM10 would exceed SCAQMD daily regional thresholds during construction and max daily regional emissions of VOC, NOX, CO, PM10, and PM2.5 would exceed daily operational thresholds at full build out. A dispersion analysis for CO, NOX, PM10, and PM2.5 was performed to evaluate Project impacts during potential overlap of construction and operational activities on localized air quality. As described on page 4.3-21 of the 2019 Draft Recirculated RSFEIR, localized thresholds represent the maximum emissions from a Project that would not cause or contribute to an exceedance of the most stringent applicable Federal or State ambient air quality standards and are developed based on the ambient concentrations of that pollutant for each source receptor area identified by SCAQMD. As summarized on Table 4.3-19, the Project would result in significant localized impacts with regard to PM10. PM10 emissions consist of roadway dust generated by tire wear and brake wear from commuters traveling to their jobs. As shown in Table 4.3-21 of the 2019 Draft Recirculated RSFEIR, approximately 96 percent of unmitigated regional PM10 mobile emissions at project buildout are attributable to roadway dust.

A health risk assessment (HRA) was conducted to allow decision makers to evaluate the cancer-related impacts of the WLC project with the assumption that new technology diesel exhaust (NTDE) causes cancer, contrary to what was found by the HEI study. The HRA was conducted consistent with South Coast Air Quality Management District (SCAQMD) Health Risk Assessment Guidance and the current 2015 Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Guidance for Preparation of Health Risk Assessments. The HRA methodology applied a risk characterization model to the results from an air dispersion model to estimate potential health risks at each sensitive receptor location. A multi-pollutant health risk assessment was conducted for the WLC which included exhaust emissions of particulate matter (PM) and total organic gases (TOG) from diesel and gasoline combustion, as well as toxics associated with fugitive PM from tire wear and brake wear of mobile sources. To be conservative, the HRA relied on EMFAC2017 to determine the breakdown of vehicle types and fuel types and did not consider potential reductions in toxic air contaminants (TACS) emissions and health risks from increased penetration of zero emission vehicles. The estimation of cancer risk involves the specification of several parameters including the concentration level of the toxic air contaminants, the rate of inhalation of the toxic, the exposure frequency (number of days per year), the exposure duration in years, the time period over which the exposure takes place, what is termed a slope factor that represents an upper bound on the increased cancer risk from a lifetime exposure to a toxic by ingestion or inhalation and early-in-life age sensitivity factors. The values of these parameters depend on the type of receptor, i.e., sensitive/residential, worker, and student as discussed below. The health risk calculation does not rely on the Health Effects Institute (HEI) finding that new technology diesel exhaust (2007-compliant) does not cause cancer. The principal focus of the HRA was on the potential health impacts to sensitive/residential receptors located within and surrounding the Project site. Table 4.3-5 on page 4.3-26 of the 2019 Draft Recirculated RSFEIR provides the exposure assumptions for the cancer risk.

Table 4.3-26 on page 4.3-67 in the 2019 Draft Recirculated RSFEIR presents the estimated cancer risks for the 30-year exposure duration that starts from the beginning of Project Construction (Construction + Operation HRA). The results are provided separately for the incremental increase in cancer risk during Project construction, incremental increase in cancer risk during Project Operation, and the total incremental increase in cancer risk prior to the application of mitigation measures. As shown in Table 4.3-26, the Project would exceed the SCAQMD's cancer risk significance threshold of an incremental increase of 10 in a million prior to the application of mitigation and would represent a significant impact. Construction impacts contribute the greatest proportion of the total impact presented in Table 4.3-26. Table 4.3-27 on page 4.3-68 of the 2019 Draft Recirculated RSFEIR shows the estimated cancer risk for the 30-year exposure duration that starts from the beginning of Project full operation in 2035 (Operational HRA). Table 4.3-27 shows that during full Project operation, the total incremental increase in cancer risk is greater than the 10 in a million threshold, prior to mitigation, and would represent a significant impact. Overall, without mitigation and without consideration of the HEI study, the Project is expected to have a significant impact mainly due to diesel PM emissions from construction activities and heavy-duty diesel truck activities. With mitigation incorporated (2019 Draft Recirculated RSFEIR, page 4.3-73 – 4.3-74), the cancer risks are substantially lower. As shown on Table 4.3-28, 2019 Draft Recirculated RSFEIR, page 4.3-27, the estimated incremental increase in lifetime cancer risks for the 30-year exposure duration for construction (construction and operation HRA) would not exceed the SCAQMD cancer risk significance threshold after incorporation of mitigation. The large reduction in cancer risk after mitigation is attributable principally to the reduced diesel PM associated with the commitment to Tier 4 construction equipment (Mitigation Measure 4.3.6.2A[a]). Table 4.3-29, 2019 Draft Recirculated RSFEIR shows that the increase in lifetime (30-year exposure) cancer risk for operation would still exceed the SCAQMD cancer risk significance threshold for sensitive receptors located within and outside the project boundary. Therefore, Mitigation Measure 4.3.5.4.A, the use of MERV 13 filters to impacted residences, was added. This mitigation measure reduced the total incremental cancer risk to less than the SCAQMD significance threshold as shown on Table 4.3-30 (page 4.3-74 of the 2019 Draft Recirculated RSFEIR). Thus, with the implementation of mitigation, any possible risk from the Project, including risks from diesel trucks, to an on-site or off-site receptor, within the study area, was less than significant. It should also be noted that the owners of the houses that would experience a significant health risk have already accepted, in writing, the developer's offer to install MERV 13 filters.

As shown above, the cancer risk and chronic and acute non-cancer risk to sensitive receptors in the community would be less than significant with incorporation of mitigation for construction and operation of the WLC.

Section 4.3.6.6 Summary of Health Effects of Air Quality Emissions, starting on page 4.3-79 of the 2019 Draft Recirculated RSFEIR discusses the health effects from ozone and PM_{2.5} resulting from the project. Tables 4.3-32 through 4.3-35 show the annual percent of background health incidence for PM_{2.5} and ozone health effects associated with the unmitigated and mitigated Project, respectively. The "background health incidence" is the actual incidence of health effects (based on available data) as estimated in the local population in the absence of additional emissions from the Project.¹¹ When taken into context, the small increase in incidences and the very small percent of the number of background incidences indicate that these health effects are minimal in a developed, urban environment. There are no relevant significance

¹¹ Background health statistics were obtained from data included in the BenMAP model, and the sources are referenced in the BenMAP manual (USEPA, 2018). For example, EPA obtained mortality rates from the Centers for Disease Control (CDC) WONDER database, and hospital admissions rates from the Healthcare Cost and Utilization Project (HCUP).

thresholds for health effects from criteria pollutants adopted by state, federal, or local agencies; thus, this information is provided for background understanding regarding the air quality emissions. Table 4.3-32 and Table 4.3-33 show the health effects, morbidity and mortality, of the unmitigated project emissions across the southern California model domain for the Annual Mean PM2.5 and Annual Mean Ozone, respectively. Table 4.3-34 and Table 4.3-35 show the health effects, morbidity and mortality, of the mitigated project emissions across the southern California model domain for the Annual Mean PM2.5 and Annual Mean Ozone, respectively. Potential PM2.5 Mitigated Project related health effects show an increase in asthma-related emergency room visits (0.0047%), asthma-related hospital admissions (0.0028%), all cardiovascular-related hospital admissions (not including myocardial infarctions) (0.00059%), all respiratory-related hospital admissions (0.0015%), mortality (0.0044%), and nonfatal acute myocardial infarction (less than 0.0020% for all age groups). Potential Project Mitigated Ozone-related health effects increased respiratory-related hospital admissions (0.00062%), mortality (0.00027%), and asthma-related emergency room visits for any age range (lower than 0.011% for all age groups). Because the health effects from ozone and PM2.5 are minimal, in light of background incidences, and health effects from other criteria pollutants would be even smaller, the health effects of those other criteria pollutants were not quantified. Because there are no established thresholds, this data was provided for informational purposes.

As stated in the OEHHA factsheet (<https://oehha.ca.gov/media/downloads/calenviroscreen/factsheet/ces30factsheetfinal.pdf>), CalEnviroScreen 3.0 is a mapping tool that can be used to identify California communities (by census tract) that are most affected by sources of pollution and are most vulnerable to the effects of pollution. The CalEnviroScreen score measures the relative pollution burdens and vulnerabilities in one census tract compared to others and is not a measure of health risk. The data presented in the comment is consistent with the results of CalEnviroScreen 3.0 tool.

Construction activities during the Proposed Project would be performed in accordance with and exceed standard mitigation practices commonly implemented to protect surrounding communities from the effects of construction-related impacts. Page 4.3-42 and 4.3-43 of the 2019 Draft Recirculated RSFEIR lists construction mitigation which include, but are not limited to, the use of Tier 4 Final off-road equipment (Mitigation Measure 4.3.6.2A[a]), provide electrical hookups to power electric construction tools (Mitigation Measure 4.3.6.2A[e]), limit idling to 3 minutes in any hour (Mitigation Measure 4.3.6.2A[d]); preparation of a Construction Staging Plan to identify staging, truck routes, and construction parking (Mitigation Measure 4.3.6.2B); prohibit grading on days with an Air Quality Index forecast greater than 150 for particulates or ozone for the project area (Mitigation Measure 4.3.6.2D); and the Project compliance with SCAQMD's proposed Indirect Source Rule for warehouses constructed after the rule goes into effect (Mitigation Measure 4.3.6.2E) (See Topical Response D for more information on the Indirect Source Rule).

Operational mitigation measures, listed below (page 4.3-53 and 4.3-54 of the 2019 Draft Recirculated RSFEIR) have been implemented to ensure that operational emissions are reduced and limited to the extent feasible. Operational mitigation includes, but is not limited to, signage informing truck drivers of idling (Mitigation Measure 4.3.6.3B[a]) and truck route information (Mitigation Measure 4.3.6.3B[c]), staff training on vehicle records and diesel technologies (Mitigation Measure 4.3.6.3B[e]), compliance of all tenant fleets with all current air quality regulations (Mitigation Measure 4.3.6.3B[h]), use of on-site equipment powered by electricity, natural gas, propane, or an equivalent non-diesel fuel and have emissions standards meet or exceed Tier 4 Interim or greater or off-road equipment and 2010 engine emission standards for on-road vehicles (Mitigation Measure 4.3.6.3B[k]), all diesel trucks shall meet or exceed 2010 engine emission

standards (Mitigation Measure 4.3.6.3B[!]), and limit on-site idling to 3 minutes (Mitigation Measure 4.3.6.3B[n]); prior to issuance of building permits for more than 25 million square feet of logistics warehousing, a publically-accessible fueling station (Mitigation Measure 4.3.6.3C) a food and convenience store will be built and operational (Mitigation Measure 4.3.6.3D); refrigerated warehouse space is prohibited (Mitigation Measure 4.3.6.3D); and the project shall comply with SCAQMD's proposed Indirect Source Rule for warehouses constructed after the rule goes into effect (Mitigation Measure 4.3.6.2E) (See Topical Response D for more information on the Indirect Source Rule).

As discussed above, although the Project would result in significant and unavoidable impacts related to regional and localized criteria pollutant emissions, the Project would result in less than significant increases in cancer risk and minimal health effects. Additionally, implementation of the Project would result in the generation of temporary and permanent jobs, many of which would benefit local residents, shorten the commute of many workers by providing a job source in a City with a severe jobs/housing imbalance, and contribute to the public education system (specifically, Moreno Valley Unified School District and San Jacinto Unified School District). Therefore, the Project would not subject a disproportionate share of health consequences to a disadvantaged population and would not conflict with Government Code section 11135(a).

Response to Comment 3-F5-30: The City website includes all the documents prepared for the Project. As shown on the website, the various documents are dated. All portions of the Revised Final EIR, including the 2015 Final EIR, 2018 RSFEIR, 2019 Draft Recirculated RSFEIR, Response to Comments, Mitigation Monitoring and Reporting Program, and all associated appendices are available for review by the public.

Response to Comment 3-F5-31: No specific comments on the contents of the Revised Final EIR are provided, and thus no further response is needed (State CEQA Guidelines §15088(a) requires that a lead agency only evaluate and respond to comments raised on environmental issues.)

1.1.7 (3-G) Letters from Private Individuals

The following are responses to “G” comments from the general public. These responses are organized as follows:

- Responses to comments on the Revised Final EIR where the comment letter requires one or more specific responses. For these comments, each comment letter is followed by a response to the comment letter (refer to each individual comment letter to see bracketed comments).
- Comments indicating general support, general opposition, or otherwise not raising substantive environmental issues and therefore not warranting a specific response. These general comments are located in Attachment A of this Memorandum. A general response to these general comments follows the response provided to Letter 3-G42. The discussion that precedes the general response identifies the number of each general comment to which the general response is applicable.

Comment Letters Received from private individuals include the following:

- 3-G1: Alejandro & Georgina Briseno
- 3-G2: Alicia Wright
- 3-G3: Amado Hernandez
- 3-G4: Ana Cabrera
- 3-G5: Andrea Chouinard

Subject: REVISED ENVIRONMENTAL IMPACT REPORT

Warning: External Email – Watch for Email Red Flags!

As a home owner in a rural residential area, I am concerned!

This email is regarding the "revised EIR for WLC"

The proposed changes will make MY neighborhood a "Commercial Route"
This will compromise what is supposed to be a Rural Neighborhood without "Commercial".

Our 2 lanes steets are what they are...2 lanes street that are not to commadate Commercial Trucks! with will bring "Traffic".

Changing the streets to 4 lanes street will "open the door" for "Commercial Trucks"! mark my words.

Along with the changes will bring "code changes" & changes to OUR neighborhood & so on.....

I moved out into this area, outside the Moreno Valley City...to get away from the "Traffic" & again...
Changing our 2 lanes to 4 lanes will bring that "Traffic" especially the Commercial Trucks! & after that, the door that WE opened will be hard to close.

These map street changes that were buried in Mr. Benzeevi's EIR, he has not made the changes "needed" to Mitigate the traffic, noise, pollution.

Our neighborhood has already had a "taste" of that Commercial Traffic.... when the 60 freeway is diverted due to accidents, closures, fires.....traffic is unbearable especially if you are resident i the ares.

My Voice matters,
Cipriano Castellano
cyegone@verizon.net

3-G12-1

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-G12: CIPRIANO CASTELLANO

Response to Comment 3-G12-1: The commenter claims that the Revised Final EIR does not mitigate traffic, noise, and pollution impacts. As demonstrated below, the Revised Final EIR conducts a thorough analysis of air quality, noise, and traffic impacts and implements all feasible mitigation to reduce those impacts.

See the Response to Comment 3-F5-29 with respect to health risk assessment.

The health studies are conservative and based on the assumption that diesel trucks cause significant health impacts, contrary to the HEI study which analyzed 2007-compliant diesel engines and found that the application of new emissions control technology to diesel engines “showed few exposure-related biologic effects” and any such exposure to NO₂ “is being substantially further reduced in 2010-compliant engines.” (HEI, p.4.) Furthermore, only 2010-compliant diesel trucks will be allowed to service the WLC per mitigation measures 4.3.6.2A h) (page 4.3-32, construction on-road haul trucks) and 4.3.6.3 b) (page 4.3-53, trucks servicing the WLC when operational).

The 2018 RSFEIR also evaluated the potential noise impacts generated from the construction and operation of the WLC. As shown in Table 4.12-8 of the 2018 RSFEIR, construction activities within the Project area would elevate existing ambient noise levels by as much as 50 dB. The existing sensitive receptors that would be most affected by on-site construction activities are located within, to the west, and to the southwest of the Project area. Therefore, noise generated during onsite construction activities would result in a significant impact. Implementation of Mitigation Measure 4.12.6.1A would reduce construction noise levels at nearby sensitive receptors through implementation of a Noise Reduction Compliance Plan (NRCP), which is expected to attenuate construction noise levels by 10 dB and prohibit construction activities within 800 feet of residences during nighttime hours. As shown in Table 4.12-8 and Table 4.12-10, even with implementation of Mitigation Measure 4.12.6.1A, sensitive receptors located near on-site and off-site construction areas would be exposed to construction noise levels that would elevate the existing ambient noise levels above the applied 10 dB substantial temporary increase threshold. Therefore, this would result in a significant and unavoidable impact with mitigation.

A Transportation Impact Analysis (TIA) in Appendix F in the 2018 RSFEIR, was conducted for the Project which identified specific near-term and longer-term circulation improvements that would be required to mitigate Project impacts and maintain acceptable peak hour and daily levels of service (LOS) on surface streets and freeways affected by the project. As part of the TIA, impacts to freeways were analyzed with regard to LOS. As indicated in the analysis, many of the freeway segments along SR-60 and I-215 would be impacted as discussed in Section 4.15.6 of the 2018 RSFEIR. The WLC project would increase the traffic in the area, with most of the area operating at a degraded level of service. Therefore, traffic impacts were found to be significant and unavoidable for roads and intersections, and on all freeway mainline, weaving, and ramp facilities because those roads, intersections, and freeways are not within the City’s jurisdiction as discussed in Section 4.15.7 of the 2018 RSFEIR. However, payment of fair share mitigation fees is required for the improvements not within the City of Moreno Valley and those jurisdictions that have established fair share mitigation programs (see mitigation measure 4.7.15.4E and 4.7.15.4F). In addition, payment is also required for the Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Chapter 3.44 (See Mitigation Measure 4.7.15.4D on page 4.4-63 of the 2018 RSFEIR).

Among the improvements that the Project would be required to mitigate include payment of TUMF fees to widen Gilman Springs Road to provide three southbound lanes and one northbound lane along the frontage of the WLC Project and to pay into the TUMF and fair-share contribution towards the widening of Redlands Boulevard between SR-60 eastbound ramps and Eucalyptus Avenue. As shown in Table 72 of the TIA, these roadway segments operate at insufficient LOS prior to the implementation of the Project. The number of lanes that a street segment consists of does not determine the type of vehicles that would travel on that road as the commenter suggests.

Subject: Comments on the World Logistic Center (WLC) Revised Final Environmental Impact Report for the Planning Commission

Warning: External Email – Watch for Email Red Flags!

Good afternoon/evening Moreno Valley Planning Commissioner,

RE: World Logistic Center Revised Final Environmental Impact Report (RFEIR)

A clean and healthy environment is a fundamental right for all California residents. To that end, more can be done to reduce exposure to pollutants and improve the quality of life in California communities facing environmental and economic challenges. This project will prejudice the current Moreno Valley General Plan Update and especially the Environmental Justice Element. The RFEIR fails to analyze how the WLC will reduce its impact on Moreno Valley's Disadvantaged Community to less than significant.

You must ask for the Moreno Valley map that shows what parts of our town are considered Disadvantaged by the state in large part because of the significant pollution – they are largely near where warehouse projects have been approved and where their trucks use city streets.

The closer people are to particulate Diesel Pollution the more health impacts they are subjected. If we did not have so many warehouses, most trucks would use I-10 and not SR-60. We as part of the SCAQMD also must significantly help reduce our particulate pollution or we will very likely be subject to fines, penalties, and major federal regulation — as written below.

Even COVID-19 is more deadly because of the pollution produced with each warehouse and their 1000,s of diesel trucks you approve as can be read below.

Sincerely,

George Hague

3-G24

3-G24

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-G24: GEORGE HAGUE

Response to Comment 3-G24-1: The comment states that more can be done to reduce exposure to pollutants and claims that the Revised Final EIR fails to analyze how the Project would reduce its impact on Moreno Valley's disadvantaged communities. As discussed in responses to Comment Letter 1-F6 and Comment Letter 2-F2, the 2019 Draft Recirculated RSFEIR fully evaluated the potential air quality and health risks of the WLC project to sensitive receptors from diesel trucks. As demonstrated in responses to Comment Letter 2-F2, the Project incorporates all feasible mitigation, including feasible measures suggested by the commenter. In addition, the settlement that the project's developers have entered into with the South Coast Air Quality Management District (SCAQMD) requires the payment of 64 cents per square foot for each building as the Project is constructed. These funds would be used by SCAQMD to improve air quality within the South Coast Air Basin "to develop mitigation efforts focused on reducing emissions in the areas affected by the warehouse project."¹²

Response to Comment 3-G24-2: The comment references the potential health effects of air pollution, and claims that COVID-19 is more deadly because of the Project's air pollution, citing a Los Angeles Times article and a Harvard study. Potential health effects resulting from the implementation of the Project has been analyzed in the Revised Final EIR as summarized in Response to Comment 2-F2-12. With regard to the attached Los Angeles Times article linking air pollution to risk of death due to COVID-19, the authors of the study investigated whether air pollution exposures are associated with increased risk of death from COVID-19, finding large and significant associations even with very small increases in air pollution. Air pollution, and specifically PM_{2.5}, has been correlated with various disease, including respiratory and cardiovascular disease. COVID-19 deaths are also highly correlated with underlying respiratory and cardiovascular diseases, so there is a possibility that exposure to PM is also correlated with COVID-19 deaths.

However, this study was released before it went through the peer-review process for publication. This peer-review process, in which experts in the field scrutinize the methods and results, is a critical step in order to ensure the quality and validity of study results. The findings of this study received substantial media attention, even though it was not yet a peer-reviewed publication. The study has not been published in a peer-reviewed journal, and the researchers have already gone through one round of corrections to their calculations based on more updated information. It is possible that there will be additional changes as a result of the peer-review process.

The study has a number of shortcomings that are likely to delay or prevent its publication in the peer-reviewed literature. Probably the most important limitation is that the COVID-19 pandemic is evolving rapidly and affecting areas of the US differently, and at different times. The data are still being collected to varying degrees in different states and many deaths are likely to still be under-reported. Because we do not have complete information on COVID-19 related deaths, this could significantly bias the findings in the Harvard study.

There are also important concerns that the study may be, at best, incomplete. For example, the spikes in COVID-19 deaths in any particular county are more likely a reflection of where that county is on the COVID-19 curve than on air pollution in that county. Many large cities, like New York City have higher air pollution

¹² SCAQMD press released October, 21, 2016, announcing the settlement.

levels, but also have higher population density and therefore more opportunity for the virus to spread. These larger cities would be expected to have higher COVID-19 related deaths that could be unrelated to air pollution levels. In addition, different states and counties adopted COVID-19 policies at different times (e.g., social distancing) and this greatly impacted the death rates from COVID-19. A mortality study would need to account for differences in both air pollution and social distancing to disentangle the effect of each of these factors. Most air pollution mortality studies also assume that deaths are unrelated to each other, but this is not the case for COVID-19. In fact, deaths tend to be clustered, for example in retirement homes. These outbreaks are related to social interactions (based on current data), and because local health systems may be overwhelmed, this could lead to higher mortality rates.

Overall, the results from the Harvard study are premature and the issues discussed here, among others, call into question the findings. More data needs to be collected on COVID-19-related deaths before a scientifically sound assessment can be conducted to assess the potential impacts of air pollution exposures on COVID-19 deaths.

Subject: Don't Approve The World Logistics Center!

Warning: External Email – Watch for Email Red Flags!

Please share our email with all the planning commissioners. We are residents of Moreno Valley who view the World Logistics Center as a LOSE-LOSE project for the City of Moreno Valley. Residents will lose because they and their children will have to breathe filthy air from particulate matter as the 12,000 daily big rig wheels hit the asphalt and cause huge amounts of particulate matter to enter the air. Young children will be the primary victims of the filthy air here, causing even higher rates of asthma and other life-long health problems. Adults and Older people will also suffer earlier death from the particulates and emissions going into the air. Air pollution and very heavy big-rig traffic is degrading, and the City of Moreno Valley itself will be degraded overall, by having such heavy big-rig traffic and air pollution. It will result in a lowered reputation for the City as a whole.

3-G25-1

Residents should not be financially burdened as their tax dollars go into widening all the city roads for big-rigs. The tax dollars should be used for amenities for residents, like parks and libraries that benefit residents, like the beautiful new library Riverside is building. Instead the Moreno Valley taxpayers have to pay, pay, pay more and more taxes, to have massive road widening, just to accommodate big-rigs. This is a totally unfair tax burden on Moreno Valley residents which will benefit one developer but not the residents in any way. Besides enduring very heavy big-rig traffic and noise and pollution, they will see a few warehouse jobs available and no amenities from all the taxes.

3-G25-1

Increasing sophistication of robotics in factories will ensure that Moreno Valley residents get few jobs out of this massive polluting development. It is such a VAGUE CONCEPT OF DEVELOPMENT that I believe the planning commission needs to really investigate exactly what all the warehouses will be used for, before approving such a development. By rushing into such a development without really understanding clearly the exact steps and timing and end result and effects, and without being 100% certain that it will really bring any benefits to the majority of Moreno Valley residents, it could turn into a colossal disaster.

3-G25-3

This World Logistics Center is a flawed project. Most residents will be deeply unhappy with all the big-rig traffic, pollution, and few jobs.

3-G25-4

Do Not Approve This Project!

Sincerely,

Long-time Residents

Greg and Susan Billinger

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-G25: GREG AND SUSAN BILLINGER

Response to Comment 3-G25-1: The 2019 Draft Recirculated RSFEIR fully evaluates the Project's health risk and traffic impacts and imposes feasible mitigation measures to reduce the effects of the Project. As discussed on page 4.3-24 of the 2019 Draft Recirculated RSFEIR, California Office of Environmental Health Hazards Assessment (OEHHA) guidance for health risk assessments, which the Project air quality analysis is consistent with, incorporates the importance of early-in-life sensitivities for young children to exposures to toxic air contaminants. Refer to Response to Comments 3-G12-1 and 3-F5-29 for a summary of health risk, health effects, and traffic-related impacts and mitigation.

Response to Comment 3-G25-2: As discussed in Response to Comment 3-G12-1, payment of fair share mitigation fees is required for the improvements not within the City of Moreno Valley and those jurisdictions that have established fair share mitigation programs (see mitigation measure 4.7.15.4E and 4.7.15.4F). In addition, payment is also required for the Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Chapter 3.44 (See Mitigation Measure 4.7.15.4D on page 4.4-63 of the 2018 RSFEIR. The City of Moreno Valley Development Impact Fee (DIF) program is used to fund roads and intersection improvements needed within the City. See page 4.15-111 of the 2018 RSFEIR for a description of the City's DIF program. As stated in footnote 8 on page 4.15-111, the Development Agreement requires that the Applicant fully fund or construct all needed improvements within the City of Moreno Valley in lieu of paying the DIF for traffic. Therefore, all improvements within the City would be fully funded by the Project and the Project will pay into established fair share and TUMF programs for improvements required outside of the City.

Response to Comment 3-G25-3: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-G25-4: Refer to Response to Comments 3-G12-1 and 3-F5-29 for a summary of health risk, health effects, and traffic-related impacts and mitigation.

Moreno Valley Planning Commission Hearing on the World Logistics Center Revised Final EIR Report
5-13-2020 by Zoom

Comments submitted by Karen Jakpor, MD, MPH 5-14-2020

Dear Members of the Moreno Valley Planning Commission and City Council Members,

You would think that a project that consumes a portion of land equivalent in size to 700 football fields, would be a project that would concern all Moreno Valley residents and would motivate the city to provide for as much public input as possible. You would think that a proposal for “the nation’s largest master-planned warehouse complex” with impacts extending throughout the entire region would warrant hearings conducted in a way as to provide the most environmental justice possible. But here we are, in the middle of a public health crisis the likes of which we have never seen before, and the developer is trying to rush through his project in such a way that community input will definitely be hindered. Shouldn’t the City of Moreno Valley be focusing instead on the immediate needs of the citizens of Moreno Valley while they are suffering through this crisis?

How many of you members of the Planning Commission have read the entire Revised Final Environmental Impact Report cover to cover that you plan to approve during this hearing? Again, the developer is trying to flood us with information written in a difficult way for the community to understand, and I bet challenging for you planners as well. You have to flip back and forth through countless pages to refer to tables in various documents as you are reading. Did you actually do that? If not, how can you say that you have properly evaluated the project being proposed. And for the record, I am very dissatisfied with the responses I received to the numerous questions I submitted during the review process of the revised EIR. In my opinion, this remains an inadequate environmental impact report.

My name is Dr. Karen Jakpor, and I am a physician volunteer with the American Lung Association. I have also been diagnosed with severe asthma and have been hospitalized more times than I can count. Let me distill this enormous report for you. The project should not be approved, because there were “significant and unavoidable impacts” before, and now in the revised EIR there will still be “significant and unavoidable impacts.” So this project can only be approved if the City Council decides there are “overriding considerations.”

Why claim that there are “overriding considerations” warranting project approval when the City of Moreno Valley and the entire Inland Empire already has a hugely disproportionate share of the nation’s warehouses and accompanying air pollution from the association diesel truck trips? Why do we need another warehouse of this size consuming such a huge portion of the land to produce jobs for robots. What we really need are jobs for people, and other projects could provide far more jobs per acre than large warehouses run by robots.

I believe the City of Moreno Valley should consider the impact of COVID-19 in their planning. We could be dealing with the impacts of COVID-19 for some time, and the COVID-19 pandemic directly affects the environmental health impacts of the proposed World Logistics Project. So these impacts, which are not address in this revised final EIR, must be fully evaluated and considered in this report. Without that consideration, the mortality projections from the report are no longer correct.

3-G3

3-G3

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

The reason I say this is that a recent study from Harvard University showed that for each increase in particulate air pollution of 1 µg in PM_{2.5}, there was an associated 8% increase in the risk of death from COVID-19. We know that pre-existing conditions increase the risk of death for COVID-19. Air pollution is causes an increase in many of these same pre-existing conditions, such as cardiovascular disease.

The study found that a person living in a county with high levels of fine particulate air pollution is 15% more likely to die from COVID-19 than someone living in a county with less fine particulate air pollution. The bad news is that we live in a county with some of the highest particulate air pollution. Do we really want to make our risk of dying of COVID-19 even higher by building the World Logistics Center?

So remember, even a small increase in particulate air pollution results in a large increase in the risk of death from COVID-19. That should be your overriding concern as you evaluate this project for approval during a pandemic!

Sincerely,

Karen Jakpor, MD, MPH
Riverside, California

Subject: Revised Environmental Impact Report

Warning: External Email – Watch for Email Red Flags!

Julia, this email is regarding the revised EIR for WLC. I moved to this area to stay in Moreno Valley but to get away from the "city". I am 100% against changing some of our 2 lane streets to 4 lanes. I for one do not want truck routes in my neighborhood. Why is this map of street changes buried in Mr. Benzeevi's EIR? He has not made the changes needed to mitigate the traffic, noise, pollution so the planning commission needs to vote NO! We already have enough trucks and pollution with the warehouses just southeast of the 60 freeway. The negative impact this would bring to the rural area of Moreno Valley is terrifying!

3-G36-1

Hear my voice, it matters!

RESPONSES TO LETTER 3-G36: LINDA CASTELLANO

Response to Comment 3-G36-1: The commenter claims that the Revised Final EIR does not mitigate traffic, noise, and pollution impacts. As demonstrated in Response to Comments 3-G12-1 and 3-F5-29, the Revised Final EIR conducts thorough analysis of air quality, noise, and traffic impacts and implements all feasible mitigation to reduce those impacts.

Subject: For the record- opposition to wlc EIR approval
Attachments: Oppose approval of wlc revised eir.pdf

Warning: External Email – Watch for Email Red Flags!

Ms. Descoteaux,

Please find my submission opposing the approval of the "revised" final EIR for the wlc. I would appreciate this being part of the public record and as we cannot attend meetings it needs to be considered by all city parties involved in the decision making process.

This meeting along with the general plan update and Theodore interchange project all need to be postponed until the public can fully participate at an open public meeting.

Thank you,
Lindsay Robinson

3-G37-

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

To whom it may concern,

For the public record, I am writing to oppose the approval by the planning commission of the “revised” final wlc EIR as it still does not adequately address nor fix all the issues described by the courts. This is another non-essential project at this time along with the general plan update and Theodore interchange project that all need to be postponed during this lockdown until the residents can fully participate in person. The Riverside Board of Supervisors and the Riverside City Council have both acknowledged the importance of the democratic process and postponed these types of decisions until the public can fully participate. Our lives, health and quality of life will be greatly negatively impacted if Mr. Benzeevi is allowed full participation while residents are denied full the same right.

3-G37

Of great concern is the fact that the mayor recently fired the city manager, assistant city manager, city attorney, the head of the Planning Dept. and the head of Human Resources among others. The message to city staff is quite clear- do what the mayor (HF) tells you to do or you will be fired. Ethics and integrity don’t matter in Moreno Valley. This is another reason to postpone these actions until the public can fully attend and participate.

3-G37

The wlc revised EIR is far too large of a document to adequately read, study, comprehend and compare to the former EIR, the judge’s writ and AG Becerra’s suit to be sure it has been changed and improved adequately. Three of the planning commissioners are also tasked with the general plan update at the same time, making it impossible for them to perform their due diligence on both items. Additionally this EIR should not move forward as the majority of the planning commissioners need to recuse themselves for conflict of interest due to their relationships with Iddo Benzeevi and Highland Fairview.

3-G37

As the general plan update is in progress at the same time, the land use of this property needs to be re-examined and rezoned to more appropriate uses that better benefits the city and protects the residents. The 2006 general plan recognized the value of land use and this area should be rezoned for the high end homes and businesses for which it was intended. This EIR offers no consideration for development alternatives of mixed land uses. To not touch this land during the process and allow Benzeevi to control the city is again opening the city up for more litigation. Please do not approve this EIR and recommend that this land be rezoned to more appropriate land use that provides more jobs, diverse jobs and state required housing.

3-G37

Time has shown that these warehouses provide little to no jobs/acre especially as automation takes over which is another reason this land use needs to be re-evaluated. The lies of high paying jobs/exaggerated numbers of jobs need to stop now. We have far too many warehouses in our city already and calling this project “logistics” doesn’t change the reality that they will be warehouses. Our residents deserve better and now that the state is calling for more housing of different types, this property needs to be reverted to 2006 plan which offered housing, and a greater diversity of businesses and jobs. Please take this into consideration and reject this EIR.

3-G37

Major concerns and many environmental impacts are still not mitigated or reduced in this “new” revised EIR. In fact little has changed, therefore it needs to be denied. A few items are mentioned below:

3-G37

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

The massive wlc will impact a large region of the Inland Empire and people from throughout this area should have been told of this meeting, because the project will likely negatively impact their quality of life and the health of their family. Please find out whether all neighboring regions were notified and supplied with information of this hastily called meeting for approval. As we're all in lockdown you should have supplied additional time for review and notification to allow surrounding regions adequate time to respond.

3-G37
CON1

There has been no change to the project setback, land uses, or design adjacent to all existing residential neighborhoods for traffic, air quality or noise impacts. As this project is entirely without known tenants it is impossible to mitigate all the negative impacts adequately. **Prior to approval- The city needs to enact a noise ordinance for warehouses before any more are approved/built to protect the residents from 24hr/day noise. Warehouses need to follow the same noise ordinances as residents/construction/yard workers and shut down from 10 pm-7 am. Solaris Paper Company is a prime example of unreasonable noise all night long. The wlc should not be allowed to build across the street from occupied homes as is their current plan and setbacks need to be increased to protect the existing residents.**

3-G37

3-G37

The Newkirk home on Dracea was always left out of the maps during the wlc hearing in spite of their efforts to inform the city staff and attendees. They requested many times that it be shown so that everyone would know what was being done to their property. They have been threatened with warehouses only several hundred feet from their front door. This travesty needs to be rectified and their property protected. Residents should have priority over out of town people "paying to play".

3-G37

There has been no change to the project along the 2-mile border with San Jacinto Wildlife Area. **The judge specifically called him out on his buffer where he was using land that wasn't his to be the buffer. wlc land needs to be added to the buffer zone. Again lights/noise need to end at night to protect our resident's health and quality of life, protect the wildlife and protect our highly valued night skies.**

3-G37

The master planned trail system connecting the north side of the city to Lake Perris is missing again. Please ensure that the safe multiuse trail is included in any and all approvals. Our original overcrossing at Sinclair was moved to Theodore to accommodate Mr. Benzeevi for skechers. This change needs to be honored and the trail system needs to show on these maps.

3-G37

There is no extra mitigation to the diesel exhaust from trucks. The offer to buy greenhouse gas credits in other counties which do nothing for us here. The 2010 or newer diesel trucks are cleaner, but not clean. They will bring health impacts to us as they further degrade our air quality with particulate pollution, but especially for the young and elderly. The COVID-19 pandemic has demonstrated how bad air quality has compounded the deadliness of respiratory diseases and unfairly affects those who live in areas of irresponsible planning. This project does not mitigate their compounded unhealthful air quality effects and thus this EIR needs to be rejected. Our residents and those in the surrounding areas deserve much better.

3-G37

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

The wlc’s greenhouse gas (GHG) impacts are huge and are not mitigated locally or even within California. GHG is causing the Earth’s atmosphere to warm, resulting in changes to the climate we are already starting to see today.

3-G3: 4

The wlc doesn’t have any system in place to turn away diesel trucks which are not 2010 compliant. As HF and followers have little to no regard for the law, self-policing is a joke especially when the land is sold to others who do not have to follow the development agreement.

3-G3: 5

There is no remedy to the traffic impacts on the already congested SR-60. Even with three or four lanes SR-60 will not be able to accommodate the addition of more than 12,000 daily diesel truck trips and 45,000 more daily car trips generated by the WLC. It will become many times worse than what we currently suffer. Caltrans has no plans to widen the 60 freeway thru Moreno Valley and even if they were to do so, it would require eminent domain on existing developments. It appears his plan is to widen our neighborhood streets so those roads and residents will suffer more traffic, noise, pollution, and danger. The roads will then need more frequent repairs which the city can’t afford, and his development agreement absolves him from paying for damages/improvements. This is not of benefit to the city nor the residents. Please reject this EIR.

There is no further addressing of city street impacts other than to exempt him from paying. Diesel Trucks should only be allowed to enter and exit the WLC by using SR-60 and not using any streets that pass peoples' homes. The new development agreement exempts him from paying for street improvements therefore entrance needs to be directly from freeway. Sec. 4.8 ...” HF shall not pay the fees imposed by Moreno Valley Municipal Code Sections 3.42.030 (arterial streets), 3.42.040 (traffic signals) and 3.42.050 (interchange improvements). **“...HF SHOULD pay the fees required by MV Municipal codes as noted in section 4.8. The excessive traffic this project will subject our roads to requires HF to pay these fees. Do not accept this provision.**

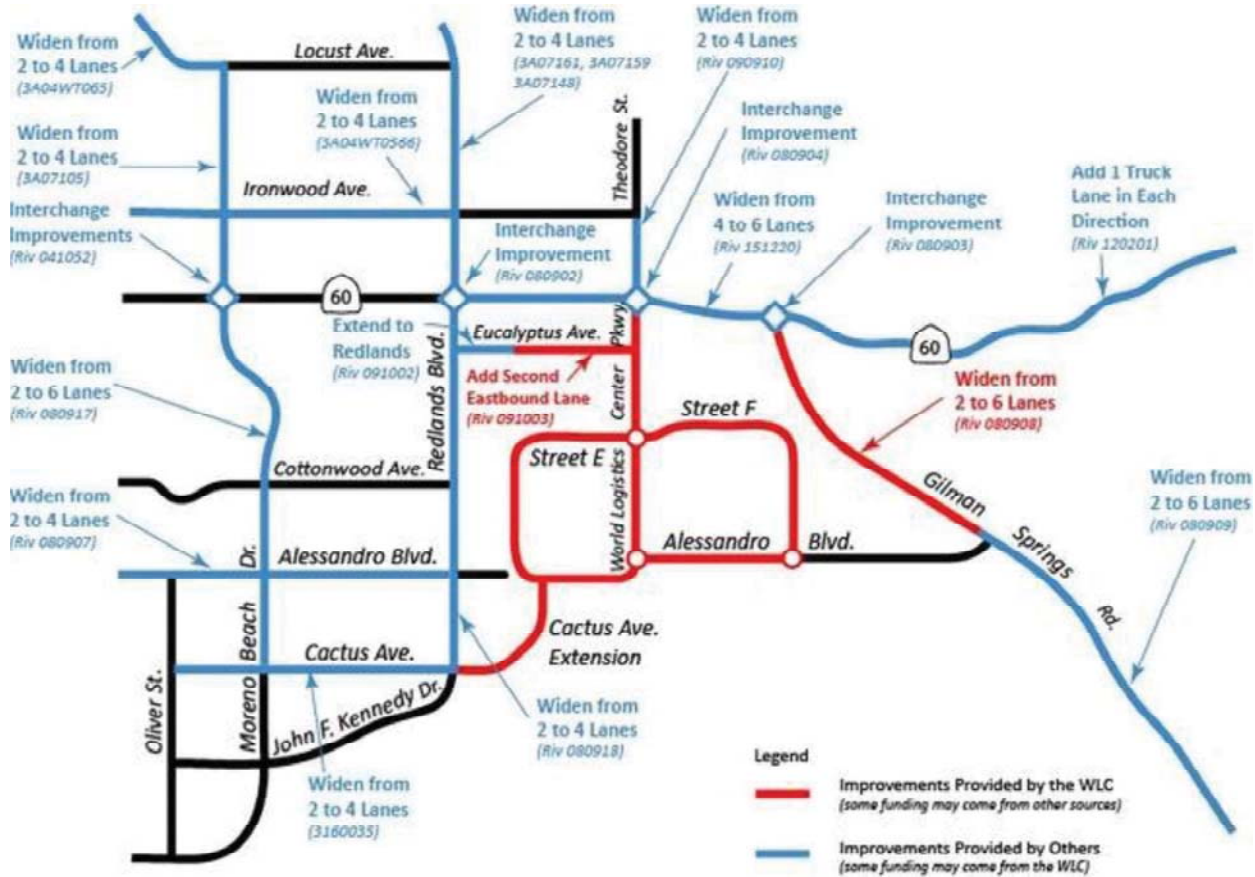

3-G3: 3

It is horrifying to see this new map of road widenings in our neighborhoods that is buried in this file. All residents in the affected areas should have received individual notices of the road proposals that Benzeevi is hiding in the EIR. Four lanes are NOT needed in these neighborhoods and destroying Gilman Springs with 6 lanes is reprehensible. There are homes along Redlands Blvd. yet no mention on what will happen to these residents. Also, he is forcing us to pay for these widenings that will harm our neighborhoods and our pocketbooks. Clearly this is his sneaky way to turn non-truck routes into truck routes further destroying our quality of life and health. Please do not approve this street widening map and remove it from this EIR.

Mr. Benzeevi has failed to honor his commitment to improve Eucalyptus by skechers although he has had plenty of time to do so. Now it appears the taxpayers will be paying for his responsibility.

Please deny this proposed street widening plan in its entirety until all affected residents are properly notified and able to voice their concerns.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

This revised EIR also neglects to adequately provide a location for truck servicing and parking. A project of this magnitude needs to provide those amenities and not force them to go to outlying areas. NE Moreno Valley is NOT where truck stops/fueling stations belong. They belong on the wlc property.

3-G3 7

There was little to no consideration from comment letters addressing the resident's concerns. Please reject this EIR until all concerns are addressed.

Now on to the conflict of interest that should stop this from moving forward at all-

Under common law conflicts, there is no need of financial benefits just the connection in which benefits one of those in the connection (Highland Fairview).

3-G3 8

Even the Appearance of a Conflict of Interest Should Be Avoided for Government Employees. This includes those who are appointed and especially because they receive payment and promise to behave ethically and in a fair and impartial manner. Because of their connections and undue influence exerted over them by HF the following Planning Commissioners need to recuse themselves resulting in no quorum. I contend that Robert Harris, Raphael Brugueres, Joann Stephens, Alvin Dejohnette and Ray Baker all need to recuse themselves from hearing, voting or advocating for in their official capacity any item which involves Highland Fairview directly and

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

in some cases, indirectly if Highland Fairview would disproportionately benefit based on the ground of standing conflicts of interest as follows.

Mr. Robert Harris has been directly connected with Highland Fairview/Iddo Benzeevi (HF) serving as an officer on his Political Action Committees (PAC) and was the person of standing who signed the paperwork for HF initiatives later deemed illegal in their efforts to circumvent the CEQA laws. He was one of the least qualified applicants but his relationship with HF and friendship with Mayor Gutierrez gave him the seat. He needs to recuse himself with anything remotely connected to HF due to conflict of interest thru association and bias.

Mr. Raphael Brugueres has been directly connected with Highland Fairview/Iddo Benzeevi (HF) serving as an officer on his Political Action Committees (PAC), collected signatures for the illegal initiatives used to circumvent CEQA laws, illegally harassed and blocked residents from signing legal referendum petitions and bragged about it on video at city council meetings, and at a city council meeting (1/15/2019) verbally threatened action against residents who opposed HF. Additionally he needs to recuse himself as he stated at several planning commission meetings prior to his appointment that all projects need to be approved and settled later in court. I am concerned that he is unable to read and comprehend the extensive data presented in anything related to planning and development and he was the **least** qualified applicant but his relationship with HF and friendship with Mayor Gutierrez gave him the seat. He needs to recuse himself with anything remotely connected to HF and should be removed from the planning commission.

Ms. Joann Stephens also has a long standing relationship with HF serving as an officer on his Political Action Committees (PAC) formed to promote the wlc. In a video dated 10/7/2013 she speaks in favor of wlc and that “we should all embrace Iddo”. At the June 11, 2015 she states ...” I've lived in the city 30-plus years and this is the best thing that I've ever seen that wants to come in here”... “I hope the City Council members are looking because I don't know how anybody can vote no on this”... Additionally she currently serves on the mayor’s general plan update committee and is under the undue influence of Iddo Benzeevi who has taken major control of the committee now that the public is not able to be present. The fact that his wlc and aquabella properties are not being touched as they consider rezoning many other properties indicates his control while he is also pushing for warehouses/commercial rezoning north of the freeway in an inappropriate area. Again she was one of the least qualified applicants to the planning commission, but her association with HF, Ms. Baca and Mayor Gutierrez gave her a seat at both tables. There is a clear conflict of interest and bias that requires Ms. Stephens recuse herself.

Mr. Baker currently serves on the mayor’s general plan update committee and is under the undue influence of Iddo Benzeevi who has taken major control of the committee now that the public is not able to be present. The fact that his wlc and aquabella properties are not being touched as they consider rezoning many other properties indicates his control while he is also pushing for warehouses/commercial rezoning north of the freeway in an inappropriate area. Mr. Baker needs to recuse himself from this vote because of the undue influence he’s under while working with Iddo Benzeevi. A clear conflict of interest by association so therefore Mr. Baker must recuse himself.

3-G37
CON 3

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Mr. Dejohnette needs to recuse himself as he is also serving on the mayor’s general plan update committee and is under the undue influence of Iddo Benzeevi who has taken major control of the committee now that the public is not able to be present. The fact that his wlc and aquabella properties are not being touched as they consider rezoning many other properties indicates his control while he is also pushing for warehouses/commercial rezoning north of the freeway in an inappropriate area. Additionally he didn’t apply for the planning commission, but the mayor appointed him as they were co-workers at March Middle School. Along with undue influence from Iddo Benzeevi, he is also under the influence of the mayor who is funded by HF. A clear conflict of interest by association so therefore Mr. Baker must recuse himself.

The mayor did a disservice to the city and the residents by forming a planning commission of some of the least qualified applicants who were already supporters of HF and similarly with the general plan update advisory committee. His actions open the city to even more unnecessary litigation and were unethical to say the least.

With the necessary recusals there is no quorum for the planning commission to consider this EIR or anything related to HF, thus this EIR and the project cannot move forward.

Should these recusals be refused, then the EIR needs to be rejected for the reasons given as well as many more that were not addressed.

Thank you,

Lindsay Robinson, resident

Proof of the PAC association included. Copies of ALL planning commissioner applications are available from the city clerk and they will clearly demonstrate lack of qualifications in comparison to other applicants. It will also show that Mr. Dejohnette did not apply for Planning Commission, but it was written in by someone else.

The following pages from the 410 noted above show proof of the PAC officers for HF Moreno Valley Coalition...

3-G37

RESPONSES TO LETTER 3-G37: LINDSAY ROBINSON

Response to Comment 3-G37-1: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-G37-2: No specific comments on the contents of the Revised Final EIR are provided. The commenter opines that the Project should be postponed due to the “lockdown” situation so that the public can fully participate. All Project documents are available for download and review on the City’s website. Therefore, anyone who wishes to access, review, and comment on Project documents has the ability to do so without needing to leave their home. As stated on the Notice of Completion, City Staff was available to make reasonable arrangements to ensure that Project documents were accessible to those wanting to review them in person. Therefore, an extension of the review period due to current stay at home guidelines is not warranted. In accordance with Governor Executive Order N-29-20, the Planning Commission hearing on May 14, 2020 was held via teleconference pursuant to the COVID-19 pandemic. Detailed instructions on how to effectively participate in the public hearing was posted on the City’s website and described in the Planning Commission agenda. Over 60 people spoke using the Zoom platform at the May 14, 2020, Planning Commission hearing.

Response to Comment 3-G37-3: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-G37-4: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-G37-5: The alternative analysis was presented in Section 6.0, Alternatives to the Proposed Project, of the 2015 Final EIR,¹⁴ which is part of the Public Record. The judge’s ruling did not find the Alternatives section deficient, thus there was no need to recirculate this portion of the 2015 Final EIR. The 2018 RSFEIR was prepared to correct the deficiencies identified in the 2015 Final EIR under the February ruling. Thus, the 2018 RSFEIR was circulated for public comment and those portions of the 2015 Final EIR that were found to be in compliance with CEQA by the Court were not re-circulated but are part of the public administrative record.

Response to Comment 3-G37-6: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-G37-7: Refer to Response to Comment 3-G35-2 for a discussion of the availability of Project documents and participation in the public hearing process. Pursuant to City of Moreno Valley noticing procedures, a Notice of Public Hearing was mailed to property owners within 600 feet of the Project site and agencies and members of the public who requested notices on April 30, 2020, posted on the City’s Website, and posted to the local newspaper (Press Enterprise) on May 3, 2020

The commenter opines that additional time should have been provided for review due to the current “lockdown” situation. All Project documents are available for download and review on the City’s website. Therefore, anyone who wishes to access, review, and comment on Project documents has the ability to do

¹⁴ City of Moreno Valley, 2015. World Logistics Center Project Final Programmatic Environmental Impact Report, Volume 3 – Final Environmental Impact Report, State Clearinghouse No. 2012021045, May.

so without needing to leave their home. As stated on the Notice of Completion, City Staff was available to make reasonable arrangements to ensure that Project documents were accessible to those wanting to review them in person. Therefore, an extension of the review period due to current stay at home guidelines is not warranted. In accordance with Governor Executive Order N-29-20, the Planning Commission hearing on May 14, 2020 was held via teleconference pursuant to the COVID-19 pandemic. Detailed instructions on how to effectively participate in the public hearing was posted on the City's website and described in the Planning Commission agenda. Over 60 people spoke using the Zoom platform at the May 14, 2020, Planning Commission hearing.

Response to Comment 3-G37-8: The commenter claims that the Revised Final EIR does not mitigate traffic, noise, and air quality impacts. As demonstrated in Response to Comments 3-G12-1 and 3-F5-29, the Revised Final EIR conducts thorough analysis of air quality, noise, and traffic impacts and implements all feasible mitigation to reduce those impacts.

Response to Comment 3-G37-9: The commenter request that the City enact a noise ordinance requiring warehouse to shut down from 10:00 pm to 7:00 am. In addition, the commenter states that setbacks need to be increased to protect existing residences located across the street from the Project. As discussed in Section 4.12.6.3 of the 2015 FEIR, with the implementation of a 250-foot buffer between the operation of any logistics facilities and residential areas, increases in ambient noise at adjacent sensitive receptors would be less than significant. An increase in buffer is not required.

Response to Comment 3-G37-10: The Newkirk home, located at 29080 Dracea Avenue (within the Project site), is shown in Figure 4.3-2 of the 2019 Draft Recirculated RSFEIR and identified as an on-site receptor. Therefore, this residence has been accounted for in the analysis set forth in the Revised Final EIR.

Response to Comment 3-G37-11: The Superior Court ordered that “the FEIR should remove all references to and consideration of the 910 acres of SJWA and MSHCP land as “buffer zone” or “CDFW Conservation Buffer Area” in the Biological Resources and Habitat Impacts analysis” (see page 4.4-1 of the 2018 RSFEIR, which has been done As presented in Section 4.4.1.15. in the 2018 RSFEIR, a 250-foot development setback is adequate for a project-SJWA separation and is supported by a compilation of available academic and scientific literature and studies on wildlife impacts from diesel emissions, and also the distance established in nesting bird surveys for setbacks from human activity. In addition, the Specific Plan Mitigation Measure 4.4.6.1A requires solid walls along the 250-foot development setback where are truck activity areas adjacent, which will help provide an additional buffer from building lighting and noise and effectively mitigate potential direct and indirect impacts on the SJWA. In addition to the 250-foot development setback and solid walls, the WLC Project includes a 150-foot building setback resulting in a total setback of 400 feet that would further reduce potential impacts on wildlife within the SJWA area. Regarding impacts to threatened and endangered species, the coastal California gnatcatcher was detected on the WLC site for which mitigation is included in Mitigation Measure 4.4.6.3A in the 2018 RSFEIR.

The 250-foot development setback is one of the design features that lessens impacts on the SJWA. As discussed in Section 4.4.1.15.a, Other Issues, a. Setbacks on page 4.4-49 of the 2018 RSFEIR, “typical setbacks to protect wildlife from human presence (though not warehousing) ranges from 50 to 500 feet, but

200–250 feet appears adequate for the most sensitive species.¹⁵ In addition to the 250-foot development setback, the WLC Project includes a 150-foot building setback resulting in a total setback of 400 feet. Furthermore, the WLC Project includes a minimum 11-foot high solid walls along the southern boundary of the WLC site that would further reduce potential urban/wildlands interface impacts. As discussed in Section 4.4.6.1 of the 2018 RSFEIR, construction and operational noise levels would result in less than significant impacts with the implementation of the two setback areas and proposed solid wall along the SJWA boundary (RDEIR at page 4.4-68). Because the project features would reduce potential interface issues between the WLC site and the SJWA, no further expansion of the setback area along the boundary with the SJWA is required

- *Setbacks:* Establishes a 250-foot wide development setback from the southernmost property line along the SJWA boundary, and an additional 150-foot building setback from the development setback to help minimize potential impacts on biological resources of the SJWA (WLC Specific Plan Section 2.2.3.f.4, Exhibit 4-16).
- *Architecture and Building Restrictions:* Requires ground- and roof-mounted equipment to be screened from off-site view (WLC Specific Plan Section 5.3.15).
- *Landscaping Restrictions:* Provides “Special Edge Treatment Areas” in terms of adjacent uses, including the SJWA and Gilman Springs Road (WLC Specific Plan Section 2.5.3, Exhibit 2-1 and Section 2.5.4, Exhibit 2-3).
- *Off-Site Lighting:* All lighting in the vicinity of SJWA shall be designed to confine all direct light rays to the project site and preclude the visibility of direct light rays from the wildlife area (WLC Specific Plan Section 4.3). The Project would also comply with the City’s new Dark Sky Lighting Ordinance, which reduces spillover light to 0.25 foot-candles at five feet from the adjacent property lines.

Response to Comment 3-G37-12: The Project will include features that would support the use of alternative modes of transportation such as bicycles. Mitigation Measure 4.3.6.4A (page 4.3-60 of the 2019 Draft Recirculated RSFEIR) requires the incorporation of Class II bike lanes and pedestrian pathways into site circulation, site design and building placement to provide pedestrian connections between internal and external facilities, and pedestrian connection of the project to residential uses within 0.25 miles away. Additionally, the project would provide bicycle parking, shower facilities, and transit availability and scheduling to all tenants and their workers (Mitigation Measure 4.3.6.4A(j)).

¹⁵ McElfish, J., Kihlsinger, R., and Nichols, S., 2008. *Setting Buffer Sizes for Wetlands*. Available online: http://staging.ecosystemmarketplace.com/wp-content/uploads/archive/documents/Doc_456.pdf

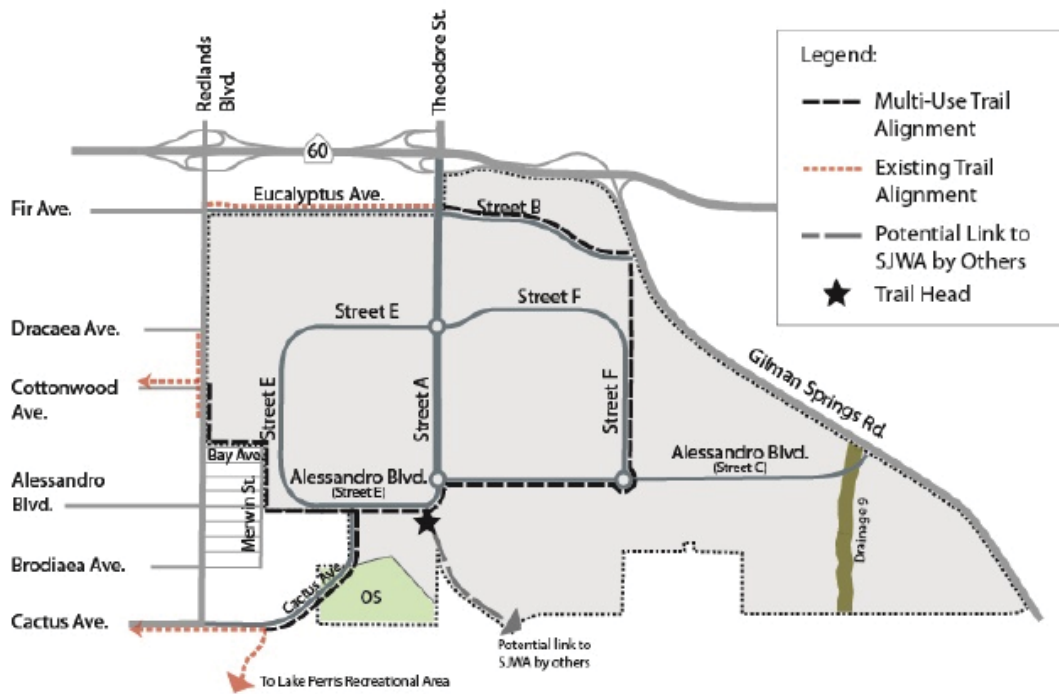

Exhibit 3-17 Multi-Use Trail Plan

As detailed on pages 3-13 and 3-14 of the World Logistics Center Specific Plan (Appendix H-1 of the 2015 FEIR), the Project will connect to and extend the existing multi-use trail on the north side of Eucalyptus Avenue to continue along Street B to Gilman Springs Road and then southerly to connect with the trail head as shown in Exhibit 3-16, below. In addition, a future connection between the trailhead to the SJWA (located on the Project site) will be allowed to be constructed by others.

Response to Comment 3-G37-13: The commenter claims that the Revised Final EIR does not mitigate exhaust from diesel trucks. As demonstrated in Response to Comments 3-G12-1 and 3-F5-29, the Revised Final EIR conducts thorough analysis of impacts associated with diesel exhaust and implements all feasible mitigation to reduce those impacts. In addition, in the Settlement Agreement between the developer and the South Coast Air Quality Management District (“SCAQMD”) for the Project as referenced in Response to Comment 2-F2-23, the SCAQMD determined that the approximately \$26 million Air Quality Improvement Fee to be paid by the applicant “will adequately mitigate heavy-duty truck related air quality impacts that may result from the construction and operation of the World Logistics Center” With regard to COVID-19, more data needs to be collected on COVID-19-related deaths before a scientifically sound assessment can be conducted to assess the potential impacts of air pollution exposures on COVID-19 deaths.

Response to Comment 3-G37-14: : The commenter claims that the Revised Final EIR does not mitigated greenhouse gases. See page 4.7-1 of the 2019 Recirculated RSFEIR for background on greenhouse gas emissions and climate change as a global issue. As demonstrated in Response to Comment 3-B2-7, the

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Revised Final EIR conducts thorough analysis of greenhouse gas emissions and implements all feasible mitigation to reduce those impacts.

Response to Comment 3-G37-15: Mitigation measure 4.3.6.3B I) specifies that all diesel trucks entering logistics sites shall meet or exceed 2010 engine emission standards specified in California Code of Regulations Title 13, Chapter 1, Section 2025 or be powered by natural gas, electricity, or other diesel alternative. Facility operators shall maintain a log of all trucks entering the facility to document that the truck usage meets these emission standards. This log shall be available for inspection by City staff at any time. This will be enforced through facility operators maintaining a log of all trucks entering or operating at the facility and monitoring for excess idling; the Vehicle Identification Number will be identified as the primary method of verifying truck compliance, as well as on-site inspections, and this log will be kept onsite and available for inspection by the City at any time. Noncompliance triggers an administrative process in the City which results in compliance efforts and if they don't comply, then a certificate of occupancy could be revoked as outlined in the MMRP. CEQA requires that mitigation measures be enforceable and does not mandate that any particular agency be responsible for such enforcement. As specified, the mitigation measures have enforcement mechanisms in place and are thus credible mitigation measures under CEQA. Additionally, the development agreement does not become void if/when the land is sold. The conditions of the development agreement are tied to the land and remain effective and enforceable.

Response to Comment 3-G37-16: The commenter claims that the Revised Final EIR does not mitigate traffic, noise, and pollution impacts. As demonstrated in Response to Comments 3-G12-1 and 3-F5-29, the Revised Final EIR conducts thorough analysis of air quality, noise, and traffic impacts and implements all feasible mitigation to reduce those impacts.

As discussed in Response to Comment 3-G12-1, payment of fair share mitigation fees is required for the improvements not within the City of Moreno Valley and those jurisdictions that have established fair share mitigation programs (see mitigation measure 4.7.15.4E and 4.7.15.4F). In addition, payment is also required for the Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Chapter 3.44 (See Mitigation Measure 4.7.15.4D on page 4.4-63 of the 2018 RSFEIR. The City of Moreno Valley Development Impact Fee (DIF) program is used to fund roads and intersection improvements needed within the City. See page 4.15-111 of the 2018 RSFEIR for a description of the City's DIF program. As stated in footnote 8 on page 4.15-111, the Development Agreement requires that the Applicant fully fund or construct all needed improvements within the City of Moreno Valley in lieu of paying the DIF for traffic. Therefore, all improvements within the City would be fully funded by the Project and the Project will pay into established fair share and TUMF programs for improvements required outside of the City.

Response to Comment 3-G37-17: Mitigation Measure 4.3.6.3B(a) of the 2019 Draft Recirculated RSFEIR (page 4.3-53) requires that "signs shall be prominently displayed informing truck drivers about the California Air Resources Board diesel idling regulations, and the prohibition of parking in residential areas." Although overnight parking is prohibited by the Specific Plan (see page 3-10 of the Specific Plan, Appendix H-1 of the 2015 FEIR), truck parking stalls are included in the project design and designated resting areas would be provided at the on-site CNG/LNG fueling station for truck drivers to rest.

Response to Comment 3-G37-18: The commenter opines that there has been little to no consideration of comment letters to address residents' concerns. To the contrary, all written comments submitted to the City,

including those of Moreno Valley residents have been reviewed and responded to as a part of the Final Response to Comments document. This document was posted to the City's website along with other Project documentation for review ten days prior to the May 14, 2020 Planning Commission Hearing.

With regard to alleged conflict of interest on the part of Planning Commissioners, the Common Law Doctrine Against Conflicts of Interest (Section 2.161 of the Municipal Law Handbook) requires a public official to "abstain from participation in cases when the public official's private financial interest may conflict with his or her duties". The commenter does not present evidence of financial interest that would require any Planning Commissioner to recuse themselves from the decision-making process.

Subject: WLC Revised EIR comments for tonight

Warning: External Email – Watch for Email Red Flags!

There has not been adequate time given to review these large documents for the WLC in time for tonight's meeting especially with the chaos and disruption of lives due to the virus. We have also been unable to easily meet with neighbors and go over these documents due to disrupted lives, stay at home orders, etc. . Little notice was put out to the communities and neighborhoods about this revised EIR being released and the planning commission meeting happening tonight. It appears there was no news release from the city and this project revised EIR is not obvious on the city web site. For a project with as many impacts as this, there should have been wide public notice to the residents of Moreno Valley as it affects many in the city, especially on the east end and will have long lasting impacts on our quality of life here.

It appears little has changed from the prior version of the EIR to mitigate any prior impacts that were described in the previous EIR and it would appear that additional impacts to our neighborhoods have been added now. There is a proposal to significantly expand streets around the east end that would have a direct impact on our lives in our neighborhood. Street widenings are now proposed for Moreno Beach, Redlands, Ironwood, and Locust. Moreno Beach widening to six lanes over Petit Hill would be a significant impact to our neighborhood with significantly increased noise and traffic over a greater number of hours and destroy the beauty of the hills around this area and the quiet of our neighborhoods. The hills would need to be cut into or even leveled significantly to do this widening. At one time the connection via Eucalyptus to Redlands was supposed to be completed instead of widening Moreno Beach to not impact hills and neighborhoods around this area. And last time this project was discussed the truck traffic from the WLC was supposed to be contained to areas on the east end such as Theodore and Gilman Springs and not onto Redlands and into San Timoteo Canyon. But now it appears the plan is for traffic to be directed even more into our neighborhoods and significantly impact our quality of life. We were promised last time that truck traffic would not flow into San Timoteo Canyon nor impact Redlands Blvd and streets west of there but with these street widenings being proposed that now appears to be the plan - trucks all over the east end. And no where is there a plan for any kind of truck stop or rest area for trucks within the WLC so they will park all over nearby streets illegally as they are already doing now but to a much greater extent. The WLC should incorporate some place like this within the center and not create more impact on neighborhoods.

In this revised EIR there appears to be no change to project set backs, or change to designs adjacent to residential neighborhoods for traffic, air quality or noise. There appears to be no change to the border with the San Jacinto Wildlife Area (where there needs to be a buffer), There is no change to mitigations needed for the diesel exhaust from trucks with the exception of buying greenhouse credits but that does nothing for the people living near this project. There is very little promise of going green with solar installations or green trucks and other vehicles. There is no additional mitigations for city street impacts. There is no mitigation for night time sky lighting from this project. There is no consideration of the increased impacts to Highway 60 and Gilman Springs and this project would add significantly to impacts from traffic on those already busy roadways.

I wish I had more time to review and comment on this project EIR revision but the turn around time is so short. Packing together a general plan update, the Theodore Street interchange and the WLC EIR review in a short time is not fair to the residents in this time of chaos and disruption of lives. And during this time we have an inability to have public meetings where people can easily attend and there is an inability to meet with friends and neighbors due to stay at home orders. And not all people are able to participate via zoom meetings at this time so it is unfair to them. The process should be slowed down during this time of chaos and not rushed and slipped by many residents of the city. Please give us additional time to adequately review the documents and comment on the revised plans. These plans will change our entire way of living and enjoying our home on the east end. We moved to the east end for a more rural life and this is not what we bought into. Please help save our neighborhoods from these increased impacts.

Melody Lardner
a resident of the east end of Moreno Valley (near Moreno Beach and Cottonwood)

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

RESPONSES TO LETTER 3-G42: MELODY LARDNER

Response to Comment 3-G42-1: No specific comments on the contents of the Revised Final EIR are provided.

Response to Comment 3-G42-2: . The commenter states that adequate time to review the Revised EIR has not been provided. Part 1 of the Revised Final EIR (page 2) provides a summary of the public review periods provided to review each circulation of the EIR. The 2018 RSFEIR public review period began July 25, 2018, and extended for 45 days to September 7, 2018. Information, which was considered significant, required revision and recirculation of portions of the RSFEIR pursuant to CEQA Guidelines Section 15088.5. The 2019 Draft Recirculated RSFEIR public review period began December 17, 2019, and extended for 45 days to January 31, 2020. As required in the CEQA Guidelines Section 15088, the City of Moreno Valley as the Lead Agency, provided written responses to public agencies that commented on either the RSFEIR or Draft Recirculated RSFEIR at least 10 days prior to certifying the Revised Final EIR. The public has had ample opportunity to review and comment on both the 2018 RSFEIR and 2019 Draft Recirculated RSFEIR prior to the Planning Commission Hearing held on May 14, 2020. Pursuant to City of Moreno Valley noticing procedures, a Notice of Public Hearing was mailed to property owners within 600 feet of the Project site and agencies and members of the public who requested notices on April 30, 2020, posted on the City's Website, and posted to the local newspaper (Press Enterprise) on May 3, 2020. The City has also received a number of comments on the Revised Final EIR which demonstrates that sufficient time to review and comment on it, although not required by law or regulation, has been provided.

Response to Comment 3-G42-3: Mitigation Measure 4.3.6.3B(a) of the 2019 Draft Recirculated RSFEIR (page 4.3-53) requires that "signs shall be prominently displayed informing truck drivers about the California Air Resources Board diesel idling regulations, and the prohibition of parking in residential areas." Although overnight parking is prohibited by the Specific Plan (see page 3-10 of the Specific Plan, Appendix H-1 of the 2015 FEIR), truck parking stalls are included in the project design and designated resting areas would be provided at the CNG/LNG fueling station for truck drivers to rest.

As discussed on page 3-8 of the Specific Plan, "the circulation system is designed to move large vehicles between the regional highway system and the businesses of the World Logistics Center while directing heavy trucks away from nearby residential neighborhoods. The World Logistics Center plan directs all heavy truck traffic to SR-60 and Gilman Springs Road and away from Redlands Boulevard (south of Eucalyptus Avenue) and Cactus Avenue. These prohibitions are incorporated in the City's Truck Route Ordinance." See *Exhibit 3-11 Truck Routes* found on page 3-8 of the Specific Plan, below.

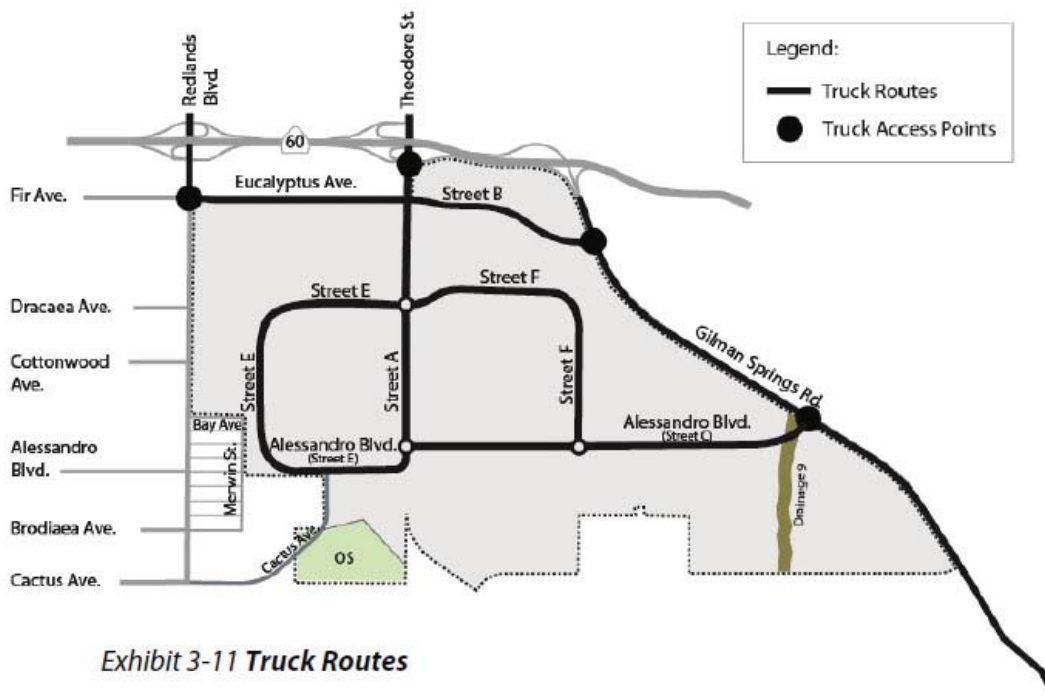

Exhibit 3-11 Truck Routes

In addition, Mitigation Measure 4.3.6.3B of the 2019 Draft Recirculated RSFEIR (page 4.3-53) requires that signage directing trucks to the designated truck routes be posted at each project exit driveway. Project trucks are anticipated to arrive at the site via State Route 60 to the north, using the Redlands Boulevard, World Logistics Center Parkway, and/or Gilman Springs off ramps and anticipated to leave the site following the same route to State Route 60. Based on the location of State Route 60, to the north of the Project site and north of Eucalyptus Avenue, trucks would not need to travel south of Eucalyptus Avenue to gain access to the Project site. Therefore, due to the location of regional access routes, Project access points, and required rerouting of construction traffic, it is reasonable to assume that Project trucks would follow directional signage when leaving the project site toward regional access routes.

Response to Comment 3-G42-4: The commenter claims that the Revised Final EIR does not mitigate traffic, noise, air quality, greenhouse gas, or lighting impacts. As demonstrated in Response to Comments 3-G12-1 and 3-F5-29, the Revised Final EIR conducts thorough analysis of air quality, noise, and traffic impacts and implements all feasible mitigation to reduce those impacts. Refer to Response to Comment 1-B2-12 for discussion of the Project’s commitments to emissions reductions, zero-emissions technology, and solar. See Response to Comment 3-F1-3 for discussion of the adequacy of a 250-foot buffer along the SJWA area.

With regard to lighting impacts, the WLC will comply with the new night lighting guidelines in the City’s Municipal Code Section 9.08.100, which limits off-site impacts to 0.25 foot-candles per square meter. The Specific Plan design guidelines, as they affect the SJWA, include a development setback of 250 feet, an additional building setback of 150 feet, an 11-foot high solid wall, orientation of lighting downward so that no direct rays extend up into the sky or onto adjacent properties, and high-pressure sodium or low-emitting

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

diodes (LEDs) as discussed on page 4.1-81 of the 2015 Final EIR. The municipal restrictions are contained in the City's Municipal Code (Section 9.08.100 Lighting), which states that any outdoor lighting associated with nonresidential uses shall be shielded and directed away from the surrounding residential uses (Section 9.08.100 C.3.a). Such lighting shall not exceed one-quarter (0.25) foot-candle at property lines and shall not blink, flash, oscillate, or be of unusually high intensity or brightness (Section 9.08.100 C.3.a). Lighting in parking areas and drive aisles must be at least 1.0-foot candle and cannot exceed a maximum of 8.0-foot candles (Section 9.08.100 C.4.a). These municipal restrictions are also discussed on page 4.1-81 of the 2015 Final EIR.

Response to Comment 3-G42-5: No specific comments on the contents of the Revised Final EIR are provided. The commenter opines that additional time should have been provided for review due to the inability to attend public hearings. All Project documents are available for download and review on the City's website. Therefore, anyone who wishes to access, review, and comment on Project documents has the ability to do so without needing to leave their home. As stated on the Notice of Completion, City Staff was available to make reasonable arrangements to ensure that Project documents were accessible to those wanting to review them in person. Therefore, an extension of the review period due to current stay at home guidelines is not warranted. In accordance with Governor Executive Order N-29-20, the Planning Commission hearing May 14, 2020 was held via teleconference pursuant to the COVID-19 pandemic. Detailed instructions on how to effectively participate in the public hearing was posted on the City's website and described in the Planning Commission agenda. Over 60 people spoke using the Zoom platform at the May 14, 2020, Planning Commission hearing.

Responses to General Comments

The following response applies to the Group 3-G Comment Letters (see Attachment D) listed as follows: 1-6, 7-11, 13-23, 26-34, 38-41, 43-98.

The comment does not raise any environmental issues or address the adequacy of the Revised Final EIR, and thus no further response is needed.

Dear Mr. Sims,

My name is Alicia Wright and married to Frank Wright, retires Navy veteran and residing here in M.V. for over 20 years.

I have seen through the passing of times the very need of the people of this city and the political and cultural efforts in change of improvements in all values and forms of life, and living conditions.

In prospective view, it is imperative that the Planning Commission pertains all efforts in the procedure in initiating the proper need of accepting and certifying the revised change of the environmental Impact Report.

Your personal care is essential to the vital care for all the Moreno Valley people.

Thank you.

Most cordial,

Subject: Planning Commission Regular Meeting 05/14/2020 7pm

Warning: External Email – Watch for Email Red Flags!

Good evening City Council Members,

I am writing to convey my objections to the Planning Commission Regular meeting scheduled 05/14/2020 at 7pm. The meeting must not go forward with certain Planning Commissioners who are not fit to legislate Public Hearing Item #2. In addition, I request the City Clerk submit comments in their entirety to the public record and I have included Mr. Beau Yarbrough of The Press Enterprise.

My objections are for Public Hearing Item #2:

#2 Case: PEN18-0050 Revised Final EIR (RFEIR)
PEN20-0017 Tentative Parcel Map 36457 (Finance)
PEN20-0018 Development Agreement

Applicant: Highland Fairview
Property Owner: Highland Fairview

Planning Commissioners Alvin Dejohnette, Joann Stephan, Robert Harris and Rafael Brugueras are not fit to convene at the Public Hearing item #2 due to their connections to both the Mayor of Moreno Valley, Dr. Yxstian Gutierrez and Iddo Benzeevi of Highland Fairview.

The Planning Commission Agenda was posted in accordance with the Ralph M. Brown Act:

54954.2.

(a) (1) At least 72 hours before a regular meeting, the legislative body of the local agency, or its designee, shall post an agenda containing a brief general description of each item of business to be transacted or discussed at the meeting, including items to be discussed in closed session. A brief general description of an item generally need not exceed 20 words. The agenda shall specify the time and location of the regular meeting and shall be posted in a location that is freely accessible to members of the public and on the local agency's Internet Web site, if the local agency has one. If requested, the agenda shall be made available in appropriate alternative formats to persons with a disability, as required by Section 202 of the Americans with Disabilities Act of 1990 (42 U.S.C. Sec. 12132), and the federal rules and regulations adopted in implementation thereof. The agenda shall include information regarding how, to whom, and when a request for disability-related modification or accommodation, including auxiliary aids or services, may be made by a person with a disability who requires a modification or accommodation in order to participate in the public meeting.

As such, I am now exercising my rights under the Ralph M. Brown Act to submit my public comments and raise my objections due to prejudice and bias by the four named Planning Commissioners, further that they must recuse their votes to the matter:

54954.3.

(a) Every agenda for regular meetings shall provide an opportunity for members of the public to directly address the legislative body on any item of interest to the public, before or during the legislative body's consideration of the item, that is within the subject matter jurisdiction of the legislative body, provided that no action shall be taken on any item not appearing on the agenda unless the action is otherwise authorized by subdivision (b) of Section 54954.2. However, the agenda need not provide an opportunity for members of the public to address the legislative body on any item that has already been considered by a committee, composed exclusively of members of the legislative body, at a public meeting wherein all interested members of the public were afforded the opportunity to address the committee on the item, before or during the committee's consideration of the item, unless the item has been substantially changed since the committee heard the item, as determined by the legislative body. Every notice for a special meeting shall provide an opportunity for members of the public to directly address the legislative body concerning any item that has been described in the notice for the meeting before or during consideration of that item.

Prejudice is defined in The Free Dictionary as follows:

"A forejudgment; bias; partiality; preconceived opinion. A leaning toward one side of a cause for some reason other than a conviction of its justice.

A juror can be disqualified from a case for being prejudiced, if his or her views on a subject or attitude toward a party will unduly influence the final decision."

Source: https://legal-dictionary.thefreedictionary.com/prejudice

Bias is defined in The Legal Dictionary as follows:

"The term bias refers to the tendency of a person to favor one thing, idea, or person over another. In a legal context, bias can lead an individual, such as a judge or juror, to treat someone unfairly, in spite of the fact that hearings and trials are designed to be unbiased assessments of the facts

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

3-G6.

of a case. Bias may also affect such issues as applications for jobs or entry into the country, and recruitment of individuals from other countries. To explore this concept, consider the following bias definition."

Source: <https://legaldictionary.net/bias/>

Alvin Dejohnette is a Special Education Teacher with the Moreno Valley Unified School District. As such, I am submitting a link to Transparent California which shows his perceived connection to Mayor Yxstian Gutierrez as Special Ed Teachers. Based on this connection, Alvin Dejohnette must recuse himself due to the prejudice of "leaning toward one side of a cause" from the perceived connection to the Mayor; further, from bias favoring the outcome for a "Yes" vote on Public Hearing Item #2.

Alvin Dejohnette Employment with Moreno Valley Unified School District: <https://transparentcalifornia.com/salaries/2018/school-districts/riverside/moreno-valley-unified/alvin-d-dejohnette/>

Mayor Yxstian Gutierrez Employment with Moreno Valley Unified School District: <https://transparentcalifornia.com/salaries/2018/school-districts/riverside/moreno-valley-unified/yxstian-a-gutierrez/>

Joann Stephan, Robert Harris and Rafael Brugueras are listed as Principal Officers with the Political Action Committee "Moreno Valley Jobs Coalition, Supporting Jobs Creation and Workforce Training Initiatives and The World Logistics Center Development, Major Funding by Highland Fairview." As filed with The Moreno Valley City Clerk on 05/12/2016 on California Form 410 (attached).

Joann Stephan, in addition has openly supported the World Logistics Center as an advocate for them from this video posted on YouTube October 7, 2013. Joann Stephan from her comments, presents prejudice and bias. Further Joann Stephan must recuse herself due to the prejudice of "leaning toward one side of a cause" from YouTube video; further, from bias favoring the outcome for a "Yes" vote on Public Hearing Item #2.

Source: <https://www.youtube.com/watch?v=XygdPnfohiw>

A second video of Joann Stephan openly advocating for the World Logistics Center can be seen on YouTube, posted 08/05/2015 with video evidence from 06/11/2015. In the video, from the 1 minute, 40 second mark you will find Joann Stephan advocating, and turning her head directly toward Iddo Benzeevi of Highland Fairview. This video footage presents clear and convincing evidence for a "conflict of interest" with prejudice and bias that Joann Stephan must recuse herself.

Source: https://www.youtube.com/watch?v=Ou6_Gc1rQZY&feature=youtu.be&fbclid=IwAR0ZOpAOdDFT9NTjrj1yL7skym99jCCv2eSe20RbGMInl1FWapxq71pibZU

The following link I am presenting was brought to my attention, which was a Photo taken with Iddo Benzeevi, Robert Harris and Rafael Brugueras on 04/15/2019 by a Real Estate seller on Facebook with her page made public. And I may add was a celebration before a City Council Vote the next day on 04/16/2019 to vote on the Skechers Building Expansion project.

Because of the photo taken with Iddo Benzeevi. There is clear and convincing evidence Robert Harris and Rafael Brugueras must recuse their selves for a "conflict of interest" with prejudice and bias favoring the outcome for a "Yes" vote on Public Hearing Item #2.

Source: <https://www.facebook.com/233736366829261/photos/a.415890128613883/968618826674341/?type=3&theater>

The photo itself is attached.

For my City Council members. I have presented clear and convincing evidence the Planning Commissioners named. Alvin Dejohnette, Joann Stephan, Robert Harris and Rafael Brugueras must recuse their selves from Public Hearing Item #2.

Very respectfully,

Angel Lopez-Ramirez

Dear Planning Commissioners.
 My name is Angelica Hinojosa and I live
 in Moreno Valley for many years. I fully sup-
 port the World Logistic center project and I
 ask you to please and the most attentive way
 to vote in favor of the changes that were
 made regarding the environmental repor, since
 the conclusion of the final repor that judge
 waters asked came out that would not harm us
 and that in term of traffic there would be
 little to what in these correncies there are
 since many people leave daily outside our city
 to work for that reason I ask them to vote
 as soon as possible so that the project can
 be built soon thanks for your attention

Subject: Re-certification for the WLC

Warning: External Email – Watch for Email Red Flags!

Dear Planning Commission and City Council:

3-G8-1

My family and I know of the five points that were certified for the World Logistics Center and it has recently come to my attention that the World Logistics Center Environmental Impact Report needs to be re-certified. As a resident of Moreno Valley, I have come to know the struggles this city has had. The World Logistics Center is the opportunity our community needs to flourish in an ever changing world. While other cities have become known for their great economic merits, Moreno Valley remains unknown by most. A project such as this will allow 15,000 construction job opportunities; if not more. As a result, many people in our communities will be able to financially support their families. Currently, our city is undergoing budget cuts due to the pandemic. This project will provide our local schools with over \$25 million to prevent the layoff of many teachers and the ensure the continued support of low-income families. The city will also be receiving money each year to help our brave first responders. Moreno Valley can and will become the epitome of financial excellence as well as diversity; everyone coming together and working for a common goal. Moreno Valley can become a partner and asset for other businesses and cities alike. Denying this change will negatively impact any chance this city and its people have to prosper. I kindly urge you to re-certify and thus accelerate the process of the Environmental Impact Report.

Warning: External Email – Watch for Email Red Flags!

I have been working at Moreno Valley College since 1994 and live in Moreno Valley; 26 years of driving in Moval gives me good insight into how Moval has evolved as a city. I can understand growth; home ownership, businesses such as the shopping center off Moreno Beach and the 60, west to Nasson; the car dealerships seem well-located; Sketchers off Theordore Dr.; even the other huge "tilt-ups" off Redlands and the 60 are tolerable. Growth is inevitable.

3-G17-1

But count me among the MVC residents and workers who object to the developments of the 2020 WLC.

How might I someday, somehow support this major development?

- (1) Make the builders pay for extensive expanded roadways for the surrounding areas affected by massive increases in diesel trucks and autos.
- (2) Make the builders pay for extensive EPA protections of the air quality, wildlife environs, and noise pollution that will result from such a massive development -- and NOT through carbon imprint payments that do nothing to protect Moval, but through sincere, relevant, well-considered LOCAL policies that will protect Moval and its surrounding communities.
- (3) Make the builders pay for Annual growth impact assessments that allow for adjusted *direct* costs to the builders, payable within 30 days, if those impact reports provide EIR evidence of inadequate policies to-date for environmental concerns noted in item 2; along with a required physical/actual adjustment within 90 days of the report's release.

At this time, I cannot support the WLC, not with little meaningful and almost no changes to prior environmental impact reports. There is something fishy in the state of Moval if this WLC moves forward without meaningful assessments and adjustments, particularly the expansion of roadways plus extensively increased environmental protections at the exclusive cost of the builders -- assuming their project moves forward.

Thank you for your time.

Jeffery D. Sims
Chairman

Dear Mr. Sims,

This letter is in pertaining to the need of adoption in revision of the present Environmental Impact Report necessary to be certified for the advancement of the future construction of the World Logistic Center Project.

As a resident citizen since 1985, and retired Korean Campaign, also member of the VFW Local Chapter 8547, it has been seen that the City of M.V. has the developable of extensive potential in future growth, already founded.

Therefore, the people of this city are encouraging for your support of approval and pertinent care being essential for the City needs by certifying the change of the Environmental Impact Report.

Thank you.

Most sincerely and respectfully,

Frank Wright MMC USNRR

Dear Planning Commission and City Council,

It is imperative that all issues of environmental control, air pollution and any forms related to be adjusted, recommended and accepted in the quickest time possible; further delays results to more problems and higher expenses. The WLC construction has proved itself of high values of utmost concern for the residences of

3-G21-2

Moreno Valley and the foundation for the influx of multiple business companies now in place and of the desire for future development .

The people have longed for the this change for better living conditions,.....so it is urgent that you act now in making MV a historical location so well deserved.

Most sincerely, Frank Wright

Dear members of the planning comission city council the recertification of the WLC will secure the project for our city of Moreno Valley,the revenue that this project will bring will help our city to be better and our community will have more jobs locally I stand for it, this is for the best of MVC. I'm a business owner, and I own a house here too, so I see Riverside growing in business, we has to do same growth for the future of our kids for them not to has to travel far away to go to work and so.I have lots of friends big rig truck drivers living here in Moreno Valley and we has to travel down to LA,Fontana,San Bernardino and so and to go to work,I have clean air in my truck law compliance, we need to make our city the best so please decertify, the best project of WLC.thanks for doing your best to the best of our city and residents of here like me. I brought my business and pay taxes us a Moreno Valley resident and happy to be here. Thanks again go Moreno Valley get biG.

To the members of the Planning Commission,

I'm so honored to write this letter to you. Thank you for taking care the business of our city. My name is Gemma Arrate. I come from Florida to Moreno Valley twenty five years ago and I'm so please to live here. This is a beautiful city, but I have seen gangs in our city, transportation problems, and some business had been closed out, this worried me too much.

I ask you to please take close attention to the World Logistic Center project. We cannot lose this opportunity to bring jobs and better economic opportunities for the city.

We want busines to come to the city. Moreno Valley its beautiful but we need the money, investments and progress.

Please make it happen, do not make more obstacles. The World Logistic Center is a great project to come to our city.

Sincerely,

Gemma Arrate, District 1

Dear Planning Commission
It is a great blessing to write to you,
my name is Guadalupe Marquez, I am
a retired resident of Moreno Valley, I've
lived here for the last 7 years. I like
my city and I can see the potential
for this city to be the best in California
if your department allows better businesses
in our city, as of right now I see great
need for improvement in our streets and
residential areas.

I truly believe that the World Logistic
Center will definitely bring the progress,
jobs and tax revenue so much needed in
our city.

I kindly ask you to please allow this
great project to start now. At the end
we will all gain much.

Respectfully yours
Guadalupe Marquez

Dear Members of the Planning Commission,

I am writing in regards of the World Logistic Center project, I fully support the project because it would be great for our city. My name is Guillermo Reza, I had been living in the city of Moreno Valley for about 15 years; our city is growing and all kinds of needs too as jobs, better roads, and schools etc.

The World Logistic Center project was approved on the year 2015 and up to this year has not been built, I would like to ask you to help open the avenues to bring this project in our city.

Don't delayed any longer, we want our city to progress! Do not hold us back!

3-G28

Thank you for your attention to this letter,

Guillermo Reza

Dear planning Commissioners

I am a long time resident of our town and I am writing to express my support to the World Logistic Center.

My name is Juliana Lopez. I am a mother of three children. My oldest son is looking for job but I saw many young people move to other cities to work and continue their studies. But I don't want that road for my son. I prefer he could stay home and continue his studies and work that is why I support 100% the WLC project to come

Thank you for your attention to this letter.

Dear Mayor, and Council, and Planning

I am Isabel Baldenegro, I have 11 years living in Moreno Valley, and I'm a mother of three children. I would like to express my opinion regarding the WLC project. We want this project to be built to have more job opportunities in our city. It would be great if my husband could get a local job and a blessing for my family to have more time to spend with him.

Some times my husband had been out for months for work.

Bringing the WLC project to Moreno Valley will help families a better quality of life.

Thank you!

Isabel Baldenegro

Dear members of the Planning Commission,

My name is Isabel Bojorquez, I am a resident of Moreno Valley. The reason for my letter is to express my support for the World Logistics Center. This project that was approved a few years ago in the city of Moreno Valley, and it has been highly anticipated by the community, as it would bring many opportunities for our city to progress and succeed. Over the last few years, the City of Moreno Valley, along with Highland Fairview have endured many lawsuits that have delayed the project from breaking ground, and I am asking you to do the right thing and approve any necessary items for this project to move forward. Thank you for your consideration.

3-G: 1

Sincerely,

Isabel Bojorquez

Resident of Moreno Valley

De city council & planning commission,

My name is Jessica Reza and I have been a resident of Moreno Valley resident for over 20 years. Over the course of the years I have seen the city come a long way with development and am proud to live in our city that has a lot of good business within it. Keeping this in mind I would like to express my support for the WLC. Highland Fairview is a company that has a great track record as a business partner in our city. They have supported a lot of local causes in our cities such as non profit organizations to our local hospital to families in need. I am in complete support of anything they bring to the table for business and look forward to seeing a business expansion from a company such as theirs. We need more companies like this in our city to continue to thrive. Please move forward in approving this project again and brining more economic growth, opportunities and tax revenue to our city. Thank you for your time in this matter,
Jessica Reza

+Hello

I'm writing this email in hopes it reaches the planning commission before today's hearing. I want them to see another resident is in support of the City Planning Commission recertification of the WLC's Environmental Report.

3-G46-1

This project is so important on so many levels. Too many to list. One primary reason I am in favor is the positive impact the project will have on our city's economy. In my humble opinion, this should be a cut and dry decision considering this project and the E.I.R. report was approved years ago and this is just a formality due to Highland Fairview revising the E.I.R. to what was asked of them.

Thank you,

Raul Sanchez

Subject: City council/ warehouses

Warning: External Email – Watch for Email Red Flags!

Dear Sirs,

I want to voice my strong objection to the continuation of building warehouses. The developer has done nothing for the city. The jobs are mostly low wage and the impact of pollution and destruction of roads destroys the city fabric.

I also object that the city council would push such a hot button topic through with out advance notice to its citizens and the ability to meet in person. I hope they look at the polls which show this topic has a negative poll of 87%. It is pretty clear to me that the citizens of Moreno Valley are tired of fighting this topic.

I am hoping to be part of this virtual meeting but in the event I'm tied up I want my disapproval on record. I just hope the city council doesn't keep giving in to this developer. It makes their decisions questionable when the citizens don't want the warehouses built. Why else would it have been in litigation for so long?

Sincerely,

Sharon Eirew

Dear Planning Commissioners,

My name is Aureliano Jacobo and my wife's name is Maria Jacobo,
we are residents of Moreno Valley for 16 years,
As a home owners and business owners we feel that the WLC project will benefit
Our city, with the revenue the WLC will bring to our city it will boost our economy
And, therefore will benefit all the local businesses and the entire region.
We are eagerly waiting for the WLC to start breaking ground and start reaping all
The benefits this amazing project will bring.
All my family support this project because Moreno Valley is our home and this is
Where we will continue to support the creation of new local jobs.
We are looking forward to Planning Commission and the City Council to make the
Right decision for our city and approve the necessary items for the WLC project
To move forward.
Thank you very much,

3-G59-1

Moreno Valley, California 92553

Dear members of the Planning Commission,

I'm happy to express myself through this letter. I pray for your office that God gives you the wisdom to make the best decisions for our city.

My name is Beatriz Garcia, I have been a resident of Moreno Valley for about 26 years. I'm a mother of three children. Some of my children already graduated and they can't find jobs in Moreno Valley. For me this is a big issue because my husband commutes for up to 6 hours for work. This is a cruel reality and I don't want my children ending up in the same situation. My family will eventually get sick and stressed from all the commuting hours.

I am thankful for CEO Iddo Benzeevi, and his great vision to bring jobs to our city and keep families together. Please approve revisions made to the WLC environmental analysis. Thank you for your attention.

3-G60-

Beatriz Garcia,

To the Members of the planning Commission

Hi My Name is Delfina Gómez
I lived in Moreno Valley for many
years. I struggled a lot through many
years living here. I would like to
see more opportunities not just for me
but for the new generation. I want
to see more money spent in our city.
Improvements and jobs. The WLC will
be helping the city to bring more
jobs opportunities on tax revenue
so the city will look better and
thank you very much for your attention.

Sincerely Yours

Dear Planning Commissioners

My name is Frances Saldaña I have been a resident of Moreno Valley for over 20 years. I am raising my voice through this letter, letting you know that I am in support of The World Logistics Center Project like many in our city that want progress. Our city has been blessed with a visionary investor like Mr. Iddo Benzeevi who is a Moreno Valley resident for more than 30 years like many of us. He saw the very lack this city has from its roots. No jobs, jobs that this project will provide.

3-G65-

Soon you will be having a public meeting and I hope that your decision will be to move this project to a closer break ground. Waiting is costing our city too much money.

Sincerely,

Frances Saldaña

City Council Of Moreno Valley
c/o City Hall/Clerk's Office
14177 Frederick Street
Moreno Valley, CA 92553

Dear Planning Commissioners,

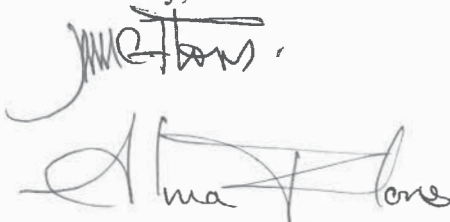

Our names are Israel and Alma Flores. We have lived in Moreno Valley for 21 years. When our family moved here, there were barely any houses or traffic. We have seen Moreno Valley grow little by little from being a bedroom town to a prosperous city. We, here in Moreno Valley, would like our city to be a job-based city such as San Diego, Irvine, and Orange County. The World Logistic Center (WLC) project would allow us to become a self-sufficient city like the ones mentioned before.

Riverside County will be blessed to receive more than \$5.7 million dollars every year of city funds and the residents will be blessed to have a variety of job opportunities to support their families. We would see a decrease in homelessness and unemployment.

We respectfully ask that you please pass the 5 reviewed environmental impact results from the WLC's Environmental Impact Report (EIR) as soon as possible. As you know, these results were less than significant making the EIR more powerful. Please think about all the job opportunities and the revenue that will help our city and county grow; and it will also prepare us for the future.

3-G69-

Sincerely,

Israel Flores and Alma Flores

14177 Frederick Street
Moreno Valley, CA 92553

Dear Planning Commissioners,

My name is Karen Flores and I have lived in Moreno Valley for 20 years out of my 26 years of life. Moreno Valley use to be dirt, a few schools, and a few fast food places. One thing that I remember the most is the fact that no one I ever spoke to knew what Moreno Valley was; today that remains the same. There have been positive developments thanks to the projects of Iddo Benzeevi. The World Logistics Center is another world class project that will create an abundance of job opportunities, increase revenue, and contribute to the green initiative. The Environmental Impact Agencies have gone out of their way to place lawsuits despite the fact that the Environmental Impact Report is in the project's favor. The agency attempted to do the exact same thing with the Sketchers facility, however, this facility was awarded the gold lead award for being the most environmentally self sufficient building in the nation. The World Logistics Center is going to be built with the same gold standards to help our environment. All five Environmental Impact Reports were reviewed and showed that they were less than significant.

3-G74

As a millennial and part of the future generation, I ask for you to please approve the Environmental Impact Reports that were reviewed and move forward with this great project. With this project our city will not only grow in profits but we will become the paragon of change.

Sincerely,

Karen Flores

To the members of the Planning Commission,

My name is Miguel Gutierrez, I'm a resident of Moval for 11 years @ the same address. (home)

I moved to Moreno Valley in 2009, been happy here for all these years. My only problem is that for the first 8 years, I had to commute to L.A county, sometimes as far as the city of Santa Clarita. Many times, I had to stay and sleep in my truck in one of my job sites. My vehicle and body took a lot of stress and beating, taking that long trip every day. I'm happy that the World Logistics Center is going to be built, and a lot of people are excited that this project is being planned. I believe that this project will benefit, my family, especially my son. He will be graduating in 2021, and I would like that he stays and work in Moreno Valley and don't have to move out of the city or that he doesn't have to make that long commute to another county (L.A) (San Diego) We need the World Logistics Center built ASAP. Thanks

Subject: Comment letter in Support of the World Logistics Center

Dear Planning Commissioners,

As a homeowner in Moreno Valley, I am writing this letter to express my support of the World Logistics Center. I strongly believe that this project will do exactly what it has been created to do. I understand all the concerns that have been brought up such as energy, biological resources, noise, farmland and cumulative impacts. As you can clearly see in the last revision of the EIR, these areas of concern have been reevaluated to ensure that this project will be of huge benefit to our city.

I see many new warehouses being built within 2 miles of my home and I've yet to receive a letter or notice or hear about them in the news asking for my permission or approval. I am not against these businesses, but I am a little concerned that the WLC project has received so much scrutiny while other projects have not. I understand this project is much more on a grander scale however, every single new construction, big or small that is erected in our city or any city for that matter, impacts the air, noise levels, biological resources etc., but I understand that these effects are necessary and come as a result of our growing city.

I especially support Highland Fairview because I can see that they have done their due diligence in making sure they address and mitigate the concerns listed above. This project is good, and our city needs it.

Sincerely,

Nelly Menjivar

Dear: Members of the Planning Commission,

I Pascuala Urista live in Moreno Valley for about 15 years and during those years it was lack of jobs and struggled a lot for my kids. I worked many hours with low payment so my children wouldn't suffer a lot. I used to work for the newspaper printer in Santa Ana Ca. for many years. I support the WLC to come to our city so there will be more jobs and opportunities for the residents to have a better live than mine

Dear Planning Commissioners,

My name is Petra Avina, I am a resident of Moreno Valley since 2009.
I am retired and I am a home owner.

Through this letter I would like to express my continue support for
The WLC project. As a resident of Moreno Valley for 11 years, I see
The great need our city has for jobs, but not only jobs is what our city
Needs, we need all the revenue that the WLC will generate. This revenue
Will be utilized to improve our city and specially our schools that will be
Beneficial for our children and future generations.

My grandkids biggest desire is to be able to find a local job once they
Graduate so that they won't have to move out of the state due to the
Lack of jobs. Please don't delay the WLC project any longer and lets
Make this amazing project a reality as soon as possible.

Sincerely,

Petra Avina

Moreno Valley, California 92553

Dear planning commissioners

My name is Porfirio G Siordia I've been a resident of Moreno Valley for 15 years and I am a heavy equipment engineer operate I've been working in construction of more about 40 years and I know how frustrating it is to drive in traffic for more than 2 hours to get to work and sometimes 2 and a half to three hours to get back home, Hours that I should have spend with my family. That is why I am in pro of the WLC project. Because, many like me go through the same thing in order to feed their families .

So please I humbly ask you to please pass 5-re-viewed environmental impacts from the WLC and EIR the results as you know were less than significant making the EIR stronger than ever. Think about the revenue this will bring to our city the prosperity of our community with more people working in Moreno Valley we will be a self sufficient city like Irvine California or San Diego California just to mention a few.

3-G 1

Sincerely,

Porfirio G Siordia

Dear Planning Commissioners

My name is Rodolfo Lepe and I have been living in Moreno Valley for 20 plus years and I work on the west coast and paint company thank god I have a job. When I heard about The World Logistics Center I knew it was going to be a big change in our city it is the very first mega project for our city and the first thing that came to my mind was the job opportunities in the city and the entire region. I know you are going to have meetings where you are going to make a decision in regards to the updates of the environmental impact report.

3-G91.

I just want to ask you and urge you at the same time to move forward with this project we have waited long enough and the city is losing money while this project is still on hold.

Sincerely,

Rodolfo Lepe

Moreno Valley, CA 92553

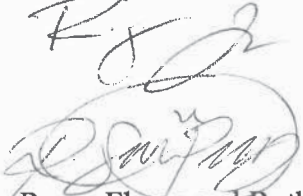

Dear Planning Commissioners,

Our names are Roger Flores and Ruth Perez and we have lived in Moreno Valley for 20 years. Moreno Valley use to be dirt, a few schools, and a few fast food places. There have been positive developments thanks to Mr. Iddo Benzeevi' projects. The World Logistics Center is another world class project that will create an array of job opportunities, will increase revenue, and will contribute to the great green initiative. The Environmental Impact Agencies have placed lawsuits despite the fact that the Environmental Impact Report is in the project's favor. They tried doing the same thing to the Sketchers facility, but no matter what they did, this facility was awarded the gold lead award for being the most environmentally self sufficient building in the nation. The same standards will be applied to the World Logistics Center. All five Environmental Impact Reports were reviewed and showed that they were less than significant.

3-G92

We ask for you to please approve the Environmental Impact Reports that were reviewed so that this great project can move forward. This project will help our city grow in revenue and will be a row model for change.

Sincerely,

Roger Flores and Ruth Perez

Moreno Valley, CA 92553

Dear Planning Commissioners,

My name is Santiago Hernandez, I have been living in Moreno Valley for 27 years.
I am a Business owner.

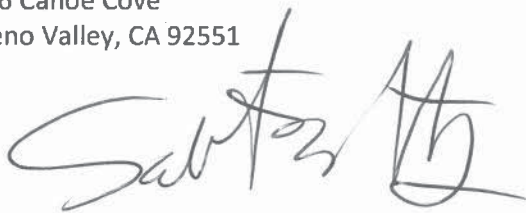

When I moved to Moreno Valley in 1993 I used to commute to Torrance every single Day. I was on the road for over 4 hours each day and my children were little and sadly I wasn't around to spend quality of time with them because I was always busy driving And working. My biggest fear was that when my children grow up they will have to Follow my footsteps and have to commute like I did because of the lack of jobs in Our city. That's when I decided to get really involved and started attending all the City Council meetings and to get informed in all the events that will bring improvement to our City.

When I heard about the WLC project, I knew right away that this project will be an economic transformation not only to our city but the entire region. I knew right away that a project of such a magnitude will bring thousands of jobs and our residents will be able to work in their own city.

Please start building this project as soon as possible.

Thank you very much.

Dear Members of the Planning Commission,

My name is Teodora Garcia. I ~~had~~ been living in Moreno Valley for approximately 16 years. I love my city and I enjoy living here. But there is one inconvenience; my husband commuted the first 8 years to Fullerton city and for the last 8 years he is going up to Nebraska city.

I would like to see in our city better Job opportunities so our families do not have to commute long distances.

I ask to our council members, our Mayor, and the planning commissioners to let the WLC be built.

This project will help our city bringing jobs.

Thank you!

RE: Revised Sections of the Final Environmental Impact Report for the World Logistics Center Project

Dear Mr. Armijo:

Attorney General Xavier Becerra submits the following comments on the Revised Sections of the Final Environmental Impact Report (“RFEIR”) prepared for the World Logistics Center (the “Project”).¹ The Project, a proposed warehouse and logistics complex in the City of Moreno Valley (“City”), would be one of the largest warehouse facilities in the world, with square footage equaling approximately 700 regulation-size football fields.

INTEREST OF THE ATTORNEY GENERAL

For well over a decade, the Attorney General has actively encouraged lead agencies to fulfill their CEQA responsibilities as they relate to climate change. It is now well-established that California, through law and policy, and consistent with sound science, is committed to achieving a low-carbon future by 2050 in order to reduce and avoid the most catastrophic effects of climate change. California has already begun to experience adverse climate effects, such as rising sea levels and longer, more intense fire seasons. The Attorney General is particularly concerned about how such effects may impact our most vulnerable communities, such as Inland Empire residents, who are already burdened by some of the worst air quality in the country.

¹ The Attorney General’s Office submits these comments pursuant to his independent power and duty to protect the environment and natural resources of the State from pollution, impairment, or destruction, and in furtherance of the public interest. (See Cal. Const., art. V, § 13; Gov. Code, §§ 12511, 12600-12612; *D’Amico v. Bd. of Medical Examiners* (1974) 11 Cal.3d 1, 14-15.) This letter is not intended, and should not be construed, as an exhaustive discussion of the RFEIR’s compliance with the California Environmental Quality Act (“CEQA”).

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Mr. Armijo
 September 7, 2018
 Page 2

Every large development project has the potential either to facilitate, or instead hinder, the State’s achievement of its climate goals. It is therefore important that as lead agencies consider the impacts of individual development projects – many of which will operate for decades into the future – they evaluate and impose feasible mitigation for climate change impacts.

With these goals in mind, the Attorney General has provided guidance to local governments, commented on potential projects, and engaged with local interest organizations concerned with climate change and environmental justice. (See California Department of Justice, Office of the Attorney General, *California Environmental Quality Act*, <https://oag.ca.gov/environment/ceqa> (as of Sept. 7, 2018).) The Attorney General has also participated in litigation throughout the State to ensure that local governments comply with state requirements to fully analyze and implement all feasible mitigation measures to lessen significant impacts from greenhouse gas emissions (“GHGs”) caused by land use development projects. (See, e.g., *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497; *People of the State of California v. County of San Bernardino* (Cty. of San Bernardino filed April 12, 2007) No. CIVSS700329.) The Attorney General also has a long-standing interest in ensuring environmental justice throughout the State and for communities in the Inland Empire. (See, e.g., *CCA EJ v. County of Riverside, et al.*, Case No. RIC1112063; California Department of Justice, Office of the Attorney General, *Environmental Justice at the Local and Regional Level: Legal Background* (July 10, 2012) https://oag.ca.gov/sites/all/files/agweb/pdfs/environment/ej_fact_sheet.pdf.)

After review of the GHG analysis in the RFEIR, the Attorney General believes that the City has failed to comply with CEQA’s requirements for analyzing and implementing feasible mitigation for the significant GHG emissions that will result from this Project. For the reasons outlined below, the City’s approach falls substantially short of meeting the requirements of CEQA, the regulations implementing CEQA – the CEQA Guidelines (Cal. Code Regs., tit. 14, § 15000 et seq.), and applicable case law. The City’s approach in the RFEIR has the potential to seriously undermine the overall effort to meet the State’s science-based GHG reduction goals for the transportation and land use sectors, and to disproportionately disadvantage environmental justice communities.

THE RFEIR’S GHG ANALYSIS VIOLATES CEQA AND UNDERMINES THE STATE’S CLIMATE OBJECTIVES.

As the RFEIR acknowledges, this Project at buildout will cause over 281,000 metric tons of GHGs to be released into the atmosphere every year, and will result in over 200,000 metric tons of GHG emissions beginning as early as 2028. (RFEIR at 4.7-35.) These emissions will presumably continue throughout the life of the project, though the RFEIR does not address this.

The RFEIR takes a very unusual and troubling approach to addressing the Project’s GHG-related impacts, especially since climate pollution is undeniably a *cumulative* problem. (*Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal.4th 204, 256-257.) The RFEIR divides the Project’s GHG emissions into two categories, which it terms

Mr. Armijo
 September 7, 2018
 Page 3

“capped” and “uncapped” – classifications created by this RFEIR. What the RFEIR deems “uncapped” emissions constitute only about 3% of the Project emissions. They include the comparatively minor landfill emissions caused by waste generated at the Project and the use of refrigerants at the Project. (RFEIR at 4.7-33.) For these emissions, the RFEIR follows the approach that would be expected under CEQA: the City has, in its discretion, designated a significance threshold (in this case, 10,000 metric tons of GHGs as recommended by the South Coast Air Quality Management District), compared the “uncapped” emissions to that threshold, and required feasible mitigation measures to ensure those emissions fall below that threshold.² (RFEIR at p. 4.7-19.) What the RFEIR terms “capped” emissions, however, constitute the remaining 97% of the Project’s predicted emissions. Those include emissions caused by mobile sources (namely, diesel trucks) and electricity use at the Project. (RFEIR at p. 4.7-33.) With respect to these emissions, the RFEIR deviates dramatically from standard CEQA methodology. The RFEIR asserts that these emissions are “covered” by the California Air Resources Board’s (“CARB”) Cap-and-Trade Program, and therefore claims that they are exempt from any further CEQA analysis or mitigation. (RFEIR at p. 4.7-22.) This is a novel and unsupportable approach under CEQA.

As discussed below, the RFEIR’s approach does not comply with CEQA, for several reasons. First, the Project is not regulated under the State’s Cap-and-Trade Program, so purported compliance with that Program cannot be used to exclude 97% of the Project’s GHG emissions from the analysis of whether the Project’s GHG emissions will result in significant climate change impacts. Second, CEQA requires that all of the emissions attributable to the Project be evaluated for significance, regardless of their source. Third, when comparing all of the Project’s emissions to California’s ambitious, science-based climate goals, as well as statewide, regional, and local plans for the reduction or mitigation of GHG emissions, the Project’s GHG emissions are clearly significant, requiring further feasible mitigation measures.

We are concerned about the City’s use of this analytical approach, both in the context of this Project and more generally. If the RFEIR’s approach is put into general use by the City, or followed by other lead agencies, emissions from transportation and electricity could largely be exempt from analysis and mitigation under CEQA. This is directly counter to the purposes of CEQA, and the Legislature’s considered decision to make clear that GHG emissions must be analyzed. (Senate Bill 97 (2007); Pub. Resources Code, § 21083.05.) The State cannot meet its well-established, long-term environmental GHG reduction goals if new local projects are free to add hundreds of thousands of tons of GHGs to the atmosphere every year without undergoing the

² Lead agencies may choose to use a “threshold of significance,” a working presumption that can assist in determining whether an impact is significant. (Cal. Code Regs., tit. 14, §§ 15064.4(b)(2); 15064.7.) “A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.” (Cal. Code Regs., tit. 14, § 15064.7, subd. (a).)

Mr. Armijo
 September 7, 2018
 Page 4

analysis and mitigation that CEQA requires. Moreover, the RFEIR’s approach will likely expose already-burdened communities in the State to greater amounts of GHG co-pollutants, such as diesel particulate matter and nitrogen oxides.

We urge the City to revise its GHG analysis to comply with CEQA by properly evaluating whether *all* of the Project’s emissions—for all phases of the Project, direct and indirect, short-term and long-term—are cumulatively significant, and adopting feasible mitigation to ensure those emissions do not have a significant impact on the environment.

I. THE RFEIR’S NOVEL APPROACH TO “CAPPED” EMISSIONS VIOLATES CEQA.

The purpose of an environmental impact report is “to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project.” (Pub. Resources Code § 21061.)

The City’s approach violates a number of well-established CEQA principles. Lead agencies must “consider the whole of an action, not simply its constituent parts, when determining whether it will have a significant environmental effect.” (Cal. Code Regs., tit. 14 § 15003, subd. (h).) This Project as a whole includes both the “capped” and “uncapped” GHG emissions, but the RFEIR fails to analyze and mitigate “capped” emissions. Moreover, both “direct and indirect significant effects” and “short-term and long-term effects” should be considered. (Cal. Code Regs., tit. 14, § 15126.2, subd. (a).) The RFEIR fails to inform the public of the long-term effects of the Project’s GHG emissions by failing to analyze GHG emissions past buildout.

In addition to violating these more general principles, the City’s approach to “capped” emissions contradicts the CEQA Guidelines specific to GHG analysis. “The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data.” (Cal. Code Regs., tit. 14, § 15064, subd. (b).) The CEQA Guidelines advise lead agencies on how to determine the significance of a Project’s GHG emissions. A lead agency should consider three non-exclusive methods for determining climate significance:

- (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;
- (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project[.];
- (3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. . . . If there is substantial evidence that the possible effects of

Mr. Armijo
 September 7, 2018
 Page 5

a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project. (Cal. Code Regs., tit. 14, § 15064.4, subd. (b)).

While “[a]n ironclad definition of significant effect is not always possible,” (Cal. Code Regs., tit. 14 § 15064, subd. (b)), the RFEIR’s conclusion that the Project’s GHG impacts are not significant under CEQA (RFEIR at p. 4.7-33) is based solely on its unjustifiable exclusion of the vast majority of the GHG emissions of the Project. That exclusion is neither consistent with CEQA nor justified by the Cap-and-Trade Program, which does not apply to the Project.

A. Since the Project is Not Regulated Under Cap-and-Trade, The RFEIR Cannot Use Cap-and-Trade to Ignore the Significance of the Project’s GHG Emissions.

The RFEIR effectively treats the Cap-and-Trade Program as if it is a qualified mitigation plan for the Project and its “capped” emissions. (See Cal. Code Regs., tit. 17, §§ 15064, subd. (h)(3); 15064.4 subd. (b)(3)). It is not.

California’s Cap-and-Trade Program applies “an aggregate greenhouse gas allowance budget [to] *covered entities* and provides a trading mechanism for compliance instruments.” (Cal. Code Regs., tit. 17, § 95801 (emphasis added).) The Cap-and-Trade Program only applies to expressly identified entities, such as cement producers, petroleum refiners, electricity generators, natural gas supplies, fuel importers, and liquid petroleum gas supplies. (Cal. Code Regs., tit. 17, § 95811.) Warehouse and logistics complexes are *not* covered entities.

Although the operator of a refinery that produces liquefied petroleum gas in California is subject to the Cap-and-Trade Program, (Cal. Code Regs., tit. 17, § 95811, subd. (e)(1)), entities downstream from that refinery in the chain of commerce are not. The refinery itself may have compliance obligations under the Cap-and-Trade Program, which can be met by reducing its own GHG emissions or surrendering compliance instruments, but the gas station that resells the gas, the truck drivers who purchase it, and the warehouses to which the trucks drive do not. Because CEQA Guidelines section 15064.4, subdivision (b)(3) instruct lead agencies to consider the extent to which *the project* complies with GHG regulations or requirements, it is inappropriate to rely upon compliance with Cap-and-Trade by other entities downstream in the chain of commerce as a basis for avoiding analysis of project-related emissions. In the Final Statement of Reasons for the CEQA Guidelines addressing GHG emissions, the California Natural Resources Agency confirmed that, in implementing CEQA Guidelines section 15064.4, a lead agency must show that a GHG reduction plan “actually addresses the emissions that would result from the project.” (California Natural Resources Agency, Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB 97 (2009), available at http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf, at p. 27.)

Mr. Armijo
September 7, 2018
Page 6

Further, the City’s approach is not, as the RFEIR claims (RFEIR at 4.7-20), supported by *Association of Irrigated Residents v. Kern County Bd. of Supervisors* (2017) 17 Cal.App.5th 708 (“AIR”). Without commenting on whether or not that case was rightly decided, AIR is facially inapposite because the project being evaluated under CEQA in that case was a refinery, a covered entity under the Cap-and-Trade Program. Because this Project is not a covered entity under the Cap-and-Trade Program, it is unjustifiable for the RFEIR to use compliance with Cap-and-Trade as a factor in analyzing the significance of the Project’s GHG emissions. There is no basis in the law for the use of Cap-and-Trade to exclude a full 97% of the Project’s GHG emissions from analysis or mitigation.

The flaw in the City’s approach becomes even more apparent when one considers its incongruous results. The RFEIR describes the Project, in part, as follows: “Goods imported through the Ports of Long Beach and Los Angeles as well as other locations are delivered via truck to the proposed distribution centers and distributed via truck both in and out of state locations. . . .” (Original FEIR at 3-27-3-28.) The heart of this Project is this movement of goods via trucks. Yet, the City’s approach avoids any analysis of 210,596 metric tons of GHG emissions associated with the movement of goods via trucks. (RFEIR at p. 4.7-33.) 97% of the Project’s total GHG emissions are simply dismissed under this approach. CEQA does not permit such a dismissal.

B. The RFEIR Must Consider All Emissions in Determining Significance.

Correctly applying CEQA requires an evaluation of *all* the Project’s GHG emissions in determining significance. (See Cal. Code Regs., tit. 14, §§ 15064.4, subd. (b)(2); 15378 (defining “project” as “the whole of an action. . . .”)) There is no basis here for comparing some of the Project’s emissions to the significance threshold, but not others. Here, the City elected to use a threshold of 10,000 metric tons of GHGs. (RFEIR at p. 4.7-19.) CEQA Guidelines section 15064.4, subdivision (b)(2), notes that when using a threshold, an agency should compare all of the “project emissions” of GHGs to that threshold. Emissions from trucks and electricity are a result of the Project just as much as the “uncapped” emissions. They therefore must be compared to the significance threshold, and mitigated to the extent feasible.

Further, the City’s attempt to exempt an impact from any significance analysis based solely on purported compliance with a single rule or regulation is unwarranted. Courts have repeatedly held compliance with a single environmental or land use law or regulation does not create an exemption from CEQA’s requirement that lead agencies evaluate all of a project’s significant environmental impacts. For example, “compliance with a general plan in and of itself ‘does not insulate a project from the EIR requirement, where it may be fairly argued that the project will generate significant environmental effects.’” (*East Sacramento Partnerships for a Livable City v. City of Sacramento* (2016) 5 Cal.App.5th 281, 301; see also *Keep Our Mountains Quiet v. County of Santa Clara* (2015) 236 Cal.App.4th 714, 732 (“[A]n EIR is required if substantial evidence supports a fair argument that [a project] may have significant unmitigated noise impacts, even if other evidence shows the [project] will not generate noise in excess of [a] County’s noise ordinance or general plan.”))

Mr. Armijo
 September 7, 2018
 Page 7

C. In Light of the Project’s Substantial, Long-Term Projected Emissions, Its GHG Impacts Must Be Deemed Significant.

It seems impossible a proper evaluation of the Project’s emissions under CEQA could support a finding that the Project’s emissions are not significant. This Project—as currently designed—will lock in hundreds of thousands of tons of GHG emissions for decades to come, and may put this City and the region on a path that deeply undermines the State’s climate goals.

To reduce and avoid the most catastrophic effects of climate change, science tells us that we must dramatically reduce our annual statewide GHG emissions. California has taken ambitious steps to accomplish that objective. Assembly Bill 32 (“AB 32”) requires California to reduce its total statewide GHG emissions to 1990 levels by 2020. (Health & Saf. Code, § 38550.) Under Senate Bill 32 (“SB 32”), California must reduce its GHG emissions to 40% below 1990 levels by 2030. (Health & Saf. Code, § 38566.) In addition, the Governor’s Executive Order S-3-5 (“EO S-3-05”) directs state agencies to reduce statewide GHG emissions to 80% below 1990 levels by 2050. To achieve such ambitious but necessary goals, California will have to reduce GHG emissions from various sectors of the economy. Transportation, industry, and electricity generation are the top three contributing sectors to the State’s total GHG emissions. (CARB, 2017 Climate Change Scoping Plan (Nov. 2017) at p. 11 (“Scoping Plan”).) Below is a graph showing the dramatic downward trajectory of statewide GHG reductions necessary to achieve the State’s climate goals.

FIGURE 5: PLOTTING CALIFORNIA’S PATH FORWARD

(Scoping Plan at p. 24.)

Mr. Armijo
September 7, 2018
Page 8

California has adopted a multitude of regulations, requirements, plans, and policies to achieve the substantial reductions in statewide GHG emissions required by AB 32, SB 32, and EO S-3-5. CARB identified, in its Climate Change Scoping Plan, multiple required and voluntary measures working in concert as necessary for California to achieve its ambitious climate goals as depicted in the graph below. (See Scoping Plan at p. 28.)

FIGURE 7: SCOPING PLAN SCENARIO – ESTIMATED CUMULATIVE GHG REDUCTIONS BY MEASURE (2021–2030)⁶⁴

The Scoping Plan proposes various strategies for reductions in emissions from transportation and energy sectors. The Scoping Plan notes that for the GHG reductions from the transportation sector, “[vehicle miles traveled (“VMT”)] reductions are necessary to achieve the 2030 target and must be part of any strategy evaluated in this plan.” (Scoping Plan at p. 112.) In addition, under SB 375, CARB assigns California’s 18 Metropolitan Planning Organizations targets for GHG emission reductions in the transportation sector which are to be achieved based on land use patterns and transportation systems. (CARB, Updated Final Staff Report: Proposed Update to the SB 375 Greenhouse Gas Emission Reduction Targets (2017), available at https://www.arb.ca.gov/cc/sb375/final_staff_proposal_sb375_target_update_october_2017.pdf.) CARB’s recommended target for the Southern California Association of Governments is a 19% reduction in GHG emissions from transportation by 2035. (*Id.* at p. 34.)

CEQA requires the City evaluate the consistency of the Project’s substantial increases in GHG emissions with state and regional plans and policies calling for a dramatic reduction in GHG emissions. The Supreme Court in *Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 3 Cal.5th 497 (“*SANDAG*”) affirmed that an EIR should consider the project’s long-range greenhouse gas emission impacts through the year 2050, and address whether the project as a whole is in accord with the state’s climate goals. (*Id.* at p. 515.) The Supreme Court further instructed lead agencies to “stay in step with evolving scientific knowledge and state regulatory schemes.” (*Id.* at p. 504.)

Mr. Armijo
September 7, 2018
Page 9

The RFEIR estimates that the Project’s total emissions will increase from the existing conditions of no emissions at the Project site to over 281,000 metric tons of GHG emissions annually at full buildout of the Project in 2040. (RFEIR at p. 4.7-33.) See the graph below depicting the trajectory of the Project’s GHG emissions.³

The Project’s substantial *increase* in GHG emissions conflicts with the downward trajectory for GHG emissions necessary to achieve state climate goals. This is illustrated clearly in the sharp difference in the upward trajectory of the graph of the Project’s GHG emissions versus the steep downward trajectory in the graph of the State’s climate goals as depicted in Figure 5 of the Scoping Plan and reproduced above. Yet, the RFEIR failed to evaluate the Project’s consistency with state and regional goals, requirements, plans, and policies to reduce

³ Visual depictions such as this graph make it easier to understand the significant impact of GHG emissions from the Project on the environment. Such clarity is encouraged by the CEQA Guidelines, which state that EIRs should be “written in plain language and may use appropriate graphics so that decisionmakers and the public can rapidly understand the documents.” (Cal. Code Regs., tit. 17, § 95811.) Such graphs are also helpful because they allow the decisionmakers to see a project’s proposed greenhouse gas emissions as a trajectory and assess the “significance of the *shape* of that emissions curve as a whole.” (Janill Richards, *The SANDAG Decision: How Lead Agencies Can “Stay in Step” with Law and Science in Addressing the Climate Impacts of Large-Scale Planning and Infrastructure Projects* (2017) 26:2 Environmental Law News 17, 19, available at http://legal-planet.org/wp-content/uploads/2018/09/environmental-law-news_2017_vol-26-no-2_fall_the-sandag-decision.pdf.) To better inform the public of the Project’s unmitigated GHG emissions, we recommend revising the RFEIR to include graphical representations of the emissions trajectory of the project.

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

Mr. Armijo
September 7, 2018
Page 10

GHGs that should have been analyzed under CEQA. Comparing the Project's GHG trajectory against the state's climate goals would inform the public of the Project's GHG impacts. For example, the RFEIR's GHG analysis should have considered whether the Project will increase VMT. Because it did not, it is inconsistent with SB 375. Although the RFEIR's revised traffic analysis does include a VMT analysis, it is included only to address air quality issues, and not GHGs. (RFEIR at pp. 4.7-19 and 4.15-3.) Under CEQA, the City is required to consider how the project can reduce VMT and electricity use, "rather than expecting[ing] these reductions to come [only] from technological advances or other measures." (SANDAG, at 523.) The City ignores its CEQA obligations and instead, the RFEIR obscures the Project's GHG impacts by improperly exempting them from CEQA analysis.

In addition, there is no discussion in the RFEIR of the GHG emissions from the Project over its expected lifespan. GHG emissions are estimated up until the Project's full buildout in 2040 (RFEIR at p. 4.7-33), but the Project will clearly continue beyond that point, and the RFEIR gives no indication of how long that will be. The cumulative impact of the Project's GHG emissions over its entire lifespan should be considered and mitigated to the greatest extent feasible. Notably, by failing to estimate emissions through 2050, the RFEIR obscures the extent to which the Project does or does not comply with California's explicit 2050 climate goals.

D. The RFEIR Should Analyze and Adopt Feasible Mitigation Measures to Avoid or Lessen the Project's GHG Impacts.

CEQA requires that an EIR consider and adopt feasible alternatives or mitigation measures that would substantially lessen the significant and harmful environment effects of the project being analyzed. (See Pub. Resources Code, § 21002.) The RFEIR's failure to properly analyze the Project's significant GHG impacts also results in a failure to mitigate those impacts as required by CEQA. If the RFEIR's analysis were done properly, the Project's GHG emissions from vehicles and electricity would have vastly exceeded the significance threshold selected by the City. Those emissions would therefore have to be reduced through changes or alterations in the Project, or the City would be required to explain why "[s]pecific economic, legal, social, technological, or other considerations including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives... ." (Cal. Code Regs., tit. 22, § 15091, subds. (a)(1) and (a)(3).) There may be mitigation measures or project alternatives that could reduce or avoid the Project's GHG emissions, such as the adoption of requirements mandating the use of zero emission vehicles or a certain percentage of electricity from renewable electricity sources, such as on-site solar power generation.⁴ By

⁴ The Attorney General recognizes that devising climate mitigation on a project-by-project basis can be challenging. Many local governments have therefore elected to move toward enforceable Climate Action Plans ("CAPs") integrated with their general plans. (CARB, California Climate Action Portal Map, <https://webmaps.arb.ca.gov/capmap/> (as of Sept. 7, 2018).) Done correctly, CAPs can put local governments on the path to a lower-carbon future

Mr. Armijo
 September 7, 2018
 Page 11

excluding 97% of the Project's GHG emissions from its significance determination, the RFEIR obscures the extent of the Project's emissions and improperly evades the City's obligation to mitigate the Project's GHG impacts.

II. ADOPTION OF THIS METHOD OF EXEMPTING "CAPPED" EMISSIONS FROM CEQA ANALYSIS WILL UNDERMINE THE STATE'S VARIOUS POLICIES AND PROGRAMS TO REACH OUR AMBITIOUS CLIMATE GOALS.

The RFEIR's failure to comply with CEQA will have real consequences. If this RFEIR's approach is widely adopted, the State will not be able to achieve its ambitious climate goals. The RFEIR exempts the Project's emissions attributable to mobile sources and electricity use from CEQA analysis and mitigation. And yet transportation and electricity are two of the State's three largest sources of GHG emissions. (Scoping Plan at p. 11). Transportation and electricity are thus two of the most important areas in which GHG emissions must be reduced.

The RFEIR's approach to the transportation and electricity sectors incorrectly presumes that the Cap-and-Trade Program will achieve *all* GHG reductions necessary in those areas. But as CARB's 2017 Scoping Plan points out, "[l]ocal land use decisions play a particularly critical role in reducing GHG emissions associated with transportation, both at the project level, and in long-term plans..." (Scoping Plan at pp. 100-101.) If other lead agencies adopt the City's approach, millions of metric tons of GHGs resulting from development projects would be ignored and unmitigated through what amounts to a categorical exemption from CEQA. Local governments would therefore not be doing their part to help the State reach its ambitious, yet necessary, climate goals of emitting 40% below 1990 GHG levels by 2030 and 80% below 1990 levels by 2050. (Heath & Saf. Code, § 38566, Governor's Executive Order No. S-3-05 (June 1, 2005).)

Instead of claiming that no amount of transportation and electricity emissions can be significant under CEQA, and thus excluding them from any analysis and mitigation, lead agencies have an obligation to acknowledge the significance of such emissions and work to implement feasible mitigation of them.⁵

III. REVISING THE GHG ANALYSIS WILL LIKELY LEAD TO GREATER PROTECTION OF ENVIRONMENTAL JUSTICE COMMUNITIES.

In addition to, and separate from, the CEQA issues, revising the RFEIR's GHG analysis will likely help mitigate some of the Project's direct harmful effects on environmental justice communities. Moreno Valley contains some of the most pollution-burdened census tracts in the

while substantially streamlining the approval of individual projects that are consistent and comply with the CAP.

⁵ There are several examples of economically viable land use development projects that contributed no net additional GHG emissions. (Scoping Plan at p. 99.)

Mr. Armijo
 September 7, 2018
 Page 12

State according to California Environmental Protection Agency's CalEnviroScreen tool.⁶ City residents experience ozone and particulate matter (PM) 2.5 at rates higher than 90% of the State. The South Coast Air Basin, where Moreno Valley is located, exceeds federal public health standards for ozone, ozone precursors, and particulate matter. Exposure to these air contaminants contributes to asthma, lung cancer, and cardiovascular disease. Indeed, residents in Moreno Valley experience higher than average emergency room visits due to asthma and higher than average rates of cardiovascular disease, particularly residents living along freeways.

Furthermore, environmental justice concerns are significant for the residents of Moreno Valley. Moreno Valley residents are predominately people of color, made up of 56.5% Hispanic and 18% African American populations. (United States Census Bureau, Quick Facts for Moreno Valley, California, <https://www.census.gov/quickfacts/fact/table/morenovalleycitycalifornia.ca/PST045217> (as of Sept. 7, 2018).) The rates of poverty are dramatically higher in Moreno Valley compared to the state—according to U.S. Census data, 18.6% of Moreno Valley residents live in poverty, compared with the statewide poverty rate of 14.4%. (*Ibid.*, and United States Census Bureau, Quick Facts for California, <https://www.census.gov/quickfacts/fact/table/ca/PST045217> (as of Sept. 7, 2018).) They experience high rates of unemployment and housing burdens (paying more than 50% of their income for housing costs). These socioeconomic characteristics of Moreno Valley residents increase their sensitivity to the health effects of the heavy pollution burdens they experience.

Adding to these burdens, Riverside County as a whole, and the City of Moreno Valley specifically, are experiencing a great influx of logistics warehouse projects. Recent developments in Moreno Valley alone include an 825,000 square-foot distribution facility for the Aldi grocery chain, a 1.6 million square-foot distribution facility for Deckers Brands footwear company, and a 1.25 million square-foot fulfillment center for Amazon. These large projects, and their related impacts on the low-income communities of color who live nearby and in the communities residing along the freeways serving them, are dwarfed by the over 40 million square-foot Project.

By conducting a proper GHG analysis in the RFEIR and adopting feasible mitigation, the City will likely better protect the environmental justice communities living near both the Project and along the freeways that trucks will use to reach the Project. Reduction of GHG emissions leads to the reduction of co-pollutant emissions. (See Nicky Sheats, *Achieving Emissions Reductions for Environmental Justice Communities Through Climate Change Mitigation Policy* (2017) 41 WM. & MARY ENVTL. L. & POL'Y REV. 377, 387 (“[E]ven without the intentional maximization of co-pollutant reduction, there should be incidental co-pollutant

⁶ CalEnviroScreen is a tool that uses environmental, health, and socioeconomic information to produce scores and rank every census tract in the state. A census tract with a high score is one that experiences a much higher pollution burden than a census tract with a low score. (See CalEnviroScreen 3.0 Report, Office of Environmental Health Hazard Assessment, January 2017, available at <https://oehha.ca.gov/media/downloads/calenviroscreen/report/ces3report.pdf>.)

Mr. Armijo
 September 7, 2018
 Page 13

reductions as GHGs are being reduced [which] should improve the health of local communities.”)) This is especially true in the context of diesel truck emissions, where a VMT reduction would reduce both GHG emissions and co-pollutant emissions. Indeed, the RFEIR acknowledges that “[t]he *most effective way to reduce air pollution* impacts on the health of our nearly 17 million residents, including those in disproportionately impacted and environmental justice communities that are concentrated along our transportation corridors and goods movement facilities, *is to reduce emissions from mobile sources,*” and that those mobile sources constitute “the principal contributor to our air quality challenges.” (RFEIR at 4.3-11 (emphasis added).) Therefore, while revising the GHG analysis is necessary to comply with CEQA, the City should also see this as an opportunity to implement mitigation measures that would benefit the City’s residents and the other environmental justice communities impacted by this Project.

CONCLUSION

We appreciate the difficulty in analyzing GHG emissions under CEQA. However, local agencies must comply with the CEQA Guidelines for GHG analysis and cannot exempt GHG emissions from any significance analysis because of California’s Cap-and-Trade Program. We urge the City of Moreno Valley to revise the GHG analysis in the RFEIR as described above so as to support this State’s efforts to reduce GHG emissions, achieve our ambitious but necessary climate goals, and benefit local communities in the area who are already suffering some of the worst air pollution in the country. We would be happy to work with the City of Moreno Valley to take the additional steps needed to fully comply with CEQA’s GHG analysis and mitigation requirements for the Project. We appreciate your consideration of our comments.

Sincerely,

HEATHER LESLIE

Re: World Logistics Center Revised Final Environmental Impact Report
 (SCH # 2012021045)

Dear Mr. Armijo:

The California Air Resources Board (CARB) has reviewed the World Logistics Center (WLC or project) Revised Final Environmental Impact Report (RFEIR). CARB appreciates the opportunity to comment on the RFEIR. Unfortunately, despite revisions, the RFEIR mischaracterizes (1) the scope of the Cap-and-Trade Program administered by CARB as they relate to the state's overall greenhouse gas reduction mandates, and (2) how that program may be relevant to a CEQA analysis. Because the RFEIR's GHG analysis relies almost entirely on those mischaracterizations for its GHG analysis and significance determination, it does not meet California Environmental Quality Act (CEQA) requirements.

The RFEIR's core flaw with regard to greenhouse gases (GHGs) is that it declines fully to analyze or mitigate emissions from fuel and electricity demand that the project will cause - the vast majority of the project's emissions - on the ground that CARB's Cap-and-Trade Program purportedly "covers" the project's emissions for this purpose. In fact, the Program does not, and was never designed to, adequately address emissions from local projects and CEQA does not support a novel exemption for such emissions on this ground. The RFEIR's approach obscures the project's significant potential contribution to greenhouse gas emissions, and does not properly account for the combination of federal, state, and local approaches to address climate change that the crisis demands and the law requires.

We also note that the project still has not been modified to address serious health concerns from criteria and toxic air pollutants that CARB discussed in prior letters. Although this letter focuses on GHGs, we continue to be very concerned that local communities may face undue pollution from this project, if completed, as a result of inadequate mitigation.

We urge the City of Moreno Valley (City) to address the criteria and toxics issues we previously raised, and to revise its GHG analysis to accurately account for all GHG emissions that would result from the project, apply those emissions against the applicable significance threshold identified in the RFEIR, adopt feasible mitigation to

September 7, 2018
Page 2

ensure those emissions would not cause significant impacts, and recirculate the RFEIR, all as required by CEQA.

I. CARB's Participation in This Project's Review Process

CEQA requires analysis of a project's GHG emissions. Like all CEQA analyses, these disclosures must inform the public and provide appropriate information on mitigation. Planning for greenhouse gas reductions is critical at the project level, as CARB and other state agencies have repeatedly determined. Although various statewide programs address the climate change crisis as well, the CEQA guidelines, and state guidance documents, are clear that achieving the necessary reductions requires project-level focus.

The WLC project proponents have taken a different view in prior versions of the RFEIR and in related litigation, *Paulek v. City of Moreno Valley* (Riverside County Superior Court Case No. RIC 1510967) ("*Paulek*"). That case addresses, among other topics, the initial GHG analysis conducted for the WLC, and in the RFEIR. There, WLC advocates contended that, because some of the suppliers of the fuels and electricity consumed by the project are in the Cap-and-Trade Program CARB administers, the project was not required to analyze or mitigate the significant emissions impacts it would cause. Attorneys for the WLC also argued that because CARB did not specifically object to the project's GHG significance methodology, CARB "apparently had no problem with the EIRs not counting capped emissions against the [WLC] in order to determine the significance of greenhouse gas emissions."¹

CARB had, in fact, recommended an array of project-based emissions reductions strategies contrary to these claims. CARB takes this opportunity to reiterate those recommendations (prior letters are attached) and to explain why the Cap-and-Trade Program's operations do not allow a departure from CEQA's general rule that project-level impacts be properly addressed.²

¹ Transcript of January 22, 2018 hearing in *Paulek* case, before Hon. Sharon J. Waters, page 18, Lines 3-7.

² In both of CARB's comment letters, which we again incorporate by reference, CARB indicated that its recommendations were for the purpose of reducing not only criteria and toxics pollutants, but also for GHG emissions. CARB reviewed the Draft Environmental Impact Report (DEIR) and provided comments to the City of Moreno Valley in a letter dated April 16, 2013. CARB's comment letter expressed concern over the increase in health risk in the immediate area and the significant and unavoidable air quality and greenhouse gas (GHG) related impacts caused by the proposed WLC. To address those concerns, CARB recommended actions to support the development, demonstration, and deployment of zero and near-zero emission technology at the WLC. On June 8, 2015, CARB again provided comments on the Final Environmental Impact Report (FEIR), making similar recommendations. In those comments, CARB noted that the FEIR was unresponsive to the comments CARB provided in its April 16, 2013 letter regarding the DEIR. (See CARB April 16, 2013 letter at 2; CARB June 8, 2015 letter at 1, 3, and 8.)

September 7, 2018
Page 3

II. The RFEIR's Claims About CARB's Cap-and-Trade Regulation Are Incorrect

CEQA translates between high-level policy goals, and individual project choices to better inform the public and support decision-making. The GHG section of the RFEIR takes a novel, and factually unsupported, departure from ordinary CEQA practice by essentially excusing analysis and potential mitigation of GHG emissions when they are indirectly "covered" by a state program. Yet, state programs regularly address at least some aspect of essentially all CEQA impact areas – from state water pollution standards to habitat conservation laws to building codes to endangered species mandates, projects are always considered against a backdrop of state rules. In the ordinary course, the presence of state programs is not taken simply to "cover" the relevant project level impact. On the contrary, CEQA requires project proponents to inquire as to how the project affects environmental resources of statewide concern and to focus on project-level analysis and mitigation. The same rule applies with regard to greenhouse gases. As the California Supreme Court has held, "[l]ocal governments thus bear the primary burden of evaluating a land use project's impacts on greenhouse gas emissions."³

Project proponents may refer to statewide analyses and programs, but, as the Court held, ultimately must provide "substantial evidentiary support" explaining how project-level decisions relate to state-level programs to justify findings of significance based on those programs.⁴ This is particularly important for new projects, as, per the Court, "a greater degree of reduction may be needed from new projects than from the economy as a whole."⁵ And these projects may not simply point to *any* statewide regulations; on the contrary, "[a] significance analysis based on compliance with such statewide regulations ... only goes to impacts within the area governed by the regulations."⁶

In this instance, the Cap-and-Trade Program simply does not cover the project, or require it do anything to mitigate its emissions. As the Court explained, CARB has not "propose[d] statewide regulations of land use planning, but relies instead on local governments." (*Id.* at 230).

CARB has expressed its non-binding views on these matters via the Scoping Plans it is required to prepare under AB 32. The California Supreme Court has recognized the

CARB was not silent. Moreover, an inference from silence would be improper, in any event. CARB sometimes does not comment on individual projects' GHG or other analyses due to resource constraints and other considerations. Nothing should be inferred from silence on a particular matter.

⁶ *Id.* at 229.

September 7, 2018
Page 4

Scoping Plan as a valuable source of data for local governments.⁷ As each version of CARB's Scoping Plan, including the recent 2017 Scoping Plan Update, explains, on the basis of extensive modeling and analysis, the Cap-and-Trade Program is not intended to address project-level impacts and does not do so. Rather, complementary measures, including land-use planning and project-level analyses, are vital adjuncts to the Cap-and-Trade Program, serve additional purposes to address climate change, and, if neglected, put undue and unanticipated pressure on the Program. The RFEIR's analysis would thus make the problem it purports to analyze even worse; if followed generally, it would result in development patterns and mitigation choices that would lessen the state's ability to address climate change, and would contribute to cumulatively considerable impacts.

Rather than address project-level emissions, the Cap-and-Trade Program covers activities related to electricity generation, natural gas supply, oil and gas extraction, refining, and transportation fuel supply and combustion. The points of regulation are the operators of electricity generating plants, natural gas fuel suppliers, operators of oil and gas extraction facilities, refinery operators, and transportation fuel suppliers at the rack. See Tit. 17, Cal. Code Regs., § 95811. The Program also addresses GHG emissions in aggregate at the state level and is not intended nor designed to mitigate greenhouse gas from, or otherwise inform, local land use decisions. Without adequate analysis and mitigation, local jurisdictions may not appropriately consider the greenhouse gas implications of their decisions, conflicting with a core CEQA principle of promoting informed decisionmaking. Rather, demand for fuels and electricity created by poorly-planned local projects creates unnecessary demand on the Cap-and-Trade system, potentially raising prices in the system and making statewide compliance more difficult.

These impacts could be substantial because the transportation sector is the state's largest source of GHG emissions (as well as criteria and toxic pollutant emissions, as we have previously addressed with regard to this project). The recently released California Greenhouse Gas Emission Inventory – 2018 Edition shows that while the state's overall GHG emissions declined from 2015 to 2016, the emissions in the transportation sector increased 2 percent over that same time period.⁸ This increase was driven by increases in fuel purchases and use. To effectively achieve the State's GHG target, both production and demand for energy and fuels must be addressed. The

⁷ As the California Supreme Court has held "CEQA requires public agencies...to ensure that such analysis stay in step with evolving scientific knowledge and state regulatory schemes." The Court viewed the Scoping Plan as a particularly useful source of information, given the extensive study and public participation involved in its preparation. (*Cleveland National Forest Foundation v. San Diego Ass'n of Governments* (2017) 3 Cal. 5th 497, 504.) A recent article provides a useful primer on this body of law. (See Janill Richards, *The SANDAG Decision: How Lead Agencies Can "Stay in Step" with Law and Science in Addressing the Climate Impacts of Large-Scale Planning and Infrastructure Projects* (2017) 26:2 Environmental Law News 17))

⁸ See https://www.arb.ca.gov/cc/inventory/pubs/reports/2000_2016/ghg_inventory_trends_00-16.pdf.

September 7, 2018
Page 5

Legislature recognized this need with regard to electricity when passing SB 350 (Stats. 2015 Ch. 547, De León) to increase the Renewable Portfolio Standard and double energy savings. A similar approach is needed for transportation sector emissions. State-level production side policies such as the Renewable Portfolio Standard, Low Carbon Fuel Standard, and Cap-and-Trade Program cannot alone achieve the State's GHG reduction targets.

In this instance, the RFEIR not only improperly relies on the Cap-and-Trade Regulation; it also fails fully to address consistency with the local measures that *do* more clearly apply. There are a suite of potential emissions reduction strategies identified in the 2017 Scoping Plan aimed at reducing GHG emissions from on-road vehicle travel (e.g., fuel economy standards, technology advancements, SB 375⁹), and the majority of such emissions are not covered in any way by the Cap-and-Trade program.

The City chose not to analyze the project's consistency with the applicable Regional Transportation Plan (RTP), for example, which is subject to GHG emissions reduction targets set by CARB pursuant to SB 375. The City asserted that the RTP does not apply to this project (Table 4.7-11, page 4.7-41 of the RDEIR). We disagree, and suggest that a more appropriate analysis would be whether the project's GHG emissions from on-road transportation would be consistent with, or conflict with, assumptions in the applicable RTP found to comply with SB 375. The city might also refer to the additional nonbinding recommendations offered in CARB's Scoping Plan, though the application of these recommendations, if used, depend on the circumstances of a particular project.

We discuss these points in more detail below.

A. The Cap-and-Trade Regulation Was Never Designed to Achieve All Necessary GHG Reductions From Land Use and Logistics Planning.

The Cap-and-Trade Program was designed from the start as one of a diverse suite of measures, some statewide and some local, to move California toward achieving its GHG targets. To understand the Cap-and-Trade Program's purposes and limitations, the Scoping Plan provides helpful context. The Cap-and-Trade Program covers about 80 percent of all GHG emissions in California.¹⁰ Crucially, just because emissions are "covered" by Cap-and-Trade does not mean all of those emissions from any particular covered entity are mitigated or reduced. It simply means they are included in the cap.

⁹ SB 375 (Steinberg, Statutes of 2008).

¹⁰ Scoping Plan at ES16.

September 7, 2018
Page 6

Thirty-nine percent of California's GHG emissions come from the transportation sector, including logistics-related transportation (like the WLC would involve).¹¹ Another 19 percent of the state's GHG emissions comes from electricity generation.¹² In addition to Cap-and-Trade, the Scoping Plan includes various other CARB measures, some of which also address transportation and electricity sector emissions, including SB 350, the Low Carbon Fuel Standard, the Mobile Source Strategy, and the Sustainable Freight Action Plan. In addition to the other complementary Scoping Plan measures, the Scoping Plan also clearly states that "[l]ocal government efforts to reduce emissions within their jurisdiction are critical to achieving the State's long-term GHG goals."¹³

The RFEIR's GHG methodology departs from this science, and has enormous implications for other projects across the state: it would amount to a determination that massive logistics centers, sprawling far-flung residential developments, and other types of remote greenfield development need not do anything to address and mitigate their GHG emissions because those emissions are already "taken care of" by the Cap-and-Trade Program. This is simply not true.

B. The Cap-and-Trade Regulation Is Not Intended to Bear the Burden of Achieving the State's Transportation and Energy Sector GHG Goals Alone.

Cap-and-Trade is not intended to achieve California's climate goals on its own. Rather, Cap-and-Trade is designed to motivate behavior by capping and pricing carbon at the regulated entity level – that is, at the industrial facility and fuel/energy supplier level. It does not send a direct price signal to developers of land use or logistics projects. This means, if CEQA and other "checks" on unsustainable development are weakened as the WLC analysis proposes, such development would simply continue without direct cost to the developers, while adding market demand without mitigating the WLC's emissions.

Moreover, if land use development does not account for GHG emissions, more and more of our state's carbon "cap" would be taken up by increasing transportation emissions. Developers do not receive a price signal from Cap-and-Trade, meaning that there will be no clear incentive to alter this pattern, even as it impacts the Cap-and-Trade system. Thus, the prices of compliance instruments under the Cap-and-Trade Program would increase at a higher rate than was contemplated when CARB developed the Cap-and-Trade Program. This would eventually cause a greater cost burden than

¹¹ As noted above, transportation-related GHG emissions have increased, from 37% in 2015, to 39% in 2016. See CARB, *California Greenhouse Gas Emissions for 2000 to 2016, Trends of Emissions and Other Indicators* (July 2018) at 1 (available at https://www.arb.ca.gov/cc/inventory/pubs/reports/2000_2016/ghg_inventory_trends_00-16.pdf); see also Scoping Plan at ES1.

¹² Scoping Plan at ES1.

¹³ Scoping Plan at 99.; see also page 101.

September 7, 2018
Page 7

anticipated, and it would be borne by all Californians rather than dealt with during the project design phase. Properly-designed local policies, by contrast, may account for GHG emissions of development in a direct way—which furthers the equity objectives of AB 32, complements Cap-and-Trade, and better achieves California’s climate goals.

C. There Is No Substantial Evidence Showing that the Project’s Transportation and Electricity Related Emissions Would Actually Be Mitigated.

In the face of these substantial difficulties, the RFEIR does not articulate substantial evidence demonstrating a rational connection to the Cap-and-Trade Program – and that connection is badly attenuated, as we have explained. The project developer in this instance is claiming it may do nothing with regard to fuels and electricity, and will rely on reductions other entities may achieve. This is not the tight evidentiary connection required by the Supreme Court and by CEQA, and it is not consistent with the State’s GHG reduction programs.

The Final Statement of Reasons (FSOR) prepared when section 15064.4 of the CEQA guidelines, concerning GHGs, was promulgated demonstrates that to properly rely on subsection (b)(3), concerning compliance with statewide programs, a project must demonstrate *with evidence in the record* how the regulations of GHG emissions would actually address the emissions that result from the project. That document states:

Reading section 15064.4 together with 15064(h)(3), however, to demonstrate consistency with an existing GHG reduction plan, a lead agency would have to show that the plan actually addresses the emissions that would result from the project. *Thus, for example, a subdivision project could not demonstrate consistency with the ARB’s Early Action Measures because those measures do not address emissions resulting from a typical housing subdivision.* (ARB, Expanded List of Early Action Measures to Reduce Greenhouse Gas Emissions in California Recommended for Board Consideration, October 2007; see also State CEQA Guidelines, §§ 15063(d)(3) (initial study must be supported with information to support conclusions), 15128 (determination in an EIR that an impact is less than significant must be briefly explained).)¹⁴

Here, there is no evidence in the RFEIR regarding who is responsible for complying with Cap-and-Trade for all the GHG emissions at issue in this case – and it certainly is not the project itself. The project is a logistics facility, with trucks involved in interstate commerce, and it is not covered by that Program. Indeed, there is no basis for the

¹⁴ See Natural Resources Agency, Final Statement of Reasons for Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97 (December 2009) at 27 (emphasis added).

September 7, 2018
Page 8

RFEIR's conclusion that the fuel for all of the vehicles serving the project would be covered under the Cap-and-Trade regulation, since it is not clear that all of these vehicles would even purchase their fuel in California.

D. The Project Fails to Account for the Duration of the Project Compared to the Duration of the Cap-and-Trade Program.

The RFEIR states the project's buildout year is 2035,¹⁵ yet the GHG analysis seems to stop after 2035. This raises multiple problems for the RFEIR analysis.

First, it is unclear why the analysis stops at buildout, when GHG emissions (and other environmental impacts) would continue into the indefinite future – at their highest levels – once full operations begin. Without further analysis throughout the project's anticipated life (which does not appear to be stated in the RFEIR but, presumably, would be at least 30 years after buildout), the analysis is incomplete and dramatically understates the project's GHG emissions. This also means the project would likely place a much higher burden on the Cap-and-Trade program than disclosed in the RFEIR – a burden that, as described above, is pushed onto all Californians instead of the project developer as a result of the project's failure to mitigate the vast majority of its GHG emissions.

Second, the RFEIR fails to account for, or even consider, the fact that the current Cap-and-Trade regulation extends only to 2030 – which is five years *before* the project's full buildout is achieved. This means that the RFEIR has no plan whatsoever to account for its GHG emissions once the project is fully built out. The RFEIR also does not address the inconsistency between the project's GHG emissions and Executive Order S-03-05, which, among other things, establishes a state GHG reduction target to reduce GHG emissions to 80 percent below 1990 levels by 2050.¹⁶ The California Supreme Court has emphasized the importance of California's GHG targets in selecting appropriate CEQA thresholds.¹⁷ Despite these considerations, there is no substantial evidence in the record to ensure that *any* of the project's post-buildout operational emissions are mitigated by the Cap-and-Trade program.

E. The Project Fails to Include a Backstop In Case Cap-and-Trade is Altered.

¹⁵ Revised FEIR at 3-1.

¹⁶ See Governor's Executive Order No. S-03-05 (June 1, 2005) (available at [http://static1.squarespace.com/static/549885d4e4b0ba0bff5dc695/t/54d7f1e0e4b0f0798cee3010/1423438304744/California+Executive+Order+S-3-05+\(June+2005\).pdf](http://static1.squarespace.com/static/549885d4e4b0ba0bff5dc695/t/54d7f1e0e4b0f0798cee3010/1423438304744/California+Executive+Order+S-3-05+(June+2005).pdf)); see also Governor's Executive Order No. B-30-15 (April 29, 2015) (available at <https://www.gov.ca.gov/2015/04/29/news18938/>).

September 7, 2018
Page 9

In addition to its other evidentiary flaws, the RFEIR does not analyze how the analysis would change, and how the project's significant GHG impacts would be mitigated, if Cap-and-Trade were revised in a way that affects the state's GHG levels. In other words, the RFEIR's approach puts an almost complete reliance on the Cap-and-Trade Program in ways that, if adopted generally, would considerably affect the Program, and then fails to consider the possibility that the Program might change even as the Project continues to exist. This could include, for example, a scenario in which:

- The Cap-and-Trade program ceased to exist, or
- If the scope of the program were limited to exclude fuels and electricity, or
- If the Legislature or other factors required the program to be amended in a way that allows a higher cap.

Rather than anticipating any of these or other potential contingencies and building in an appropriate backstop to ensure the project's GHG emissions are mitigated below significance, the RFEIR instead blindly relies on the current Cap-and-Trade Program, with no further commitments or requirements. As a result, the RFEIR fails to provide substantial evidence supporting its conclusion that the project will result in less than significant GHG emissions, while forwarding an analysis that, if accepted, would make the state significantly less able to address climate change impacts resulting from its built infrastructure.

III. The RFEIR is Inconsistent with CEQA Requirements.

The RFEIR's multiple errors with regard to the Cap-and-Trade Program render it contrary with CEQA law. The RFEIR misapplies the key CEQA Guideline, section 15064.4(b), which provides in pertinent part:¹⁸

- (b) A lead agency should consider the following factors, *among others*, when assessing the significance of impacts from greenhouse gas emissions on the environment:
1. The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;
 2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
 3. The extent to which *the project complies* with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and

¹⁸ CEQA Guidelines § 15064.4(b) (emphasis added).

September 7, 2018
Page 10

must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. *If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.*

Thus, the CEQA Guidelines focus on project-level compliance and project-level impacts. State programs are available for consideration, but they are not held out as a panacea, for GHGs any more than for any other resource area.

Yet, the RFEIR relies upon subsection (b)(3) of this provision to claim that emissions which are indirectly included under the “cap” created by the Cap-and-Trade Program (referred to in the RFEIR as “capped emissions”) need not be analyzed and mitigated under CEQA. This approach would excuse all of the WLC’s transportation and electricity related emissions, leaving the project only “on the hook” for analyzing and mitigating a tiny fraction of its emissions. The following sections explain why this approach is legally and factually flawed.

A. Subsection (b)(3) Itself Does Not Allow The Approach Used in the Revised Final EIR.

As noted above, subsection (b)(3) of CEQA Guidelines section 15064.4 can be used as a factor to assess GHG significance when “*the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions...*” Here, the RFEIR concedes that the project is not subject to the Cap-and-Trade Regulation.¹⁹ This in itself should be sufficient to demonstrate that subsection (b)(3) is inapplicable to the project, as “the project” does not “comply” with Cap-and-Trade at all.

B. The RFEIR’s Hybrid Approach Used To Determine Significance Is Not Allowed.

In addition to improperly relying on subsection (b)(3), as described above, the RFEIR improperly attempts to create a “hybrid” significance scheme based on selectively combining subsection (b)(3) with the South Coast Air Quality Management District’s (SCAQMD) bright-line threshold. As explained in the RFEIR, a potentially appropriate significance threshold in this case is the SCAQMD’s 10,000 metric ton threshold.²⁰ The problem here is that the RFEIR does not compare the project’s GHG emissions against this 10,000 metric ton threshold, and then mitigate those emissions to below that threshold to the extent feasible. Rather, the RFEIR simply subtracts from its emissions quantifications any GHG emissions that it deems to be “capped,” and compares only the net “non-capped” emissions against the bright-line threshold.

¹⁹ See page 4.7-4.

²⁰ RFEIR at 4.7-21.

September 7, 2018
Page 11

This approach is unsupported in law. Regardless of which threshold applies, CEQA requires lead agencies to “make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project.”²¹ CEQA then provides that the lead agency must consider “whether *the project emissions* exceed a threshold of significance the lead agency determines applies to the project.”²² Thus, even if subsection (b)(3) properly applied here (which it does not, as explained above), nothing in the CEQA Guidelines allows this hybrid approach of cherry-picking what emissions are applied to an otherwise-applicable bright-line threshold. The City has not even attempted to satisfy its burden of providing such substantial evidence. As noted elsewhere in this letter, Cap-and-Trade does not result in ton-for-ton mitigation of each metric ton covered by the program. Rather, it is a declining market-wide cap designed to achieve certain statewide goals – which, as explained elsewhere in this document, is not designed to mitigate all GHG emissions from land use and logistics facilities.

Because the REFIR fails to properly apply the vast majority of the project’s GHG emissions to the applicable bright-line significance threshold, it also fails to mitigate those emissions, as it simply dismisses them as “less than significant”. If the full scope of the GHG emissions attributable to the project were compared to the applicable bright-line threshold, the mitigated emissions would still be substantially over the threshold. CEQA requires that the project’s significant GHG emissions must be mitigated to the extent feasible. Additional mitigation measures are available to further reduce the project’s GHG emissions that were not considered due to the inappropriate exclusion of the majority of project-generated emissions from the analysis.

C. Reliance Upon *AIR v. Kern County* Is Improper.

While the RFEIR provides little support for the GHG significance approach it takes, the briefing for *Paulek* further explains the reasoning behind the project’s GHG analysis. In those briefs, attorneys for the developer claim that an unrelated appellate ruling, the *AIR v. Kern County* decision²³ is relevant. That decision concerned CEQA analyses for sources actually covered by the Cap-and-Trade Regulation, but the claim is that it somehow applies not only to GHGs from projects that are directly subject to the Cap-and-Trade Regulation, but also to all transportation and electricity related GHG

²¹ CEQA Guidelines § 15064.4(a).

²² CEQA Guidelines § 15064.4(b)(2).

²³ *Association of Irrigated Residents v. Kern County Board of Supervisors* (2017) 17 Cal. App. 5th 708. In CARB’s view this case was wrongly decided as to the Cap-and-Trade issue, and it is certainly not apposite in this very different context.

September 7, 2018
Page 12

emissions, the logic being that those emissions are technically included in the statewide “cap” on emissions. This is incorrect factually, for all the reasons discussed above.

It is also not a controlling case legally. The holding in *AIR v. Kern County* addressed whether it “is appropriate for a lead agency to conclude a *project compliance* [sic] with the cap-and-trade program provides a sufficient basis for determining the impact of the project's greenhouse gas emissions will be less than significant.”²⁴ The project at issue in that case was a refinery that was directly subject to the Cap-and-Trade Regulation. The court did not address the broader question of whether *all* GHG emissions from resources that are indirectly covered by Cap-and-Trade, at some undefined upstream point, may be cast aside as less than significant. Here, as noted above, the WLC is *not* subject to the Cap-and-Trade regulation. It therefore does not “comply” with the Cap-and-Trade program, and is distinguishable from the project at issue in *AIR v. Kern County*.

C. Reliance Upon Obscure 2013 Negative Declarations and a Policy Document from Another District Is Similarly Uncompelling.

The RFEIR itself also attempts to justify excluding “capped emissions” from its significance analysis by referencing two seemingly cherry-picked 2013 mitigated negative declarations,²⁵ and one 2014 guidance document from the San Joaquin Valley Air Pollution Control District (SJVAPCD) titled Policy APR-2025. The RFEIR does not explain why it chose to follow the methodology allegedly used in two obscure mitigated negative declarations and in a 2014 policy document from an air district in a different air basin, rather than following traditional CEQA GHG analysis and mitigation principles. Furthermore, the primary SJVAPCD guidance documents regarding analyzing and mitigating GHG emissions under CEQA make no mention of Policy APR-2025, including the guidance documents relied upon in the *AIR v. Kern County* decision.²⁶

To the extent the RFEIR is considering what other air districts have done, it is worth noting that the California Air Pollution Control Officers' Association (CAPCOA) has considered a range of potential CEQA significance thresholds, none of which summarily

²⁴ *AIR v. Kern County* at 743 (emphasis added).

²⁵ The Revised FEIR only cryptically references these MNDs, without citations or links to the documents, and without any other information explaining the basis for their CEQA significance approach. The RFEIR's failure to include or adequately reference these mitigated negative declarations hampers the public's ability to review and comment on the RFEIR.

²⁶ See, e.g., *AIR v. Kern County* at 743-744; see also http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf; http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf; and <http://www.valleyair.org/Programs/CCAP/12-17-09/3%20CCAP%20-%20FINAL%20LU%20Guidance%20-%20Dec%2017%202009.pdf>.

September 7, 2018
Page 13

exclude emissions that are indirectly included within the Cap-and-Trade program.²⁷ While that document was generated in 2008, it makes multiple references to the Cap-and-Trade program, and does not endorse simply subtracting all so-called “capped emissions” from GHG analyses.

D. Even If CEQA Guideline 15064.4(b)(3) Applied Here, The RFEIR Ignores Other Requirements in the CEQA Guidelines.

The sections above provide in-depth analysis regarding why subsection (b)(3) of CEQA Guideline 15064.4 does not allow this project to simply disregard the vast majority of its GHG emissions. Even if that subsection did apply, there are other deficiencies in the RFEIR’s GHG analysis that must be addressed.

First, the CEQA Guidelines make clear that an agency cannot focus solely on a single significance consideration while ignoring other evidence or indicators showing potentially significant impacts. For example:

- Section 15064.4(b) states that “[a] lead agency should consider the following factors, *among others*, when assessing the significance of impacts from greenhouse gas emissions on the environment.”
- Section 15064.4(b)(3) provides in pertinent part: “If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.”
- Section 15064(h)(3) provides: “If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding that the project complies with the specified plan or mitigation program addressing the cumulative problem, an EIR must be prepared for the project.”

As discussed in depth above, there is evidence in this record showing significant GHG impacts that were not analyzed or mitigated in the RFEIR. CEQA does not allow these impacts to be overlooked, even if the lead agency believes the project’s GHG emissions would be less than significant under one particular (and here, improper) significance metric.

IV. Criteria Pollutants and Toxic Emissions Must Still Be Considered

In its 2013 and 2015 comment letters, CARB noted its substantial concerns regarding the project’s air pollutant and toxics emissions, and suggested several feasible means of reducing the significant impacts from those emissions. These emissions raise

²⁷ See CAPCOA, CEQA & Climate Change (January 2008). Available at <http://www.capcoa.org/wp-content/uploads/downloads/2010/05/CAPCOA-White-Paper.pdf>.

September 7, 2018
Page 14

substantial local exposure and environmental justice concerns, as Moreno Valley already suffers from very substantial air pollution exposures. These exposures would likely be worsened without appropriate mitigation measures.²⁸ CARB incorporates the comments from those letters into this letter by reference, and strongly recommends that the RFEIR be revised to incorporate all mitigation recommended in its 2013 and 2015 comment letters.

V. Conclusion

While the WLC has enormous GHG implications in itself, the attention this project has received, and the recent legal developments in the emerging *AIR v. Kern County* and *Paulek* line of cases, demonstrate that the City's decisions in the RFEIR have implications beyond the WLC project as well. The City should revise its GHG analysis to accurately account for all GHG emissions that would result from the project, apply those emissions against the applicable significance threshold identified in the RFEIR, and adopt feasible mitigation to ensure those emissions would not cause significant impacts, as required by CEQA.

Sincerely,

Richard W. Corey
Executive Officer

Re: World Logistics Center Draft Recirculated Revised Sections of the Final Environmental Impact Report (SCH # 2012021045)

Dear Mr. Armijo:

The California Air Resources Board (CARB) has reviewed the Draft Recirculated Revised Sections of the Final Environmental Impact Report (RRSFEIR) for the World Logistics Center (WLC or Project). CARB appreciates the opportunity to comment on the RRSFEIR, and raises two primary issues with the RRSFEIR in this letter.

1. The RRSFEIR contains the same flawed GHG analysis as the RFEIR.

CARB previously reviewed the City's July 2018 Revised Final Environmental Impact Report (RFEIR), and submitted comments regarding the RFEIR on September 7, 2018. As noted in that comment letter, CARB believes the RFEIR's analysis of greenhouse gas (GHG) related impacts does not meet California Environmental Quality Act (CEQA) requirements, as it relies almost entirely on mischaracterizations to reach its less-than-significant impact determination.

Unfortunately, the flaws described in CARB's September 7, 2018 comment letter remain in the RRSFEIR, which continues to rely upon mischaracterizations regarding California's Cap-and-Trade Program to dismiss any serious analysis or mitigation of the Project's GHG emissions. Therefore, as part of its comments on the current draft RRSFEIR, CARB re-submits its September 7, 2018 comment letter (attached to this letter) in its entirety. CARB directs its comments toward both the direct and cumulative impact analysis sections in the RRSFEIR.

2. The RRSFEIR does not include the new GHG mitigation measures it references.

The RRSFEIR includes passing references to new GHG-related mitigation measures, particularly measures 4.7.6.1E-1 and 4.7.6.1E-2 (see pages 4.7-20, 6.7-14, and 6.7-20). However, it appears the measures themselves have not been included in the RRSFEIR. Without the ability to review the mitigation measures relied upon by the City in reaching its significance determinations, the public has no way to evaluate the effectiveness of those measures, thwarting CEQA's public disclosure purpose.

Mr. Albert Armijo
January 30, 2020
Page 2

Conclusion

Both this comment letter and CARB's September 7, 2018 comment letter set forth substantial deficiencies in the environmental analysis prepared for the WLC project. Given these deficiencies, the City should revise the RRSFEIR to include adequate analysis and mitigation regarding all of the Project's environmental impacts, including GHG, air quality, and cumulative impacts. The City should then re-circulate the document for public review to allow the public to review and comment on the City's revised proposal.

Thank you for your consideration. As always, we welcome any questions from the City regarding ways to adequately analyze and mitigate the Project's GHG emissions.

Sincerely,

Richard W. Corey
Executive Officer

INTRODUCTION

The massive World Logistics Center (Project) will cause approximately 70,000 daily truck trips transporting goods from the ports of Long Beach and Los Angeles to Moreno Valley. (AR 003039, 058605–06.) These vehicle trips will emit hundreds of thousands of metric tons of greenhouse gas (GHG) emissions every year over the life of the Project. (AR 002729.) These GHG emissions, along with emissions from electricity needed to power the more than 40-million-square-foot project, will add to the existing climate pollutant problem, accumulating in the atmosphere and persisting for decades or longer.

Rather than analyzing and mitigating the Project’s emissions, lead agency Respondents Moreno Valley Community Services District, *et al.* (Respondents) shirk their responsibility as a local government to address climate change. They improperly rely on CARB’s statewide Cap-and-Trade climate program (Cap-and-Trade Program), which does not impose any regulatory requirements on this Project, as an excuse not to analyze and mitigate the Project’s climate change impacts. Respondents improperly ignore roughly 95% of the GHG emissions from the Project (AR 002718–19), disregarding the significance of those emissions, avoiding their duty to adopt all feasible mitigation measures, and failing to properly disclose their responsibility for this pollution to the public.

Respondents’ approach mischaracterizes the way state climate policies work and violates the California Environmental Quality Act (CEQA). CEQA directs that Respondents take “all action necessary” to protect the environment, recognizing the importance of local action driven through “meaningful” consideration of environmental impacts. (See Pub. Resources Code, §§ 21000, 21001, 21002, 21002.1.) CEQA does not allow Respondents to waive their CEQA obligations by pointing to a regulation that does not bind them (Cal. Code Regs., tit. 14, § 15000 et seq. (CEQA

Guidelines), § 15064.4), and Respondents wholly misconstrue the regulatory scheme they seek to use.

Although Respondents claim their approach is consistent with state climate policy, it is not. (See Plaintiffs/Appellants’ Supplemental Request Regarding Judicial Notice, Exhibit 1, California Air Resources Board, California’s 2017 Climate Change Scoping Plan (Nov. 2017) (2017 Scoping Plan) at pp. 19 [“Local actions are critical for implementation of California’s ambitious climate agenda”], 97–99 [more extensive discussion about the need for local action to achieve California’s climate goals]; see also Health & Saf. Code, §§ 38502, subd. (h) [identifying competing priorities to balance in emissions reductions], 38592 [nothing in this division relieves any person, entity, or agency of compliance with other law], 38690 [identifying overlapping automobile emissions policy].) Respondents’ approach has been repudiated by CARB, the Attorney General’s Office, and the Natural Resources Agency, as contrary to critical state climate goals. The state has long—and expressly—relied on a portfolio of climate change measures, including significant efforts by local governments, to address emissions that result from their land use decisions.

Respondents rely on the Cap-and-Trade Program to excuse their obligation to make better land use decisions. Cap-and-Trade is not intended as a stand-alone climate policy; instead, it assumes steady efforts to reduce emissions across the state. While Cap-and-Trade has an important role to play in limiting emissions from entities like power plants and refineries, the Program does not cover a host of other sources, including warehouses. Although the Program creates financial and legal obligations on fuel suppliers and electricity generators that may ultimately supply this Project, the Project experiences neither the direct legal requirements of the Program nor the full economic costs associated with its additional emissions. If projects were allowed to evade responsibility in

this way, they would steadily increase Cap-and-Trade Program costs upstream, while locking the state into ever-more expensive and inappropriate high-emitting development patterns. This is a recipe for failure in achieving the state’s climate goals. To avoid this scenario, the state relies on local governments to limit emissions from new development projects. Emissions from such projects are the responsibility of local governments and should be mitigated through the proper application of CEQA. Eliminating this crucial piece of the state’s portfolio approach undermines the state’s climate goals.

We have arrived at a crossroads for the future of GHG analysis under CEQA. If Respondents prevail, this case could singlehandedly undo the will of the Legislature by excusing essentially all projects from the obligation to consider GHG impacts from vehicle trips and energy use. This Court should reject Respondents’ argument and confirm that all lead agencies must do their part if we are to meet the state’s long-term climate stabilization objective.

STATEMENT OF INTERESTS

I. INTEREST OF THE ATTORNEY GENERAL

California has already begun to experience significant adverse impacts from climate change such as “more frequent, more catastrophic and more costly” wildfires, drought, “coastal erosion, disruption of water supply, threats to agriculture, spread of insect-borne diseases, and continuing health threats from air pollution.” (2017 Scoping Plan at p. ES2.) As California’s chief law enforcement officer, the Attorney General has the independent power and duty to protect the interest of all of California’s current and future residents in a clean, health, and safe environment. (See Cal. Const., art. V, § 13; Gov. Code, §§ 12511, 12600–12612; *D’Amico v. Bd. of Medical Examiners* (1974) 11 Cal.3d 1, 15.)

Upholding this duty, the Attorney General has actively encouraged lead agencies to fulfill their CEQA responsibilities as they relate to climate change for well over a decade. (See, e.g., *Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 3 Cal.5th 497 (*SANDAG*) at p. 519 [“nothing we say today invites regional planners to ‘shirk their responsibilities’ under CEQA”]; *City of Long Beach v. City of Los Angeles* (2018) 19 Cal.App.5th 465; *People v. County of San Bernardino* (San Bernardino County 2007) No. CIVSS0700329.)

The World Logistics Center, like every large development project, has the potential to either facilitate or hinder the state’s achievement of its climate goals. Here, Respondents’ unsupported approach to analyzing the Project’s GHG emissions has the potential to seriously undermine the overall effort to meet the state’s science-based GHG reduction goals for the transportation and land use sectors and to disproportionately affect environmental justice communities.¹ Given these significant interests, the Attorney General submits this amicus brief in support of Appellants,² in compliance with rule 8.200(c)(7) of the California Rules of Court in his independent capacity and on behalf of the California Air Resources Board (CARB).

¹ The Attorney General opposed this methodology in a comment letter it submitted on the revised sections of the Final EIR for this Project (Revised Final EIR or RFEIR). (Letter re: Revised Sections of the Final Environmental Impact Report for the World Logistics Center Project, Sept. 7, 2018, at:

<<https://oag.ca.gov/sites/all/files/agweb/pdfs/environment/comments-revised-sections-feir.pdf?>>.) The Revised Final EIR is not at issue in this litigation, but it includes the original EIR’s same flawed GHG analysis.

² This brief is submitted in support of Plaintiffs and Respondents Albert Thomas Paulek, et al. and Plaintiffs and Appellants Laborers International Union of North America, Local 1184, et al.

II. INTEREST OF THE CALIFORNIA AIR RESOURCES BOARD

CARB has a strong interest in participating in this case as amicus curiae. CARB is charged with protecting the public from the harmful effects of air pollution and developing programs and actions to fight climate change. As creator and administrator of the Cap-and-Trade Program, and as the lead agency on the Scoping Plan setting out many of the state’s climate policies, CARB is an expert on how the Cap-and-Trade Program was designed to function and interact with other state laws and programs as part of California’s portfolio approach to addressing GHG emissions. In their briefing, Respondents misrepresent CARB as effectively endorsing the EIR’s approach to GHG analysis. (Combined Respondents’ and Cross-Appellants’ Opening Brief at pp. 17, 36–38, 47–48, 56, 63.) But CARB has repeatedly made clear it does *not* support Respondents’ approach.³ As explained more fully below, Respondents’ arguments regarding GHG analysis are contrary to the construction given to applicable regulations by CARB, and by the Natural Resources Agency, agencies charged with interpreting and enforcing the programs at issue.

BACKGROUND

I. LEGAL BACKGROUND REGARDING CALIFORNIA’S EFFORTS TO COMBAT CLIMATE CHANGE

In 2006, recognizing the importance of combatting climate change and furthering the objectives of Executive Order S-3-05, the Legislature enacted the Global Warming Solutions Act of 2006, commonly known as

³ CARB also explained this approach when it formally opposed the GHG analysis Respondents rely on here through its comments on the RFEIR for this Project. (Letter re: World Logistics Center Revised Final Environmental Impact Report, Sept. 7, 2018, at: <https://ww3.arb.ca.gov/toxics/ttdceqalist/logisticsfeir.pdf?_ga=2.236813640.855160185.1575908432-1460774677.1564163003>.)

AB 32. (Health & Saf. Code, § 38500, et seq.) AB 32 mandates that, by 2020, California must reduce its total statewide annual GHG emissions to the level they were in 1990, and to 40 percent below that level by 2030. (Health & Saf. Code, §§ 38550, 38566.) This mandate puts the state on a trajectory of significant and continuous GHG emissions reductions through 2050, in order to stabilize the atmospheric levels of GHGs and reduce the risk of dangerous climate change.

Under AB 32, the Legislature tasked CARB with preparing a guidance planning document, known as the Scoping Plan that, while not binding, set out the state's views based on extensive environmental and economic analyses on how policies may be effectively implemented so that California will meet the its ambitious GHG reduction goals. (See Health & Saf. Code, §§ 38561 et seq.) The Scoping Plan emphasizes the need for a multi-pronged emissions reduction approach that can be carried out by many entities and reflects the state's position that it is necessary to reduce emissions at the source and through reductions in demand for energy. (2017 Scoping Plan, pp. 12, 19, 28).

The Scoping Plan includes a suite of regulations, measures, and policies designed to operate together to reduce GHG emissions. The Cap-and-Trade Program is one such policy. Entities that are directly subject to the Cap-and-Trade Program—like power plants, factories, refineries, and electricity generators and importers—must purchase and surrender compliance instruments (e.g., allowances) for their emissions. (See Cal. Code Regs., tit. 17, § 95812.) Downstream emitters such as cars and trucks, much less warehouses that such cars and trucks drive to, are not covered entities under Cap-and-Trade and have no such obligation to purchase or surrender allowances. The existence of the Program, in other words, does not obviate the need for action at other levels of the economy. On the contrary: If sources like the long-lasting development project in this

case build without regard to their emissions, they will increase overall state emissions and hence increase pressure and costs within the Cap-and-Trade Program.

To address the wide range of GHG emissions sources that are not directly controlled through the Cap-and-Trade Program, the state relies on other policies⁴—many of which require collaboration between the state and local governments. Agencies large and small across the state (including, crucially, cities and counties) are responsible for ensuring that proposed new land use plans, transportation projects, and development projects are consistent with evolving scientific knowledge and state regulatory schemes; CEQA is a critical tool for implementing these obligations.⁵ (See *SANDAG, supra*, 3 Cal.5th at p. 519; see also CEQA Guidelines, § 15064.4, subd. (b).)

The Scoping Plan makes clear that the Cap-and-Trade Program was *not* designed to replace local governments’ long-term planning obligations, but rather designed to work in concert with those policies to achieve the

⁴ See, e.g., Health & Saf. Code, §§ 38561, subd. (e) (requiring CARB to consider “the relative contribution of each source or source category to statewide greenhouse gas emissions”), 43018.5, subd. (a) (requiring CARB to “adopt regulations that achieve the maximum feasible and cost-effective reduction of greenhouse gas emissions from motor vehicles”).

⁵ For example, CARB provides regional emission reduction targets for local jurisdictions’ land use and transportation planning obligations under Senate Bill (SB) 375. (See Health & Saf. Code, § 65080, subd. (b)(2)(A) [known as “The Sustainable Communities and Climate Protection Act”].) CARB also works with regional air pollution control districts and air quality management districts to address emission sources that have both local and global effect, including methane from landfills and hydrofluorocarbons (HFCs), as well as to support state- and federally-mandated permitting of certain industrial sources of GHG emissions. (See California Air Resources Board, California’s 2017 Climate Change Scoping Plan (Nov. 2017) pp. 3, 104 <https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf>.)

state’s goals. (2017 Scoping Plan at p. 102 [“California’s future climate strategy will require increased focus on integrated land use planning”].)

Recent state reports have shown that California’s vehicular GHG emissions continue to increase year after year, and CARB has emphasized the need for local action. (See California Air Resources Board, 2018 Progress Report: California’s Sustainable Communities and Climate Protection Act (November 2018) at 4.) These increasing emissions demonstrate the crucial need for *more* complementary local action—not less—to ensure the state meets its GHG targets in cost-effective ways.

In light of the state’s GHG reduction policies, and CEQA’s focus on embedding environmental considerations in local decision-making, the Supreme Court has emphasized that careful CEQA analysis of GHG impacts will be required going forward, as lead agencies must “stay in step” with the evolving science and law related to the state’s long-term climate objectives in order to carry out their duties under CEQA. (*SANDAG, supra*, 3 Cal.5th at p. 519.)

II. OVERVIEW OF THE GHG ANALYSIS IN RESPONDENTS’ EIR

Mischaracterizing the collaborative efforts required to combat climate change and the role of the Cap-and-Trade Program, Respondents’ EIR takes a very unusual and troubling approach to addressing the Project’s GHG-related impacts.⁶ Respondents divide the Project’s GHG emissions into two categories, which the EIR terms “capped” and “uncapped.” (AR 002719.) What the EIR deems “uncapped” emissions constitute only about 4.6% of the Project’s emissions. (*Ibid.*) The “uncapped” category includes comparatively minor landfill emissions caused by waste generated at the

⁶ The Attorney General and CARB only address Respondents’ inappropriate use of the Cap-and-Trade Program in the GHG analysis of the EIR. This amicus brief is not intended to and should not be construed as an exhaustive discussion of the EIR’s compliance with CEQA.

Project and the use of refrigerants at the Project. (*Ibid.*) For these emissions, the EIR follows the approach that would be expected under CEQA: the City of Moreno Valley, in its discretion, designated a significance threshold (in this case, 10,000 metric tons of GHG emissions as recommended by the South Coast Air Quality Management District), compared the “uncapped” emissions to that threshold, and required feasible mitigation measures to ensure those emissions fall below that threshold. (AR 002719, AR 002729.)

What the EIR terms “capped” emissions, however, constitute the remaining 95.4% of the Project’s predicted emissions. (AR 002719.) Those include emissions caused by mobile sources (namely, diesel trucks), as well as natural gas and electricity use at the Project. (*Ibid.*) For these emissions, the EIR deviates dramatically from standard CEQA methodology. The EIR asserts these emissions are “covered” by Cap-and-Trade and therefore wholly exempt from any further CEQA analysis or mitigation. (AR 002723.) The EIR does *not* compare the Project’s “capped” emissions to the 10,000 metric ton threshold. (AR 002725.) Indeed, after mitigation measures are applied to the Project, the “capped” emissions remain nearly 40 times greater than the significance threshold. (AR 002729.) In forgoing any attempt to decrease the Project’s true total emissions to a less-than-significant level, Respondents fail to consider further mitigation measures that could have made this Project more compatible with the state’s climate goals. As described below, this approach is unlawful.

ARGUMENT

Respondents avoid disclosing and addressing mitigation for thousands of tons of GHG emissions each year pursuant to the misguided theory that those emissions are addressed by Cap-and-Trade. This argument is founded on misunderstandings of both the Cap-and-Trade Program and

CEQA—both of which require different industries and projects to take responsibility for their own impacts, rather than rely on others for mitigation. Most fundamentally, warehouse projects like the Project are not subject to Cap-and-Trade. Respondents therefore cannot accurately assert that “compliance” with Cap-and-Trade provides any legal basis to avoid analyzing and adequately mitigating the majority of the Project’s emissions.

The CEQA Guidelines allow projects to consider regulations “[with] which the project complies” for purposes of considering significance of GHG emissions. (See CEQA Guidelines, § 15064.4, subd. (b)(3).) However, that consideration does not apply here and Respondents’ approach, which in effect relies on other entities to undertake Respondents’ CEQA mitigation, not only violates both CEQA’s legal requirements and public disclosure and mitigation purposes, but also undermines the state climate objectives Cap-and-Trade is intended to further. Cap-and-Trade is designed to act in tandem with—not in spite of—critical tools like local land use planning to reduce GHG emissions. If allowed for Respondents and adopted by other local jurisdictions, such abdication by local governments would dramatically hinder the state’s ability to achieve its legislatively mandated long-term climate stabilization objectives and forgo pollution reduction co-benefits from GHG mitigation measures that are vital for environmental justice communities.

The Resources Agency agrees with CARB that “to demonstrate consistency with an existing GHG reduction plan, a lead agency would have to show that the plan actually addresses the emissions that would result from the project.” (See California Natural Resources Agency, Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB 97 (2009),

<http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf>, at p. 27.)

I. WAREHOUSE AND LOGISTICS PROJECTS ARE NOT REGULATED BY CAP-AND-TRADE AND THEIR EMISSIONS MUST STILL BE MITIGATED BY LOCAL GOVERNMENTS

Warehouse and logistics complexes are not regulated by Cap-and-Trade. The Cap-and-Trade Program thus provides no legal or policy basis for Respondents to avoid their obligation to evaluate and mitigate GHG emissions. Cap-and-Trade applies “an aggregate greenhouse gas allowance budget [to] *covered entities* and provides a trading mechanism for” such allowances. (Cal. Code Regs., tit. 17, § 95801 (emphasis added).) Respondents seek to use Cap-and-Trade to zero-out and excuse the application of feasible mitigation measures to over 95% of all GHG emissions from the Project. Cap-and-Trade applies only to expressly identified entities (“covered entities”) such as cement producers, petroleum refiners, electricity generators, natural gas suppliers, fuel importers, and liquid petroleum gas suppliers. (Cal. Code Regs., tit. 17, § 95811.) Warehouse and logistics complexes are *not* covered entities. Cap-and-Trade compliance instruments do not factor in *whatsoever* because this Project is not covered by Cap-and-Trade.

The mere fact that warehouse and logistics complexes are in the chain of commerce with covered entities does not transform them into covered entities themselves. As an example, although the operator of a refinery that produces gasoline in California is subject to Cap-and-Trade, (Cal. Code Regs., tit. 17, § 95811, subd. (e)(1)), entities downstream from that refinery in the chain of commerce are not. The refinery itself may have compliance obligations under the Cap-and-Trade Program, which can be met by reducing the refinery’s own GHG emissions or surrendering allowances, but the gas station that resells the gas, the truck drivers who purchase it, and

the warehouses to which the trucks drive do not have compliance obligations. Under the state's portfolio approach, while the refinery may have met some or all of its climate obligations via Cap-and-Trade, the downstream entities have not. Because warehouses receive no set price or regulatory signals from Cap-and-Trade, they are not being directly incentivized to reduce emissions. Instead, other components of the state's portfolio address those emissions. Nothing in Cap-and-Trade explicitly or impliedly repealed the use of other measures to address climate change; they were designed to work together. (See, e.g., 2017 Scoping Plan at p. 28.) Local governments must responsibly plan new development to further the state's climate goals.

II. ALLOWING RESPONDENTS' UNTENABLE APPROACH TO GHG ANALYSIS WOULD HAVE SIGNIFICANT, NEGATIVE STATEWIDE CONSEQUENCES

If Respondents' approach to GHG analysis is endorsed, other lead agencies will undoubtedly follow this approach, and emissions from the transportation and land use sectors will be largely omitted from analysis and mitigation under CEQA. Widespread adoption of this approach would: (1) place the entire burden of California's well-established, long-term land-use related GHG reduction goals on Cap-and-Trade, thereby straining the program beyond its intended purpose and (2) expose already burdened communities in the state to greater amounts of GHG emissions and co-pollutants that accompany GHG emissions, such as diesel particulate matter and nitrogen oxides.

A. Respondents' GHG analysis undermines California's GHG reduction goals

As explained above, the Cap-and-Trade Program is just one part of a suite of complementary measures designed to achieve California's ambitious GHG reduction and climate stabilization objectives. Cap-and-

Trade provides no legal basis for Respondents to avoid local governments' obligations as lead agencies under CEQA to evaluate and mitigate GHG emissions from a project that the Cap-and-Trade Program does not even cover.

While any one policy may be insufficient or at risk of circumvention, the suite of policies work in concert toward the state's goals.^{7,8} This overlap is by design, and makes the suite of policies more resilient to changed circumstances, enforcement problems, and legal challenges. The upstream Cap-and-Trade Program thus works in tandem with downstream choices, including planning choices, to ensure both that total emissions decline and that projects throughout the state are designed to avoid putting undue upstream pressure on emissions or control costs. Weakening one policy because another policy might address it runs contrary to this approach.

⁷ See 2017 Scoping Plan, *supra*, pp. ES7–8, 10, 22, 97; cf. Elinor Ostrom, A Polycentric Approach for Coping with Climate Change (2014) 15 *Annals Econ. & Fin.* 97, 123 <<https://perma.cc/YSF4-B7N8>> (Nobel laureate describing an ideal policy approach to climate change as “Complex, Multi-Level Systems to Cope with a Complex, Multi-Level Problem”); Amir Bazaz, et al., Global Covenant of Mayors, Summary for Urban Policymakers: What the IPCC Special Report on Global Warming of 1.5.°C Means for Cities (Dec. 2018) pp. 22–23 <<https://perma.cc/R37B-3WDD>> (identifying interaction between sources of governance and importance of incentives beyond financial consequences at the community level).

⁸ Complementary measures are also important in light of the risk to any one measure posed by litigation. Private parties and the federal government have challenged California's GHG reduction policies, including aspects of the Cap-and-Trade Program. California's GHG vehicle emissions regulatory authority is currently also under challenge. The wisdom of the portfolio approach endorsed by the Scoping Plan is to ensure that the state's efforts continue via many channels, rather than relying on any one potentially challenged measure.

If other lead agencies adopt Respondents’ approach to GHG analysis under CEQA, their development projects would produce millions of metric tons of GHG emissions that would go unmitigated through what amounts to an unauthorized categorical exemption from CEQA. The economic analyses and feasibility of achieving the state’s legislatively mandated goals in the Scoping Plan account for all policies working in tandem. If any one policy fails to deliver reductions, this would put strain on the Cap-and-Trade Program to deliver more reductions than anticipated and at higher costs.

Respondents’ failure to account for the significance of the Project’s GHG emissions from transportation is particularly troubling in light of the fact that the transportation sector accounts for over 35% of the state’s total GHG emissions and these emissions continue to rise. (2017 Scoping Plan, *supra*, pp. ES1, 11 [charts of emissions by source]; see also California Air Resources Board, 2018 Progress Report: California’s Sustainable Communities and Climate Protection Act (November 2018) at 4.) As the California Supreme Court noted, “transportation emissions are affected by the location and density of residential and commercial development, the Scoping Plan does not propose statewide regulation of land use planning but *relies instead on local governments.*” (*Center for Biological Diversity v. Department of Fish and Wildlife* (2015) 62 Cal.4th 204, 230; emphasis added.) Local governments thus play a unique role in decreasing GHG emissions from the transportation sector.

Respondents contend that because statewide emissions are capped under the Cap-and-Trade Program, the amount of emissions from “capped” sources will be the same with or without their Project, but this claim ignores both their obligations under CEQA to disclose and mitigate their emissions and the intended design of the Cap-and-Trade Program. (See

Combined Respondents’ and Cross-Appellants’ Opening Brief at pp. 48–49.)

Cap-and-Trade is not a program designed to reduce emissions from local government actions, or land use; instead, it was designed on the assumption that local actors would simultaneously work to reduce emissions within their spheres. Cap-and-Trade alone was designed to account for less than 40% of the total emissions reductions needed to achieve California’s 2030 climate goals, and on the explicit assumption that local design choices would continue to reduce overall emissions (and hence economy-wide costs in the Cap-and-Trade Program). (2017 Scoping Plan at p. 28.) Indeed, relying entirely on the Cap-and-Trade Program to address land use would produce a mismatch that would strain the Program by functionally increasing demand for emissions reductions as unregulated entities displace their obligations onto the Program rather than taking action themselves, raising compliance costs for covered entities across all sectors and all consumers across the state at all income levels. California’s portfolio approach was designed to meet AB 32’s requirement that “greenhouse gas emissions reduction activities . . . adopted and implemented by [CARB] are complementary, nonduplicative, and can be implemented in an efficient and cost-effective manner.” (Cal. Health & Saf. Code, § 38561.) By taking a portfolio approach, the state has recognized that taking GHG action in specific sectors ensures that we achieve our broader climate and energy demand reduction goals. (See 2017 Scoping Plan at pp. 2, 24, 100 [describing Governor Brown’s five key climate change strategy “pillars”].) Ultimately, cost increases could make the Cap-and-Trade Program less effective as a key part of the suite of California’s climate policies.

In sum, Respondents’ position is fundamentally inconsistent with the state’s approach to climate change, and so disregards significant emissions

that should properly be addressed under CEQA, not an unrelated emissions program like Cap-and-Trade. Moreover, Respondents' approach would allow similar emissions from other projects that would follow its lead. (See Part III(A), *infra.*) The majority of land use projects are, like this Project, not covered by the Cap-and-Trade Program. Freight alone is an enormous industry; over 1.5 billion tons of freight were moved in California during 2015. (*Id.* at p. 73.) And other types of projects such as residential developments or agricultural enterprises may seek to invoke precedent created by this case. Thus, even if the Project standing alone does not excessively strain the Cap-and-Trade system, the collective weight of new projects failing to address GHG emissions in the CEQA process would.

B. Respondents' GHG analysis prevents co-pollutant reduction measures necessary to protect California's environmental justice communities

Permitting massive land development projects without requiring the necessary mitigation measures to decrease project emissions will also harm California's environmental justice communities—those already suffering from the worst environmental pollution in the state. The census tract the Project will be built in is ranked in the 75th to 80th percentile of census tracts in California in terms of greatest pollution burden indicators and health and vulnerability factors for population characteristic indicators. (CalEnviroScreen 3.0 for Census Tract 6065042624, Office of Environmental Health Hazard Assessment, last visited November 27, 2019 <<https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-30>>.) Even without the Project, residents of this census tract already experience ozone, the main ingredient of smog, at a rate higher than 98% of the rest of California. (*Ibid.*) Relatedly, these residents also experience cardiovascular disease, which can result from exposure to air pollution, at a rate higher than 95% of the state. (*Ibid.*)

Considering additional mitigation properly may have resulted in additional zero-emissions technologies used for the Project, including, perhaps, from its trucks, as many commenters recommended. If such measures are not considered from this Project and other future projects like it are not mitigated, Moreno Valley and communities throughout the state will likely continue to suffer from worse air pollution. (See Nicky Sheats, *Achieving Emissions Reductions for Environmental Justice Communities Through Climate Change Mitigation Policy* (2017) 41 WM. & MARY ENVTL. L. & POL’Y REV. 377, 387 [“[E]ven without the intentional maximization of co-pollutant reduction, there should be incidental co-pollutant reductions as GHGs are being reduced [which] should improve the health of local communities.”]; see also Scoping Plan at p. 74 [“Air pollution from tailpipe emissions contributes to respiratory ailments, cardiovascular disease, and early death, with disproportionate impacts on vulnerable populations such as children, the elderly, those with existing health conditions . . . , low income communities, and communities of color.”].)

III. RESPONDENTS’ EIR VIOLATES CEQA

As explained above, the EIR’s approach to GHG analysis misrepresents the Cap-and-Trade Program and the Project’s place in that scheme. As a result, the EIR takes an unsupportable approach to evaluating the significance of GHG emissions from the Project. Contrary to CEQA’s focus on information disclosure and local responsibility for mitigation, the EIR ignores the vast majority of the Project’s emissions, and, in a misleading analysis, compares only a small fraction of the Project’s emissions to the applicable significance threshold. This flawed analysis leads the EIR to conclude that the impact from GHG emissions would be mitigated to a less-than-significant level, misleading the public and shirking mitigation responsibilities. Even if the Cap-and-Trade Program directly

applied to the Project’s emissions (it does not since, as explained above, this Project is not a covered entity under the Program), this method of evaluating a project’s significance *after* taking into account purported “mitigation” or impact-reducing components is not allowed by CEQA. As a result of its flawed analysis, the EIR fails to adopt all feasible mitigation measures and subverts CEQA’s important political function of ensuring informed decision making and informed public participation.

The EIR’s approach to GHG analysis fails on multiple levels. Perhaps most critically, in addition to pointing to “compliance” with a regulation that simply does not cover the Project to excuse mitigation, the EIR focuses on a single significance consideration while ignoring other evidence showing potentially significant impacts. CEQA does not allow clearly significant GHG impacts to be overlooked, even if a lead agency believes those impacts are considered less than significant under one particular metric. (See, e.g., *Oro Fino Gold Mining Corp. v. County of El Dorado* (1990) 225 Cal.App.3d 872, 274 [citizens’ personal observations about the significance of noise impacts on their community constituted substantial evidence that the impact may be significant and should be assessed in an EIR, even though the noise levels did not exceed general planning standards]; accord *SANDAG, supra*, 3 Cal.5th at p. 515 [“An adequate description of adverse environmental effects is necessary to inform the critical discussion of mitigation measures and project alternatives at the core of the EIR”].) This failure to address potentially significant impacts not only minimizes the Project’s significant impacts, but also warps the evaluation of whether the Project’s contribution to GHG emissions is a cumulatively considerable impact. (CEQA Guidelines, § 15064.) The cumulative effect of dozens of similar warehouse projects in the Moreno Valley area could—and almost certainly will—be significant.

A. The EIR improperly applies CEQA Guidelines Section 15064.4 to determine the significance of the Project’s GHG emissions.

The Resources Agency, the state’s expert on CEQA, has rejected the approach of using purported “compliance” with an inapplicable program to mitigate emissions. (Final Statement of Reasons for the CEQA Guidelines Amendments (2018) at p. 27 [“a subdivision project could not demonstrate ‘consistency’ with [CARB’s] Early Action Measures because those measures do not address emissions resulting from a typical housing subdivision”].)

The EIR misapplies CEQA Guidelines section 15064.4, which offers multiple factors a lead agency should consider in assessing the significance of impacts from GHG emissions. That Guideline provides, in pertinent part:

- (b) A lead agency should consider the following factors, *among others*, when assessing the significance of impacts from greenhouse gas emissions on the environment:
 - (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;
 - (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
 - (3) The extent to which *the project complies* with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project’s incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a *particular project* are still cumulatively considerable notwithstanding compliance with the adopted

regulations or requirements, an EIR must be prepared for the project.⁹

(CEQA Guidelines, § 15064.4, subd. (b), italics added.)

As reflected in subdivision (b)(3), compliance with “regulations or requirements adopted to implement a statewide, regional, or local plan” can factor into the assessment of GHG significance, but only when *the project complies* with those regulations or requirements. Yet, the EIR relies upon subsection (b)(3) to claim that emissions for which upstream suppliers surrendered allowances need not be analyzed and mitigated under CEQA. This approach excuses all of the Project’s transportation- and electricity-related emissions, thus requiring analysis and mitigation of only a tiny fraction of the Project’s emissions.

⁹ The 2018 update to the CEQA Guidelines added the following language:

(b) In determining the significance of a project’s greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project’s emissions to the effects of climate change. The agency’s analysis should consider a timeframe that is appropriate for the project. The agency’s analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes.

(b)(3) . . . In determining the significance of impacts, the lead agency may consider a project’s consistency with the State’s long-term climate goals or strategies, provided that substantial evidence supports the agency’s analysis of how those goals or strategies address the project’s incremental contribution to climate change.

(c) A lead agency may use a model or methodology to estimate greenhouse gas emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project’s incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

Respondents' application of subdivision (b)(3) to this Project is wrong. Because the Project is not a covered entity under the Cap-and-Trade Program, subsection (b)(3) is inapplicable, as the project cannot "comply" with Cap-and-Trade at all. Moreover, as discussed above, such "compliance" would undermine Cap-and-Trade's purposes if adopted as a CEQA approach, not serve the environmental goals both AB 32 and CEQA set out to deliver.

B. The EIR failed to apply the SCAQMD's GHG emissions threshold to *all* of the Projects' GHG emissions.

The EIR takes an impermissible approach of applying the Cap-and-Trade Program to ostensibly reduce the Project's emissions significantly, then comparing only that reduced quantity to the bright-line significance threshold. This approach is not supported in law.¹⁰

CEQA requires lead agencies to "make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project." (CEQA Guidelines, § 15064.4.) CEQA then provides that the lead agency must consider "whether *the project emissions* exceed a threshold of significance the lead agency determines applies to the project." (*Id.* at subd. (b)(2).) As explained in the EIR, a potentially appropriate

¹⁰ The EIR also attempts to justify excluding "capped emissions" from its significance analysis by referencing two seemingly cherry-picked 2013 mitigated negative declarations from other lead agencies, and one 2014 guidance document from the San Joaquin Valley Air Pollution Control District (SJVAPCD). (EIR 4.7-33.) The EIR does not explain why it chose to follow the methodology allegedly used in two obscure mitigated negative declarations and in a policy document from an air district in a different air basin, rather than following traditional CEQA GHG analysis and mitigation principles. These irrelevant, project-specific documents do not constitute substantial evidence supporting Respondents' argument.

significance threshold in this case is the South Coast Air Quality Management District's (SCAQMD) SCAQMD's 10,000 metric ton limit.¹¹ (EIR at p. 4.7-32.)

The problem here is that the EIR does not compare the Project's total GHG emissions against this 10,000 metric ton threshold, and then mitigate those emissions to below that threshold to the extent feasible. Instead, the EIR simply subtracts from the total any GHG emissions it deems to be "capped," and compares only the few "non-capped" emissions to the bright-line threshold. Because the EIR only compares a small fraction of the Project's GHG emissions to the applicable bright-line significance threshold, it only requires relatively minor mitigation measures to reduce the Project's emissions to what the EIR considers "less than significant." (EIR at pp. 1-55–57.)

Respondents' approach improperly applies so-called "mitigation" (the Cap-and-Trade Program) *before* comparing GHG emissions to the significance threshold. By combining impacts and mitigation analyses, it is unclear how the purported mitigation reduces impacts. This approach was rejected in *Lotus v. Dept. of Transportation* (2014) 223 Cal.App.4th 645, where the court stated:

The failure of the EIR to separately identify and analyze the significance of the impacts . . . before proposing mitigation measures is not merely a harmless procedural failing. . . . [T]his shortcutting of CEQA requirements subverts the purposes of CEQA by omitting material necessary to informed decisionmaking and informed public participation. It precludes both identification of potential

¹¹ It is worth noting that the Scoping Plans are not binding as to any particular CEQA methodology, or as to land use planning generally, and do not require use of any particular significance threshold. They are guidance documents; individual land use authorities can and do depart from particular suggestions in them if they have appropriate reasons to do so. The issue in this case, however, is that the Cap-and-Trade program does *not* provide such an appropriate reason.

environmental consequences arising from the project and also thoughtful analysis of the sufficiency of measures to mitigate those consequences. The deficiency cannot be considered harmless.

(*Id.* at p. 658.)

Furthermore, if the full scope of the GHG emissions attributable to the Project were compared to the applicable bright line threshold, the emissions, as mitigated, would still be substantially over the threshold—and would therefore require consideration of additional mitigation measures. (See EIR, pp. 4.7-35–36.)

Applying appropriate mitigation measures to reduce the so-called “capped” emissions would not “result in double counting and double mitigating emissions that are already mitigated through cap-and-trade” as Respondents assert. (Combined Respondents’ and Cross-Appellants’ Opening Brief at p. 57.) Gesturing towards Cap-and-Trade regulated entities is not proper mitigation because Cap-and-Trade does not apply to this Project in any way, and the Project itself has ample mitigation opportunities onsite. To mitigate this Project’s GHG emissions, Respondents would have to address emissions from mobile sources, which account for over 70% of the Project’s total emissions (which again are nearly 40 times greater than the significance threshold). (AR002729.) To reduce these emissions, fewer trucks could drive from the Project to the Ports of Long Beach and Los Angeles every day, the Project could be built closer to the ports, the Project could require more zero emission vehicles be used or provide charging equipment or incentives to encourage their use, or any number of other meaningful mitigation measures. But Cap-and-Trade does not require any of this. Such measures are instead included by local governments in local land use projects to ensure approved project impacts fall below significance thresholds. By never counting the “capped” emissions toward the significance threshold, there is *no* counting and *no*

project-level mitigation of hundreds of thousands of tons of yearly GHG emissions from this Project.

C. Respondents fail to consider the long-term GHG impacts of the Project.

The Supreme Court has made clear that an EIR should consider a project’s long-term GHG impacts, and should address whether the project as a whole is in accord with the state’s climate goals. (*Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 3 Cal.5th 497 (*SANDAG*) at p. 515.)¹² The state’s climate change goals extend beyond 2030. (See, e.g., Executive Order S-03-05 [established a statewide target of reducing GHG emissions to 80 percent below 1990 levels by 2050].) Because the Project is expected to operate for decades into the future, Respondents must account for emissions beyond 2030. But Respondents fail to account for emissions beyond that point—despite the fact that the Project’s full operation will not start until *five years later*, in 2035. (EIR at p. 4.3-61.) Respondents present no substantial evidence that any of the Project’s post-buildout operational emissions are mitigated by the Cap-and-Trade Program. (See, e.g., EIR, pp. 4.7-36–37 [stating, without citation, that “[s]ome of the project’s GHG emissions are subject to the requirements of the AB 32 Cap and Trade Program and will have a GHG allocation based on current GHG emissions levels”].) This is not an adequate CEQA analysis. (See *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884, 904 [EIR must contain substantial evidence that mitigation measures will reduce associated impacts to less-

¹² The parties in *AIR v. Kern* did not have the opportunity to brief the significance of *SANDAG* because the California Supreme Court filed its opinion in *SANDAG* over a month after the close of briefing in *AIR v. Kern*. It appears to amici that this is the first case at the California Court of Appeal where parties have had the opportunity to address both *SANDAG* and *AIR v. Kern* in their briefs.

than-significant-levels, such as by requiring compliance with applicable regulatory standards and preparation of site-specific studies]; Cal. Code Regs. tit. 14, § 15370, subd. (d) [“mitigation” includes “[r]educing or eliminating the impact over time by preservation and maintenance operations during the life of the action”].)

D. Reliance on *AIR v. Kern County* is improper.

Respondents incorrectly claim the Fifth Appellate District’s decision in *Association of Irrigated Residents v. Kern County Bd. of Supervisors* (2017) 17 Cal.App.5th 708 (*AIR*) upheld the use of the same GHG methodology as Respondents attempt to use here. (Combined Respondents’ and Cross-Appellants’ Opening Brief at p. 53.) Respondents’ use of the Cap-and-Trade Program here goes far beyond what was sanctioned in *AIR*. In *AIR*, the project being evaluated under CEQA was a refinery, a *covered entity* under Cap-and-Trade. The court held a lead agency was authorized “to determine that a project’s greenhouse gas emissions will have a less than significant effect on the environment based on *the project’s* compliance with the cap-and-trade program.” (*Id.* at p. 718; italics added.) Regardless of whether or not *AIR* was rightly decided, *here*, the question is much simpler and different from the question before the court in *AIR*. Here, it is undisputed that the Project is *not* a covered entity required to comply with the Cap-and-Trade Program. (Cal. Code Regs., tit. 17, § 95811.) Accordingly, this Court need only decide if projects that are *not* covered entities under Cap-and-Trade are nonetheless allowed to use the program to ignore significant GHG emissions they cause. The answer to that question is no.

Respondents argue the distinction between covered and non-covered entities is “a distinction without a difference.” (Combined Respondents’ and Cross-Appellants’ Opening Brief at p. 63.) Respondents are incorrect.

This distinction is crucial under CEQA and vital to the success of California’s ambitious climate policies.

From a CEQA perspective, the distinction is important because CEQA Guidelines section 15064.4, subdivision (b)(3) instructs lead agencies to consider the extent to which *a project* complies with GHG regulations or requirements. It is thus inappropriate for entities downstream in the chain of commerce from a covered entity to rely upon compliance with the Cap-and-Trade Program as a basis for avoiding analysis of project-related emissions.

From a policy perspective, as described above, the distinction is crucial because projects that are not subject to the Cap-and-Trade Program do not have the same direct incentives to reduce their GHG emissions as covered facilities, and Cap-and-Trade alone is not designed to achieve California’s ambitious climate goals. The distinction between covered and not-covered entities is thus crucial to the portfolio of climate change measures the state is relying on to protect our citizens going forward.

E. Respondents’ GHG analysis obfuscates the climate change impacts of this Project, undermining CEQA’s public disclosure purpose.

By failing to comply with CEQA Guidelines Section 15064.4, failing to compare all of the Project’s emissions to the GHG emissions threshold, and failing to consider the long-term GHG impacts of the Project, Respondents’ analysis undermines the informational purpose of CEQA. The purpose of an EIR “is to inform the public generally of the environmental impact of a proposed project.” (Cal. Code Regs. tit. 14, § 15003, subd. (c).)

CEQA prohibits public agencies from approving or carrying out a project that will have significant effects on the environment unless the agency makes “findings” demonstrating either that it made changes to the

project to avoid or mitigate those significant impacts, or that certain overriding considerations outweigh the impact. (Pub. Resources Code, § 21081.) Without a full and accurate disclosure of the Project’s impacts, Respondents erroneously concluded that the GHG impact would be less-than-significant, and thereby avoided making the subsequent findings that would inform the public whether the Project’s significant impacts are unavoidable and/or justified. Additionally, Respondents’ approach hinders the public’s ability to submit informed comments during the EIR’s public comment period—aside from addressing the *lack* of analysis—because the public is not provided with, and thus cannot evaluate, complete information or proper CEQA analysis.

CONCLUSION

California is striving on all fronts to meet its ambitious, long-term GHG reduction objectives; the health of its citizens and the environment depend on it. But this Court’s approval of Respondents’ approach to GHG analysis and mitigation would treat the Cap-and-Trade Program as the sole remedy to limit GHG emissions from land-use projects, placing unnecessary strain on Cap-and-Trade’s cost-effectiveness and seriously undermining the state’s critical climate change efforts. Amici respectfully request this Court reject the trial court’s holding and find in favor of Appellants as to GHG analysis.

INTRODUCTION

While there are many threats to biological diversity in the United States, the loss and fragmentation of habitats and ecosystems have become the most significant (Wilcove et al. 1998). The survival of plant and animal species and whether our natural systems will continue to provide essential services—recycling of nutrients, flood and pest control, and maintenance of clean air, water, and soil—significantly depends upon where and how land is used, converted, and managed. Land use change resulting from development and associated human activities (e.g., agriculture, grazing, forest harvesting, and hunting) often alters the abundances and varieties of native species; introduces novel and potentially detrimental species to an area; and disrupts natural water and nutrient cycles, and natural disturbance patterns (e.g., fire) (U.S. Geological Survey 1998).

Everyday, land use planners are faced with decisions regarding whether and how land is developed, parcelized, and used, and in what pattern. For the most part, such land use decisionmaking occurs without taking into account individual and cumulative impacts to biological resources. Implementing biologically sensitive spatial planning early in the development process will help preserve our natural heritage for the future, since the most crucial time for planning is when the first 10 to 40 percent of the natural vegetation is altered or removed from the landscape (Forman and Collinge 1997). A growing interest exists among land use planners and developers to use the tools at their disposal to better protect biological diversity. However, these professionals often lack the necessary information to incorporate ecological principles into their decisionmaking and to transform their traditional planning approaches into progressive, ecologically-based conservation tools.

To encourage and facilitate better integration of ecological knowledge into land use and land management decision-making, the scientific community needs to provide planners with applicable ecological information and guidance. To this end, the Ecological Society of America (ESA) convened a

committee of leading scientists to identify principles of ecological science relevant to land use and to develop guidelines for land use decisionmaking.¹ The result was the development of eight general guidelines to assist land use planners in evaluating the ecological consequences of their decisions (see Box 1).

Conservation guidelines, such as those established by the ESA Land Use Committee, are designed to be flexible and to apply to diverse land use situations. As a result, they tend to be general in nature. For ecological principles to be put into practice, however, land use planners will need more specific information on potential threshold responses of species and ecosystems to development activities, particularly in relation to habitat fragmentation. To facilitate the adequate preservation of contiguous or

connected natural areas, land use planners will need to know what science tells them about the minimum sizes of habitat patches species need to survive, or the amount of habitat necessary for the long-term persistence of native populations and communities in a region. In addition, they need information about the adequate size and placement of habitat corridors that would facilitate species movement and colonization among disjunct habitat patches, and about recommended widths of riparian buffers to protect water quality and provide wildlife habitat. Similarly, knowing the extent to which edges influence natural habitats would help land use professionals evaluate the effective area of any given habitat patch or corridor. Other fragmentation thresholds—such as the maximum distance between isolated patches tolerable in a landscape before ecological processes and patterns become disrupted—would arm decisionmakers with specific parameters that could be incorporated into land use design and modeling.

“Spatial planning is most significant in nature conservation when 10-40% of the natural vegetation has been removed from a landscape.”

Forman and Collinge (1997), Landscape and Urban Planning 37, p. 129

¹ “The Ecological Society of America (ESA) is a non-partisan, nonprofit organization of scientists founded in 1915 to: promote ecological science by improving communication among ecologists; raise the public’s level of awareness of the importance of ecological science; increase the resources available for the conduct of ecological science; and ensure the appropriate use of ecological science in environmental decision making by enhancing communication between the ecological community and policy-makers.”
As cited in Ecological Society of America. “About ESA.” <www.esa.org> (31 July 2002).

Given the inherent complexity of ecological systems, scientists are understandably reticent about providing exact prescriptions for land use planning and design because answers vary depending on the species, ecosystem, or scale in question. Nevertheless, by not promoting the use of even

partial knowledge about species or ecosystem responses to human disturbance and fragmentation, the result is that land use decisions—even the most well-intentioned—are being made completely uninformed by science.

BOX 1. GUIDELINES FOR LAND USE PLANNING AND MANAGEMENT

In the face of rapid land use change, the Ecological Society of America's Land Use Committee recommends that land use planners and developers take into consideration the following eight guidelines to evaluate the potential impact of their decisions on our natural systems (see Dale et al. 2000 for full discussion):

1. Examine the impacts of local decisions in a regional context.

The persistence of species and the sustainability of ecosystems are determined not only by immediate surroundings but also by larger landscape factors, such as how habitats are interspersed across the landscape. Thus, local land alterations may have broad-scale regional impacts. Land use planners should both identify the surrounding region that is likely to affect and be affected by a local project and examine how adjoining jurisdictions are using and managing their lands. Regional environmental data (e.g., land cover classes, hydrologic patterns, and habitats for species of concern) should be incorporated into the decision-making process to facilitate a regional assessment of impacts.

2. Plan for long-term change and unexpected events.

Ecological processes, such as nutrient cycling, energy flow patterns, and disturbance regimes, may function over lengthy and variable time scales. In addition, ecosystems change over time. As a result, impacts posed by land use decisions are often long-term and unpredictable. Impacts may be delayed and not fully realized until years or decades later, or they may be cumulative such that a "unique trajectory of events" results that could not have been predicted from any single event. The complexity and variability of ecosystem responses dictate that land use decisions consider potential occurrences and implications of unanticipated and long-term events (e.g., variations in weather and disturbance patterns).

3. Preserve rare landscape elements and associated species.

Rare landscape elements, such as wetlands, riparian and mountain zones, and old-growth forests, often provide critical habitats for rare and endangered species. To protect a region's biological diversity, the natural diversity within a landscape must be preserved. Land use planners should identify the location of rare and unique landscape elements, by methods such as inventory and analysis of vegetation types, geology, hydrology, and physical features, and by their associated species. Once such landscape elements are identified, development should be guided away from such areas and toward more common landscape features.

4. Avoid land uses that deplete natural resources over a broad area.

Depletion of natural resources over time will lead to the irreversible disruption of ecosystems and associated processes. Consequently, land use planning and development should strive

to prevent the diminishment of natural resources (e.g., soil, water, and habitat types such as wetlands) in any given area by identifying vital or at-risk resources and by taking the necessary precautions to avoid actions that threaten resource sustainability. Certain land uses or land activities may be deemed altogether incompatible in particular settings.

5. Retain large contiguous or connected areas that contain critical habitats.

Large habitat patches typically support a greater diversity and abundance of plants and animals and can maintain more ecosystem processes than small patches. Large intact habitats provide more resources, allowing larger populations of a species to persist, thus, increasing the chance of survival over time. Parcelization of large habitats often decreases the connectivity of systems, negatively affecting the movement of species necessary for fulfilling nutritional or reproductive requirements. To counter such effects, large intact areas and small areas that are well connected to other critical habitats should be protected.

6. Minimize the introduction and spread of non-native species.

Non-native species often negatively affect the survival of native species and disrupt the functioning of ecosystems. The spread of non-natives is facilitated by the development of transportation infrastructure and by the creation of edge environments and artificial landscapes. Land use professionals should strive to minimize the potential introduction and spread of non-native species into natural environments.

7. Avoid or compensate for effects of development on ecological processes.

Development may not only cause site-specific impacts, but may also disturb regional ecological processes. Ecological processes, such as fire, grazing, dispersal patterns, and hydrologic cycles, help to sustain plant and animal populations across a landscape. Thus, land uses that could negatively affect other systems or lands through the disruption of these processes should be avoided while those that benefit or enhance ecological attributes should be encouraged.

8. Implement land use and land management practices that are compatible with the natural potential of the area.

The natural potential of a site, as determined in part by local physical and biologic conditions, should be factored into how land is used and managed. Land uses that do not take advantage of a site's natural potential or consider its limitations, will likely result in unnecessary resource loss and high economic costs.

For more information on ecological principles to guide land use planning decisionmaking, see Dale et al. (2000), Duerksen et al. (1997), and Dramstad et al. (1996).

FROM GUIDELINES TO THRESHOLDS

The Environmental Law Institute (ELI) surveyed existing scientific literature to determine whether a body of knowledge has emerged within the scientific community relevant and applicable to national land use decision-making, specifically pertaining to biological conservation thresholds. A literature search of the major ecological, conservation, and land use journals was conducted using the Science Citation Index (ISI Web of Science) using search terms under the following categories: habitat fragmentation,² buffers,³ corridors,⁴ ecological thresholds,⁵ and indicator species.⁶ To increase applicability to current land use decisionmaking in the states, the search was confined to studies pertaining to the continental United States, as well as articles published between 1990-2001, and pre-1990 articles commonly cited within the scientific community. Only those articles containing quantitative information directly relevant to determining conservation thresholds for land use planning and land management were considered.⁷ In addition to the literature search, review papers found in the gray literature (e.g., those produced by land management and regulatory agencies) were also included when possible and applicable.

ELI found adequate information on potential ecological threshold measures for the following areas: habitat patch area, percent of suitable habitat, edge effects, and buffers. Corridor design is reviewed in brief; however, specific guidance on corridor size was not feasible given inadequate available information within the scientific literature. This survey reflects scientific information largely related to habitat fragmentation and landscape ecology issues, with a focus on the spatial relationships (e.g., size, shape, location) and interactions of land attributes over large geographic areas.⁸ This

review does not cover other important conservation elements such as how to account for the biological integrity or ecological significance of habitat patches, which land use planners should consider when determining which parcels of land to protect. In addition, the thresholds presented in this review does not adequately address the conservation of species or habitat types that are naturally rare or localized (e.g., those with patchy distributions or limited ranges).

This report summarizes the Institute’s findings and provides a platform for identifying gaps in existing knowledge to help guide more in-depth ecological research directly applicable to land use planning. This report in no way attempts to misrepresent the complexity of species and ecosystem response to land conversion, degradation, and fragmentation by providing simplified prescriptions. Land use planners should cautiously interpret the presented threshold values and ranges and tailor them to their unique circumstances and geographic settings.

First and foremost, land use planners need to establish their priorities for conservation—whether they be water quality or quantity, wildlife habitat, or biodiversity. In addition, conservation targets need to be established—whether they be regionally rare or endangered species or unique landscape elements (e.g., wetlands, old growth forests, riparian zones), or other targets—because this will directly influence the value and scale of any threshold.⁹ Thresholds should be chosen or developed to meet the needs of the resources a locality is most concerned with managing and conserving. Planners should place great emphasis on evaluating site-specific and regional physical and biological conditions that influence the resiliency of particular systems to human disturbance.

The threshold values presented in this report should not detract from the larger goals of conserving or restoring indigenous species, rare and representative habitats, ecosystem functions, and natural connectivity. Where possible, the ESA land use guidelines should be followed. Land use planners should strive to protect large, intact parcels of land, high quality and ecologically important habitat, and where appropriate, should connect protected natural areas. When development is deemed necessary, land use planners should promote more compatible land uses and avoid or minimize fragmenting habitat patches wherever possible.

² To locate papers with potential habitat fragmentation threshold information, the following search terms were used: minimum habitat size, habitat size, habitat requirement, habitat fragmentation, patch size, minimum fragment size, island biogeography, landscape connectivity, habitat connectivity, and metapopulation theory.

³ To locate papers with potential threshold information on buffer width, the following search terms were used: riparian buffer, wetland buffer, buffer zone, buffer distance, forest buffer, buffer width, and buffer size.

⁴ To locate papers with potential threshold information on corridor width, the following search terms were used: fragment connectivity, boundary permeability, landbridge, highway overpass, highway underpass, stream cross, habitat corridor, corridor, migration corridor, riparian corridor, and underpass.

⁵ To locate papers with potential ecological threshold information, the following search terms were used: ecological threshold, conservation threshold, environmental threshold, and landscape threshold.

⁶ To locate papers with potential threshold information relevant to indicator species, the following search terms were used: indicator species, indicator species and habitat fragmentation, and indicator species and thresholds.

⁷ The majority of the papers encountered and selected focus on terrestrial species and to a lesser extent freshwater aquatic communities.

⁸ As defined by Risser et al. (1984), "Landscape ecology considers the development and dynamics of spatial heterogeneity, spatial and temporal interactions and exchanges across heterogeneous landscapes, influences of spatial heterogeneity on biotic and abiotic processes, and management of spatial heterogeneity."

⁹ Thresholds presented in this report reflect a taxonomic bias in the scientific literature toward birds and mammals. Thus, for many of the recommended threshold values, these two animal groups are assumed to be the conservation targets.

BOX 2. DEFINITION OF TERMS

Biological diversity (or biodiversity) – the variety of life and its processes, which includes the abundances of living organisms, their genetic diversity, and the communities and ecosystems in which they occur (The Keystone Center 1991). Diversity at all levels from genes to ecosystems need to be maintained to preserve species diversity and essential ecosystem services like climate regulation, nutrient cycling, water production, and flood/storm protection (Dale et al. 2000).

Biological (or ecological) integrity – refers to a system's wholeness, including presence of all appropriate elements and occurrence of all processes at appropriate rates, that is able to maintain itself through time (Angermeier and Karr 1994).

Boundary – a zone comprised of the edges of adjacent ecosystems or land types (Forman 1995).

Corridor – a linear strip of a habitat that differs from the adjacent land on both sides, connecting otherwise isolated larger remnant habitat patches (Forman 1995, Fischer et al. 2000).

Buffers – linear bands of permanent vegetation, preferably consisting of native and locally adapted species, located between aquatic resources and adjacent areas subject to human alteration (Castelle et al. 1994, Fischer and Fischenich 2000).

Ecosystem – a geographic area including all the living organisms (e.g., people, plants, animals, and microorganisms), their physical surroundings (e.g., soil, water, and air), and the natural cycles (nutrient and hydrologic cycles) that sustain them. Ecosystems can be small (e.g., single forest stand) or large (e.g., an entire watershed including hundreds of forest stands across many different ownerships) (USFWS 1994).

Ecosystem functions – the biophysical processes that take place within an ecosystem, apart from any human context (e.g. nutrient, energy, and hydrologic cycling; or soil formation).

Ecosystem services – refer to the ecosystem goods (e.g., food, and medicine) and services (e.g., climate regulation, water purification, and flood control) that humans derive benefit, directly or indirectly, from ecosystem functions (Costanza et al. 1997).

Ecosystem sustainability – the tendency of a system to be maintained or preserved over time without loss of decline to elements such as its structure, function, diversity, and production. Sustainability is widely regarded as economically and ecologically desirable and the only viable long-term pattern of human land use (Dale et al. 2000).

Edge – the portion of an ecosystem or habitat near its perimeter, where influences of the surroundings prevent development of interior/core-area environmental conditions (Forman 1995).

Edge effects – the negative influence (e.g., such as the profound modifications of biological and physical conditions) of habitat or ecosystem edges on interior conditions of habitat or on associated species (Meffe and Carroll 1997, Lindenmayer and Franklin 2002).

Habitat – consists of the physical features (e.g., topography, geology, stream flow) and biological characteristics (e.g., vegetation cover and other species) needed to provide food, shelter, and reproductive needs of animal or plant species (Duerksen et al. 1997).

Habitat fragmentation – the breaking up of previously continuous habitat (or ecosystem) into spatially separated and smaller parcels. Habitat fragmentation results from human land use associated with forestry,

agriculture, and settlement, but can also be caused by natural disturbances like wildfire, wind, or flooding. Suburban and rural development commonly change patterns of habitat fragmentation of natural forests, grasslands, wetlands, and coastal areas as a result of adding fences, roads, houses, landscaping, and other development activities (Dale et al. 2000).

Landscape – a large heterogeneous land area (e.g., multiple square miles or several thousand hectares) consisting of a cluster of interacting ecosystems repeated in similar form (e.g., watershed) (Forman 1995, Duerksen et al. 1997).

Land use – the purpose to which land is used by humans (e.g., protected areas, forestry for timber production, plantations, row-crop agriculture, pastures, or human settlement) (Dale et al. 2000).

Local population – set of individuals of a species that live in the same habitat patch and interact with each other; most naturally applied to "populations" living in such small patches that all individuals practically share a common environment (Hanski and Simberloff 1997).

Matrix – the background ecosystem or land use type in a mosaic, characterized by extensive cover, high connectivity, and/or major control over the landscape functioning (Forman 1995). For example, in a large contiguous area of mature forest embedded with numerous small disturbance patches (e.g., timber harvest patches or clearcut areas), the mature forest constitutes the matrix element type because it is greatest in areal extent, is mostly connected, and exerts a dominant influence on the associated species and ecological processes (McGarigal 2003).

Metapopulation – a network of semi-isolated populations with some level of regular or intermittent migration and gene flow among them, in which individual populations may be extinct but then be recolonized from other subpopulations (Meffe and Carroll 1997).

Mosaic – a pattern of patches, linear corridors, and matrix in a landscape (Forman 1995).

Minimum viable population - The minimum viable population size is the smallest number of individuals required to maintain a population over the long-term (Forman 1995).

Non-native (or exotic) species – organisms (plants, animals, insects, and microorganisms) that occur in locations beyond their known historical, natural ranges or have been brought in from other continents, regions, ecosystems, or habitats (National Invasive Species Council 2001).

Patch – a relatively homogeneous type of habitat that is spatially separated from other similar habitat and differs from its surroundings (Forman 1995).

Remnant patch – habitat patches that escape disturbance (e.g., development) and are left remaining from an earlier more extensive span of habitat (e.g., woodlots in an agricultural area) (Dramstad et al. 1996).

Scale – the relative size or degree of spatial resolution of an area of interest. Small areas of interest (e.g., area around a house of single subdivision) are considered to be fine scale; in contrast to a larger area (e.g., a county or watershed), which is considered to be of coarse scale (Forman 1995, Duerksen et al. 1997).

Suitable habitat – habitat that meets the survival and reproductive needs of a species, allowing for a stable or growing population over time (Lamberson et al. 1994).

THRESHOLDS FOR LAND USE PLANNING: ADDRESSING HABITAT FRAGMENTATION

Habitat fragmentation severely threatens biodiversity and ecosystem functioning wherever humans dominate the landscape. Land use planners play a significant role in determining whether and how landscapes and ecosystems are fragmented or maintain natural connectivity.

Habitat fragmentation is the process whereby contiguous natural areas are reduced in size and separated into discrete parcels. Fragmentation results from a reduction in the area of the original habitat due to land conversion for other uses, such as residential and commercial development. It also occurs when habitat is divided by roads, railroads, drainage ditches, dams, power lines, fences or other barriers that may prohibit the free movement and migration of plant and animal species (Primack 1993, Forman 1995). When habitat is destroyed, a patchwork of habitat fragments is left behind, often resulting in patches that are isolated from one another in a modified and inhospitable landscape matrix.¹⁰ Fragmentation causes the microclimate to be altered due to changes in solar radiation, wind, and humidity; habitat patches become more isolated with a growing distance between remnant patches; and the resulting landscape is modified by changes in size and shape of the resulting patches (Saunders et al. 1991). These changes have varying impacts on species persistence and ecosystem sustainability.

Groups of organisms respond differently to habitat fragmentation. Some species, such as game species like white-tailed deer and bobwhite quail (referred to as edge species), may actually thrive under altered conditions (Bolger et al. 1997). However, many other species—often rare species and habitat specialists—are negatively affected. Species that depend upon the interior of forests, prairies, wetlands or other natural habitats will be absent from landscapes that lack sufficient natural areas containing true core habitat (Meffe and Carroll 1997). Although a fragmented landscape may enhance the abundance of certain generalist species, overall, fragmentation threatens the maintenance of biodiversity and the functioning of natural systems (Soulé 1991, Forman 1995).

Varying shapes and configuration of habitat patches resulting from habitat fragmentation, Buchanan, Alabama. Courtesy of John R. Tolliver, USDA Forest Service, www.forestryimages.org.

To the detriment of many species, particularly those that are area-sensitive, habitat patches may lack the range of resources necessary to support permanent populations (Primack 1993, Forman 1995). Habitat fragmentation will reduce the foraging and nesting ability of animals and can lead to the rapid loss of species due to the creation of barriers to dispersal and colonization. In a fragmented landscape, normal dispersal will be disrupted when the land surrounding the remaining patches is inhospitable to species formerly thriving in the contiguous habitat (e.g., because it is degraded or is home to predators). For example, many bird species that dwell in the forest interior will not cross even short distances of open areas (Askins 1995). When species migration and dispersal is limited, new immigrants are less likely to supplement diminishing populations, thereby, increasing extinction vulnerability (Askins 1995).

The negative effects of habitat fragmentation are compounded by an altered physical environment (*see* “Edge Effects”). Land conversion and land transformation can cause major alterations in hydrologic regimes, mineral and nutrient cycles, radiation balance, wind and dispersal patterns, and soil stability (Harris 1984 as cited in Collinge 1996; Hobbs 1993 as cited in Forman 1995). Changes in such ecosystem properties and processes in turn affect native species composition, abundance, and long-term persistence, further degrading the biodiversity and the integrity of the affected natural areas.

¹⁰ Matrix is the background ecosystem or land use type in a mosaic, characterized by extensive cover, high connectivity, and/or major control over the landscape functioning (Forman 1995) (see Box 2).

UNDERSTANDING THE EFFECTS OF FRAGMENTATION

Over the past 25 years, the scientific community has devoted much energy to understanding the various components of fragmentation—the influence of fragment size, shape, configuration, heterogeneity, connectivity, among other factors—and how they effect the sustainability and persistence of species and natural processes in a landscape. Ideally, scientists would understand the influence and interaction of these characteristics on the continued survival of species and the integrity of ecosystems. Due to gaps in scientific knowledge, available information was only found within the literature to present potential threshold responses related to patch area, proportion of suitable habitat, edge effects, and buffers.

This paper provides land use decisionmakers with concrete information culled from the scientific literature in order to translate the land use guideline #5 offered by the Ecological Society of America (see Box 1) for on-the-ground practice. Recommendations on “how to retain large contiguous or connected areas that contain critical habitat” are presented, with specific information on how to best protect habitat patches and sufficient natural area, to minimize edge effects, and to design riparian buffers and habitat corridors.

HABITAT PATCHES

A common consequence of land development is the fragmentation of an originally connected natural landscape into a mosaic of disconnected habitat patches.¹¹ The size of the remaining habitat fragments significantly influences the type, abundance, and diversity of species that can persist in the affected region. In general, large patches better sustain wildlife populations and ecosystem functions over time than small patches. Holding other factors constant—such as patch shape, condition, and configuration—larger areas of habitat tend to support larger population sizes and a greater number of interior, specialist, and native species due to increased habitat diversity and more core area (Harris 1984, Dramstad et al. 1996, Forman 1995). The probability of a species population being extirpated generally increases with decreasing patch size.¹² This is due to the tendency of larger patches to retain a greater array of the natural resources and ecological functions provided by healthy ecosystems than smaller patches with more edge, increased susceptibility to invasion by exotics or predators, and more disturbed conditions

(Soulé 1991, Metro 2001) (see “Edge Effects”). Area-sensitive forest bird species in the mid-Atlantic United States, for example, have been found to exhibit lower species diversity and higher extinction and turnover rates in landscapes with smaller mean forest patch size (Boulinier et al. 2001).

Diagram 2. Patch size and local extinction. Probability of a local species population going extinct increases with decreasing habitat patch size. A larger patch generally supports a larger population size for a given species than a smaller patch, making it less likely that the species will go locally extinct in the larger patch. Modified from Dramsted et al (1996), *Landscape Ecology Principles in Landscape Architecture and Land-Use Planning*, p. 20.

In general, to ensure the survival of individual species, population levels must remain large enough to protect against extinction from random natural events (e.g., floods, fires, droughts) and to maintain sufficient genetic variation to adapt to changing environmental conditions (e.g., changes in rates of predation, competition, disease, and food supply) (Gilpin and Soulé 1986, Meffe and Carroll 1997). A common tool used to determine the size of a population(s) needed to ensure long-term survival is a Population Viability Analysis (PVA). A PVA uses quantitative methods to predict the likely future status of a population or set of populations of conservation concern—often those that are at risk of extinction (Morris et al. 2002). This technique can take into account the many environmental, demographic, and genetic variables that determine extinction probabilities for individual species (Meffe and Carroll 1997).

¹¹ A patch is a relatively homogeneous type of habitat that is spatially separated from other similar habitat and differs from its surroundings (Forman 1995).

¹² What is being discussed in this report is to the local extinction of a species population from a particular habitat or region (termed extirpation or population extinction), rather than the overall elimination of the species worldwide (termed global extinction).

Because plant and animal population size is the best predictor of extinction probability, habitat patches should be large enough to maintain viable populations of important species—including rare, endangered, and economically important species—and to maintain the ecological processes that support these communities. Based on Population Viability Analyses, general guidelines have been proposed for minimum viable population sizes:¹³ 1) populations less than 50 individuals being too small and vulnerable to extinction due to their rapid loss of genetic variability and inability to withstand natural catastrophes; and 2) populations of 1,000 to 10,000 individuals being adequate to ensure long-term persistence (Meffe and Carroll 1997). Such numbers, however, should be viewed with scrutiny because much debate still exists about what size constitutes a minimum viable population for the many different species that make up natural systems (Saunders et al. 1991).

MANAGING FOR ADEQUATE HABITAT PATCH SIZE

For purposes of this review, minimum patch area is the smallest habitat patch that should be protected in order to sustain a species, a diversity of species or communities, or functioning of ecosystems. The literature suggests that, depending on the species or habitat in question, minimum critical patches range from as little as 0.0004 hectares (0.001 acres) (based on the needs of certain invertebrates) up to 220,000 hectares (550,000 acres) (based on the needs of certain mammals) to sustain target species or communities (*see* Appendix B). This wide range reveals that a generic “minimum” critical patch size or habitat requirement does not exist; thresholds are entirely dependent on the target species in question.

Ultimately, the amount of habitat necessary to maintain healthy wildlife populations varies according to many factors, such as taxonomic group, body size, foraging and resource requirements, and dispersal patterns of the species (Bender et al. 1998). Taxonomic groups, such as invertebrates and plants, which have smaller dispersal ranges and tend to respond to their environment at smaller spatial scales, are reported to need less habitat area (e.g., less than 10 hectares or 25 acres) (McGarigal and Cushman 2002).

Larger patch areas are recommended to support bird, mammal, and fish species. Minimum habitat requirements for birds ranged from one hectare up to 2,500 hectares (6,250 acres), with the majority (75 percent) of the values found within the literature to be under 50 hectares (125 acres).¹⁴ Minimum patch size required by mammals ranges from one hectare to 10 hectares for small mammals and up to 220,000 hectares for large-bodied or wide-ranging mam-

mals (e.g., bears, cougars). Larger bodied vertebrates and wide-ranging predators tend to require larger territories to meet resource and reproductive needs (Soulé 1991). Minimum habitat area is greater for predators, such as bears, with recommended patch sizes greater than 900 and 2,800 hectares and cougars with 220,000 hectares (Mattson 1990, Mace et al. 1996, Beier 1993, respectively).¹⁵ In contrast, estimates for habitat requirements for small mammals, such as rodents and rabbits, varied from one hectare to 10 hectares (Soulé et al. 1992, Barbour and Litvaitis 1993, Bolger et al. 1997). Only one study was found to provide evidence on possible watershed area needed to sustain fish species, finding that suitable patch sizes larger than 2,500 hectares might increase the chance of bull trout occurrence in Idaho (Rieman and McIntyre 1995).

Overall, the majority of the findings in this survey pertain to birds and mammals (*see* “A Closer Look at Habitat Patch Size” in Appendix A for specific information on numbers and trends). Few studies were found to recommend patch sizes to sustain plant, invertebrate, or fish populations. Keeping in mind this sample represents a narrow array of species and habitats, the protection of habitat patches of 55 hectares (137.5 acres) or more appears to capture 75 percent of species requirements reviewed in this select survey (*see* Figure 1). Such minimum land parcels, however, are not likely to capture particularly area-sensitive species, like wide-ranging predators or particularly sensitive interior bird species, found to need habitat patches greater than 2,500 hectares (or about 6,175 acres) (Trine 1998, Mattson 1990, and Beier 1993).

Given the great scientific uncertainty and gaps in the knowledge base on minimum habitat requirements of species and ecosystems, land use planners should adopt a conservative approach. The goal should be to maintain sufficiently large intact and well-connected habitat patches that would support the most area-sensitive species, species of greatest environmental concern (e.g., rare, threatened, or endangered species), or focal species, such as keystone species,¹⁶ link species,¹⁷ or umbrella species.¹⁸ Declines in these groups of organisms may have wide ranging implications, negatively affecting the persistence of other associated species and ecosystems (Dale et al. 2000).

Land use planners should carefully consider the conservation needs of species with large-area or specialized life history requirements or that depend upon a combination of different habitats (e.g., large-ranging predators; interior species, or rare species); these species are likely to survive only in rel-

¹⁵ One hectare is equal to approximately 2.5 acres.

¹⁶ Keystone species are species that have greater effects on ecological processes than would be predicted by their abundance or biomass alone (Dale et al. 2000).

¹⁷ Link species are species that exert critical roles in the transfer of matter and energy across trophic levels of a food web or that provide critical links for energy transfer within complex food webs (Dale et al. 2000).

¹⁸ Umbrella species are species that either have large area requirements or use multiple habitats and thus overlap the habitat requirements of other species (Dale et al. 2000).

¹³ The minimum viable population size is the smallest number of individuals required to maintain a population over the long-term (Forman 1995); for example, the size of a population that would have a 95 percent probability of persisting for 100 years (Boyce 1992).

¹⁴ Recommended conservation threshold values are based on the goal of capturing 75 percent of the requirements found for species, communities, and habitats surveyed in this literature review; thus, the third quartile was used by calculating the value for which 75 percent of the threshold values lie below this value (after numerical ranking).

atively large areas or in very specific habitat types (potentially very small, localized areas), which should be actively targeted for protection (Saunders et al. 1991, Ruggiero et al. 1994, Collinge 1996). To help guide conservation planning, umbrella species (e.g., vertebrate mammals such as cougars and grizzly bears) have been proposed as targets for conservation, because their protection may ensure the protection of other secondary species (Franklin 1993). By protecting areas large enough to maintain viable populations of wide-ranging species, sufficient habitat may be maintained to ensure survival of other species dependent on the same habitat. Land use planning that allows for the persistence of focal species—like rare and endangered species, keystone or umbrella species—may help direct land conservation. Land use planners will need the help of local biologists to identify appropriate focal and area-sensitive species in their region to better implement habitat conservation strategies.

Land use planners should strive to protect and maintain habitat patches larger than 55 hectares (137.5 acres).

Even though protecting large expanses of connected habitat is the ultimate goal, this may not be practicable in the often highly developing landscapes in which land use planners often find themselves working. In these settings, land use professionals should try and conserve what habitat remains and, where possible, work with land management agencies and land trusts to identify potential areas for habitat restoration. Working to conserve even the smallest remaining natural areas is important, particularly in human-dominated landscapes. A series of small- or medium-sized reserves may capture a greater diversity of habitat types, environmental heterogeneity, and biological diversity than the preservation of one large fragment (Tschardt et al. 2002) (see “Role of small patches”). Protecting natural habitats with the greatest conservation significance locally and regionally—regardless of size—is vital to preserving biological diversity and ecosystem services. No matter how small habitat patches may be, they still have ecological and/or aesthetic values, whether providing habitat for small organisms like amphibians or insects; providing green space for recreational activities; helping moderate temperature and provide shade in urban areas; or decreasing run-off from streets, pavements, and other impermeable surfaces.

OTHER PATCH AREA DESIGN CONSIDERATIONS

The size of any given habitat patch is only one factor determining whether or not the patch will support species persistence, biological diversity, and ecosystem functions. Other factors to consider are the shape, location/configuration, condition, and boundaries of patches, as well as the role of small habitat patches. The following is general guidance on ways to counteract the negative impacts of habitat fragmentation and habitat loss at a landscape scale.

- Patch shape:** Patch size and shape determine the distance of the patch’s edge to the habitat interior and the amount of core area remaining in any remnant habitat patch (see “Edge Effects”) (Collinge 1996). Shape determines the edge to interior ratio of a habitat patch, which should be as low as possible to minimize edge effects (Wilcove et al. 1986, Saunders et al. 1991, Collinge 1996). Circular habitat reserves are recommended to minimize contact between the protected core habitat and adjacent environmental or human pressures (Wilcove et al. 1986). In contrast, long, thin remnants have proportionally more edge, and thus, more negative edge effects (Forman and Godron 1981, Saunders et al. 1991).

Diagram 3. Patch shape and edge. The edge to interior ratio of a habitat patch is affected by patch shape. A more convoluted, irregular, or linear patch will have a higher proportion of edge, thus, increasing the number of edge species and decreasing the number of interior species.

- Patch location/configuration:** The landscape context in which patches reside may have an even greater effect on the function and sustainability of a habitat fragment than the characteristics of the patch itself (Forman 1995). The distances between suitable habitat patches and the nature of the matrix between these patches will influence species survival (Ruggiero et al. 1994, Andren 1997). In general, more connected habitats are better than isolated habitats because patches in close proximity are likely to enhance species dispersal, recolonization, and persistence (Fahrig and Merriam 1994). Even where wildlife populations may decline or disappear in isolated patches due to random events or patch conditions, recolonization may occur if species are able to successfully disperse from nearby habitat (Pulliam et al. 1992). To maintain demographic linkages, suitable patches should be positioned to provide stop-over points or “stepping stones” for species dispersal (Forman and Godron 1981). The allowable distance between patches will depend

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

upon individual species' dispersal capabilities, which vary within and among species groups (Ruggiero et al. 1994, Bender et al. 1998). When making land use planning decisions, practitioners should consider the contribution of patches to the overall landscape structure and how well the location of any given patch relates or links to other patches (Dramstad et al. 1996).

- Boundary zone:** The contrast between a patch edge and the surrounding landscape matrix (also referred to as the boundary zone) affects the severity of edge effects and the dispersal abilities of wildlife populations. The higher the contrast between patch types or patches and their surrounding matrix, the greater the edge effects (Franklin 1993). Boundaries in a landscape could be either “hard” or “soft.” Hard boundaries usually result from human activities, such as clearcutting and development, and have linear borders with high vegetation contrast, such as between a forest and cultivated field. Soft edges, which dominate natural landscapes, tend to have varying degrees of structural contrast with curved habitat boundaries (Forman 1995). To minimize edge effects at the local scale and facilitate the movement of species between a patch and the surrounding matrix, land use planners should mimic naturally occurring edges and provide gradual thinning of vegetation (e.g., smaller shrubs grading into larger shrubs and taller trees at the edge of a wooded patch) rather than an abrupt transition from vegetated to denuded areas (Forman and Godron 1981, Forman 1995, Duerksen et al. 1997).
- Patch condition:** The quality of the habitat patch itself will also influence the ability of remnant species and systems to persist or function over the long-term (Fahrig and Merriam 1994, Forman 1995). Large patches with degraded habitat—such as those dominated by non-native species, or with diminished biological diversity, severe erosion, or modified hydrologic patterns—may have less conservation value than small patches of high biological integrity.¹⁹ The biological integrity of land parcels and whether or not they contain unusual or distinctive landscape features (e.g., cliffs, caves, meadows, thermal features, and vernal pools), old-growth forests or mature habitats, or rare, threatened, or endemic species, are also factors that land use planners should consider when selecting which lands to conserve (Dramstad et al. 1996, Duerksen 1997, Lindenmayer and Franklin 2002).
- Role of small patches:** While large patches generally are recommended to provide sufficient habitat to sustain populations of species—particularly area-sensitive

species—small patches also play a vital role in regional conservation. Although larger patches may contain greater habitat diversity than smaller ones, a collection of multiple small patches may capture a greater array of habitats, and perhaps more rare species, than a single large habitat patch (Forman and Godron 1981, Saunders et al. 1991, Forman 1995, Tschartnke et al. 2002). Small wetlands of less than two hectares, for example, can support surprisingly high species richness of amphibians (Richter and Azous 1995 as cited in Metro 2001). Proximity to core habitat and local habitat heterogeneity, rather than riparian habitat area, may better predict reptile and amphibian richness (Burbink et al. 1998). In addition, small isolated riparian habitat patches have been found to be vital stop-over sites for en-route migratory birds in the southeastern United States (Skagen et al. 1998). If strategically positioned between larger habitat patches, smaller patches can serve as “stepping stones” to allow for greater species dispersal and recolonization (Murphy and Weiss 1988; Burel 1989 and Potter 1990 as cited in Fahrig and Merriam 1994; Forman 1995).

Many of the above described factors influence not only the effective habitat patch size, but also other fragmentation thresholds, such as the proportion of suitable habitat or the amount of edge in a landscape. Thus, land use planners should keep these design considerations in mind when interpreting the thresholds presented below.

Diagram 4. Stepping stone patches. Protecting habitat patches strategically positioned between larger habitat patches can be a way to enhance species dispersal and colonization in a landscape, and to increase local species population persistence. Modified from Duerksen et al. (1997), *Habitat Protection Planning: Where the Wild Things Are*, p 14.

¹⁹ Biological integrity refers to “a system’s wholeness, including presence of all appropriate elements and occurrence of all processes at appropriate rates” (as cited in Angermeier and Karr 1994).

Figure 1. Minimum patch area requirements (in hectares) needed to maintain populations or communities of birds, mammals, fishes, invertebrates, or plants species in the United States, as cited in the scientific literature. Numbers represent the recommended minimum patch area sizes; two numbers along one line indicate a recommended range (see Appendix A for specific findings). Lines extend from zero to the recommended minimum patch area sizes to indicate the span of habitat needed for protection.

SUITABLE HABITAT IN LANDSCAPE

Landscapes are complex assemblages of many habitat fragments that together help sustain large-scale biological systems. As a result, meeting minimum patch sizes for species in a given landscape may be inadequate to ensure their persistence (Fahrig 2001). The configuration and nature of the landscape surrounding a patch also greatly determine whether a region will support species persistence and diversity (Lindenmayer and Franklin 2002).

In addition to considering the size of patches, land use planners must consider the total amount of suitable habitat in a given landscape. Local populations of plants and animals are often linked together by dispersal, essentially forming a larger “metapopulation” (Hanski and Simberloff 1997).²⁰ Individual species from such subpopulations migrate between habitat patches, interacting and breeding with other individuals, which influences the overall survivorship of the species in a region. In addition, the quality and availability of habitat patches can greatly determine the viability of a metapopulation. Some habitat patches may be of higher quality allowing for the local species population to benefit from higher reproductive rates than death rates. These “source” populations produce excess individuals that could emigrate into neighboring patches to settle and breed, thus, expanding the overall population and helping to buffer it from local extirpation. On the other hand, some habitat patches may be of poor quality, where local productivity is less than mortality. Referred to as “sink” populations, these areas lack immigration of individuals from source populations, leading to the extirpation of the local population (Pulliam 1988). For species populations that exhibit a metapopulation structure, land use planners should strive to protect existing source habitat patches, as well as restore habitat that may serve to support future source populations. However, land use planners should be cautious not to designate critical habitat solely by the proportion of the local population present; a source habitat could support as little as 10 percent of the metapopulation, which is responsible for maintaining the other 90 percent of the total population (Pulliam 1988). Rather, land use planners should work with ecologists to identify source habitat by demographic characteristics (e.g., death and birth rates of species).

Metapopulation theory reveals that the local extinction of a subpopulation can be prevented by occasional immigration from neighboring patches, termed the “rescue effect,” which is considered important in maintaining small populations and high levels of species diversity (Brown and Kodric-Brown 1977, Stevens 1989). Local extinctions may commonly occur within small habitat patches; about 10-20 percent of certain local populations of plants, arthropods, amphibians, birds, and small mammals within various habi-

Diagram 5. Metapopulation and Source/Sink Dynamics. Local populations of organisms in different habitat patches may be linked demographically, forming an interdependent metapopulation. “Source” habitat patches, which supplement local populations in “sink” habitat patches, should be targeted for protection. Ideally, land use planners should protect entire metapopulations. Modified from Mette and Carroll (1994), *Principles of Conservation Biology*, p 188.

tat types have been found to go extinct per year (Fahrig and Merriam 1994). Thus, a set of interconnected habitat patches should be conserved to sustain sufficiently large metapopulations that would allow for regional species persistence.²¹ Habitat patches must also be configured to facilitate dispersal and recolonization between patches, particularly those used for breeding and foraging (Saunders et al. 1991, Fahrig and Merriam 1994, Boulinier et al. 2001, Fahrig 2001). Land use planners should strive to identify particular subpopulations, habitat patches, or links between isolated patches that are critical for the maintenance of the overall metapopulation of priority species (Meffe and Carroll 1997).

Not only is the quality of the habitat patches themselves important, but also the condition of the matrix between isolated habitat patches. If the matrix is able to support populations of species present in the original contiguous habitat or allows for adequate species dispersal or migration between fragments, then communities in remnant patches may retain diverse and viable populations of native plants and animals (Askins 1995). Estimating the proportion of suitable habitat in a landscape is a larger scale method of determining how much suitable habitat should be conserved to ensure the persistence of species in a region.

MANAGING FOR THE AMOUNT OF NECESSARY HABITAT IN A LANDSCAPE

Scientists generally offer recommendations on the proportion of suitable habitat that should be conserved in a

²⁰ A metapopulation is a set of local populations that interact by individuals moving between the local populations (or subpopulations) (Hanski and Gilpin 1991).

²¹ A local extinction refers to the extinction of a single, local population in a given geographic area; a local extinction does not entail that the entire species has gone extinct within its known range.

landscape based on two scientific trends. First, species disappear in a landscape with the loss of a certain amount of habitat, and different species go extinct at different thresholds of habitat loss (Fahrig 2002). Thus, scientists have estimated extinction thresholds to determine the proportion of suitable habitat needed to sustain specific species.²² The “extinction threshold” is the minimum amount of habitat required for a population to persist in a region below which the population will go extinct (Fahrig 2001, Fahrig 2002).²³ Extinction thresholds are essentially the converse of population viability estimates derived from PVAs (described above).

Second, threshold values may be based on the amount of habitat below, which the negative effects of habitat fragmentation may compromise species persistence. This is termed “habitat fragmentation thresholds” (Andrén 1994, Fahrig 1998). As the proportion of suitable habitat decreases in a

²² From a species perspective, suitable habitat has been interpreted as habitat utilized for nesting, with associated expected birth and death rates that allow for a stable or growing population (Lamberson et al. 1994).

²³ The extinction threshold may be estimated by: 1) the minimum amount of habitat below which the equilibrium population is zero; or 2) the minimum amount of habitat below which the probability of long-term population survival is less than one (Fahrig 2002).

landscape, the reduction in patch sizes and the increasing isolation of these fragments begins to significantly affect the abundance, distribution, or diversity of species in the landscape due to alterations in species movement or the spread of disturbance (e.g., wildfire, flooding, invasion by exotic species), among other factors (Gustafson and Parker 1992, Andrén 1994). The recommendations presented in this review are largely based on existing literature reviews of both extinction thresholds and habitat fragmentation thresholds (see Andrén 1994, Fahrig 2001).

Studies of suitable habitat range between 5 percent to 80 percent of the landscape depending on the species, geographic region, and parameters in question (see Appendix C). Seventy-five percent of the surveyed studies reported that suitable habitat should be up to 50 percent of the total landscape, whereas 50 percent of the studies reported at least 20 percent of habitat (see Figure 2). Given the constraints presented by the available literature (see “A Closer Look at Proportion of Suitable Habitat” in Appendix A for explanation on limitations), the conservation of greater proportions of habitat—such as a minimum of 60 percent—is recom-

BOX 3. PLANNING AT THE RIGHT SCALE

Natural communities vary greatly in the area in which they occur. In order to determine which land parcels and how much habitat to protect, land use planners should plan at the appropriate scale for the target system or species. Ideally, planning would occur across multiple scales to capture the greatest habitat and species diversity (see Box 2 for a definition of scale).

1. Coarse scale

Certain habitats and species, termed “matrix” habitats and “coarse-scale” species, will require planning to occur at a very large scale to capture their wide-ranging needs. Natural communities—such as spruce-fir forests (Northeast), longleaf pine forests (Southeast), tallgrass prairie (Midwest), and sagebrush (West)—can span as much as one million contiguous acres. Matrix communities are historically dominant habitat and exist across widespread physical gradients, such as broad ranges of elevation, precipitation, and temperature. Coarse-scale species (also termed wide-ranging species) require large areas to access the quantity of habitat or the different habitat types needed for survival (e.g., prairie chicken, fox, badger, marten, and pike minnow). Migratory species (e.g., migratory birds or salmon) and top-level predators (e.g., caribou, wolves, and bears) may depend upon not only matrix communities, but also associated habitat patches (described below), connecting corridors, and aquatic systems. To address the needs of such expansive communities and wide-ranging species, land use planners will need to take a landscape scale and regional approach; an area of several thousand acres up to one million acres may need to be conserved. This scale of planning will likely demand an inter-jurisdictional perspective and inter-municipal cooperation.

2. Intermediate scale

Planning may need to occur at a smaller scale—on the order of several hundred to a thousand acres—to conserve “large patch” community types and “intermediate-scale” species. Occurring in large patches, but not as vast an area as matrix types, are communities like red maple-black ash swamps or northern hardwood forests. Large patch communities may span a thousand acres but

are bound by certain physical factors (e.g., coastal salt marshes being defined by low topographic position and predictable tides) or by a single dominant ecological process (e.g., fire, flooding, or drainage). Intermediate-scale species are those that depend on a single large patch or several different kinds of habitats (e.g., amphibians that depend on both wetland and upland complexes).

3. Fine scale

Land use planners will need to plan at a more “fine” or site-specific scale to ensure that “small patch” communities and local-scale species are protected. Small patch communities are communities that naturally occur in narrow, localized, or discrete areas (e.g., fens, bogs, glades, caves, or cliffs) or occur only where specific or narrow physical factors and local environmental conditions are present (e.g., seepages, outcrops, certain types of soil). Local-scale species are species with limited movement and dispersal abilities or specific habitat needs that restrict their populations to a single community or habitat type. Belonging to this category are many rare and threatened species, insects, and plants. Occurrences of small patch communities and local-scale species may be found in only a couple of acres up to several hundred acres.

Given the natural variability in occurrence of communities and species and their wide-ranging geographic needs land use planners will need to plan at multiple scales to capture the biological diversity of a region, as well as to plan at the right scale for designated conservation targets.

The conservation thresholds found within this literature survey are predominately based on matrix and large patch communities, as well as coarse- and intermediate-scale terrestrial species. Thus, the findings and recommendations in this report do not fully address the conservation needs for small patch communities, local-scale species, and aquatic environments. To ensure the protection of restricted communities and rare species, land use planners will need to collaborate with local ecologists to identify priority conservation areas for their region.

The above information is based on research by The Nature Conservancy (TNC) (see Poiani and Richter 2000, and TNC 1998).

mended to sustain long-term populations of area-sensitive species and rare species.

Scientists have proposed that more robust species (e.g., large dispersal range, high fecundity, high survivorship)—usually the more common widespread species—may persist in even the most extensively fragmented systems with only 25 to 50 percent of suitable habitat. In contrast, rare species and habitat specialists like the Northern spotted owl may require up to 80 percent of suitable habitat to persist in a region (Lande 1987, Lande 1988, Lamberson et al. 1992). Land use planners should take into account the more sensitive and rare species within their region to develop critical thresholds for proportions of suitable habitat relevant to their geographic setting (Mönkkönen and Reunanen 1999). Such an approach may also provide for the protection of more common and robust species that depend on similar habitat types.

In addition to the proportion of suitable habitat, other considerations should be factored into land use decisionmak-

Land use planners should strive to conserve at least 20% to 60% of natural habitat in a landscape.

ing, such as the spatial arrangements of remaining habitat patches and the matrix between patches. In landscapes that are highly fragmented—including most urban, suburban, and even rural areas with less than 30 percent of remaining suitable habitat—the spatial arrangement of habitat patches greatly affects species survival (Andrén 1994). For example, wetland bird communities are found to depend not only on their local habitat, but also on the amount of wetlands within a surrounding three kilometer buffer (Fairbairn and Dinsmore 2001).

The condition of the surrounding matrix in which habitat patches are embedded also influences the effective size of the remaining fragments and the degree to which the patches are isolated (Andrén 1994, Lindenmayer and Franklin 2002). In turn, these factors affect whether or not species will be able to successfully disperse among habitat patches and whether important ecosystem processes, such as fire and hydrologic cycling, will occur on the landscape (Fahrig and Merriam 1994) (*see* “Patch location/configuration”).

Figure 2. Recommended minimum proportions of suitable habitat (in percentages) needed to maintain populations or communities of birds, mammals, invertebrates, or hypothetical species (as determined by models) in the United States, as cited in the scientific literature. Numbers represent the recommended minimum proportions of habitat; two numbers along one line indicate a recommended range (see Appendix B for specific findings). Lines extend from zero to the recommended proportion to indicate the span of habitat needed for protection.

EDGE EFFECTS

Habitat fragmentation inevitably results in the creation of edge environments. Edges occur where a habitat—such as a forest, prairie, or wetland—meets a road, clearcut, housing development, or some other natural or artificial transition or boundary (Soulé 1991). Habitat fragments differ from the original contiguous natural habitat in that they have a greater amount of edge per area and the habitat core is closer to an edge environment. Patch edges may have significantly different conditions than the contiguous system or habitat interior, with altered fluxes of wind, sun exposure, water, and nutrients that greatly affect animal and plant communities (Saunders et al. 1991, Murcia 1995). This change in energy, nutrient, or species flow results from increased amounts of edge and reduced interior habitat, and has been termed the “edge effect.”

Increased amounts of edge along habitats create a disturbed environment that allows for the establishment of pest and predator species, which penetrate the fragment interior and adversely affect the diversity and abundance of interior species (Primack 1993). Mammalian predators (e.g., raccoons, foxes, coyotes, feral cats), egg-eating birds (e.g., crows and blue jays), and brood parasitizers (e.g., brown-headed cowbirds) concentrate their hunting along forest edges, thus, increasing the intensities of predation on native species (Soulé 1991).²⁴ Habitat fragmentation also increases the vulnerability of remnant patches to invasion by exotic and pest species (Soulé 1991, Askins 1995). Higher frequency and intensity of disturbances, like fire and wind damage, may also result due to increased edge (Soulé 1991). Edges like roads and trails introduce such disturbances as pedestrian, pet, and vehicular traffic, causing animals to avoid such areas (Duerksen et al. 1997). Each of these edge effects has significant impact on the vitality and composition of the species in the remaining habitat patch.

Information on environmental and species response to edges helps determine how large patch sizes should be designed to provide sufficient interior habitat, as well as how far development, such as roads, trails, and housing, should be from remnant core areas.

MANAGING FOR EDGE INFLUENCE

The intensity of edge effects has been measured by a number of different methods. The influence of an edge (termed “edge influence”) may be defined as the distance between the border to the point where microclimate and vegetation do not significantly differ from the interior conditions of the habitat. From a species perspective, edge influence may be defined as the distance from an edge to the area where species densities, survival rates, or reproductive rates

Creation of edge by deforestation, Willamette National Forest, Oregon. Photo courtesy of Steve Holmer, American Lands Alliance.

do not differ from those in the interior habitat (Forman 1995, Murcia 1995). Edge influence has also been measured by the behavioral response of animal movement, such as flushing distance, from a disturbance associated with edge environments.²⁵

The intensity of edge effects is influenced by many physical factors, such as the shape and size of the patch, the direction the edge faces (i.e., aspect), and the structural contrast of its boundaries (Soulé 1991).

As discussed earlier, larger, circular patches will have more interior habitat and less edge than a rectangular or oblong patch of the same size (Forman and Godron 1981) (*see* “Patch shape”). The orientation of edges affect the amount of exposure to solar radiation, with edges facing the equator tending to have wider edge influence (Forman and Godron 1981, Murcia 1995). The more structurally different the boundaries between different habitat types, the greater the edge effects.

To decrease the influence of edge, buffers are recommended to “soften” the transition between natural and artificial environments (*see* “Boundary zone”). A remnant forest patch directly abutting cropland or urban development will have significant edge effects in contrast to a forest adjacent to a buffer of small shrubs or secondary vegetation. In addition, some habitat types may be more susceptible to negative edge effects; for example, grasslands have been found to exhibit wider edges than forest edges (Forman 1995).

Scientists offer a wide range of findings on the distance edge effects penetrate into ecosystems in the United States, with results ranging from only eight meters up to five kilometers. Based on the response of birds to edge environments, edge effects may penetrate into a habitat patch from about 16 meters up to almost 700 meters; mammals may avoid edge environments from 45 meters up to 900 meters; and microclimate changes may extend from eight meters up to 240 meters into habitat (*see* Appendix E). The majority of the surveyed studies (75 percent) estimates edge influence to be approximately 230 meters or less (*see* Figure 3).

Based on this select review, land use planners should take a conservative approach to mitigating edge effects. To pro-

²⁴ Cowbird females lay their eggs in the nests of other bird species, relying on these hosts to incubate and raise their chicks. Brown-headed cowbirds have been found to parasitize over 220 host species. (*see* <http://www.audubon.org/bird/research/cowbird-info.html>).

²⁵ Flushing distance is the distance that an animal may flee in response to a disturbance, such as in response to pedestrian or pets on a trail or vehicular traffic on roads (Duerksen et al. 1997).

vide for sufficient suitable habitat, land use planners should buffer remnant patches by at least 300 meters from all edge peripheries, particularly for matrix and large patch community remnants; naturally small patch communities may not require such a wide buffer (*see* Box 3). The area within the buffer should not be counted as suitable habitat provided for species conservation. In addition, roads, trails, and other development should be placed at least 300 meters away from interior habitat to minimize impact. Ideally, land use planners and ecologists should

To avoid the negative effects of edges, land use planners should consider buffering up to 230 to 300 meters around edge peripheries.

work collaboratively to determine the intensity of edge effects by the response of species or groups of species that are most sensitive to patch size in the ecosystems or regions of concern (Forman 1995). Measuring edge distance by the most sensitive species—often vertebrates of conservation concern—would mean that the influence of edges may actually be hundreds or thousands of meters, thus, requiring much larger patch sizes to meet habitat requirements.

Figure 3. Distances (in meters) that edge effects penetrate into habitats in the United States, as cited in the scientific literature. Edge width is measured by abiotic, bird, mammal, or plant responses; abiotic responses include microclimate changes, such as changes in temperature, humidity and light. Numbers represent edge width distance findings; two numbers along one line indicate a range of edge width distance (see Appendix C for specific findings). Lines extend from zero to the determined edge widths to indicate the span of habitat that is affected by edge effects.

RIPARIAN BUFFERS

Although generally comprising a small proportion of the landscape—often less than 1 percent—riparian areas are regional hot spots that support a disproportionately high number of wildlife species and provide a wide array of ecological functions and values (Naiman et al. 1993, Fischer and Fischenich 2000, National Research Council 2002). The support of high levels of species diversity and ecological processes in these areas is due in part to regular disturbance events, like floods, as well as to climatic and topographic variation and the availability of water and nutrients (Naiman et al. 1993).

Riparian areas are ecosystems adjacent to or near flowing water, such as rivers, lakes, shorelines, and some wetlands. They are transitional areas between aquatic and upland terrestrial systems and exhibit gradients in environmental conditions, ecological processes, and living organisms (National Research Council 2002). Unfortunately, riparian systems are continuously threatened by adjacent or upstream human activities. For example, agricultural, industrial, or urban development can increase levels of light, temperature, stormwater runoff, sedimentation, pollutant loading, and erosion, which degrade water quality and diminish suitable aquatic habitat (Castelle et al. 1994). In the last 200 years,

over 80 percent of riparian land in North America and Europe has disappeared (Naiman et al. 1993).

To ameliorate the negative impacts of adjacent land uses, a common regulatory and management practice is to establish protected areas, or buffers, around aquatic resources like rivers, streams, lakes, and wetlands. At least 15 states and seven local jurisdictions in the United States have adopted riparian buffer regulations, protecting widths ranging from six meters to over 300 meters in size (Johnson and Ryba 1992).

Buffers are vegetated zones, usually linear bands of permanent vegetation, preferably native species, located between aquatic resources and adjacent areas subject to human alteration (Castelle et al. 1994, Fischer and Fischenich 2000). Buffers can help regulate riparian microclimate and provide necessary shading for the in-stream growth and reproduction of aquatic life; stabilize stream banks and prevent channel erosion; provide organic litter (e.g., leaf litter) and woody debris, which are important sources of food and energy for fish and aquatic invertebrate communities; remove or regulate sediment, nutrients, or other contaminants (e.g., pesticides, herbicides) from runoff; provide flood attenuation and storage to decrease damage to property; and provide wildlife habitat (Castelle et al. 1994, O’Laughlin and Belt 1995, Wenger 1999, Fischer and Fischenich 2000, National Research Council 2002).

MANAGING FOR ADEQUATE BUFFER WIDTH

Recommended buffer widths are commonly determined by one of two methods: uniform versus variable widths. Uniform-width buffers are commonly adopted because they are easier to enforce, require less specialized knowledge, time, and resources to administer, and allow for greater regulatory predictability (Castelle et al. 1994). Uniform widths are often based on a single resource protection goal, usually related to water quality. In contrast, with variable-width buffers, the size or width of the strip is adjusted along its length to account for multiple functions, adjacent land use, and site and stream conditions. The width of the strip may be adjusted depending on the value of the aquatic resources, the intensity of surrounding land use, and the type and condition of vegetation, topography, soils, or hydrology, among other variables. For example, a larger width may be required for buffers surrounding more pristine or highly valued wetlands or streams; in close proximity to high impact land use activities; or with steep bank slopes, highly erodible soils, or sparse vegetation (Castelle et al. 1994, Fischer and Fischenich 2000).

Although the method of varying buffer width is generally believed to provide more adequate protection for aquatic resources, it may be less efficient because variable strips can retain less material than a uniform-width buffer of equivalent average width (Weller et al. 1998). Thus, providing policymakers with scientific guidance on uniform buffer widths allows for the implementation of practicable land management practices that protect aquatic resources.

For this report, riparian buffer widths are measured from the top of the bank or level of bankfull discharge of one side of a water body;²⁶ therefore, a 50 meter buffer on a 10 meter stream would create a zone at least 110 meters wide (Wenger 1999, Fischer and Fischenich 2000).

As with other conservation thresholds, the scientific literature does not support an ideal buffer width applicable in all circumstances. This survey found recommended buffer widths ranging from one meter up to 1600 meters, with 75 percent of the values extending up to 100 meters (see “A Closer Look at Buffer Width” in Appendix E for further discussion). At minimum, a riparian buffer should encompass “the stream channel and the portion of the terrestrial landscape from the high water mark towards the uplands where vegetation may be influenced by elevated water tables or flooding, and by the ability of soils to hold water” (Naiman et al. 1993).

Land use planners should strive to establish 100-meter wide riparian buffers to enhance water quality and wildlife protection.

The necessary buffer size varies considerably based on the specific management goal. In general, recommended buffer sizes are significantly greater if the intent is to protect ecological functions, such as providing wildlife habitat and supporting species diversity, as opposed to water quality functions.

Based on the majority of scientific findings, land use practitioners should plan for buffer strips that are a minimum of 25 meters in width to provide nutrient and pollutant removal; a minimum of 30 meters to provide temperature and microclimate regulation and sediment removal; a minimum of 50 meters to provide detrital input and bank stabilization; and over 100 meters to provide for wildlife habitat functions.²⁷ To provide water quality and wildlife protection, buffers of at least 100 meters are recommended (see Figure 4).

OTHER BUFFER DESIGN CONSIDERATIONS

The width of any given buffer is just one aspect, albeit important, which determines its ability to provide a variety of functions. Other factors to consider are the linear extent, vegetation composition, and level of protection of buffers. The following is general guidance on the design and development of buffers.

- **Vegetation:** Buffers should have diverse vegetation that is both native and well-adapted to the region. Maintaining a diverse array of species and vegetation structure (e.g., herbaceous ground cover, understory saplings, shrubs, and overstory trees) is recommended to allow for greater tolerance to possible fluctuations in environmental conditions (e.g., water levels, temperature, herbivory), and to provide for greater ecological functions (e.g., wildlife habitat) (see Fischer and Fischenich 2000 for further guidance on vegetation type, diversity, and propagation techniques).
- **Extent:** In part, the effectiveness of a buffer in meeting management objectives is a function of the linear extent of the aquatic system that is protected (Wenger 1999). Protection efforts should prioritize the establishment of continuous buffer strips along the maximum reach of stream, rather than focusing on widening existing buffer fragments (Weller et al. 1998). Protection of the headwater streams as well as the broad floodplains downstream is also recommended. Headwater streams and downstream floodplains generally encompass less than 10 percent of total landmass; thus, this level of protection is practicable (Naiman et al. 1993). Ideally, buffers

²⁶ The bankfull discharge is the maximum level of discharge that a stream channel can convey without flowing onto its floodplain. This stage plays a vital role in forming the physical dimensions of the channel because the flows near the bankfull stage move the most sediment over the long-term and the processes of sediment transport and deposition are the most active in forming the channel (Dunne and Leopold 1978).

²⁷ While a 100-meter buffer is recommended to provide for adequate wildlife values, some natural riparian habitat is too narrow to support such an area. In these cases, land use planners should consider the utility of narrower buffers, especially where they might function as wildlife corridors (see “Habitat Connectivity”).

should extend along all perennial, intermittent, and ephemeral streams, lakes, shorelines, and adjacent wetlands (Weller et al. 1998, Wenger 1999), so long as such buffering would not create detrimental upland habitat fragmentation as might be the case in areas of high stream densities (Lindenmayer and Franklin 2002).

- **Buffer protection:** To ensure that buffers function adequately, all major sources of disturbance and contamination should be excluded from the buffer zone, including dams, stream channelization, water diversions and

extraction, heavy construction, impervious surfaces, logging roads, forest clear cutting, mining, septic tank drain fields, agriculture and livestock, waste disposal sites, and application of pesticides and fertilizers (Wenger 1999, Pringle 2001). Another consideration is the level of legal protection afforded to the area. Whether the buffer is in preservation status or protected under a conservation easement that allows for some level of activity, for example, will also determine its ability to provide desired functions.

BOX 4. UNDERSTANDING THE EFFECTS OF LAND USE

The many different uses of land—whether for agriculture, silviculture, recreation/open space, or commercial or residential development—will have varying impacts on the ecosystems, habitats, and species in a region. The types, extent, and combinations of land uses within a matrix will affect the viability of habitat patch sizes, the amount of suitable habitat, the severity of edge effects, and the utility of buffers and corridors in a given landscape.

Certain land use types are likely to be more compatible with biodiversity conservation in certain landscapes, depending on the natural arrangement of physical features, habitats, and species, and the effect of previous land uses (Forman 1995). A study on breeding bird communities in central Pennsylvania, for example, found that forests within agricultural landscapes had fewer forest-associated species, long-distance migrants, forest-canopy and forest-understory nesting species, and a greater number of edge species than forest landscapes primarily disturbed by silviculture, irrespective of the effect of disturbance (Rodewald and Yahner 2001). In Colorado, ranchlands and protected reserves were found to be more compatible with species of conservation concern (including songbirds, carnivores, and plant communities) than exurban developments, which tended to support only human-adapted species (Maestas et al. *in press*).

To plan for long-term sustainability, land use planners will need more guidance on the level of compatibility of different land uses in various regions and ecosystems. As a general rule, a landscape mosaic should be planned first according to its ecological constraints (e.g., water availability, forest and soil productivity, natural flooding/fire cycles) and natural site potential (e.g., natural potential for productivity and for nutrient and water cycling) (Dale et al. 2000). In terms of hierarchical planning, a general recommendation is for land use planners to first plan “for water and biodiversity; then for cultivation, grazing, and wood products; then for sewage and other wastes; and finally for homes and industry” (Forman 1995 *as cited in* Dale et al. 2000, p.658).

Figure 4. Recommended minimum riparian buffers (in meters) from each side of a water body (e.g. stream bank) needed to prevent noise/wind damage; provide detrital input; moderate temperature/microclimate; stabilize banks; provide flood attenuation; control sediment; reduce nutrients/pollutants; and provide wildlife habitat functions and general protection of aquatic systems in the United States, as cited in the scientific literature. Numbers represent the recommended minimum buffer widths; two numbers along one line indicate a recommended range (see Appendix D for specific findings). Lines extend from zero to the recommended buffer widths to indicate the span of habitat needed for protection.

HABITAT CONNECTIVITY

Conservation biologists generally agree that species viability and diversity are enhanced by well-connected habitats (Fahrig and Merriam 1985, Gilpin and Soulé 1986, Primack 1993, Noss and Cooperrider 1994, Meffe and Carroll 1997, Beier and Noss 1998, Lehtinen et al. 1999). Because small, isolated reserves are unlikely to maintain viable populations over the long-term, and because climate change and disturbances require that organisms be able to move over large distances, corridors are recommended as one conservation measure to counter the negative effects of habitat fragmentation and patch isolation (Noss 1991).

Not only can riparian buffers help ensure water quality protection and habitat for plants and animals adjacent to waterbodies, but they can also act as dispersal routes for species and connect remnant patches.²⁸ Although riparian corridors are useful for some terrestrial wildlife, linkages outside riparian areas may be required to maintain connectivity for non-associated upland species (McGarigal and McComb 1992).

Corridors (also referred to as conservation corridors, wildlife corridors, or dispersal corridors) are intended to permit the direct spread of many or most taxa from one region to another (Brown and Gibson 1983 as cited in Noss 1991). They should facilitate foraging movements, seasonal migrations, dispersal and recolonization, and escape from disturbance (Saunders et al. 1991, Soulé 1991). Whether or not corridors actually provide connectivity will depend largely on the species in question and its dispersal capabilities and movement patterns across the landscape (Saunders et al. 1991). Given the species-specific nature of this issue, generalizations about the biological value of corridors are under debate among the scientific community (Noss 1987, Simberloff and Cox 1987, Simberloff et al. 1992, Franklin 1993, Beier and Noss 1998) (for further discussion see Appendix A “Further Analysis”).

MANAGING FOR OPTIMAL CORRIDOR WIDTH

An important design consideration when maintaining or establishing habitat corridors is width. Corridor width can influence the dispersal behavior of species, resulting in changes in home range size, shape, and use. In addition, corridor width is positively correlated with the abundance and species richness for birds, mammals, or invertebrates (Lindenmayer and Franklin 2002). As is true for other conservation thresholds, in general, the wider the better. Wider corridor bands are recommended to provide interior habitat conditions, which allows for the movement and/or habitation of interior species. In addition, greater habitat area is

²⁸ A riparian corridor is a strip of vegetation adjacent to an aquatic system that connects two or more larger patches of habitat through which an organism is likely to move (Fischer et al. 2000). Corridors are not only riparian but also can be positioned in upland environments as well.

Diagram 6. Habitat Connectivity. Habitat connectivity can be increased by the protection of stepping stone patches or by the establishment of a corridor. Modified from Dramsted et al. (1996), *Landscape Ecology Principles in Landscape Architecture and Land-Use Planning*, p. 37.

more likely to provide sufficient cover for species from predators, domestic animals, or human disturbance (Forman and Godron 1981). Corridors that are too narrow may consist entirely of edge, thus, deterring the use by interior or area-sensitive species or causing an increase in mortality from predation (Wilcove et al. 1986).

Although corridor width has been identified as an important design element, few studies explicitly examined minimum corridor width requirements. This survey found a limited number of studies that provide indirect evidence on effective corridor sizes, however, none of the reviewed studies explicitly tested different corridor widths with the goal of determining an optimal size. Although they did not directly examine recommended corridor width, three studies did find corridor widths of 32 meters and 100 meters to encourage the movement of butterflies and reduce species turnover rates for breeding birds, respectively (Haddad and Baum 1999, Haddad 1999 for butterflies; Schmiegelow et al. 1997 for birds).

Data limitations on the relationship between corridor width and species response prevent the development of recommendations on optimal corridor size. For any given set width, corridor effectiveness will vary with other attributes, such as length, habitat continuity, habitat quality, and topographic position in the landscape, among other factors (Lindenmayer and Franklin 2002) (see “Other Corridor Design Considerations”).

First and foremost, land use planners should strive to limit the degree of isolation between existing habitat patches and optimize the natural connectivity to allow for the dispersal of sensitive native species through the most appropriate means. This may be done by establishing habitat corridors, maintaining specific structural conditions within the landscape, or setting aside stepping stone patches (Lindenmayer and Franklin 2002) (see “Inter-patch distance”).

Simultaneously, land use planners should minimize the connectivity of artificial habitats like clearcuts, agricultural fields, and roadsides that tend to spread exotic and pest species (Noss 1991).

OTHER CORRIDOR DESIGN CONSIDERATIONS

Corridor width is one important factor that determines whether a corridor will enhance landscape connectivity. Other factors to consider are the condition of the landscape matrix, the distances between remnant patches, and the extent and configuration of the corridors themselves.

- **Condition of landscape matrix:** The landscape matrix in which corridors are embedded greatly influences corridor use. If conditions in the matrix are suitable (e.g., sufficient original vegetation cover exists), then species reliance on corridors may be minimized. On the other hand, if matrix conditions are inhospitable or degraded (e.g., are highly developed or fragmented; have disrupted ecological processes or disturbed conditions; or are highly invaded by exotic species), then corridor systems linking remnant patches may be required to retain landscape connectivity (Rosenburg et al. 1997 *as cited in* Lindenmayer and Franklin 2002). Given that land use planners often work in extensively developed or developing areas, the latter case is the most likely. Understanding the relationship between the landscape matrix and the movements of target organisms will be

fundamental in determining the best placement of corridors to enhance connectivity (Lindenmayer and Franklin 2002).

- **Inter-patch distance:** The distance between remnant patches will affect the conservation value of corridors. When distances between remnant patches are short as compared to the movement ability of target species, a stepping stone approach may be the most effective mechanism for promoting dispersal (*see* “Patch location/configuration”). On the other hand, if the distance separating habitat fragments is relatively far, corridors may be the right mechanism to provide landscape connectivity (Haddad 2000).
- **Corridor configuration and extent:** Networks of intersecting corridors may provide for more effective migratory pathways, allowing greater opportunities for animal foraging and predator avoidance (Forman and Godron 1981). Ideally, a corridor would “encompass the entire topographic gradient and habitat spectrum from river to ridgetop” (Noss 1991). Such an expansive corridor network may allow for the representation of different native habitat and land cover types in a region. In addition, having such a broad system of corridors would help enhance overall resiliency in case of the destruction of individual corridors by unexpected disturbances (Noss 1991).

BOX 5. CONSERVATION THRESHOLDS: A STARTING POINT

The following summarizes findings from a select sample of scientific papers pertinent to species and ecosystems in the United States on critical thresholds related to minimum habitat patch area, proportion of suitable habitat, edge influence, and riparian buffer width. Recommendations are based on the goal of capturing 75 percent of the requirements found for species, communities, and habitats surveyed; thus, the third quartile was used by calculating the value for which 75 percent of the threshold values lie below this value (after numerical ranking). These guidelines should be interpreted very cautiously because they are based on a small sample, and may not be applicable for specific species, habitats, and geographic settings of concern. Land use planners and land managers should consider these results as a baseline from which to launch more tailored and in-depth assessments.

Habitat Patch Area

In general, land use planners should strive to maintain and protect habitat patches greater than 55 hectares (137.5 acres). The goal should be to maintain larger parcels greater than 2,500 hectares (or about 6,175 acres) to protect more area-sensitive species.

Proportion of Suitable Habitat

In general, land use planners should strive to conserve at least 20 percent up to 50 percent of the total landscape for wildlife habitat, where possible.* The conservation of greater proportions of habitat—such as a minimum of 60 percent—may be needed to sustain long-term populations of area-sensitive species and rare species.

Edge Influence

In general, to avoid the negative effects of edges on habitats, land use planners should consider establishing buffer zones up to at least 230 to 300 meters from the periphery of edges.

Riparian Buffer Width

In general, land use planners should plan for riparian buffer strips that are a minimum of 25 meters in width to provide for nutrient and pollutant removal; a minimum of 30 meters to provide temperature and microclimate regulation and sediment removal; a minimum of 50 meters to provide detrital input and bank stabilization; and over 100 meters to provide for wildlife habitat functions. To provide water quality and wildlife protection, buffers of at least 100 meters are recommended.

Landscape Connectivity

Land use planners should strive to reduce the distances between habitat patches and to optimize the natural connectivity of the landscape. This may be done by establishing habitat corridors that connect previously isolated patches; by maintaining the natural, structural conditions within the landscape; or by setting aside stepping stone patches. Simultaneously, land use planners should minimize the connectivity of artificial habitats like clearcuts, agricultural fields, and roadsides.

*The 50 percent recommendation is based on capturing 75 percent of the threshold values surveyed; 20 percent is based on capturing 50 percent of threshold values surveyed. The latter recommendation is provided because land use planners are often working in highly developed regions where protecting 50 percent or more of the landscape is impractical.

RECOMMENDATIONS FOR FUTURE RESEARCH AND ACTION

THE ROLE OF THE SCIENTIFIC COMMUNITY

More scientific research is needed to help inform specific land use decisions being made everyday in the United States—decisions that significantly determine the future of domestic biodiversity. This survey of the scientific literature found that out of all land management strategies geared toward reducing the effects of urbanization and sprawl, the most substantial guidance available is on how to best develop riparian buffers. Conversely, science offers very little consensus opinion to land use planners on how to determine which habitat patches to conserve and where; the amount of habitat to protect in a region or conversely the maximum amount of impervious surface to allow; the ways in which to mitigate against the negative consequences of habitat edges; or how best to design and plan for corridors. In addition, because development will continue to occur and because private lands are increasing becoming more important in species conservation, more information is needed on the level of compatibility of the various types and combinations of land uses with biodiversity. To better inform decisionmaking, the scientific community needs to provide more specific information to land use practitioners on how to implement ecologically conscious growth.

In addition, scientists should address the taxonomic bias in the literature. A recent review of 134 papers on habitat fragmentation found that over half of the research focuses on birds, the vast majority being songbirds. Mammals and plants come second, making up about 18 percent; invertebrates and reptiles/amphibians are the most understudied, with only 9 percent and 4 percent, respectively (McGarigal and Cushman 2002). Our survey found similar results. Most of the fragmentation research used for this study looks at the effects of fragmentation on bird species and, to a lesser extent, mammals. Sixty-six percent of the surveyed research on edge effects; 57 percent on patch area; 44 percent on proportion of suitable habitat; and 32 percent of the wildlife papers on buffers measured effects on bird species.

“Fragmentation effects are difficult to translate into management rules-of-thumb for several reasons: (1) they tend to be highly specific to the taxa, spatial scales, and ecological processes considered; (2) they vary according to the landscape type and its structure; and (3) their influence on species distribution and abundance may be obscured by local effects such as changes to certain microhabitat features (e.g., habitat degradation).”

Villard (2002), Ecological Society of America, Ecological Applications 12(2), p.319

Mammals made up 24 percent of the research on proportion of suitable habitat; 21 percent on patch area; 11 percent of research on buffers; and 9 percent on edge effects. Fish, invertebrate, and plant response made up anywhere from zero to 13 percent of the research. This focus has left particularly large gaps in research on reptiles and amphibians, invertebrates, and plants.

If the scientific community wishes to help curtail the loss and endangerment of species, then it will need to start addressing other taxonomic groups. The most at-risk species in the United States are flowering plants and freshwater species. In terms of species numbers, flowering plants have by far the greatest number of at-risk species (over 5,000 species are at-risk). In terms of the proportion, species that rely on freshwater habitats—mussels, crayfishes, stoneflies, amphibians, and fishes—exhibit the highest level of risk. With only 14 percent of bird species being at risk and 16 percent of mammal species, these groups are the least threatened (Master et al. 2000).

Above all else, this literature search reveals the inadequacy of the information currently available for land use planners to use in their day-to-day decisions, which have profound effects on biological diversity. The scientific community should be commended for developing theories, such as metapopulation concepts, which have important implications for applied management like endangered species recovery. However, due to the simplified assumptions implied within metapopulation models, their application to real landscapes is severely limited (Fahrig and Merriam 1994). In addition, whether metapopulations are actually common in real landscapes is largely unknown (Lindenmayer and Franklin 2002). Similarly, the SLOSS debate on whether a single large reserve is better than a group of small ones, which consumed the academic community for many years, failed to produce concrete management recommendations (Forman 1995).²⁹ In order for ecological principles to be put into practice, land use professionals will need general rules of thumb and specific guidelines to implement on-the-ground.

²⁹ SLOSS stands for Single Large Or Several Small, which refers to whether conservation reserves are best designed as one large tract of protected land versus several smaller tracts of the equivalent area (Meffe and Carroll 1997).

Only about 10 percent of the papers reviewed in this survey provided quantitative information useful for developing conservation thresholds relevant to land use planning. Similarly, most of the papers published in the *Journal of Applied Ecology* during a large proportion of the last 30 years have been devoid of practical applications or management recommendations (Pienkowski and Watkinson 1996). Given the complexity surrounding habitat fragmentation, it is understandable that the scientific community is apprehensive about presenting or extrapolating research findings such that they can be easily applied to land use planning and management. Scientists even warn that providing general thresholds “may be more dangerous than useful because many species can be lost if the threshold is determined by averaging over the requirements of many species” (Mönkkönen and Reunanen 1999).

Without adequate information on land use thresholds, land use decisionmaking will continue to be uninformed by the best available science. Although reaching consensus in the scientific community on these thresholds may be an impractical goal, if enough resources are directed to answer specific land use threshold questions, research results may begin coalescing on some general range of values, which would provide useful guidance. Hopefully, this literature review will prompt scientific research that is relevant to and usable by everyday land use practitioners.

THE ROLE OF THE POLICY COMMUNITY

Although more scientific study is needed to provide ecologically-based and scientifically defensible advice on land use planning and land management thresholds, substantial research has already been conducted. The policy community could play a more active role as a conduit between the scientific community and land use planners—to help interpret the available research, help with dissemination, and communicate back to scientists on research gaps and needs. Periodical reviews of the literature, such as this survey, should be conducted to provide land use planners and land management practitioners with the most up-to-date and best available scientific information. In addition, where possible, scientific research will need to be translated into easily applied management recommendations. To ensure that land use decisions are well-informed, mechanisms should be in place to communicate current scientific understanding to the general public. Scientific institutes, such as the National Academy of Sciences, among others, should conduct or commission studies on areas where particular research gaps are found. Clear arguments, particularly those that are economically based, need to be conveyed to the land use community so that they understand why they should make land use decisions with biodiversity in mind.

THE ROLE OF THE LAND USE PLANNING COMMUNITY

The failure of land use planners to communicate their needs to the scientific community may be another reason that science inadequately addresses land use planning concerns. Land use practitioners should be encouraged to better communicate with scientists about the type of information that they need and in what format it would be most useful. An exchange about what is working on-the-ground and what is not, and about public concerns regarding land use alteration and biodiversity, would be of great benefit.

However, given the diverse habitat requirements of species and the great uncertainty and unpredictability of species and ecosystem response to habitat alteration, land use planners should not wait for the development of *the magical threshold value* before applying known general ecological guidelines, such as those presented by the Ecological Society of America’s Land Use Committee. To ensure that our natural resources will be conserved for future generations, spatial planning needs to proceed immediately using the best available information.

Land use planners should err on the side of caution and adopt the most conservative threshold ranges, particularly since factors, such as global climate change, are likely to intensify land use impacts. The future change of our climate—predicted to rise globally by an average about 4° Fahrenheit (2° Celsius) by the year 2100—is likely to alter the level and timing of temperature and precipitation and to increase the frequency of environmental disturbances (like floods, droughts, hurricanes, and fires), causing shifts in suitable ecosystem and species ranges, as well as the composition of species and flows of energy and nutrients (Field et. al. 1999). For species and ecosystems to be able to withstand such drastic environmental perturbations, sufficient intact and well-connected habitat will be essential. Thus, larger patch sizes, greater habitat area, wider buffers, and more corridors are likely required under future global warming than presented in this review.

Land use planners should realize that, ultimately, there is no replacement for site-specific assessments. It is both difficult and often misleading to develop thresholds that generalize across landscapes and across ecoregions (Mönkkönen and Reunanen 1999). Since thresholds will fail to be meaningful when generalized across landscapes, ecosystems, and states, thus unable to capture the unique variation in nature, land use planners and managers need to work in close collaboration with ecologists (Mönkkönen and Reunanen 1999). Land use professionals should use the articles and research highlighted in this review only to the extent that they are appropriate for their region and to launch more in-depth analyses. This review predominately covers thresholds and guidelines for planning at a large (coarse) scale. This report,

however, does not focus on the conservation of rare or localized species or habitat types, and species other than birds and mammals. It does not provide guidance on how to protect lands of greatest biological value. Rather than simply adopting the types of measures discussed in this review, land use planners should collaborate with scientists to better protect small patch communities and local-scale species and to better identify site-specific and regional conservation needs.

Although land use planners are asked to make local, site-specific decisions on a daily basis, it is still vital to maintain a landscape perspective. Numerous, small development projects that independently may not contribute to significant habitat loss, degradation, or fragmentation, may cumulatively have devastating consequences. Site-specific land use decisions would be more ecologically mindful if better informed by scientific information. Yet, to really make a difference for

biodiversity, land use planners will need to begin considering their cumulative and landscape-scale impacts.

Biodiversity needs to be a central component directly considered in all land use and community planning projects. An overarching land use vision with a statewide or county-wide blueprint for protecting ecosystems, representative and rare species, and broader patterns of biodiversity would serve as an important framework to guide the implementation of the specific thresholds outlined in this report. For example, Florida developed a model that identifies areas with priority conservation significance and landscape linkages (i.e., corridors) captures most of the major ecological communities and known occurrences of rare species for the entire state (Hector et al. 2000). Conserving regional biodiversity and accounting for land use impacts over a large scale—both spatially and temporally—will likely require inter-municipal cooperation and state-level leadership, as in the case of Florida.

CONCLUSION

Land use decisions have profound effects on biological diversity. Land use planners, however, have many opportunities to tailor their traditional land use tools to better address biodiversity conservation. To the extent possible, planning decisions should be based on the best available science. Although the current scientific literature provides much guidance to land use planners on how to incorporate ecological knowledge into their actions, significant gaps exist in the information provided by the scientific community. The more that is known about how human mediated fragmentation impacts ecosystems, the more it is revealed that species and communities interact in complex,

dynamic, and often unpredictable ways on multiple temporal and spatial scales. For science to meet the needs of local land use planners, on-going and dedicated collaboration needs to exist between the scientific, policy, and land use planning communities. Although a consensus may never develop in the scientific community on broad conservation thresholds, more effective and targeted guidance can be developed to help land use planners make more ecologically informed decisions. Without this information, little incentive exists for land use planners and land managers to factor biodiversity considerations into their decisions at all.

APPENDIX A. FURTHER ANALYSIS

Titles and abstracts of 1,458 papers within scientific and land use planning journals were reviewed to determine whether they provide specific information on conservation thresholds that could help guide land use planning in the United States. A total of 160 papers (11 percent) were selected for inclusion in this study: 20 papers with quantitative information on minimum patch area; 27 papers on minimum proportion of suitable habitat; 25 papers on edge width distance; and 88 papers on minimum buffer width.³⁰

A CLOSER LOOK AT HABITAT PATCH SIZE

Only 20 papers were found in the scientific literature to provide specific information on minimum patch area requirements pertaining to ecoregions within the United States; these papers provided 28 citations on threshold patch size.³¹ The majority of papers that address habitat patch size focus primarily on estimating the area of habitat needed to sustain specific target species—as measured by species occurrence, population densities, or breeding success—and to a lesser extent species diversity or community assemblages. As reported in previous literature reviews, little is known about the amount of patch area needed to maintain essential ecosystem functions, such as primary productivity, nutrient and hydrologic cycling, or disturbance regimes (Forman 1995).

This survey reveals a taxonomic bias in scientific literature. Out of the total 28 citations, 16 citations (57 percent) pertain to birds and six citations (21 percent) to mammals. Minimum patch area requirements reported in the literature ranged from one hectare to over 2,500 hectares for birds, and from one hectare to over 220,000 hectares for mammals. Only two studies provide three relevant citations on patch size requirements for plant species: an estimated two hectares needed to sustain a representative tree community type (Elfstrom 1974), and at least 10 hectares needed to conserve an old growth forest if surrounded by secondary forest, or 100 hectares if surrounded by clearcuts (Harris 1984). Two additional studies provide patch area information for invertebrates, which indicate that habitat requirements for invertebrates may range from a minimum of 0.0004 hectares (four meters squared) up to one hectare. One study provides

information for fishes, predicting a 50 percent chance of bull trout occurrence in watershed patches larger than 2,500 hectares (Rieman and McIntyre 1995).

Reported habitat patch size thresholds vary widely, even within the same taxonomic group and for the same species. This lack of convergence on minimum critical patch size reflects the large range of habitat needs exhibited by different species across different ecosystems and that species response to habitat fragmentation is very complex. This natural and inherent complexity is compounded by the lack of consistency in methodology researchers used to measure minimum habitat requirements—with differing study designs as well as parameters measured. Minimum patch area is commonly determined for target species by measuring species occurrence on a site, species densities, or nesting/breeding success. To a lesser extent studies evaluate the persistence of species diversity or community assemblages. Since different parameters are measured, different results are produced. For example, according to this survey, neotropical wood thrushes require anywhere from one hectare up to greater than 2,500 hectares of habitat depending on the variable measured (evidence of breeding versus nesting success and occurrence of nesting predation) (Robbins et al. 1989 and Trine 1998).

By in large, this review reiterates a viewpoint expressed by the scientific community several years ago: simply not enough is known about minimum critical size that should be protected in order to maintain species diversity and species composition in any given ecosystem (Lovejoy and Oren 1981 *as cited in* Saunders et al. 1991; Noss and Harris 1986). Given the lack of information on the habitat patch size requirements of species, communities, or ecosystems in the United States, land use planners should work with land and natural resource agencies and local scientists to identify the habitat patches most in need of protection.

A CLOSER LOOK AT PROPORTION OF SUITABLE HABITAT

Twenty-seven papers were encountered within the scientific literature reporting extinction or habitat fragmentation thresholds on the proportion of suitable habitat needed for an array of species. The papers surveyed provide 26 different estimates of the amount of habitat needed, depending on the species and taxa in question, and the parameter measured. The majority of findings—42 percent (11 citations)—relate to the amount of habitat recommended to maintain bird

³⁰These numbers only include papers that provided specific threshold information, which was factored into the assessment (see Appendices). Review papers and background papers are not included in these figures if they failed to provide relevant quantitative information.

³¹ Because papers provide multiple findings/recommendations related to minimum patch area size requirements, the number of papers does not necessarily equal the number of citations.

CLOSER LOOK AT EDGE INFLUENCE

species or populations. Based on this review, bird species in the United States may require anywhere from 5 percent to 80 percent of suitable remaining habitat.

The second most commonly researched group is mammals. About 23 percent of the findings (six citations) pertained to mammalian response to habitat loss and habitat isolation, which suggests that this taxonomic group may require anywhere from 6 percent to 30 percent of suitable habitat. This range, however, should not be considered representative for all mammalian groups, because it only includes small mammals (e.g., chipmunks, rabbits, squirrels) (*see* Appendix C). An important focal group—wide-ranging predators and large-bodied mammals—failed to be represented in this select review, thus, the proportions are skewed to the smaller range relevant to smaller bodied mammals.

Four studies (five citations) provide thresholds for invertebrates, ranging from 20 percent up to 60 percent of required protected habitat. Additionally, four studies base their findings on models predicting response by hypothetical species, which reveal that threshold responses may occur anywhere from as large a range as 20 percent to 90 percent of habitat loss.

As revealed by the diverse range of values offered by scientists, it is clear that no common threshold exists for the amount of habitat needed to support different populations of species or needed to minimize the negative effects of habitat fragmentation in a landscape. The lower range of proportions (e.g., 5 to 30 percent) tend to be habitat fragmentation thresholds, as determined by evidence that species are in some way negatively affected by habitat loss or habitat isolation. A significant proportion of these studies is based on predicted species response to habitat loss and fragmentation by models (at least seven of the citations). The larger proportions (e.g., 60 to 80 percent) tend to be based on models that predict the amount of habitat needed to sustain long-term species persistence or to prevent the consequences of extensive habitat fragmentation in a landscape.

Given the sparse and diverse findings, land use planners should apply these thresholds with great caution. As reported in earlier reviews, most of the habitat fragmentation studies are performed during short time periods (e.g., one or two seasons), and only provide a snap shot of how species may respond to habitat loss and isolation (Andrén 1994). In these studies, the damage to populations resulting from habitat alteration could have occurred previously (Mönkkönen and Reunanen 1999)—particularly for historically modified landscapes like eastern deciduous forests (Meier et al. 1995, Mitchell et al. 2002). Thus, the long-term consequences of fragmentation are likely not revealed in this select review because a time lag often exists between the fragmentation of a landscape and the associated response by species, populations, or systems (Andrén 1994).

Twenty-five studies surveyed provide 32 findings on the distance that edges might affect habitats in the United States. Like the other conservation thresholds, the focal species of choice is birds. Sixty-six percent of the findings (21 citations within 12 articles) measure the influence of edges related to bird response, revealing that edge influence for birds extends anywhere from about 16 meters to up to almost 700 meters. Studies measuring bird or bird nest abundance report that edge effects extend between 180 and 687 meters where as those measuring predation and nesting success range from 50 to beyond 600 meters. Bird response (e.g., flushing distance) to disturbances such as roads and human traffic extends from 16.27 meters to 300 meters.

Secondarily, the influence of edges is measured by abiotic responses. Edge effects based on microclimate conditions—such as changes in light, temperature, humidity, nutrients, and moisture—are found to extend from eight meters up to 240 meters based on five studies (six citations) (Ranney et al. 1981, Laurance and Yensen 1991, Brothers and Spingarn 1992, Matlack 1993, and Chen et al. 1995).

To a lesser extent, the scientific literature provides information on the effects of edges on mammals and plants. Three studies have found that mammals avoid edge environments from at least 45 meters to 900 meters. For example, studies reveal that wide-ranging grizzly bears are displaced from 100 to 900 meters due to traffic along roadways (Mills 1996, Miller et al. 2001, and Weaver et al. 1996). One study provides evidence on the influence of edges on plant communities, finding that almost no recruitment of seedlings occurs within 65 meters of forest clear-cut edges in Oregon (Jules 1998).

Within this review, no single study is found to report edge influence in relation to invertebrate communities in the United States. As is true for the other thresholds, research has been conducted more extensively in tropical forests outside of the United States, and may serve to address knowledge gaps. For example, a study in Brazil reveals that edge effects may be more intense for invertebrate groups. Edge effects may penetrate up to 50 meters as measured by bird density; 80 meters as measured by soil moisture; 100 meters as measured by canopy height, foliage density, and leaf-litter invertebrate abundance and richness; 200 meters as measured by leaf-litter invertebrate species composition and invasion of disturbance adapted beetles; and 250 meters for invasion of disturbance-adapted butterflies (Laurance et al. 1997).

To get a better handle on the intensity of edge influence in the United States and, consequently, the amount of habitat needed to reduce the effects of edges and related disturbances, land use planners will need more site-specific guidance from ecologists. Land use planners and land managers

will also need more information on effective measures that can be taken to better “soften” the many different types of edges affecting the large array of habitat types in the United States.

A CLOSER LOOK AT BUFFER WIDTH

Eighty-eight papers (156 citations) are found to provide recommendations on riparian buffer widths.³² Of all the conservation thresholds surveyed, buffer prescriptions are the most studied and best documented. Substantial research has been conducted on the effective size of buffers, particularly related to water quality considerations, to assist regulatory and land management agencies in developing scientifically sound minimum buffer width (Castelle et al. 1994). Several literature reviews have been conducted to help inform state and local governments in developing riparian protection plans and ordinances (*see* Johnson and Ryba 1992, Furfey et al. 1997, Wenger 1999, Fischer 2000, Fischer et al. 2000, and Metro 2001). In April 2000, the U.S. Army Corp of Engineers released national recommendations for riparian buffer strip and riparian corridor design (Fischer and Fischenich 2000). This baseline research significantly informed the buffer width recommendations in this report.

One review offers the following buffer prescriptions: a three to 10 meter buffer to provide detrital input; 10 to 20 meters for stream stabilization; five to 30 meters for water quality protection; 20 to 150 meters for flood attenuation; and 30 to 500 meters or more for riparian habitat (Fischer and Fischenich 2000). The Institute’s review reveals wider buffer ranges to provide a variety of functions, with a range of six to 32 meters to reduce noise and wind damage; 10 to 52 meters to stabilize stream banks; three to 80 meters to provide detrital input; four to 92 meters to remove nutrients and pollutants; three to 122 meters to remove sediments; 20 to 150 meters to provide flood attenuation; 10 to 300 meters to regulate temperature and microclimate; and three to 1600 meters to provide wildlife habitat (*see* Appendix E).

Findings in this review primarily relate to river and stream systems, however, a small number of papers explicitly address wetlands (*see* Buhlmann 1998 and Joyal et al. 2001). Although not all wetlands lie within riparian zones (e.g., isolated wetlands), they serve as vital resources and provide essential functions, such as flood storage, water purification, sediment trapping, and wildlife habitat (Mitsch and Gosselink 1993). Thus, placing buffers around these areas to protect them from nearby development activities is also advised.

Predicting the adequacy of a buffer strip to provide sufficient wildlife habitat and to protect natural species diversity is quite challenging. The width recommendations primar-

³² Some papers recommend multiple buffer widths, for example, they may suggest different widths for different species or functions of concern. Thus, the number of papers does not equal the number of citations.

ily focus on birds and are based on various methods—ranging from determining species presence or nesting within the area to determining species abundance, diversity, or community assemblages. Few studies attempt to measure species survival over time; thus, it is questionable whether the recommended buffers will ensure persistence of the target species and communities over the long-term.

As mentioned above, the actual effective size and adequacy of any given buffer is determined by the management target, as well as other site-specific factors, such as site and watershed conditions; intensity of adjacent land use; slope steepness; stream order; soil characteristics (depth, texture, erodibility, moisture, pH); floodplain size and frequency of inundation; hydrology; buffer characteristics (e.g., type, density, and structure of vegetation, and buffer length); and landowner/manager objectives (Naiman et al. 1993, Castelle et al. 1994, Wenger 1999, Todd 2000). For example, larger buffers may be necessary when the buffer strip is in poor condition (e.g., comprised of sparse exotic vegetation, disturbed/erodible soils); is located on steep bank slopes (e.g., greater than 10 percent to 15 percent);³³ is surrounded by intense land uses; or is located within watersheds with increased impervious surfaces that results in high nutrient, chemical, and sediment inputs, and runoff (e.g., adjacent to urban/suburban areas or intensive agricultural farmland). Such factors should be considered when evaluating the applicability of the general recommended buffer sizes (*see* Wenger 1999, Fischer and Fischenich 2000, Metro 2001). In addition, management decisions should not only be based on site-specific characteristics but also on basin or watershed level needs to maintain the hydrologic connectivity and natural variability of these systems (Naiman et al. 1993, Pringle 2001).³⁴

A CLOSER LOOK AT CORRIDORS

To determine whether or not corridors are effectively enhancing species conservation, scientists evaluate whether (and how) patch occupancy, species abundance and diversity, colonization, and immigration rates change with and without the presence of corridors (Beier and Noss 1998).

Many studies lend support to the premise that corridors retain important species or provide faunal habitat (Bennett 1998). Few studies, however, provide clear evidence that corridors are required for species movement in landscapes (Hobbs 1992). Many species simply do not respond or require corridors (Rosenburg et al. 1997, Bowne et al. 1999, Hannon and Schmiegelow 2002). For example, male-hooded warblers preferentially travel across open areas, even in

³³ Herson-Jones et al. 1995 (found that greater than 10 percent slopes are steep slopes) and Nieswand et al. 1990 (found that greater than 15 percent slopes are steep) (as cited in Wenger 1999).

³⁴ Hydrologic connectivity refers to water-mediated transfer of matter, energy, or organisms within or between elements of the hydrologic cycle (Pringle 2001).

landscapes with corridors connecting habitat patches (Norris and Stutchbury 2001). For species like the Northern spotted owl, which has been found to disperse randomly, the presence of corridors will likely not enhance its survival (Murphy and Noon 1992 *as cited in* Lindenmayer and Franklin 2002). Because of the complexity of animal behavior, land use planners should not assume that establishing corridors between habitat patches in a region will automatically guarantee enhanced and effective dispersal and recolonization among the separated wildlife populations.

The benefits of corridors should be weighed against their potential repercussions. Scientists warn that corridors may potentially transmit diseases, fires, or other catastrophes among habitats and populations, as well as increase invasions by non-native invasions or exposure to predation (Simberloff and Cox 1987, Noss 1991, Noss and Cooperrider 1994). To add to the complexity of this issue, many corridor studies—

both those that claim corridor benefits and those that claim costs—suffer from design flaws that limit their ability to discern the real conservation value of corridors (Beier and Noss 1998).

A recent scientific review is able to shed some light on the corridor controversy; a review by Beier and Noss (1998) presents evidence from well-designed studies that suggest that corridors seem to be providing sufficient connectivity to enhance the viability of wildlife populations. Conversely, a lack of evidence backs the assertion that the presence of corridors actually has a greater adverse impact than their absence (Beier and Noss 1998, Hobbs 1992). Although wildlife corridors should not be automatically assumed to be an essential component of all land conservation strategies (Lindenmayer and Franklin 2002), planners should consider corridors as one potentially valuable conservation tool (Beier and Noss 1998, Hobbs 1992).

APPENDIX B. MINIMUM PATCH AREA

Minimum patch area requirements (in hectares) found within the scientific literature (as of December 2001) to maintain populations or communities of animal or plant species in the United States. One hectare is about 2.5 acres.

TAXA	PATCH AREA	FINDING	STATE	CITATION
Birds				
	≥ 1 ha	Minimum area requirement for breeding wood thrushes is 1 ha, although nesting success on fragments of that size would be extremely low.	MD, PA, VA, WV	Robbins et al. 1989
	> 1	Five species of chaparral-requiring birds were supported by census plots larger than 1 ha.	CA	Soulé et al. 1992
	≥ 2 ha (seed-eating birds) ≥ 40 ha (insect-eating birds)	The minimum area point ¹ for insect-eating birds was estimated to be at least 40 ha, in contrast to 2 ha for seed-eating birds. This is interpreted as the habitat size needed to support a representative bird community.	NJ	Forman et al. 1976 ² Galli et al. 1976 ²
	≥ 5 ha (marsh)	Ten of the 25 species did not occur in marshes less than 5 ha.	IA	Brown and Dinsmore 1986
	≥ 5, ≥ 30, ≥ 40, ≥ 50, ≥ 55 ha	Estimates of minimal area requirements for five area-sensitive species ranged from 5 to 55 ha.	IL	Herkert 1994
	≥ 6.5 ha, 15.4 -32.6 ha	Black tern required 6.5 ha in heterogeneous landscapes, but required 15.4 - 32.6 ha in homogeneous landscapes.	SD	Naugle et al. 1999
	≥ 10 ha (forest)	Forest patches ≥ 10 ha had much greater bird diversity than patches < 3.25 ha	GA	McIntyre 1995
	> 80 ha	In fragments < 80 ha, nesting success was low (43%), and nest predation was high (56%).	PA	Hoover et al. 1995
	< 20 ha, >2500 ha	Based on a study of cowbird parasitism and nest predation on 3 large forest tracts (1100 - 2200 ha) in southern Illinois, maintaining wood thrush populations in the midwest might require > 2500 ha reserves. In the east even a small woodlot (< 20ha) may sustain a population.	IL	Trine 1998
Mammals				
	> 1 ha	Control plots larger than 1 ha supported most species of rodents.	CA	Soulé et al. 1992
	≥ 5 ha	Cottontails may become vulnerable to extinction if large patches ≥ 5.0 ha are not maintained.	NH	Barbour and Litvaitis 1993
	≥ 10 ha	Fragments < 10 ha did not support populations of native rodents.	CA	Bolger et al. 1997

TAXA	PATCH AREA	FINDING	STATE	CITATION
	≥ 900 ha (9 km ²)	More than 80% of bear sightings occurred in blocks of undisturbed habitat ≥ 9 km ² .	MT	Mace et al. 1996 ³
	≥ 2800 ha (28 km ²)	Grizzly bears in the Yellowstone ecosystem should have security blocks 28 km ² in size.	MT, ID, WY	Mattson 1990 ³
	≥ 220,000 ha (2200 km ²)	Model predicts low extinction risk for cougars in areas as small as 2200 km ² , but w/ increasing risk with little immigration.	CA	Beier 1993
Fishes				
	> 2500	Found support that suitable patch size (as defined by watersheds above 1600 m elevation) influences the occurrence of bull trout. Predicted probability of occurrence is 0.5 for patches larger than 2500 ha.	ID	Rieman and McIntyre 1995
Invertebrates				
	≥ .0004 ha (4m ²)	Vegetation patches ≥ 4m ² , as well as open areas, were important to the distribution and abundance of carabid beetles.	OH	Crist and Ahern 1999
	≥ 1 ha	Observed minimum patch size for occupancy by populations of 3 butterfly species is 1 ha.	model	Hanski 1994
Plants				
	≥ 2 ha (5 acres)	Minimum area point ¹ for tree communities was estimated to be about 2 ha.	NJ	Elfstrom 1974 ²
	≥ 10, ≥ 100 ha	Conserving an old-growth forest might require 10 ha if surrounded by comparable forest, but 100 ha if surrounded by a clearcut.	—	Harris 1984 ⁴

— Indicates that the geographic location was not determined because the recommendation was cited secondarily from another review article.

model indicates that the research was conducted through modeling and therefore is not specific to any geographic area.

¹ Minimum area point is the point on a species-area curve, which shows the relationship between species number and habitat area, where there is an abrupt change in the slope. The minimum area point has been considered an index of how large a community must be to representative of the community type (Forman 1995).

APPENDIX C. PROPORTION OF SUITABLE HABITAT

Recommended minimum proportions of suitable habitat found within the scientific literature (as of December 2001) to maintain long-term persistence of viable populations or communities of species or to minimize the negative consequences of habitat fragmentation in the United States.

TAXA	PROPORTION OF SUITABLE HABITAT	FINDING	STATE	CITATION
Birds				
	≥ 5%	When < 5% of area was covered by habitat, there was an effect on bird density.	WI	Ambuel and Temple 1983 ¹
	≥ 5%	When < 5% of area was covered by habitat, there was an effect on bird community.	—	Howe 1984 ¹
	> 8%	When 8% of area was covered by habitat, there was an effect on land bird community.	—	Nilsson 1978 ¹ Nilsson 1986 ¹
	≥ 10%	When < 10% of area was covered by habitat, there was an effect on species richness.	—	Soulé et al. 1988 ¹ Bolger et al. 1991 ¹
	>10-30%	The negative effects of patch size and isolation on native species may not occur until the landscape consists of only 10-30% of the original habitat.	review	Andrén 1994
	> 15%	When 15% of area was covered by habitat, there was an effect on bird density.	—	Askins et al. 1987 ¹
	> 20%	When 20% of area was covered by habitat, there was an effect on bird community.	MD	Lynch and Whigham 1984 ¹
	> 22%	When 22% of area was covered by habitat, there was an effect on land bird community	—	Whitcomb et al. 1981 ¹
	> 50%	Numerous species were more likely to inhabit wetlands in landscapes where less than 50% of the upland matrix was tilled.	SD	Naugle et al. 2001
	≥ 60%	A model assuming 60% suitable habitat suggests a high likelihood for the longterm persistence of Northern spotted owls.	model	Lamberson et al. 1994
	> 80%	Metapopulation model predicted that the Northern spotted owl population would go extinct if the proportion of old-growth forest was reduced to less than 20% of landscape.	model	Lande 1988 ⁴ Lamberson et al. 1992 ⁴
Mammals				
	> 6%	When 6% of area was covered by habitat, there was an effect on chipmunk density.	—	Henderson et al. 1985 ¹
	> 6%	When 6% of area was covered by habitat, there was an effect on pika abundance.	—	Smith 1974 ¹ Smith 1980 ¹
	≥ 10%	When < 10% of area was covered by habitat, there was an effect on mammal species richness.	—	Soulé et al. 1992 ¹
	> 10%	When 10% of area was covered by habitat, there was an effect on Columbian ground squirrel presence/absence.	—	Weddell 1991 ¹
	> 10-30%	The negative effects of patch size and isolation on the native species may not occur until the landscape consists of only 10-30% of the original habitat.	review	Andrén 1994
	> 15%	When 15% of area was covered by habitat, there was an effect on small mammal presence.	—	Lomolino et al. 1989 ¹

TAXA	PROPORTION OF SUITABLE HABITAT	FINDING	STATE	CITATION
Invertebrates				
	≥ 20%	The threshold for changes in movement patterns of beetles occurred at 20% coverage of cells.	CO	Wiens et al. 1997
	≥ 20%	Clover patches became significantly more isolated below 20% habitat, which disrupted the predator foraging behavior of ladybird beetles, decreasing their ability to serve as biocontrol agents of aphids.	model	With et al. 2002
	≥ 40%	Habitat specialists of grasshoppers exhibited limited movement and disjunct populations—which can affect population persistence—when preferred habitat occupied less than 40% of the landscape.	model	With and Crist 1995
	≥ 40, ≥ 60%	Rare species were disproportionately affected by fragmentation and did not occur in patches with less than 40% habitat. Over half of the species were never observed in plots with less than 60% habitat remaining.	OH	Summerville and Crist 2001
Hypothetical Species				
	> 10-30%	As habitat loss continues beyond the threshold (occurring somewhere in the range of 70-90% habitat loss) decline in population performance should become much more severe. But model predicts that habitat fragmentation begins to occur when about 60% of original vegetation remains.	model	Gardner et al. 1987 ²
	≥ 20%	The threshold value of habitat amount is 20% habitat, below which the effects of habitat fragmentation on population persistence may become evident.	—	Andrén 1994 ³ Fahrig 1998 ³
	> 70%	Models of forest landscapes forecast that patches of old-growth forest can become fragmented even when about 70% of the landscape cover remains.	model	Franklin and Forman 1987
	> 80%	Terrestrial species with low demographic potential could not persist in landscape even with 80% of suitable habitat in landscape.	model	Lande 1987 ⁴

— Indicates that the geographic location was not determined because the recommendation was cited secondarily from another review article.

model indicates that the research was conducted through modeling and therefore is not specific to any geographic area.
review indicates papers that base recommendation on a survey of the literature.

APPENDIX D. EDGE INFLUENCE

Distances (in meters) that edge effects penetrate into habitats in the United States as found within the scientific literature (as of December 2001), according to abiotic, bird, mammal, and plant response.

TAXA/SUBJECT	EDGE INFLUENCE	FINDING	STATE	CITATION
Abiotic				
	8 m	Microclimatic differences ceased to exist beyond 8 m into forest fragments.	IN	Brothers and Spingarn 1992
	13.3 m	Model indicated that elevated soil temperatures may extend up to 13.3 m from edge.	model	Laurance and Yensen 1991
	≥ 15 m	In deciduous forest patches, microclimate changes were estimated to extend at least 15 m from the forest edge to the interior.	WI	Ranney et al. 1981 ²
	50 m	Significant edge effects were detected in light, temperature, litter moisture, vapor pressure deficit, humidity, and shrub cover, affecting the forest microenvironment up to 50 m from the edge.	PA, DE	Matlack 1993
	15-60 m (solar radiation) > 240 m (humidity and wind speed)	Solar radiation gradients extend 15–60 m into upland old-growth forest and humidity and wind speed gradients at > 240 m.	—	Chen et al. 1995 ⁹
Birds				
	16.27 m, 16.95 m, 37.73 m	Maximum flushing* distance in response to pedestrians and dogs was 16.27 m (American robin), 16.95 m (vesper sparrow), and 37.73 m (western meadowlark).	CO	Miller et al. 2001
	50 m	Predation and parasitism rates are often significantly greater within 50 m of an edge.	—	Paton 1994 ³
	50 m	Murrelet nest success was higher when nests were more than 50 m from the forest edge.	—	Nelson and Hamer 1995 ⁴
	75 m	Estimated that edge-related nest predation extended 75 m into forested buffer strip.	ME	Vander Haegen and Degraaf 1996
	75 m, 100 m	For the majority of species found to have reduced numbers near trails due to nest predation and brood parasitism by brown-headed cowbirds, the zone of influence of trails appears to be around 75 m; however, Townsend's Solitaires exhibited reduced numbers as far as 100 m away from trail.	CO	Miller et al. 1998
	75 m, 125 m, 140 m, 160 m, 210 m, 300 m	Buffer zones that would prevent flushing by approximately 90% of the wintering individuals of a species are: American kestrel, 75 m; merlin, 125 m; prairie falcon, 160 m; rough-legged hawk, 210 m; ferruginous hawk, 140 m; and golden eagle, 300 m.	CO	Holmes et al. 1993
	100 m	Flushing distances of waterbirds in response to pedestrians, all-terrain vehicles, automobiles, and boats, indicate that human disturbance extends up to 100 m.	FL	Rodgers and Smith 1997

Attachment: WLC Responses to Comments Prior to PC Hearing_10JUNE2020_Part 1 (4074 : World Logistics Center)

TAXA/SUBJECT	EDGE INFLUENCE	FINDING	STATE	CITATION
	180 m	Avian densities were altered up to 180 m away from homes on the perimeter of ex-urban developments.	CO	Odell and Knight 2001
	200–500 m	The abundance of interior habitat bird species was reduced within 200 to 500 m of an edge.	CA	Bolger et al. 1997b ¹
	≥ 300 m	Nest parasitism by brown-headed cowbirds decreased with distance away from forest edge but extended ≥ 300 m into the forest.	—	Brittingham and Temple 1983 ⁵
	511 m, 687 m	Most Cooper hawk nests occurred 511 m from paved roads and 687 m from human habitation.	Northeast	Bosakowski et al. 1992
	600 m	Effect of increased predation extends 600 m into habitat.	—	Wilcove et al. 1986 ⁴
Mammals				
	≥ 45 m	The influence of a clearcut on small mammals (California red-backed vole and deer mouse) extends at least 45 m into the forest from its edge.	—	Mills 1996 ⁶
	81.92 m	Maximum flushing distance of mule deer in response to pedestrians and dogs was 81.92 meters.	CO	Miller et al. 2001
	100–900 m	Human traffic along open roads displaces most grizzly bears from 100–900 meters.	—	Mattson et al. 1987 ⁷ McLellan and Shackleton 1988 ⁷ Aune and Kasworm 1989 ⁷ Kasworm and Manley 1990 ⁷ Mace et al. 1996 ⁷
Plants				
	65 m	Populations in forest remnants within 65 m of forest clear-cut edges have almost no recruitment of young plants.	OR	Jules 1998
General				
	5000 m	In different habitats and for different taxa, edge effects may penetrate up to 5 km.	—	Janzen, 1986 ⁸

* Flushing distance is the distance that an animal may flee in response to a disturbance, such as in response to pedestrian or pets on a trail or vehicular traffic on roads.

— Indicates that the geographic location was not determined because the recommendation was cited secondarily from another review article.

model indicates that the research was conducted through modeling and therefore is not specific to any geographic area.

	Plants (minimize non-native vegetation)	≥ 198 m	Hennings 2001 ³
	Birds (Rufous-sided towhee)	≥ 200 m	Knutson and Naef 1997 ³
	Reptiles (Blanding's turtles nesting habitat)	≥ 410 m (wetland buffer)	Joyal et al. 2001
	Reptiles (False map turtles, slider turtles, lotic turtles dispersal)	≥ 449 m	Bodie and Semlitsch 2000
	Birds (complete assemblages)	≥ 500 m	Kilgo et al. 1998 ⁴
General Protection of Aquatic Systems			
	Multiple functions	1–90 m	Todd 2000
	Multiple functions	≥ 10 m	Fischer and Fischenich 2000
	Multiple functions	≥ 15 m	Fischer, Martin, and Fischenich 2000
	Multiple functions	30 m	Furfey et al. 1997
	Sediment/contaminant control, general water quality maintenance	30.5 m (+0.61 m per 1% slope)	Wenger 1999
	Wetland and river integrity	≥ 335 m	Schaefer et al. 1991 ⁶

SPTH, or site potential tree height, is used as a standard measurement to allow for multiple riparian functions. SPTH is measured in various ways. FEMAT (1993) defines SPTH the height of a site potential tree as the average maximum height of the tallest dominant trees of 200 years or more of age for a given site class (For further discussion, refer to Metro 2001).

THE ENVIRONMENTAL LAW INSTITUTE®

For more than three decades, the Environmental Law Institute has played a pivotal role in shaping the fields of environmental law, management, and policy domestically and abroad. Today, ELI is an internationally recognized, independent research and education center.

Through its information services, training courses and seminars, research programs, and policy recommendations, the Institute activates a broad constituency of environmental professionals in government, industry, the private bar, public interest groups, and academia. Central to ELI's mission is convening this diverse constituency to work cooperatively in developing effective solutions to pressing environmental problems.

The Institute is governed by a board of directors who represent a balanced mix of leaders within the environmental profession. Support for the Institute comes from individuals, foundations, government, corporations, law firms, and other sources.

California Air Resources Board's Process for the Review and Approval of Compliance Offset Protocols in Support of the Cap-and-Trade Regulation

1 BACKGROUND

Under the Cap-and-Trade Program, covered entities may use compliance offset credits to satisfy up to eight percent of their compliance obligation.¹ This limit applies to each individual covered or opt-in covered entity for each compliance period. Compliance offsets are tradable credits that represent verified greenhouse gas (GHG) emissions reductions or removal enhancements from sources not subject to a compliance obligation in the Cap-and-Trade Program and resulting from one of the following: (1) a project undertaken using an Air Resources Board (ARB or Board) approved Compliance Offset Protocol pursuant to Subarticle 13 of the Cap-and-Trade Regulation; (2) an offset credit issued by a linked jurisdiction pursuant to Subarticle 12 of the Cap-and-Trade Regulation; or (3) a sector-based offset credit issued by an approved sector-based crediting program pursuant to Subarticle 14 of the Cap-and-Trade Regulation. In almost all cases, these GHG sources are outside of the industrial, energy, and transportation sectors. This document describes ARB's process for the review and approval of new ARB Compliance Offset Protocols. As an important market feature, offset credits can provide covered entities a source of low-cost emissions reductions for compliance flexibility. The inclusion of offset credits will also support the development of innovative projects and technologies from sources outside capped sectors that can play a key role in reducing emissions both inside and outside California.

As required by Division 25.5 of the Health and Safety Code (Assembly Bill 32 or AB 32), any reduction of GHG emissions used for compliance purposes must be real, permanent, quantifiable, verifiable, enforceable, and additional (Health and Safety Code §38562(d)(1) and (2)). Any offsets issued by ARB must be quantified according to Board-approved Compliance Offset Protocols. The Cap-and-Trade Regulation (Regulation) includes provisions for collecting and submitting the appropriate monitoring documentation to support the verification and enforcement of reductions realized through the generation and retirement of Compliance offset credits. The regulatory provisions and the requirements of the Compliance Offset Protocols will ensure that the reductions are quantified accurately, represent real GHG emissions reduction, and are not double-counted within the system. Compliance Offset Protocols are considered regulatory documents and are made publicly available so that anyone interested in

¹ "Compliance obligation" is defined as "the quantity of verified reported emissions or assigned emissions for which an entity must submit compliance instruments to ARB." Title 17, California Code of Regulations, section 95802(a).

developing an offset project can do so if their project meets Board-approved standards. Information on existing and proposed protocols can be found here:

<http://www.arb.ca.gov/cc/capandtrade/offsets/offsets.htm>

It is important to note that compliance offset credits are only one way to incentivize voluntary GHG reductions outside of the Cap-and-Trade Program. Projects that could reduce GHG reductions could be incentivized through the use of grants, the generation of voluntary offsets, and potentially as regulatory offsets for compliance with the California Environmental Quality Act.

2 COMPLIANCE OFFSET PROTOCOL REQUIREMENTS

2.1 How will ARB determine which protocols to take through the approval process?

Periodically, ARB staff will review offset protocols that are available for use in the voluntary offset programs. These voluntary protocols will be assessed against the protocol criteria listed below. This process will be coordinated with our Western Climate Initiative (WCI) partners. Staff will also consider proposed protocols submitted by stakeholders that include elements to ensure any resulting offsets would meet the AB 32 offset and ARB protocol requirements presented in section 2.2. The specific process and steps prior to Board consideration are provided in section 3 below.

In addition to the ability to generate offsets that meet the AB 32 criteria, there are several other factors that are considered when deciding which project types will be considered for potential development of a Compliance Offset Protocol. These factors include, but are not limited to, the following:

- Potential for projects in California;
- Potential offset supply;
- Cost-effectiveness; and
- Co-benefits.

ARB staff is also working with our WCI partner jurisdictions to identify which offset project types to evaluate next as part of the regional trading program, which may also include a review of existing protocols from voluntary offset programs.² Staff will determine if a proposed protocol for a project type can be applied in California and/or at the regional level, and if it has the potential to meet the criteria listed above. There may be instances where a protocol is not applicable in every jurisdiction of a linked program. In all cases, all linked jurisdictions will have to agree on offset project protocols to

² See: <http://www.westernclimateinitiative.org/component/remository/Offsets-Committee-Documents/> accessed May 3, 2013.

ensure nothing will impact the fungibility of offsets across a regional Cap-and-Trade Program.

ARB staff will continue to meet with stakeholders and consider additional proposed offset project types that meet the AB 32 offset and ARB protocol requirements as we coordinate with WCI partner jurisdictions.

2.2 What criteria will ARB use to evaluate new protocols?

ARB must ensure that all GHG emissions reductions issued as offset credits under a Compliance Offset Protocol meet the AB 32 offset criteria as defined in the Regulation. ARB's decision not to develop a Compliance Offset Protocol does not preclude that project type from being incentivized through grants, development of voluntary offsets, or potentially as mitigation for compliance with the California Environmental Quality Act.

The Regulation also specifies the criteria for Compliance Offset Protocols in section 95972. These requirements will be broadly applied to each offset project type for which ARB is developing a protocol. There may be additional considerations that staff, in collaboration with stakeholders, may look at for specific offset project types.

New protocols can only be considered for project types that meet the following requirements:

- The resulting GHG emission reductions are from sources that are not covered by the cap and that are not subject to a compliance obligation. This is because there is no net reduction (i.e. no "offset") as a result of emissions being shifted from one source under the cap to another source under the cap. As a matter of policy, we do not issue offset credits for reductions from sources that would be covered by the cap but are located outside the State. For example, energy-related projects, such as the installation of solar panels, would not be eligible for offsets as the actual emission reductions are associated with power generation and all electricity generation is already covered under the Cap-and-Trade Program. Similarly, transportation fuels are covered in the program starting in 2015, so ARB will not adopt a Compliance Offset Protocol for cleaner vehicle fleets.
- The GHG emissions reduction must be a direct reduction within a confined project boundary. Recycling activities would not be eligible for offset credit as the recycling activities do not have a direct GHG reduction at the recycling facility, but may have an emissions impact upstream when new materials are extracted or manufactured in lieu of the recycling. Currently, to avoid double counting

issues in the Cap-and-Trade Program, ARB does not plan to adopt protocols that include a lifecycle analysis.

- The GHG emissions reduction must be permanent. For avoided GHG emissions, there must be no opportunity for a reversal of the avoided emissions. An example of this type of permanence is methane flaring in livestock digester projects, which permanently destroys methane. For GHG sequestration, the project must be able to ensure the GHG will not be released into the atmosphere for at least one hundred years. Both the U.S. Forest and Urban Forestry Projects Compliance Offset Protocols require a commitment to keep any credited carbon stocks sequestered for at least 100 years.
- The GHG emissions reduction must be conservatively quantified to ensure that only real reductions are credited. This requires a sound foundation and understanding of the underlying quantification for all sources, sinks, and reservoirs within a project boundary so that the net change from implementing the project represents a real reduction for issuing credit.
- The GHG emissions reduction must be verifiable and enforceable. This requires a Compliance Offset Protocol to have clear monitoring and measurement requirements that can be audited by a verifier and enforced by ARB.
- The GHG emissions reduction must be additional, or beyond any reduction required through regulation or action that would have otherwise occurred in a conservative³ business-as-usual scenario.⁴ In order for ARB to ensure offset credits are additional, ARB would not adopt a protocol for a project type that includes technology or GHG abatement practices that are already widely used. See section 4 for more information.

³ “Conservative,” in the context of offsets, means “utilizing project baseline assumptions, emission factors, and methodologies that are more likely than not to understate net GHG reductions or GHG removal enhancements for an offset project to address uncertainties affecting the calculation or measurement of GHG reductions or GHG removal enhancements.” Title 17, California Code of Regulations, section 95802(a).

⁴ “Business-as-usual scenario” means “the set of conditions reasonably expected to occur within the offset project boundary in the absence of the financial incentives provided by offset credits, taking into account all current laws and regulations, as well as current economic and technological trends.” Title 17, California Code of Regulations, section 95802(a).

3 PROCESS FOR ADOPTION OF COMPLIANCE OFFSET PROTOCOLS

3.1 What are the rulemaking requirements for approving Compliance Offset Protocols?

Compliance Offset Protocols are considered regulatory documents and are subject to the Administrative Procedure Act (APA).⁵ As with any regulation that is considered by the Board, each Compliance Offset Protocol must be developed through a full stakeholder process. As part of this APA process and consistent with ARB's certified regulatory program, staff will also develop an environmental analysis that is included in the staff report prepared for any Compliance Offset Protocol to be considered by the Board. This process satisfies the requirements of the California Environmental Quality Act (CEQA). The primary steps and details of the APA process and how it applies to protocol review and adoption are as follows:

- Offset Protocol Announcements and Timing:** Staff will announce decisions to develop new offset protocols in a public setting, open to all stakeholders. Information related to new offset protocols will be shared in a transparent and public process so as not to give any one entity a potential market information advantage over another entity.
- Informal Development Activities:** During this step, staff will hold public workshops or technical meetings to discuss the development of a potential offset protocol, focusing on areas such as, but not limited to, project specific mitigation methods, defining a project boundary, quantification of baseline conditions, and quantification of actual GHG reductions or removal enhancements. Staff will look at offset supply potential that could be generated under each potential Compliance Offset Protocol, prioritizing those with supply in California and then broadly across the United States. When considering offset supply, staff will be interested not only in the potential supply from a single project and the potential supply if only small projects can occur, but also in whether the mitigation methods or technology(ies) are easily transferrable for a larger volume of reductions. This process would, where appropriate, also include the development of draft protocol text following stakeholder input.

Depending on the complexity of the project type, ARB may hold a series of workshops or technical workgroup meetings. Dates of the workshops or

⁵ Government Code, § 11340 et seq. Although Health and Safety Code section 38571 exempts quantification methodologies from the Administrative Procedure Act (APA), Compliance Offset Protocols and the corresponding adoption through the Cap-and-Trade Regulation would include regulatory components that are subject to APA requirements.

meetings will be posted on the ARB website and posted to the relevant email listservs. When possible, such meetings are webcast for broad public participation.

All workshop presentations will be posted on the ARB website and a protocol-specific development webpage will be posted that contains information about the development of that specific protocol. During the first public workshop, a protocol staff lead for ARB will be identified along with his or her contact information.

- **Issuing the Notice:** This step initiates the APA rulemaking action. When, after completing the preliminary activities described above, ARB determines that it would like to proceed with a formal rulemaking on a proposed Compliance Offset Protocol, ARB will issue a notice of proposed rulemaking, which is included in the California Regulatory Notice Register. This notice will include the Board hearing date when staff will present the proposed Compliance Offset Protocol for Board consideration. This notice is posted at least 45-days prior to the Board hearing.
- **Availability of the Proposed Text and the Initial Statement of Reasons:** At least 45-days prior to the Board hearing, ARB will make available the proposed Compliance Offset Protocol text and a staff report that includes an explanation of why certain decisions were made in the development of the proposed Compliance Offset Protocol, any relevant analyses to support the proposed Compliance Offset Protocol, and an analysis of potential environmental impacts. ARB will post the proposed text and the staff report on its rulemaking website with the 45-day notice. ARB practice is to notify the public of the availability of these documents through the relevant email listservs.
- **45-Day Comment Period:** ARB will provide at least 45 days for the public to review the proposed Compliance Offset Protocol text and staff report and provide written comments to ARB.
- **Public Hearing:** Staff will present the proposed Compliance Offset Protocol to the Board for its consideration. This process usually includes a staff presentation at a regularly scheduled Board hearing. The dates and agendas for each hearing are posted on the rulemaking website. Stakeholders can provide written and oral testimony to the Board before the Board takes any action on the proposed Compliance Offset Protocol text. The Board may choose to adopt the proposed Compliance Offset Protocol text as written or to direct staff to make changes and release amended material for a formal comment period of at least 15-days. ARB will consider all formal comments on its proposed Compliance Offset Protocol as required by the APA and Board policy.

- Summary and Response to Comments:** ARB must summarize and respond to all formal comments submitted during the 45-day comment period, at the Board hearing, and during any subsequent 15-day comment periods on the proposed Compliance Offset Protocol in a document referred to as the Final Statement of Reasons. In this document, ARB will indicate where it made a change in response to a comment, or why a change is not appropriate. When applicable, the written responses to comments addressing the environmental analysis will be considered by the Board prior to making any findings required by the CEQA before a proposed protocol is adopted. This process ensures that ARB has understood and considered all relevant material presented to it before adopting a proposed protocol.
- Submission of a Rulemaking Action to the Office of Administrative Law (OAL) for Review:** Following final ARB approval, the rulemaking record is submitted to OAL for review. ARB also posts a Notice of Decision with the Secretary of Natural Resources in accordance with its CEQA certified program. OAL has 30 working days to review the rulemaking record to determine whether it demonstrates that ARB satisfied the requirements of the APA. Upon OAL approval, the Board-adopted Compliance Offset Protocol is filed with Secretary of State and becomes effective within a quarterly time schedule provided in the APA.

The Administrative Procedures Act mandates that ARB complete a rulemaking within one calendar year from the date the 45-day notice is published in the California Notice Register. If ARB does not submit the final protocol and regulatory amendments to the Office of Administrative Law by that date, ARB must initiate a new rulemaking. This includes a new 45-day comment period and Board hearing.

4 ADDITIONALITY

AB 32 and the Cap-and-Trade Regulation require any reductions used for compliance to be beyond what would otherwise be required by law, regulation, or legally binding mandate, and that exceed what would otherwise occur in a conservative business-as-usual scenario. For each proposed Compliance Offset Protocol, staff will establish whether GHG reductions or removal enhancements that result from the implementation of offset projects under the protocol are already being required by a local, state, or federal regulation. If a specific GHG mitigation method is already required by regulation, any reductions from that mitigation method would not meet the requirements for additionality. In this case the proposed Compliance Offset Protocol could not include

that specific GHG mitigation method and compliance offsets would not be issued for that reduction activity.

To assess if a specific GHG mitigation method may have “otherwise occurred,” staff will establish if that method is common practice in the geographic area in which the proposed Compliance Offset Protocol is applicable. Where possible, this review would include staff’s best estimate of the percent of the technology or mitigation in use for that sector. This can be done through outreach to the sector that would generate potential offsets, discussions with trade organizations, data research, and reviews of technology trends. Staff will take into consideration cost barriers that may prohibit technology or GHG mitigation methods from occurring in the absence of revenues from the generation of offset credits. For each proposed Compliance Offset Protocol, staff will share their findings during a stakeholder process and solicit feedback to determine whether a specific technology or GHG mitigation method is beyond common practice, and if the resulting reductions would meet the requirements for additionality.

5 HOW DOES ENVIRONMENTAL CREDIT STACKING WORK UNDER THE CALIFORNIA COMPLIANCE OFFSET PROGRAM?

Environmental credit stacking refers to a situation where a single activity provides more than one marketable environmental credit. For example, forest projects can result in carbon sequestration and improved watershed quality benefits. ARB believes that environmental co-benefits are a desired result of its Compliance Offset Protocols. The additional incentives such as other environmental credits would not by themselves disqualify a project type from being considered for the development of a Compliance Offset Protocol. ARB’s assessment of additionality will be based on how prevalent a mitigation practice or technology is within a sector, regardless of whether or not the activity could generate other marketable environmental credits.

6 WILL ARB PERIODICALLY REVIEW COMPLIANCE OFFSET PROTOCOLS?

Yes, ARB will continue to monitor the adoption of new or modified regulations that could affect additionality, as well as new developments in scientific data and quantification related to adopted Compliance Offset Protocols that would warrant a change to an existing Compliance Offset Protocol. Staff will propose amendments to Compliance Offset Protocols as necessary through a stakeholder process prior to Board consideration. Staff will weigh the decision to update a protocol against the market desire for certainty to support an active and robust compliance offset program. Any amendments to an existing Compliance Offset Protocol would involve the same APA process as developing a new Compliance Offset Protocol.

Once ARB updates an existing Compliance Offset Protocol, the previous version would no longer be used by new projects from the date that OAL approves the new version. Any existing projects under the previous version of the protocol would be required to use the new version of the protocol once the existing crediting period has ended.

7 HOW CAN I PARTICIPATE IN THE COMPLIANCE OFFSET PROTOCOL DEVELOPMENT PROCESS?

ARB encourages interested parties, including subject matter experts and general members of the public to attend Compliance Offset Protocol development workshops and provide informal and formal written feedback on proposed content during the Compliance Offset Protocol development process. Stakeholders can also request meetings with ARB staff to discuss protocol-related issues. Stakeholders are encouraged to sign up for the Cap-and-Trade listserv to make sure they are notified of any workshops or public information related to Compliance Offset Protocol development:

http://www.arb.ca.gov/listserv/listserv_ind.php?listname=capandtrade.

8 SUBMITTING IDEAS FOR COMPLIANCE OFFSET PROTOCOLS?

8.1 Can a voluntary offset program recommend a protocol for review?

Yes. Voluntary offset programs such as the American Carbon Registry, Climate Action Reserve, Verified Carbon Standard, and others may submit protocols to ARB for review. However, regardless of how the voluntary protocols are developed, ARB staff must determine whether the voluntary protocol should be developed for use in the Cap-and-Trade Program and if so, to conduct its own rulemaking process under the Administrative Procedure Act. As outlined above, under this process ARB would review, modify, and present a proposed Compliance Offset Protocol for Board consideration. This process ensures that any voluntary protocol modified for consideration by the Board demonstrates the resulting reductions meet the offset criteria in AB 32 as defined in the Cap-and-Trade Regulation and the criteria listed earlier in this document.

Protocols developed by the voluntary programs are not Compliance Offset Protocols as they are not developed through a rulemaking process, may not meet the AB 32 and Cap-and-Trade Regulation criteria, and were not approved by the Board.

8.2 Why has ARB not developed Compliance Offset Protocols for all of the existing voluntary offset protocols?

There are many existing voluntary offset protocols for use in the voluntary offset market. However, ARB must ensure any Compliance Offset Protocol it develops will result in

offset credits that meet the AB 32 offset criteria and the general protocol criteria in section 2.2. ARB will periodically review the available voluntary offset protocols and the potential to develop them into Compliance Offset Protocols.

8.3 Why can't we limit offset protocols just to California projects?

An important role for compliance offsets in the Cap-and-Trade Program is to provide cost containment for covered entities in the program. A covered entity can meet up to eight percent of its compliance obligation by using offsets in each compliance period. It is important to note that if all entities under the cap were to maximize the use of offsets up to the eight percent limit, there would still need to be on-site GHG emissions reductions at covered entities to meet the overall cap limits through 2020. Since the Cap-and-Trade Program already covers most sectors of California's economy under the cap, limiting offsets to just projects in California would significantly reduce the offset supply potential available to covered entities. This would increase their cost for compliance under the Cap-and-Trade Program. As stated in section 2.1, ARB will try to identify potential Compliance Offset Protocols that may be applicable in California, as well as across the United States.

8.4 What if I have a good idea for an offset protocol?

ARB encourages stakeholders to engage with staff regarding the development of new Compliance Offset Protocols and potential new project types that may fit the criteria for compliance offsets. Section 2.2 of this document contains the requirements for Compliance Offset Protocols. These requirements can help stakeholders discern if their ideas could potentially be considered for the Compliance Offset Program.

8.5 Will ARB only approve protocols based on a standardized approach?

Yes, approved Compliance Offset Protocols serve as a cornerstone of the Compliance Offset Program to ensure that reductions are appropriately quantified, monitored, reported, and documented. Those protocols taken to the Board for adoption will consist of standardized methods that quantify reductions based on specific criteria and pre-established calculation methods. This approach streamlines the calculation of project baselines and determination of the additionality of projects by using standard eligibility criteria that ensure projects are additional. By establishing the standardized criteria in the Compliance Offset Protocol, there is less subjectivity by verifiers or offset project developers as to whether a project may be additional and this supports consistent quantification rigor in the offset program.

8.6 Will ARB approve protocols developed under a project-based approach?

No, ARB is not planning to accept project-based protocols because each individual project protocol must be approved by the Board and such a process would be lengthy and administratively burdensome.

Additional Information

More information on the Cap-and-Trade Program, compliance offsets, and current rulemaking activities can be found here:

<http://www.arb.ca.gov/cc/capandtrade/capandtrade.htm>

Chapter 15

Carbon Offsets in California: Science in the Policy Development Process

Barbara Haya, Aaron Strong, Emily Grubert, and Danny Cullenward

Abstract Natural and social scientists are increasingly stepping out of purely academic roles to actively inform science-based climate change policies. This chapter examines a practical example of science and policy interaction. We focus on the implementation of California's global warming law, based on our participation in the public process surrounding the development of two new carbon offset protocols. Most of our work on the protocols focused on strategies for ensuring that the environmental quality of the program remains robust in the face of significant scientific and behavioral uncertainty about protocol outcomes. In addition to responding to technical issues raised by government staff, our contributions—along with those from other outside scientists—helped expand the protocol development discussion to include important scientific issues that would not have otherwise been part of the process. We close by highlighting the need for more scientists to proactively engage the climate policy development process.

Keywords Carbon offsets • Climate change policy • Carbon markets • Science and policy

15.1 Introduction and Background

Natural and social scientists in the field of global climate change are increasingly stepping out of purely academic roles to inform and support policy that is science-based. This chapter explores the roles that science and scientists play in climate policy development using an example from the California climate policy process. Beginning in the spring of 2013, we participated in the public process for

D. Cullenward, Ph.D.
University of California, Berkeley, Berkeley, CA, USA

developing two new carbon offset protocols in California. We relay our experiences as scientists in these processes with two main goals. First, we describe the types of input we and other natural and social scientists provided to regulators, in order to shed light on how scientific issues emerge in policy development and the associated role scientists play in practice. Second, we hope this example will encourage interested scientists to engage the climate policy process more directly. Fundamentally, we believe that scientists' active participation in climate policy development can improve policy outcomes and generate useful research agendas.

The primary theme of our work is supporting the robustness of California's offsets policies, a topic on which most of our efforts focused. As used in discussions of global climate change, another term—*resilience*—most commonly refers to the ability of communities or nature to adapt to the uncertain impacts of climate change. In the context of climate change policy, *robustness* offers a similar framing. It refers to the ability of a policy to reliably meet its goals despite substantial uncertainty in predicting or measuring its outcomes (Lempert and Schlesinger 2000).

The concept of policy robustness is particularly relevant in the context of policies concerning carbon offsets because of the deep scientific and behavioral uncertainties involved in calculating accurate emission reductions from offset projects. Because greenhouse gas emitters in a climate policy system that recognizes offsets—such as California's carbon market—use offset credits to justify increased emissions within the policy system's boundaries, it is critical that offsets accurately represent true emission reductions. Meeting this standard is no simple matter, however, as it requires scientifically complex and inherently uncertain methodologies.

The uncertainty stems from the need to calculate emission reductions by comparing an offset project's emissions against an inherently unknowable counterfactual scenario: the emissions that would have occurred without the offset project. Both estimates are subject to uncertain physical, social, and economic drivers. In light of this uncertainty, ensuring that offset credits represent true emission reductions requires conservative decisions about project and baseline emissions to ensure that protocols actually reduce the credited emissions reductions. Accordingly, our participation in California's public policy development processes focused on ways to preserve the robustness of the two offset protocols on which we worked.

The chapter is organized as follows. We begin with an overview of California's climate mitigation policies, describing how offsets fit into the state policy system, as well as the key challenges offsets pose for policy-makers. Next, we describe our activities as stakeholders in the public process for developing new offset protocols. We illustrate our work with a handful of examples that highlight scientific issues that emerged in the policy process, including issues that the regulatory agency identified for public input, as well as those issues we raised in our independent capacity. In the final section, we offer some concluding thoughts about our experience and the various roles we and other scientists played in these policy processes. Finally, we encourage other environmental scientists to explore proactive models of policy engagement.

15.1.1 *California's Climate Policy*

In 2006, California passed the Global Warming Solutions Act (AB 32), launching the state's comprehensive approach to climate mitigation policy. Its key feature is a legally binding requirement to reduce statewide greenhouse gas (GHG) emissions back to 1990 levels by the year 2020. To accomplish this goal, state law delegated broad authority to the California Air Resources Board (CARB), which developed a suite of climate policy instruments over the last several years (CARB 2008, 2014a). The most prominent is California's cap-and-trade program. This program applies to California's electricity, industrial, and fuels sectors, covering about 85 % of statewide emissions.

Briefly, cap-and-trade carbon markets set an overall limit (or *cap*) on anthropogenic greenhouse gas emissions within the covered sectors. The regulator then issues tradable emissions allowances, with the total number equal to the cap. Each emissions allowance credit confers the right to emit one tonne of GHG pollution (measured in tonnes of CO₂ equivalent, tCO₂e). Covered entities must submit one allowance per tCO₂e of pollution they emit. Since allowances are tradable, if a regulated emitter can reduce emissions more cheaply than the price of a permit, it can do so, freeing up permits to sell to others who face costlier mitigation opportunities. This lowers compliance costs compared to a system in which each emitter must meet an established standard without trading.

Carbon offsets extend the flexibility of this approach by allowing covered entities to seek lower-cost emission reduction opportunities outside of the carbon market—for example, in another state or in an economic sector not covered by the cap—instead of reducing emissions within the capped sectors. The financial benefits to regulated emitters are straightforward: expanding the range of mitigation opportunities outside the capped system through offsets reduces compliance costs. Since climate change is driven by the global stock of GHGs in the atmosphere, reducing one tonne of emissions has the same effect regardless of location.¹ As we discuss below, however, accurately calculating the net emissions reductions raises new challenges.

15.1.2 *Offsets in California*

Companies subject to the cap-and-trade market can use offset credits to cover up to 8 % of their total emissions. This limit on the use of offsets appears significantly more generous when expressed as a percentage of the total mitigation required in the carbon market: if all regulated parties use the maximum amount allowed, offsets

¹Though other pollution impacts that are coincident with the greenhouse gas emissions may have important local and regional effects, including on public health

would contribute about half of the total emission reductions expected under California's climate policy through 2020 (Haya 2013).

Carbon offsets in California work as follows. CARB issues offset credits for projects that follow approved protocols. The protocols themselves determine what project activities are eligible and define the methodologies by which projects estimate their emission reductions. Thus, offset protocols must be designed to anticipate all of the emissions-related drivers that apply in a given sector—a task that typically involves complex issues of environmental and social science.

Although the decision to develop a new protocol lies entirely at CARB's discretion, offset protocol methodologies must meet certain standards. State law and market regulations both require that emission reductions from offsets be “real, additional, quantifiable, permanent, verifiable, and enforceable.”² Each of these terms has a formal legal definition. The most challenging requirement has been *additionality*, defined in AB 32 as crediting only those emission reductions that are made “in addition to any greenhouse gas emission reduction otherwise required by law or regulation, and any other greenhouse gas emission reduction that otherwise would occur.”³ CARB's climate regulations provide more context on how additionality is to be tested, requiring the use of a “conservative, business-as-usual scenario.”⁴

The regulations also directly address uncertainty and risk management, defining conservative scenarios as those whose “project baseline assumptions, emission factors, and methodologies that are more likely than not to understate net GHG emission reductions or GHG removal enhancements for an offset project to address uncertainties affecting the calculation or measurement of [net GHG reductions].”⁵

Finally, it is important to recognize that political perspectives on offsets vary widely. Many stakeholders, including most major emitters in the market, are strongly supportive of offsets as a mechanism to keep compliance costs low. After all, the supply of offset credits is widely expected to meaningfully reduce carbon market prices relative to a market without offsets (Borenstein et al. 2014; EPRI 2013). In contrast, several nonprofit stakeholders have expressed concerns about whether California's offsets truly represent reductions in GHG emissions. For example, two environmental groups sued CARB, claiming that the agency's decision to evaluate additionality using a performance standard at the protocol level does not satisfy the requirements of AB 32. The trial court rejected the plaintiffs' claims, finding that CARB had the necessary legal authority to adopt its performance standard approach. The court then applied a highly deferential standard to review CARB's treatment of additionality in each of its existing protocols (*Our Children's Earth Foundation v. CARB* 2015). Beyond highlighting the political opposition to offsets, this decision suggests that future legal challenges to CARB's protocol methodologies would face a difficult legal test under which the regulator is likely to prevail.

³ Cal. Health & Safety Code § 38562(d)(2).

⁴ Cal. Code Regs. tit. 17, § 95802(a)(4).

⁵ Cal. Code Regs. tit. 17, § 95802(a)(76).

15.1.3 Critical Issues for Carbon Offsets

Offsets raise a number of technical challenges, and CARB's two new protocols are no exception. A carbon market maintains its environmental integrity only if the offset credits it recognizes represent actual net reductions in greenhouse gas emissions. In practice, however, uncertainty about those reductions requires detailed scientific input and is often the subject of significant controversy.

A critical task for policy-makers is establishing a robust standard for offset additionality. An offset project is considered additional only if it occurred because of the financial investment made in return for offset credits. In other words, an offset program should only credit those emission reductions it causes and should not credit reductions that would otherwise have occurred. This standard is necessary to ensure that any climate policy system that accepts offsets achieves its intended emission reductions. But additionality is difficult to achieve in practice. Several studies have shown that a large portion of credits generated by the Clean Development Mechanism (CDM, the Kyoto Protocol's offsets program) were non-additional projects that would have occurred without the financial incentive of offset credits and thus do not represent net emission reductions (Cullenward and Wara 2014; Haya 2009; Haya and Parekh 2011; Wara 2008). As a result, their use by countries to meet Kyoto Protocol targets came at the expense of real reductions in greenhouse gas emissions.

Two issues further complicate the basic question of establishing whether offset credits represent real additional emission reductions. First, uncertainty analysis is particularly important for offset projects in the land-use and agricultural sectors, where emissions vary widely across location, crop, and ecosystem types. Second, there is the risk that offset program incentives cause emissions to increase outside of offset project boundaries. The most egregious example involves offset credits in the CDM awarded for the destruction of hydrofluorocarbons (HFCs), a potent family of greenhouse gases emitted as byproducts in the production of certain refrigerants. Manufacturers realized they could earn greater profits from destroying HFCs than from the sale of the refrigerant itself. There is strong evidence that they increased their production as a result of this incentive, creating surplus HFC byproducts that they subsequently destroyed to earn offset income (Wara 2008). Beyond enticing non-additional credits, the income from HFC-related offsets might have discouraged national governments from directly regulating HFC emissions, in order to maintain offset project eligibility—an effect that has been documented for a range of other project types (Figueres 2006).

Although the problems observed in past offset systems remain relevant, it is important to recognize that CARB's approach to additionality is different than that of its predecessor, the Kyoto Protocol's CDM. The CDM requires individual offset project applicants to evaluate their counterfactual emissions scenarios and demonstrate additionality for each individual project. In contrast, the California system makes these determinations at the protocol level by defining project eligibility criteria. Once CARB has approved a protocol, a project applicant needs only to

demonstrate compliance with the protocol's eligibility criteria in order to earn credit. Given the use of up-front project eligibility criteria, robust protocol design is particularly critical to ensuring that California's offset credits represent real emission reductions.

Finally, we note the importance of CARB's early offset protocols as institutional precedents in American climate policy. As one of the first legally binding climate policies in the United States, California's cap-and-trade system has already become a standard point of reference for climate policy design. In turn, CARB's treatment of complex and uncertain scientific issues in its offset protocol development process will surely set an important example for others.

15.1.4 Proposed Mine Methane Capture and Rice Cultivation Protocols

By the beginning of 2013, CARB had approved four offset protocols covering projects in the following areas: (1) forestry, (2) urban forestry, (3) livestock waste management, and (4) destruction of ozone-depleting substances. We participated in the policy development process for two new protocols: (1) mine methane capture and (2) rice cultivation, which we describe briefly here for background.

CARB approved the Mine Methane Capture (MMC) protocol in April 2014 (CARB 2014b), following a year of development and stakeholder engagement. The protocol awards credits to projects that capture methane that otherwise would have been released into the atmosphere from coal and trona⁶ mining activities. CARB's MMC protocol recognizes two types of projects. Methane can be captured for use as a fuel, such as by injecting captured gas into natural gas pipelines or using it to fire an on-site power plant. Alternatively, MMC projects can destroy methane without putting it to productive use through flaring or oxidation. In any of these cases, methane (CH₄) is converted to carbon dioxide (CO₂), a much less potent greenhouse gas.

At the time that this chapter was written, CARB was in the process of developing a rice cultivation protocol and responding to comments submitted on a discussion draft of the protocol released in March 2014. This protocol would credit reductions in methane emissions from changes in rice cultivation practice in California and the South Central United States. Rice cultivation produces methane emissions because production fields are submerged under water for a large portion of the year. This causes biomass to decompose without oxygen, producing CH₄ rather than CO₂. Methane emissions can be reduced if the fields are submerged for less time or if less biomass is left on the field to decompose anaerobically.

⁶Trona is a mineral mined as the primary source of sodium carbonate in the United States.

15.2 Science in the Policy Development Process

In April 2013, CARB established technical working groups to bring together stakeholders to inform the development of two new offset protocols. The working groups included offset project developers, project verifiers (who verify that project developers have met the protocol's requirements), representatives from industries facing compliance obligations in the carbon market (i.e., offset buyers), environmental nonprofit staff, academic research scientists, representatives from organizations that develop offsets standards for voluntary carbon markets, and state and federal officials from outside agencies. Each working group convened approximately once every three months, though additional discussion continued between meetings.

15.2.1 The Interdisciplinary Nature of Climate Change Policy Development

As a preliminary matter, we note that the scientific and technical expertise needed to ensure the environmental integrity of carbon offset protocols spans a wide range of disciplines. For example, the MMC and rice cultivation protocols drew on experts—including a number of outside scientists, in addition to our group—who provided advice on statistical uncertainty assessment, biogeochemical and ecological modeling, field measurements of gas fluxes, economic analysis, lifecycle analysis, basic mineralogy, engineering of mine construction, wildlife ecology, insect population dynamics, the sociology of agricultural crop production practices, modeling hydrological connectivity above- and belowground, state and federal water law, land-use law, environmental law, and organizational theory. As this list indicates, there are many opportunities for a variety of scientific experts to proactively engage the climate policy process—no agency has all of the necessary experts on staff.

15.2.2 What Did We Do?

Our participation in the offset protocol development process included a wide range of activities. We interfaced with a variety of stakeholders, including CARB staff, CARB board members, offset project developers, and nonprofit groups. Similarly, our communications ranged from informal conversations in person to formal written comment letters. As members of the technical working groups for each protocol, we attended meetings at the agency's headquarters in Sacramento and brought attention to issues we viewed as critical to the environmental integrity of the draft protocols as they developed, based on detailed independent analysis.

We provided our assessments to CARB staff as informal communications and later submitted formal comment letters during public comment periods in the administrative process. At times when we believed that CARB was not adequately addressing critical concerns, we spoke with individual CARB staff and board members outside of the formal working group process, occasionally with the participation of other stakeholders; we also raised our concerns through public testimony at formal board meetings.

The overarching goal of our involvement was to apply our research team's interdisciplinary expertise to helping ensure the environmental quality of the protocols. We did not use a single set of methods in our contributions, but rather, each of us brought methods from our respective disciplines to our shared goal. Below, we offer examples of scientific issues that highlight the kinds of input we offered in an effort to ensure that California's offset protocols reflect the best available science and are robust in the face of significant uncertainty.

Our examples are organized according to different ways that scientific issues arose in the policy development process—at the agency's request or according to our independent review of the protocols—rather than by protocol or chronology. In this way, we hope to illustrate both how science was used in developing the protocols and what roles scientists can expect (or be expected) to play in such processes.

15.2.3 Scientific Issues Raised by the Agency

Our first category of scientific engagement in the policy development process focuses on those issues that CARB proactively identified, either via agency staff asking stakeholders directly for input or by inclusion on agency-drafted meeting agendas. We review one such example in this section.

15.2.3.1 Scale of Uncertainty Assessment in Model-Estimated Emissions from Rice Cultivation

If the proposed rice cultivation protocol is adopted, it will become the first California protocol to use a computer-based model to estimate emission reductions. Using a model is necessary in this case because direct field measurements of emissions are technically challenging, costly, and time-consuming. The proposed protocol relies on a mechanistic biogeochemical model, the DeNitrification-DeComposition (DNDC) model, originally developed at the University of New Hampshire (2012).

The DNDC model is used to estimate offset project emissions and emission reductions. Through the technical working group, we—along with other scientists, including DNDC model developers, biogeochemists, and agricultural experts—addressed questions about model uncertainty and validation, the model's ability to estimate emissions of the potent GHG nitrous oxide (N₂O), and specific biogeochemical parameters used in the model.

Models are by definition simplifications of complex processes and are not perfectly accurate. Accordingly, the draft protocol applies a *deduction* that reduces the model-estimated emission reductions to conservatively account for any model error. Early drafts of the protocol included this deduction, but applied only one value for all eligible projects. Since DNDC must be field-calibrated to particular crop types, however, we were concerned that a blanket assessment of an uncertainty deduction for model error was too general and would not reflect the uncertainty of the model as it would be applied in the rice cultivation protocol—specifically, to fields in different ecosystems, with different cultivars, and in different regions around the country.

We focused our attention on how finely to parse assessments of model uncertainty, raising this issue in both formal and informal comments. Ultimately, the draft protocol included separate uncertainty deduction calculations for each of the rice-growing regions, rather than a single uncertainty deduction for all applications of the model. Furthermore, CARB decided to update the uncertainty deduction coefficients on an annual basis, a feature that will make the protocol more robust in light of new information. On the other hand, there is no formal mechanism for updating the model itself in response to newly published scientific information that directly affects relevant calculations. In the end, the potential for model structures and inputs to change highlights the profound challenge of integrating active scientific research into a fixed policy structure. Inevitably, there will be trade-offs between the adaptability of the protocol to new information and the stability of compliance rules that offset project developers desire.

15.2.4 Scientific Issues We Raised

A second category of scientific engagement describes our independent evaluation of issues that emerged during the protocol development process, as opposed to the assessment of issues on which CARB specifically requested input. In this section, we discuss examples of issues we raised about the conservative estimation of emission reductions from individual projects, additionality assessment, and the risk of unintended consequences caused by interactions between offset protocols and other policies. In some cases, we raised questions that were not being addressed at the time, and in others, we advanced new perspectives on issues that were already under agency consideration.

15.2.4.1 Statistical Bias in the Rice Cultivation Emissions Model

Statistical bias occurs when a prediction repeatedly over- or underestimates real-world outcomes. A model is unbiased if its outcomes are equally likely to over- and underpredict actual emissions as determined by direct field measurements. An unbiased model may still over- or underestimate the reductions achieved by an

individual offset project, but the uncertainty deduction factor (discussed above) ensures that over-crediting is still avoided with a high degree of certainty. However, a model that has not been validated as statistically unbiased for the project types credited under the protocol may result in an overestimation of the emissions reduced by those project types, even after the uncertainty deduction factor is applied.

During the rice protocol development process, CARB staff referred to hundreds of field measurements that had validated the DNDC model, finding no trend in the estimates. Thus, they concluded that the model was not biased. We were concerned, however, that some of the project types eligible under the protocol were not included in the data used to validate the model. Noting this gap, we argued that an assessment of bias at the level of the entire DNDC model was insufficient, and that project-type specific assessment of model bias was warranted. To avoid over-crediting, we suggested that CARB approve the eligibility of a project type under the protocol only if the DNDC model has been validated to have no statistical bias for the type of activities credited by that project type. As of this writing and to the best of our knowledge, CARB staff provided the technical working group with only a list of published references, not the actual data from the model runs used in the bias assessment.

As CARB continues to collect field data to validate the model, we hope to view the complete dataset on which CARB validates the DNDC model. This example illustrates the important role scientists play in reviewing the technical basis of policy—in this case, the methods used to assess statistical bias in an emissions model, in order to avoid over-crediting. It also illustrates the importance of transparency and access to data, both of which are necessary to enable scientific review.

15.2.4.2 Additionality of Methane Capture at Abandoned Mines

Our second example in this category concerns the treatment of additionality in the MMC protocol. CARB determines the additionality of different project types by assessing whether the project activity is *common practice* among a relevant population; a project type is considered additional if it is not common practice. Applying this approach to methane capture at abandoned mines under the MMC protocol, CARB staff studied abandoned underground mines in the United States, finding that “few currently capture and destroy mine methane. Methane capture and destruction is therefore deemed not to be business-as-usual at these mines” (CARB 2013, p. 7). This language suggests that CARB was prepared to deem all abandoned mine methane control projects additional under the MMC protocol.

The case of methane capture at abandoned mines demonstrates the importance of assessing additionality for subcategories of project types and not just for the entire population of possible projects as a whole. It also highlights the value of performing a conservative quantitative assessment to examine compliance with the protocol level additionality standard. While only 38 of the more than 10,000 abandoned mines in the United States have implemented methane capture projects, these 38 mines emit one third of all methane released from abandoned mines in the country (Ruby Canyon Engineering 2013a). Thus, existing methane capture projects at

abandoned mines are correlated with high rates of methane emissions—exactly as one would expect, given that the costs of capturing methane decrease as the rate and concentration of methane emissions at mines increase.

If all abandoned mines were eligible for MMC offset credits, the protocol could generate non-additional credits from projects that would have proceeded regardless of the financial incentives offsets provide. Indeed, if methane capture project development trends at abandoned mines from the last two decades were to continue, the volume of non-additional credits enabled by CARB's initial common practice assessment would likely far exceed methane capture from truly additional projects enabled by the financial incentive created by the offsets program as assessed by Ruby Canyon Engineering (2013b).

A more detailed analysis of abandoned mines suggested a path forward. Currently, most methane capture at abandoned mines occurs at mines that captured methane for pipeline injection when they were active. In fact, all mines that captured methane and were closed within the last ten years continued to capture methane after being abandoned. Methane capture at this subcategory of mines is undoubtedly common practice. Accordingly, CARB narrowed its eligibility criteria in the final protocol it adopted in April 2014, excluding those abandoned mines where methane had been captured and injected into pipelines when the mine was active (CARB 2014b, p. 14).

Our calculations showed that this approach excludes most, but not all, of the non-additional crediting that would conceivably be generated under CARB's initial definition of common practice at abandoned mines. While most non-additional methane capture is excluded from crediting by the narrowing of CARB's eligibility criteria for abandoned mines, past trends suggest that a smaller amount of methane capture may still be cost-effective on its own. We performed a quantitative analysis on the narrowed pool of eligible projects.

We found that if past trends in the development of new methane capture projects at abandoned mines that never previously captured methane were to continue, the expected generation of credits from non-additional projects is likely to be small compared to the expected effect of the protocol on new project development. Our analysis further indicated that under-crediting from conservative methodologies used to estimate emission reductions from abandoned mines under the protocol can reasonably be expected to counterbalance this non-additional crediting.⁷ In other words, even though it is likely that some abandoned mines that would have chosen to implement methane capture technology regardless of the offset credit could generate credits under the protocol, the total quantity of offset credits generated by the protocol is unlikely to exceed the net emission reductions enabled by the protocol.

⁷For a more detailed description of this assessment, please see comments submitted by Barbara Haya on behalf of our research team dated February 14, 2014, "RE: Comments on the informal draft of the Mine Methane Capture (MMC) Projects Compliance Offset Protocol released 31 January 2014" available on California Air Resources Board's Workshop Comments Log: <http://www.arb.ca.gov/lispub/comm2/bccommlog.php?listname=discussion-draft-ws>.

As a result, we concluded that the protocol is expected to meet the additionality requirement defined under AB 32.

In addition to describing how the regulator's approach to a particular technical issue evolved during the MMC protocol development process, this example illustrates a methodological issue that speaks to the broader architecture of California's offsets policy. CARB's common practice approach appears to be designed to avoid the subjectivity of other eligibility metrics by referring to objective measurements of the frequency of emission-reducing activities. Nevertheless, we believe that this approach belies a persistent analytical subjectivity. As the abandoned mine issue shows, how CARB defines the population of project types against which it makes its common practice determination has important implications for the additionality of the offset protocol as whole. This example illustrates the importance of performing additionality assessments on subcategories of projects and conservatively excluding subcategories that could be considered common practice. More broadly, it also shows that the decision to use a common practice standard does not avoid the need for careful risk assessments of possible outcomes; these assessments remain necessary to identify appropriate project eligibility criteria that contain the risk of over-crediting.

15.2.4.3 Potential Conflicts with Clean Air Act Implementation

Our final example concerns a prospective impact that could occur beyond offset project boundaries. Here, our analysis focused on the potential for California's MMC protocol to interfere with other states' implementation of regulations under the federal Clean Air Act. The problem is this: although California's offset regulations exclude as ineligible those offset projects whose emission-reducing activities are separately required by law, they do not consider the incentive California's offset protocols create to keep legal standards in other jurisdictions low.

Under the Clean Air Act, any major new source of greenhouse gases is required to apply for a Prevention of Significant Deterioration (PSD) permit from its state environmental agency. In turn, the state agency is required to determine the best available control technology (BACT) for that particular project. State agencies have broad discretion in setting each project's BACT, with limited room for the federal Environmental Protection Agency (EPA) to review their findings. We expressed concern that California's MMC protocol would create incentives for out-of-state agencies to keep GHG BACT standards for mines artificially low. After all, were an out-of-state regulator to require methane destruction under the BACT determination for a PSD permit that methane destruction project would become ineligible for offset credits (and revenues).

In order to mitigate this risk, we recommended a do-no-harm precaution, temporarily excluding from the MMC protocol those mines that would require a PSD permit under the Clean Air Act. Once a specified number of PSD permits were

issued to comparable mines, however, we suggested the MMC protocol could then expand its eligibility to mines that required PSD permits—so long as the early BACT determinations indicate that this course would be appropriate. Ultimately, these issues were not addressed in the adopted protocol and will be monitored informally.

15.3 Conclusions

The development of two new carbon offset protocols in California provides a rich case study in science-based policy-making. As public members of the technical working groups established by the California Air Resources Board, we both observed and contributed to the scientific discussions that arose during the course of protocol development. In addition to responding to the issues and questions raised by CARB directly, we—along with other outside scientists—played an essential role in expanding the protocol development discussion.

Most importantly, our engagement focused extra attention on the robustness of the protocols, providing strategies to avoid over-crediting despite substantial uncertainty in predicting protocol outcomes. Robustness is critical in the development of carbon offset protocols because of the significant scientific and behavioral uncertainty involved in accurately calculating emission reductions from individual projects. Fundamentally, this uncertainty stems from the challenge of estimating emission reductions (and the number of offset credits awarded) against an inherently unknowable counterfactual scenario of what would have happened without the offset program. Because offset credits are used in place of emission reductions within existing climate policy systems, methodological decisions must be made conservatively and guided by scientific risk assessments in order to avoid weakening these systems. Protocols should also be responsive to new scientific information and changes in the socioeconomic drivers of emissions. By conducting independent analyses of these kinds of issues, we aimed to increase the agency's capacity to evaluate key risks and improve the robustness of the offset protocols.

Finally, we hope the examples in this chapter encourage more members of the scientific community to seek ways to actively engage the development of climate policies. Although the offset protocols on which we worked were certainly informed by traditional scientific publications, our experience shows how the full treatment of scientific issues in the policy process occurs more through direct participation than literature reviews. Many of the critical policy questions involving science and uncertainty analysis would be difficult, if not impossible, to anticipate from a detached distance. In addition, their successful resolution depends on professional relationships built through iterative interactions in the policy process. Collectively, these factors suggest the need for more academics to explore ways to actively engage the climate policy process in the future.

POLICY BRIEF: The California Air Resources Board's U.S. Forest offset protocol underestimates leakage

May 7, 2019

Barbara Haya, PhD, Research Fellow, Center for Environmental Public Policy, University of California, Berkeley, bhaya@berkeley.edu

SUMMARY

Analysis of projects generating 80% of total offset credits issued by the California Air Resources Board's (ARB) U.S. Forest offset protocol finds that 82% of these credits likely do not represent true emissions reductions due to the protocol's use of lenient leakage accounting methods. The U.S. Forest protocol has generated 80% of the offset credits in California's cap-and-trade program. The total quantity of emissions allowed because of this over-crediting equals approximately 80 million tons of CO₂, which is one third of the total expected effect of California's cap-and-trade program during 2021 to 2030 (ARB 2017).

Leakage, in the context of the protocol, occurs when a reduction in timber harvesting at a project site causes an increase in timber harvesting elsewhere to meet timber demand. The way ARB's protocol accounts for leakage when calculating the number of credits awarded has three serious problems.

First, the protocol uses a 20% leakage rate when a rate of 80% or higher is supported by published studies of leakage rates from reduced timber harvesting in the United States (Gan & McCarl 2007, Wear & Murray 2004). Using an unsupported low rate results in over-crediting.

Second and more importantly, there is an inconsistency between the timing of when increases in on-site carbon storage and releases due to leakage are accounted for in the protocol's methods. Most improved forest management projects assume and credit a large reduction in timber harvesting in the first year of the offset project, but deduct the associated leakage over 100 years. This outcome is physically inconsistent, as it assumes the forest would be harvested in the first year for the purpose of giving credit but assumes harvesting would be spread out over 100 years for the purpose of reducing credits to account for leakage. As a result, most forest offset projects begin in greenhouse gas debt; project landowners generate offset credits that allow emitters in California to emit more than the state's emissions cap today, in exchange for promises that their lands will continue to increase their storage of carbon over 100 years.

Third, it is unclear whether the protocol requires forestland owners to increase carbon stocks to cover leakage for 25 years or for 100 years. The ambiguity relates to whether forestland owners are required to continue to maintain on-site growth to cover the impacts of leakage after the end of the project's 25-year crediting period. If forestland owners are only required to account for leakage for 25 years, participating projects could result in no net increase in carbon storage over 100 years compared to the baseline scenario.

The below table presents the actual emissions reductions achieved by projects under the protocol under different assumptions, reported as proportions of the credits already issued. For example, the cell on the upper left (100%) represents the assumptions underlying current policy. If these

assumptions are accurate, then 100% of the credits issued represent true emissions reductions. On the other hand, if these assumptions are inaccurate, the proportion of credits that represent actual emissions reductions can be much lower. The cell on the lower right (18%) shows that if the true leakage rate is 80% and ARB chose to only credit reductions already achieved, rather than reductions expected in the future, then the real reductions achieved to date by the project add up to only 18% of the credits issued.

This analysis was performed on all credits generated by 36 compliance forest offset projects through March 23, 2019. Collectively, these projects generated offset credits equal to 97 million tons of CO₂ reductions, which is 80% of the total credits that ARB has issued under its U.S. Forest protocol.

**Actual emissions reductions by U.S. Forest offset projects
as percent of credits issued to date**

		Expected over 100 years (ARB's current approach)	Achieved to date (Recommended approach)
If the true leakage rate is:	20%	100%	65%
	40%	99%	49%
	60%	97%	33%
	80%	96%	18%

ARB can avoid the over-crediting discussed here with a few modifications to its protocol. ARB should (1) apply a leakage rate that is 80% or higher; and (2) determine the net benefits of reduced harvesting on an annual basis by accounting for both the increased carbon storage on site and the decreased carbon storage elsewhere due to leakage at the same time. This solution is reflected in the bottom right cell of the above table (18%).

These changes are needed for the protocol to be in accordance with current law and regulation. First, given the uncertainty in true leakage rates from reduced timber harvesting within the United States, using an 80% leakage rate or higher, as is supported by the academic literature, better fulfills the conservativeness principle laid out in ARB's cap-and-trade regulations.¹ Using low rates that are not reflected in published literature is unjustified and does not fulfill the conservativeness principle. Second, generating credits today for expected net reductions over many decades into the future runs contrary to the goals of California's Global Warming Solutions Act (AB32), the 2006 law authorizing California's cap-and-trade and offsets programs. This law states that for any trade in credits using a market-based compliance mechanism, the reductions credited should occur "over the same time period" and be "equivalent in amount to any direct emission reduction required" under California's climate change law.²

¹ " 'Conservative' means, in the context of offsets, utilizing project baseline assumptions, emission factors, and methodologies that are more likely than not to understate net GHG reductions or GHG removal enhancements for an offset project to address uncertainties affecting the calculation or measurement of GHG reductions or GHG removal enhancements." California Code of Regulations, title 17, § 95802.

² California Health & Safety Code § 38562(d)(3).

DETAILED DISCUSSION

How the U.S. Forest offset protocol works

The large majority of U.S. Forest offset projects credit forestland owners for holding more carbon on site per acre than they would have in the business-as-usual baseline scenario. Landowners must commit to maintaining those higher carbon levels for 100 years. Projects can be anywhere in the United States, and to date, approximately 20% of credits generated have been from projects in California, and 80% have been from projects elsewhere in the United States.

Most of these improved forest management projects define a business-as-usual baseline scenario that involves aggressive timber harvesting that brings on-site carbon storage close to the average per acre for forests in their region. The assumption is that these offset projects maintain higher on-site carbon stocks by reducing timber harvesting.

In the first year of an improved forest management offset project, the landowner earns offset credits for the amount of carbon on their land above the business-as-usual baseline scenario minus two factors. First, estimates of carbon released due to leakage are deducted. Second, not all loss of on-site carbon is released into the atmosphere. The protocol accounts for the portion of harvested timber that remains long-term in wood products like in houses and furniture and buried in landfills, which would be reduced if total timber harvesting is reduced by the project. Each subsequent year, the landowner is credited for any incremental increase in carbon sequestration on the participating lands as trees grow and sequester more carbon, minus the same two factors.

Leakage rate

ARB's U.S. Forest offset protocol uses a 20% leakage rate. A 20% leakage rate means that 20% of the reduction in timber harvesting caused an offset project is replaced by an increase in harvesting on other forestlands. The other 80% of the reduction is assumed not to be replaced and simply represents a decrease in timber use (i.e., fewer houses built, less paper produced, etc.)

Published literature suggests the leakage rate from reduced timber harvesting in the United States is at least 80%. Using a computable general equilibrium model, Gan & McCarl (2007) estimate that if timber production were reduced in the United States, 77% of that that timber harvesting would be displaced to other countries. Wear & Murray (2004) use econometric modeling to trace the effects of reductions in federal timber sales in the western United States in the late 1980s through the 1990s. They estimate that 84% of the reduced timber production was displaced to elsewhere within North America. Both articles underrepresent total leakage from conservation on U.S. forestlands. The former only estimates international leakage, ignoring leakage that might occur among forestland within the United States; the latter only estimates leakage in North America, ignoring leakage that could occur elsewhere. The existing academic literature on leakage rates from reduced forest harvesting does not support a 20% leakage rate. A conservative approach to addressing uncertainty in the true leakage rate would apply a leakage rate that is at least 80%.

The Climate Action Reserve, which developed the original U.S. Forest offset protocol on which ARB based its own protocol, revised its leakage rate from 20% to a sliding scale up to 80%,

depending on the amount of timber harvesting performed by the offset project itself. Under this protocol, an 80% leakage rate is applied to offset projects that do not harvest at all.

The timing issue explained

As is typically done with offset projects, emissions reductions are estimated against a baseline scenario representing what would likely have happened without the offset program. Almost all ARB improved forest management offset projects define baseline scenarios that are well below their actual carbon stocks in their first year. On average across all projects analyzed, these baselines equal 70% of current carbon stocks. This means that in the first year of a project, the land owner is issued a quantity of credits equal to, on average, around 30% of the carbon stocks on their project lands, adjusted downward to account for leakage and any reduction in carbon held long-term in harvested wood products and landfills.

To create a baseline, the landowner models the carbon stocks and fluxes associated with a 100-year timber harvest scenario that reflects the harvesting expected to take place without the financial incentives from the offset program. The modeled scenario should be financially feasible and fulfill all legal and contractual obligations. In order for most projects to earn credits under the protocol, the calculated average carbon stocks in the baseline scenario over 100-years should be no less than that of the average forestlands for the project's region and forest type.

This modeled scenario is then abstracted into two key parameters used to calculate emissions reduced and credits generated by the project. Baseline on-site carbon storage and harvesting rates are assumed to equal the average values generated by the modeled scenario over 100 years. This simplified baseline is treated as equivalent, in terms of carbon accounting, to the range of financially feasible timber harvest scenarios that could have happened without the offset program. Flat average baseline values have the advantage of not requiring the landowner to calculate year-to-year increases in carbon storage against the harvest and growth cycles in one specific baseline management regime for each of 100 years. But this approach has one important disadvantage—flat average baseline values for carbon storage and harvest rates are internally contradictory and physically impossible.

The figure below presents an example of a modeled harvesting scenario used to define the baseline for one large offset project – ACR360, a half million acre project in southern Alaska. The curved dotted line is the modeled business-as-usual scenario for above-ground standing live carbon stocks. The straight dotted line is the baseline used to generate credits, which is the average above-ground standing live carbon stock in the 100-year modeled scenario. The solid line is the actual carbon storage on the project lands at the start of the project.

This simplified baseline scenario suggests that, if the project were not earning offset credits, its lands would be harvested to baseline levels in year 1 and maintained at those carbon stocking levels for 100 years. However, contradicting this assumption, the baseline also assumes that a constant quantity of timber is harvested each year over the project life, equal to the average rate over the 100-year modeled scenario. This second assumption is used to calculate leakage.

These two assumptions are contradictory because it is not possible for both carbon storage and harvesting to simultaneously remain at their respective average values over the project life. Carbon storage and harvesting rates are correlated with one another, and inextricably tied to the actual net growth rate of the project forest. If carbon storage is assumed to drop to the baseline in year 1, that

would happen because of a large amount of timber harvesting. If the harvesting rate is assumed to be constant over 100 years, however, then the carbon storage on the land will also decrease slowly, rather than abruptly in year 1. By mixing these two assumptions into a physically impossible baseline scenario, the protocol maximizes credits generated without reflecting the actual rate at which emissions to the atmosphere are avoided. The protocol calculates gains in carbon against the baseline using the first assumption, and losses in carbon from leakage using the second assumption. As a result, credit generation is frontloaded, and landowners need to continue to increase net carbon storage for decades to make up for the leakage effects associated the reduced harvesting credited at the start of the projects.

Baseline carbon stocks for Finite Carbon – Ahtna Native Improved Forest Management offset project

From: ACR360 “Finite Carbon – Ahtna Native Alaskan IFM” Version 1.3, Attachments G and H: Baseline Carbon Stocks, Submittal Date: 1/19/2018

This over-crediting allows emitters in California to emit more than the state’s emissions cap today in exchange for promises of forest carbon sequestration over 100 years to cover leakage from the start of the project. This is problematic for several reasons. First, emissions today are not equivalent to reductions decades from now given the urgency of climate change mitigation to avoid tipping points. California is designing its cap-and-trade and offset programs as models for other jurisdictions. If California exports a model that trades emissions today with reductions decades from now, California would promote a form of climate policy that fails to reduce emissions in these immediate critical years. Second, these promises can be difficult to keep since productivity slows in ageing forests (Gray et al 2016) and as forests respond to a warming climate. On project lands with less harvesting, fewer older trees will be replaced with younger trees, and the average tree age will increase over the 100 years of the project.

ACR360 generated close to 15 million offset credits in its first year, equal to more than 60% of the expected average annual effect of California’s cap-and-trade program on emissions during 2021-2030.

The 25 year versus 100 year issue explained

If forestland owners are required to increase carbon to cover leakage for 100 years, then there would be no over-crediting over 100 years of the project. Over-crediting in the early years of the project would slowly be compensated as leakage is deducted each year for the project life.

However, it is unclear whether the protocol requires forestland owners to account for the emissions from leakage for 25 or for 100 years. The crediting period of a U.S. Forest offset project is 25 years. After the end of each 25-year crediting period, landowners can choose to renew their offset project for another 25 years but are not required to do so. For each year of a crediting period, landowners must report the net impact of the project on emissions taking into account any change in on-site carbon storage, and any releases due to leakage or reductions in carbon held long-term in harvested wood products and in landfills. If the net impact of the project in any year is negative, a *reversal* is understood to have occurred. The carbon reductions that were previously credited and later released must be replaced with additional procurement of allowance or offset credits.

How a reversal is defined after the last year of crediting is unclear in the protocol. Following the last year of crediting, forestland owners are required to maintain the credited on-site carbon storage for another 100 years. It is unclear if they are also required to ensure their forestland continues to grow to cover off-site releases due to leakage and due to reductions in carbon held long-term in harvested wood projects and landfills.

If forestland owners are only required to account for leakage for 25 years, crediting for reduced harvesting in the first year of the project will be awarded in full, while potentially, as low as only 1% of the leakage associated with that reduced harvest is deducted each year for only 25 years. It would be possible for participating projects to result in a net decrease in carbon storage over 100 years compared to the baseline.³

Methods

Landowners report how they calculate their requested credit issuance in Offset Project Data Reports (OPDRs) based on instructions laid out in the protocol. These reports are made public through the offset registries. We reproduce these calculations for all credits issued to 36 projects as of March 23, 2019. We use data provided by the landowner in their OPDRs and supplemental materials, and adjust the projects' assumptions for leakage and the timing of harvesting in the baseline to investigate the quantity of over-crediting.

Adjusted leakage rate

Using data reported in the OPDRs, we reproduce the calculations of leakage (also called *secondary effects*), carbon in harvested wood products and landfills (HWP&L), and total reductions achieved using leakage rates of 40%, 60%, and 80% instead of 20%.

³ Please see public comments submitted to ARB on May 10, 2018, *Comments on proposed cap-and-trade regulatory amendments*, for a more detailed discussion of this need to clarify and revise how the protocol defines a reversal after the last year of credit issuance, found at <http://bhaya.berkeley.edu>.

Adjusted timing of baseline harvesting

We recalculate the credits that would have been generated if the protocol's leakage calculations matched its assumption that timber is harvested in year 1 of the baseline scenario to bring carbon storage down to baseline levels, and continues to be harvested at smaller rates needed to maintain the baseline carbon storage level for one hundred years.

We do this in the following manner:

First, the baseline harvesting level prior to delivery to the mill (PDM) in the first year of the project is calculated as the difference between standing live carbon in the project compared to the baseline.

Second, we calculate the baseline carbon in trees harvested in years 2 to 100 so that the sum of the baseline PDM over 100 years is the same as the sum using ARB's current methods. We calculate the baseline PDM in years 2 through 100 (99 years) as:

$$PDM_{\text{annual after year 1}} = (PDM_{\text{total}} - PDM_{\text{year 1}}) / 99$$

Third, we recalculate the carbon in baseline HWP&L in a similar manner, by:

- a) using the ratio of HWP&L to PDM in year 1 of the baseline in the OPDR to recalculate carbon in HWP&L in year 1 of the baseline for the revised PDM value;
- b) calculating carbon in HWP&L in years 2 through 100 using the same process as for timber harvesting, so that the sum of carbon in HWP&L over 100 years of the baseline is the same in our estimates as it is in ARB's current estimates over the project life;

Fourth, we recalculate emissions reductions from the project using these revised leakage and carbon in HWP&L figures, and otherwise following the methods defined by the protocol.

When baseline or project PDM figures are missing from any of the OPDRs, we calculate the missing PDMs mathematically from other reported figures when possible, and apply the following assumptions when needed:

- The ratios of carbon in HWP&L to PDM remain the same across reporting periods.
- When the first reporting period does not equal exactly one year, the PDM in the first year is a prorated amount, reflecting what most projects with at least two reporting periods have done.
- The ratio of carbon in HWP&L to PDM is the same in both the baseline and project scenarios.

Other than the changes and assumptions described above, we repeat the methods used in the OPDRs to re-estimate emissions reduced and credits generated.

Executive Summary

In 2013, California launched a multisector cap-and-trade market designed to reduce greenhouse gas pollution and meet the greenhouse gas mitigation targets set forth in Assembly Bill 32 (2006). Building on many years of effort and policy deliberation, California included in the cap-and-trade market the ability for covered entities with a compliance obligation to pay actors outside the program to reduce *their* emissions, frequently referred to as purchasing ‘offsets’. Since 2013, California has operated a first-of-its-kind forest carbon offset program, in which 39 forest projects across the United States have earned credits through July 2016.

This research analyzes California’s experience in running a first-ever compliance offset program for forests. To our knowledge, no official program evaluations of the forest offset program have been conducted to date. In the absence of identified and measurable official metrics and goals, this paper takes a more general ‘lessons learned’ approach, asking what the State has gotten from this policy innovation and what insights can be applied to other forest carbon sequestration efforts, like California’s ongoing natural and working lands inventory.

From project design document review, survey responses and interviews with project owners and developers, we have four core findings. First, the California program has gone much further towards assuring additionality than other programs, including most voluntary forest offset programs, though some lingering and perhaps unavoidable questions remain. Second, a wide variety of California compliance entities buy forest offset credits, including some that operate facilities located in areas identified by the State as disadvantaged communities. Third, environmental benefits have been created by the program, though their financial importance may be minimal. Finally, California has taken forest offset protocols and policy to new levels, though the future of the market is quite uncertain given the need for supermajority reauthorization of the cap-and-trade program.

This paper first provides an overview of the forest offset program, its history and development, and some data about the current state of the program. It then describes the methods used in this study, and presents the above findings in detail. It concludes by illustrating several ‘lessons learned’ that should be incorporated by the Air Resources Board and cooperating agencies into the broader natural and working lands effort in California.

Overview and Development of the California Forest Carbon Offset Program

Before presenting the results of our research into the offset program, it is necessary to briefly describe the origins, history, policy design choices, and project performance of the California forest offset program in order to inform readers and put our findings in proper context. As of this writing, no comprehensive program evaluations have been conducted of the forest offset program.

Climate Change, Forests, and California Policy

Forest Carbon History and Potential

Forests have played an integral role in climate forcing emissions throughout American history, though only more recently have they served as a net carbon sink. Historically, American forests served as a significant net source of emissions in the 19th and early 20th Centuries, as old growth forests were harvested and trees were a primary building material and energy source. As fossil fuels replaced wood as a fuel source, and as forests regrew in the middle decades of the 20th Century, American forests became a net carbon sink, reaching their lowest net emissions rate (or, alternatively, highest carbon storage rate) in the 1980s. Since then, increased harvesting has lessened American forests' utility as a carbon sink, however significant carbon storage potential remains if deforestation is avoided in the 21st Century.¹ It has been estimated that forest carbon sequestration is equivalent to 12-19% of US fossil fuel emissions,² and the Obama Administration's Climate Action Plan noted the sequestration role being played by US forests,³ though net carbon sinks from land use and forestry changes have been smaller in recent years than in 1990.⁴

California's Experience

Although the concept of forest offsets and other land use-related policies designed to incentivize carbon sequestration stretch back before the adoption of the

Kyoto Protocol,⁶ California’s commitment to forest offsets can be traced to Senate Bill (SB) 1771 (Sher) in 2000.⁷ That bill established the California Climate Action Registry (CCAR), a voluntary emissions inventory established by the state to define, measure and track greenhouse gas emissions. As part of its Climate Change Inventory, CCAR was instructed to acquire and develop data on the “costs, technical feasibility, and demonstrated effectiveness of . . . net reductions through the management of natural forest reservoirs.”⁸

Land trust organizations sought to take this forest carbon data-gathering role at CCAR further, and promoted Senate Bill 812 in 2002 (Sher).⁹ SB 812 directed CCAR to develop procedures and protocols for measuring and crediting the emissions impacts of “conservation and conservation-based management [activities in] . . . native forest reservoirs in California” that went beyond “applicable federal, state, and local land use laws and regulations.”¹⁰ How, exactly, CCAR would implement this measuring and crediting was a policy design task delegated to a state-convened working group that engaged land trusts, state foresters, forest industry representatives and an electric utility.¹¹

This first 2002-2005 working group fleshed out many of the initial policy design questions, which led to the opening of California’s voluntary carbon offset market in 2005. Importantly, from the very beginning, the state focused on a carbon-based payment structure, that is, strict accounting for forest carbon on a per-ton basis that could interface with cap-and-trade programs. The state chose not to take a practice-based or area-based payment approach to offset crediting that would have involved more general and less reliable carbon estimation and impact assumptions.¹² This tradeoff likely resulted in greater carbon sequestration from the projects who participated, perhaps multiple times more, but at the price of increasing project development and monitoring costs and thus a smaller population of potentially eligible projects. Indeed, this initial voluntary protocol (and its update in 2006) drew criticisms from other landowners not involved in conservation or conservation-based

management, as its stringent environmental and permanence requirements made initial participation rather unattractive for many for-profit private landowners and the California forest industry at the prices offered by voluntary carbon markets.¹³

A second working group, engaging more forest industry participants, followed after passage of California's landmark Assembly Bill (AB) 32 in 2006. From the beginning of planning the cap-and-trade portion of AB 32 compliance, the California Air Resources Board (ARB) signaled that forest offsets would play a cost-containment role in this new market. Cost-containment was an important concern – ARB's expectations for carbon prices in the cap-and-trade market ranged as high as \$50/ton before the market began operating¹⁴ (though in actual program experience, the allowance price has not risen above \$20/ton since market launch¹⁵). Eventually, the State decided that entities could use offsets to meet up to 8% of their compliance burden, though use of offsets was optional and no particular participation goals were set.¹⁶ With all reductions required to be “real, permanent, quantifiable, verifiable, enforceable, and additional” under AB 32,¹⁷ the second protocol working group focused on “revis[ing] the early protocol to make it compliance-ready,” a shift that had never before been attempted in any other jurisdiction.¹⁸ In addition, to serve the goal of maximum participation and lower project costs (thus greater cost-containment for the cap-and-trade market), the new protocol was to be available for use nationwide, not just for projects in California.¹⁹
